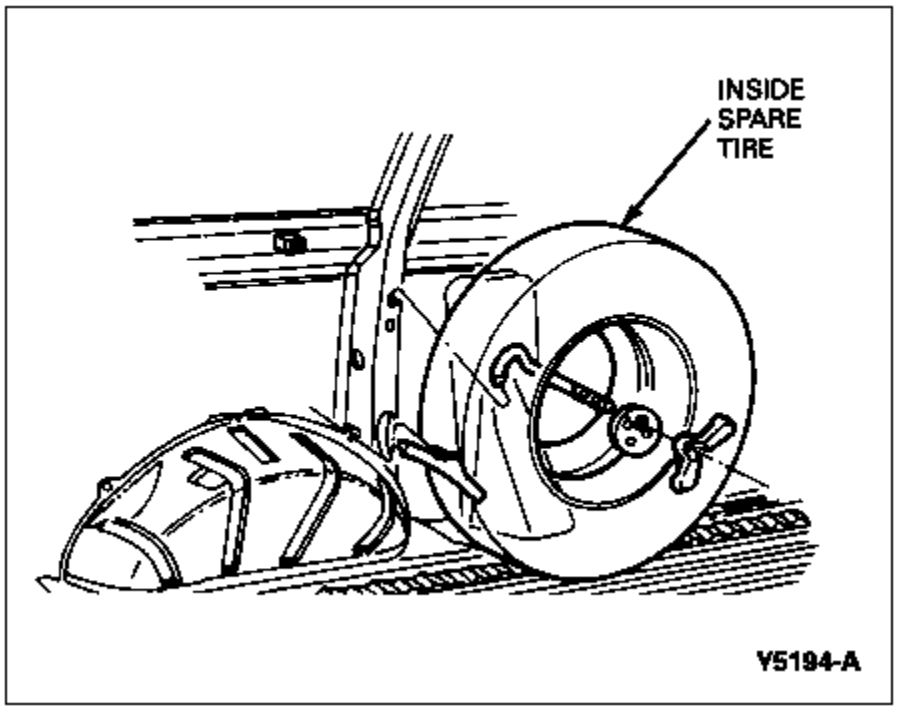
Tire, Spare, Inside, Aerostar

Removal

If the Aerostar is a standard length vehicle the spare tire is mounted inside to a carrier at the left rear quarter panel. To remove the spare tire, remove the wing nut and plate. A flat tire can be temporarily stowed in the same location.



If the Aerostar is the bus with a standard length body or extended length (all models), the temporary spare tire is stowed at the rear of the vehicle under the body.

The Aerostar standard length E-4WD bus spare tire is mounted on the floor.

1. Insert lug nut wrench into the actuator hole and turn counterclockwise until the cable extends to allow the spare tire to be pulled rearward from under the vehicle.

2. Slide spare tire to the rear and remove the retainer from the wheel.

3. To stow cable/retainer with spare tire removed, insert cable fitting into carrier rear wall slot, place wheel retainer against the carrier, and turn lug nut wrench clockwise until slack is removed.

Tire, Spare, Under Vehicle, Aerostar

Removal

1. Open the liftgate and insert drive section of the jack handle through hole above rear bumper.
2. Turn handle counterclockwise until tire can be slid rearward and cable is slack.
3. Slide retainer through center of wheel.

Tire, Spare, Temporary

WARNING: IF YOU USE THE TEMPORARY SPARE TIRE CONTINUOUSLY OR DO NOT FOLLOW THESE PRECAUTIONS, THE TIRE COULD FAIL, CAUSING YOU TO LOSE CONTROL OF THE VEHICLE AND POSSIBLY INJURE YOURSELF OR OTHERS.

CAUTION: Continuously using a spare tire other than a conventional spare tire on vehicles equipped with Traction-Lok® rear axles could cause damage to the Traction-Lok® differential.

NOTE: Extended use of other than matching size spare tires on a Traction-Lok® rear axle could result in a permanent reduction in effectiveness. This loss of effectiveness does not affect normal driving and should not be noticeable to the driver.

The temporary spare tire is smaller than a regular tire and is designed for emergency use only. This spare tire is marked with the words TEMPORARY USE ONLY.

Tire, Spare, Carrier, Aerostar (Base Vehicle)

Removal

1. Remove the two screws and remove the spare wheel bracket support from the underbody.
2. Remove the four screws and remove the spare wheel carrier lift assembly and the spare wheel carrier lift gear assembly from the underbody.
3. Remove the four screws and remove the spare wheel carrier mounting bracket from the underbody.

Installation

1. Position the spare wheel carrier mounting bracket on the underbody and install the four retaining screws. Tighten to 9-14 Nm (7-10 lb-ft).
2. Position the spare wheel carrier lift assembly and the spare wheel carrier lift gear assembly on the underbody. Install the four retaining screws and tighten to 9-14 Nm (7-10 lb-ft).
3. Position the spare wheel bracket support on the underbody. Install the retaining screws and tighten to 3.2-4.0 Nm (28.3-35 lb-in).

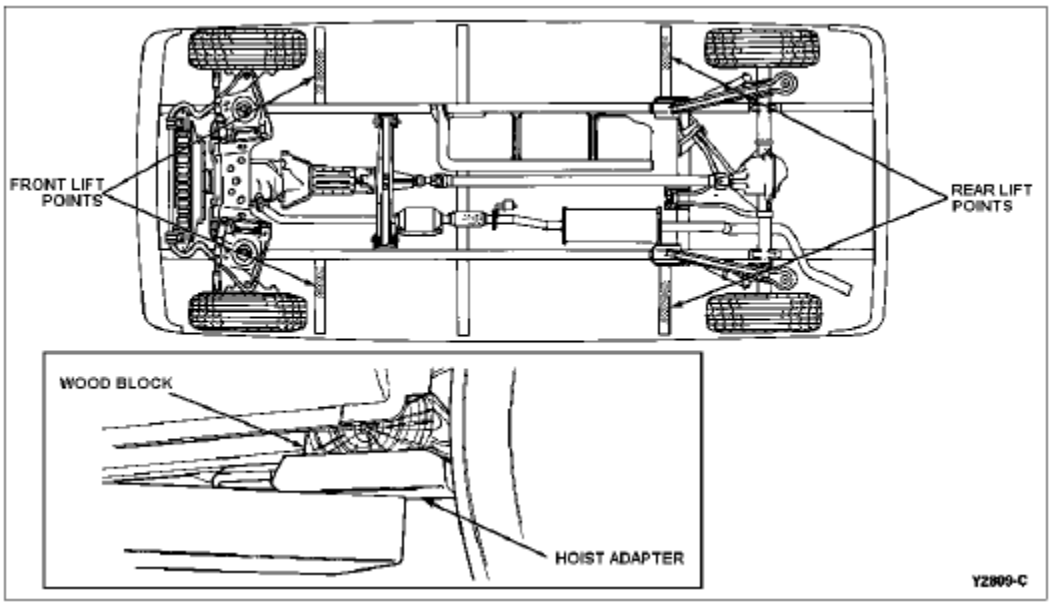
Lifting Instructions

Refer to manufacturer's operating manual for proper lifting procedures.

Hoist, Single Post

CAUTION: When raising a vehicle on a single-post hoist, place a wood block between the frame lift point and hoist adapter. This provides adequate clearance to prevent damaging the lower body.

Hoist Lift Points, Single-Post Hoist



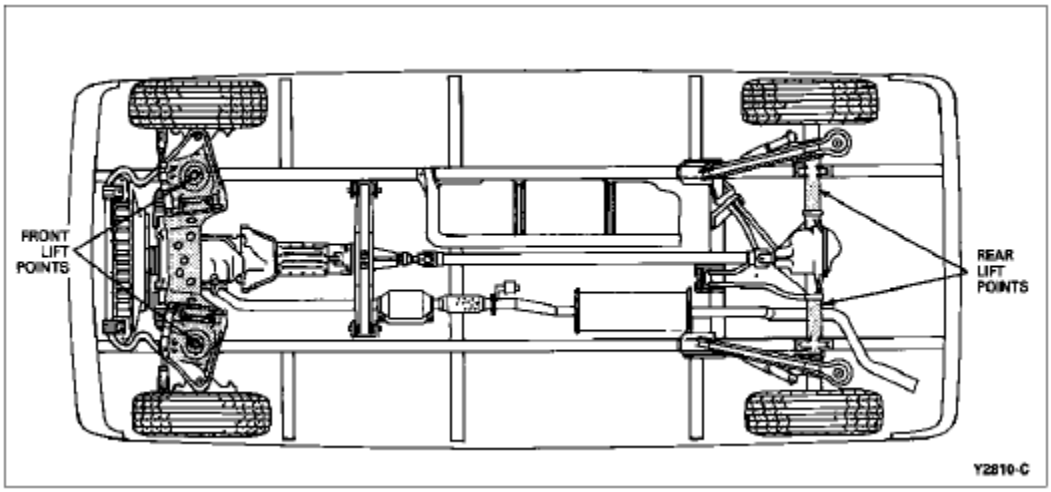
Hoist, Twin Post

WARNING: DO NOT LIFT VEHICLE USING TORSION BARS.

CAUTION: Damage to suspension, rear axle cover or steering linkage components may occur when positioning hoist adapters. Front adapter pads should be positioned carefully at 45 degrees, down and forward to ensure maximum contact under the center of lower suspension arms or spring supports as near wheels as practical. Rear suspension hoist adapters (forks) should be placed vertically under rear axle tubes, but adapters must not interfere with lower control arm mounting brackets or hydraulic brake lines.

CAUTION: When raising a vehicle on a twin-post hoist, care should be taken to position the vehicle so that the hoisting adapters (forks) do not damage the axle carrier casting or rear cover, or contact the front stabilizer bar or brackets.

Hoist Lift Points, Twin-Post Hoist, Aerostar



Jack, Floor

The Ranger jack (17080) is located behind the passenger seat. The SuperCab jack is located in the side panel storage area behind the passenger seat.

11	17A059	Bracket Assembly — Jack Hold
12	17035	Wheel Nut Wrench
A	—	Tighten to 2-3 Nm (18-27 Lb-In)

WARNING: TO MINIMIZE THE RISK OF PERSONAL INJURY, DO NOT PUT ANY PORTION OF YOUR BODY UNDER THE VEHICLE WHILE THE VEHICLE IS ON THE JACK. THE JACK IS PROVIDED FOR EMERGENCY WHEEL AND TIRE CHANGING ONLY. IF THE VEHICLE IS TO BE SERVICED, SUPPORT THE VEHICLE ON JACK STANDS. NEVER START THE ENGINE WHILE THE VEHICLE IS SUPPORTED ON THE JACK.

WARNING: ON VEHICLES EQUIPPED WITH A TRACTION-LOK® AXLE, NEVER RUN THE ENGINE WITH ONE WHEEL OFF THE GROUND, SUCH AS WHEN CHANGING A TIRE. THE WHEELS STILL ON THE GROUND COULD CAUSE THE VEHICLE TO MOVE.

WARNING: WHEN LIFTING A VEHICLE WITH THE VEHICLE JACK OR ANY FLOOR JACK, SET THE PARKING BRAKE AND BLOCK THE DIAGONALLY OPPOSITE WHEEL TO PREVENT VEHICLE FROM MOVING.

WARNING: POSITION FLOOR JACKS UNDER AXLES AS CLOSE TO THE WHEELS AS POSSIBLE. DO NOT SET FLOOR JACK UNDER SHOCK ABSORBER. IT IS IN AN UNSTABLE LIFT POSITION. REFER TO THE FOLLOWING ILLUSTRATIONS.

CAUTION: Do not use the differential housing as a lift point. Leaks or damage to the rear axle cover and adjoining differential housing surface may occur if a floor jack or any lifting device is allowed to contact the cover at any point where the cover joins the housing.

CAUTION: On vehicles equipped with an under-chassis mounted spare tire, remove the tire, wheel or tire carrier from the vehicle before it is placed in a high lift position in order to avoid sudden weight release from the chassis.

CAUTION: With transfer case in N (NEUTRAL), neither the automatic transmission P (PARK) nor the manual transmission R (REVERSE) position will hold the vehicle stationary. Do not leave the vehicle unattended with the transfer case (if so equipped) in N (NEUTRAL). When one rear wheel is lifted off the ground, neither the automatic transmission P (PARK) position nor the manual transmission R (REVERSE) position will prevent the vehicle from moving and possibly slipping off the jack, even if those positions are properly engaged. To prevent inadvertent vehicle movement while changing a tire, always set the parking brake fully and always block the wheel diagonally opposite the wheel being changed.

Position the scissors-type emergency jack as shown in the following illustrations.

1. Automatic transmission: place shifter in P position. Manual transmission: place shifter in reverse. Four-wheel drive: place transfer case in 2H, 4H or 4L.
2. Set parking brake and block both sides of diagonally opposite wheel.
3. Remove jack, jack handle sections, lug wrench and spare tire.
4. Remove wheel cover (if equipped) with plastic coated tip of lug wrench.
5. Loosen wheel nuts with lug wrench. Do not remove wheel nuts.
6. Raise jack to desired height by using the thumb wheel.
7. Position jack under the correct jacking point as shown on the front bracket on lower suspension arm or rear axle.
8. Remove wheel nuts.
9. Remove tire and install spare tire.
10. Replace wheel nuts and hand-tighten.
11. Lower vehicle.
12. Tighten wheel nuts with lug wrench to 115-156 Nm (85-115 lb-ft).
13. Restow flat tire.
14. Unblock wheel.
15. Restow jacking equipment.

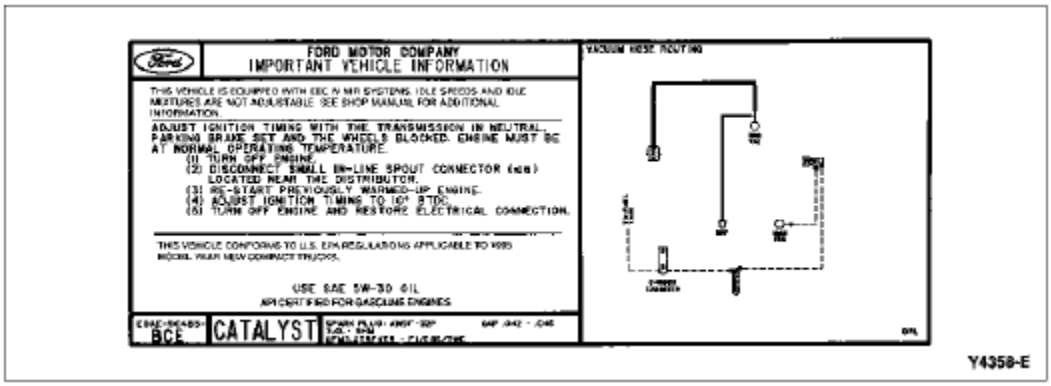
Vehicle Emission Control Information (VECI) Decal

Vacuum hoses on the engine (6007) use a color stripe to aid in hose routing checks. The stripe will usually be the same color as on the vehicle emission control information (VECI) decal, but the correct vacuum hose routing must be verified by using the correct component connections shown on the VECI decal.

Typical VECI Decal



Scheduled Maintenance — Emissions

The Emission Systems Required Maintenance Schedule lists the items required to maintain the vehicle emission systems at levels determined by the Federal Government (Environmental Protection Agency). Also printed is an index to a number of maintenance procedures, each of which is related to an item listed on the maintenance schedule. Use these procedures to perform the required emission system maintenance items listed on the maintenance schedules.

Maintenance service adjustments must conform to specifications contained here, listed in the specifications manual or shown on the Vehicle Emission Control Information Decal, or the emissions system may become inoperative.

As a safety precaution, before starting the engine (6007) to perform maintenance, ensure that the gearshift lever (7210) is in PARK (P) (automatic transmission) or NEUTRAL (N) (manual transmission), the parking brake control (2780) is set and the wheels are blocked.

Refer to the appropriate sections of the Powertrain, Drivetrain Manual and the Powertrain Control/Emissions Diagnosis Manual for the maintenance procedures, which are related to the items listed in the maintenance schedule. Use these procedures to perform the required emission system maintenance items listed in the maintenance schedules.

CAUTION: TO ENSURE THE DURABILITY OF THE VEHICLE AND ITS EMISSION CONTROL SYSTEMS, IT IS NECESSARY THAT SCHEDULED MAINTENANCE BE PERFORMED AT THE DESIGNATED INTERVALS.

CAUTION: FORD RECOMMENDS THE USE OF GENUINE FORD REPLACEMENT PARTS. THE MAINTENANCE, REPLACEMENT, OR REPAIR OF THE EMISSIONS CONTROL DEVICES AND SYSTEMS (THE COST OF WHICH IS NOT COVERED BY WARRANTY) MAY BE PERFORMED BY ANY AUTOMOTIVE REPAIR ESTABLISHMENT OR INDIVIDUAL AND MAY USE OTHER THAN FORD SERVICE PARTS FOR SUCH MAINTENANCE OR REPAIR. IF OTHER THAN FORD OR MOTORCRAFT PARTS OR FORD AUTHORIZED REMANUFACTURED PARTS ARE USED FOR MAINTENANCE REPLACEMENTS OR THE SERVICE OF COMPONENTS AFFECTING EMISSIONS CONTROL, THE OWNER SHOULD ASSURE HIMSELF THAT SUCH PARTS ARE WARRANTED BY THEIR MANUFACTURER TO BE EQUIVALENT TO GENUINE FORD MOTOR COMPANY PARTS IN PERFORMANCE AND DURABILITY. PLEASE CONSULT THE WARRANTY BOOKLET FOR COMPLETE WARRANTY INFORMATION.

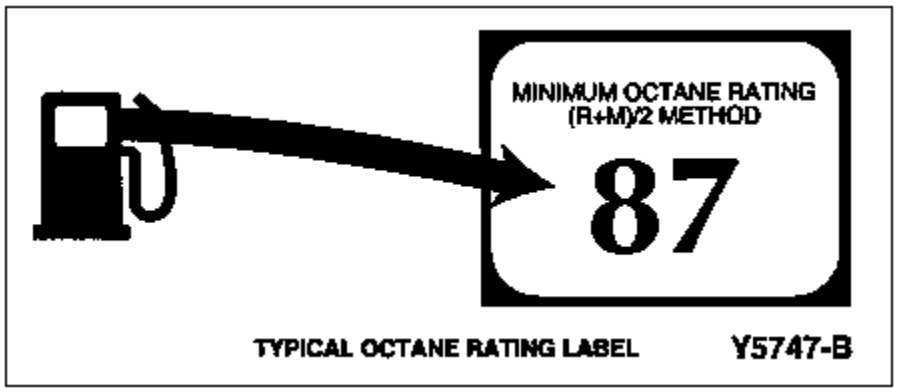
NOTE: The positive crankcase ventilation (PCV) valve is a critical emissions component. The dealer will replace the valve at no cost at 60,000 miles (96,000 kilometers) (except Canada and California vehicles).

Any modification of the emission control systems could create liability under federal law (U.S.) if made prior to the first sale and registration, and under the laws of some states if made thereafter. Further, federal law prohibits vehicle manufacturers, dealers and other persons engaged in the business of repairing, servicing, selling, leasing, or trading motor vehicles as well as fleet operations from knowingly removing or rendering an emission control system inoperative after sale and delivery to an ultimate purchaser. In Canada, modifications of the emission control system could create liability under applicable federal or provincial laws.

Gasoline Octane Rating

This vehicle is designed to use regular unleaded fuel with an octane rating of 87. At service stations, the octane rating is displayed in a label on the pumps.

Using a fuel with a lower octane rating can cause persistent and heavy knocking, which can damage the engine (6007).



TYPICAL OCTANE RATING LABEL Y5747-B

Engine Oil Viscosity

WARNING: CONTINUOUS CONTACT WITH USED MOTOR OIL HAS CAUSED SKIN CANCER IN LABORATORY MICE. PROTECT YOUR SKIN BY WASHING WITH SOAP AND WATER.

NOTE: All compact truck engines are filled with SAE 5W-30 oil at the factory.

Engine oils with an SAE 5W-30 viscosity are PREFERRED for your vehicle. They provide the best engine performance, fuel economy and engine protection for all climates down to -25°C (-15°F).

Inspection and Verification

Leaks

Visually inspect for dust and water leaks. Any unsealed crevice or small opening in the lower section of the body will permit dust and water to be drawn into the body.

To determine the exact location of a dust/water leak, remove the following trim from the vehicle:

- Cowl trim panel. Refer to Section 01-05A or Section 01-05B .
- Quarter trim panel.
- Rear seat back and seat cushion. Refer to Section 01-10 .
- Carpet and side trim panel. Refer to Section 01-05A or Section 01-05B .
- Spare tire.
- Center pillar trim. Refer to Section 01-05A or Section 01-05B .
- Scuff plates. Refer to Section 01-05A or Section 01-05B .

After removing the trim, the location of most leaks will be evident. The entrance of dust is usually indicated by a pointed shaft of dust or silt. Seal these leaks, then road test the vehicle on a dusty road to make sure all leaks are sealed.

Noise

Wind noise, rattles and their sources are detected by driving the vehicle at highway speeds in four different directions. Listen for sources of noise with all windows closed, radio off, heater and air conditioner blower motor turned off and ventilation ducts open. A stethoscope can be used to pinpoint the source of wind noise.

Most wind noise-producing leaks will occur at the door and window seals or at sheet metal joints in the door or the door opening in the body.

tomsn048@gmail.com

tomsn048@gmail.com

Symptom Chart — Body Service

BODY SERVICE

Condition	Possible Source	Action
• Dust Leak	• Cowl trim panel, kick pads, and floor mats.	• REMOVE trim. CHECK for leaks and SEAL with appropriate sealer. ROAD TEST for leaks. RECHECK trim for leaks, or USE light under vehicle with trim removed. CHECK interior of body at joints and weld lines.
• Dust/Water Leaks at Floorpan and Grommets	• Missing or damaged plugs and/or grommets.	• CHECK plugs for proper installation.
• Drain Holes Collecting Water	• Holes clogged with mud or road tar.	• CHECK drain holes regularly. CLEAN drain holes of dirt and foreign material with a punch or screwdriver.
• Wind Noise, Air Entering Vehicle Through Small Holes in Body	• Leaks at door and window seals or sheet metal joints in doors or door openings.	• SEAL leaks with RTV sealant and foam tape. ROAD TEST, or USE Vacuum Leak Detector 164-R0256 or equivalent to obtain a water leak reading. RECHECK for leaks using detector. ROAD TEST.
• Rattles	• Loose screws, nuts, bolts, small pieces of body deadener in door wells, pillars, and quarter panels.	• CHECK doors by carefully striking underside of door with a mallet. LISTEN for loose objects in door. REPAIR. TIGHTEN body bolts and screws.
	• If tightening bolts and screws does not eliminate rattle, cause could be misalignment.	• REFER to Section 01-03 for adjustment and alignment procedures.
	• Weatherstripping and anti-squeak material has slipped out of position.	• APPLY additional cement or other adhesive; INSTALL in proper location to eliminate rattle.

tomsn048@gmail.com

tomsn048@gmail.com

Dust and Water Leaks

After trim removal has revealed the location of leaks, seal these leaks, and road test the vehicle on a dusty road to make sure all leaks are sealed. Dust entry is usually indicated by a pointed shaft of dust or silt at the point of entrance. After the road test, check for indications of a dust pattern around the door openings, cowl panel, and cowl side panel.

Sometimes leaks can be located by putting bright lights under the vehicle, with the above components removed, and checking the interior of the body at joints and weld lines. The light will show through where leaks exist. The Vacuum Leak Detector 164-R0256 or equivalent can locate dust and water leaks.

tomsn048@gmail.com

Wind Noise

Seal all leaks with RTV sealant foam tape or by positioning or replacing the seals. Road test the vehicle to make sure all leaks have been adequately sealed.

An alternate method of verifying corrective actions involves the use of Rotunda Combination Engine EAR/Chassis EAR 107-R2102 or equivalent. After identifying the leak point through a drive evaluation, obtain a meter reading by using the leak detector. A check with the leak detector after repairing the leak will verify the effectiveness of the corrective action. A final test drive may still be advisable to make sure other objectionable leaks, not noticed because of a major leak, do not exist.

tomsn048@gmail.com

Rattle Elimination

All bolts and screws should be tightened periodically. In the event that tightening the bolts and screws, located on such assemblies as the doors, hood and door does not eliminate the rattles. Refer to Section 01-02 and Section 01-03 .

Rattles and squeaks are sometimes caused by weatherstripping and anti-squeak material that has slipped out of position. Apply additional cement or other adhesive.

tomsn048@gmail.com

Body Sealant Locations

The body sealant locations are as follows:

- front floorpan and rear floorpan
- quarter wheelhouse inner panel and quarter wheelhouse outer panel
- dash panel
- running boards
- door openings
- roof side drip rail

tomsn048@gmail.com

Body Side Stone Protection Vinyl, Lower

Materials Required

- Abrasion Resistant Coating available from paint companies and other aftermarket coating manufactures.
- Color Coat Paint System
- Silicone and Wax Remover
- Multi-Purpose Paint Precleaner (Spray Gun Cleanup) VC-542-A

Equipment, Suggested

- Rotunda Spray Gun 085-R1626 (No. 63 Air Cap, No. SS Fluid Tip, No. 363 AN needle) or equivalent
- Rotunda Detached Pressure Cup 085-R1617, 1.89 liter (2 quarts), with Air-Adjusting Gauge or equivalent
- Rotunda Dual Action Sander 107-R1619 or equivalent
- Rotunda Heat Gun 107-R0300 or equivalent
- No. 180-Grit Paper
- Lint-Free Cloth
- Tack Cloth
- Regular Masking Tape
- No. 80 Disc for Disc Sander
- No. 220/240 Disc

A large area resulting from peeling or damage will necessitate removal of the factory sprayed-on vinyl coating. The following procedure is suggested.

NOTE: Where sheet metal is damaged to the extent that fender, door or quarter panel replacement is required (or in initial installation), disregard Steps 1 and 2.

NOTE: Approximately 1.89L (2 quarts) is required for an initial installation on a vehicle similar to a factory-applied system. The specified dry film thickness of 15 to 20 mils will require at least three, or possibly four, applications of coating material, with flash-off time allowed between coats. As with painting, spray coat the complete lower panel.

As the adherence of this coating to properly prepared sheet metal is excellent, the necessity of prime painting the sheet metal prior to protective coating is eliminated. However, adhesion will be adversely affected unless the sheet metal area to be covered (either repaired or new) is prepared in accordance with the following procedure.

1. Using Rotunda Heat Gun 107-R0300 or equivalent, or lamp, soften the vinyl coating until it is pliable. Scrape off the softened vinyl with a putty knife or similar tool. If necessary, sand off any hard-to-remove vinyl coating using an orbital disc sander (No. 80 disc). (Abrasion resistant coating is not suitable for "spot" corrections.)

2. Perform the necessary repairs to correct the sheet metal damage.

Vehicle, Masking

tomsn048@gmail.com

Suitable covers should be installed over the wheels. Mask off all upper exterior body sheet metal. Remove wheel opening stone shields and mask mouldings.

NOTE: If the vehicle has lower body side mouldings above the "turn under" of the rocker panel, the moulding can serve as the upper margin of the area to be coated. If the vehicle does not have suitable mouldings, a sculpture or break line in the sheet metal can be used. However, the method used in masking off the upper coating margin line will depend on the presence or absence of mouldings in this area.

Masking tape should be positioned so that the moulding lower side is also covered. However, do not cover the sheet metal immediately below the moulding.

It is not necessary to mask off the body door openings in the coating area, as they will be uniformly coated where the door margins allow the coating to enter. However, these door opening areas should be cleaned to make sure of coating adherence.

Sheet Metal

Sheet Metal, Serviced

1. Scuff sand (No. 180 grit paper) the glossy surface of the painted areas to be coated.
2. Remove sanding dust using a lint-free tack cloth and compressed air.
3. Using a clean, lint-free cloth, solvent wipe the area to be coated with Multi-Purpose Paint Precleaner VC-542-A or equivalent, or wax and grease remover, and allow to flash-off.

Sheet Metal, New

1. The glossy surface of the paint in the coating area must be ground off with an air-driven D/A sander such as Rotunda Dual Action Sander 107-R1619 or equivalent. A 220/240 grit-disc does a good, fast job. **Do not** sand through the primer.
2. Scuff sand (No. 180 grit paper) the primer. Do not sand through the primer.
3. Remove sanding dust using a lint-free tack cloth and compressed air.
4. Using a clean, lint-free cloth, solvent wipe the area to be coated with Multi-Purpose Paint Precleaner VC-542-A or equivalent, and allow to flash-off.

---

tomsn048@gmail.com

tomsn048@gmail.com

Coating Spray Procedure

The coating must be applied by an experienced automotive painter. The coating must be thoroughly agitated and used without thinning. As the material is reasonably heavy-bodied, a pressure cup equipped spray gun is recommended or appropriate equipment recommended by the coating manufacturer. Satisfactory coating appearance (minimal orange peel and sag) has resulted with gun air pressures of approximately 207 kPa (30 psi) and cup pressures of approximately 103 kPa (15 psi).

To protect the lower exposed painted fender, rocker, and quarter panel down flanges, the vehicle must be elevated high enough so that the painter can spray this area effectively. When an initial installation is to be made, a remote 1.89L (2-quart) capacity pressure cup makes a much more efficient tool, as the spray gun can be used closer to the floor. The spray gun, fluid hose and/or cup must be cleaned immediately after use. While lacquer thinner can be used when the suggested cleanup material is unavailable, the Multi-Purpose Paint Precleaner or equivalent is quicker and much more efficient. With the spray gun at 207 kPa (30 psi) and pressure feed cup at 103 kPa (15 psi) follow this procedure:

1. Apply a wet, sag-free coat. Allow three to five minutes flash-off time.
2. Apply the second wet, sag-free coat. Allow three to five minutes flash off-time.
3. Apply the third wet, sag-free coat. Allow three to five minutes flash off-time.
4. Apply the final wet, sag-free coat. Allow three to five minutes flash-off time and pull off the fine line tape, exposing the raw upper edge of the coating.
5. Immediately clean the spray equipment using Multi-Purpose Paint Precleaner VC-542-A or equivalent.
6. Allow at least two hours drying time at approximately 21°C (70°F).

tomsn048@gmail.com

tomsn048@gmail.com

Color Coat

The complete coated area, as well as the upper raw edge, must be covered with color coat. Mask off the upper margin line using fine line tape positioned 1.59mm (1/16 inch) above coating edge. Using appropriate repair paint and application procedures (to include both prime and color coat), the protective coating area can now be finish painted.

If damaged sheet metal extends above the protective coating area, normal prime/color paint procedures should be followed.

tomsn048@gmail.com

Bumpers, Plastic

Where substrate material has not been removed, cuts and cracks to the radiator grille opening panel or rear bumper covers can be repaired using the approved service material: 3M P.R.O. Fill EZ-Sand, No. 05895 or equivalent.

The following repair procedures can be used for either the radiator grille opening panel or the rear bumper covers.

tomsn048@gmail.com

Bumpers, Polypropylene

The following three types of damaged bumpers are considered repairable:

- A bumper with a hole less than 50mm (1.97 inches) in diameter.
- A bumper with a crack less than 100mm (3.94 inches) in length.
- A bumper with a crack less than 100mm (3.94 inches) in length that is less than half of the width of the bumper.

Although a bumper which has been damaged greater than this could also be repaired, it should be replaced with a new one. This is because such repair would detract from the beauty and quality of the bumper due to the decrease of the adhesive strength, etc. In addition, such repair is not considered reasonable in terms of work load.

Repair polypropylene bumpers having flaws that have reached the surface of the polypropylene and are too serious to be restored by painting.

1. Cut the rough edges around the flaw with a knife to make it smooth. Sand the area with a sander to make an angle of about 45 degrees.

2. **NOTE: Heat only the shaded area to melt it.**

   Weld damaged area.

   - For repair of a cracked area, melt the crack together using Rotunda Airless Plastic Welder 107-01250 or equivalent.
   - For repair of a hole, degrease the area and the reverse side of the damaged area. Install aluminum tape on reverse side of damaged area.

3. **CAUTION: Do not move the welding rod until the welded part cools.**

   NOTE: Take care not to excessively melt the welding rod. If the part is welded with the welding rod melted like jelly, the welding strength will be lowered.

   Melt the polypropylene welding rod with Rotunda Airless Plastic Welder 107-01250 or equivalent, and deposit it in the cracked area. Operate a heat gun 2-51mm (.5-2.0 inches) away from the part that will be welded.

4. **NOTE: Do not sand part continuously.**

   Sand the surface of the polypropylene little by little, since it is easily melted even by the abrasion heat. If melted, remove the melted area. Sand the areas to which repair agent will be applied.

5. Apply polypropylene primer uniformly to an area larger than the re paired area with a brush. It will take about 10 minutes to dry at 20°C (68°F).

6. **NOTE: When mixing the main and stiffening agents, be careful not to allow bubbles to form.**

   NOTE: Since the repairing agent hardens fast (about five minutes), proceed with the work

tomsn048@gmail.com

immediately after mixing the agents.

It will take about 30 minutes to dry at 20℃ (68°F) before it can be sanded.

Mix the main agent and the stiffening agent in a ratio of one to one. Apply the mixed repair agent to the damaged area.

7. **NOTE: If excessive force is applied to the area when sanding, the surface will not become smooth.**

   NOTE: If there is fuzz around the repaired area, melt it by heating it slightly with a heat gun.

   Sand the area with No. 180-No. 240 sandpaper.

8. **NOTE: Polypropylene primer will dissolve, even after drying, if it is wiped with solvent. Use only water to clean.**

   Degrease the painted surface.

9. Dry the part.

10. Add the flex agent to the urethane primer surfacer and spray it on the repair.

11. Air dry at 20℃ (68℉) for eight hours.

    Force dry at 60℃ (140℉) for one hour.

12. Lightly sand the area on which the primer surfacer is sprayed and the complete surface of the bumper with No. 400-No. 600 sandpaper. Do not expose the surface of the polypropylene. Wet sanding or dry sanding is acceptable.

13. **CAUTION: Use only polypropylene primer for a polypropylene bumper.**

    Wipe the complete surface of the bumper with degreasing agent. Quickly wipe the surface with a clean rag to degrease it.

14. Apply a matching coat of paint to the polypropylene bumper.

15. Force dry at 60℃ (140℉) for one hour. Air dry at 20℃ (68℉) for eight hours.

tomsn048@gmail.com

Bumper Covers Plastic, Flair Mouldings

Where substrate material has not been removed, cuts and cracks to the bumper covers can be repaired using the approved service material: 3M P.R.O. Fill EZ-Sand, No. 05895 or equivalent.

The following repair procedures can be used for bumper covers.

Procedure 1 — Substrate Cuts or Cracks

Substrate Material Not Removed

1. Wipe repair area with silicone and wax remover, to ensure clean surfaces.

2. Apply a thin coating of Instant Adhesive E8AZ-19554-A or equivalent meeting Ford specification WSK-M2G402-A4 to one surface of the cut or crack. Position the surfaces very carefully together in their original position. Quickly and firmly press the two surfaces together for at least one minute. Good bond strength is developed after one minute but maximum strength requires 3 to 12 hours cure time. **Note the precautions on adhesive container.**

3. If the part did not have paint damage and the part was properly positioned, painting may not be required. However, if painting is necessary, proceed as follows:

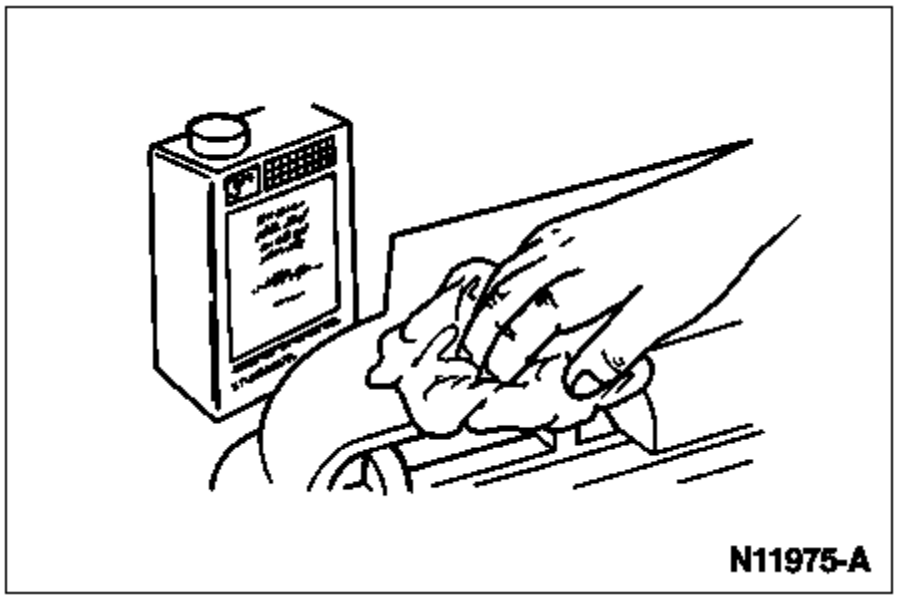
    a. Scuff-sand the repair area with a sanding block and No. 400 paper. Be careful not to sand through the color coat surface. Usually dulling the surface is sufficient. Wipe off or clean the repair area with a clean, dry cloth or an air gun.
    b. Wipe the sanded surface with silicone and wax remover or equivalent.
    c. Refinish as described in this section under Refinishing Flexible Exterior Parts.

Procedure 2 — Substrate Holes, Gouges and Tears

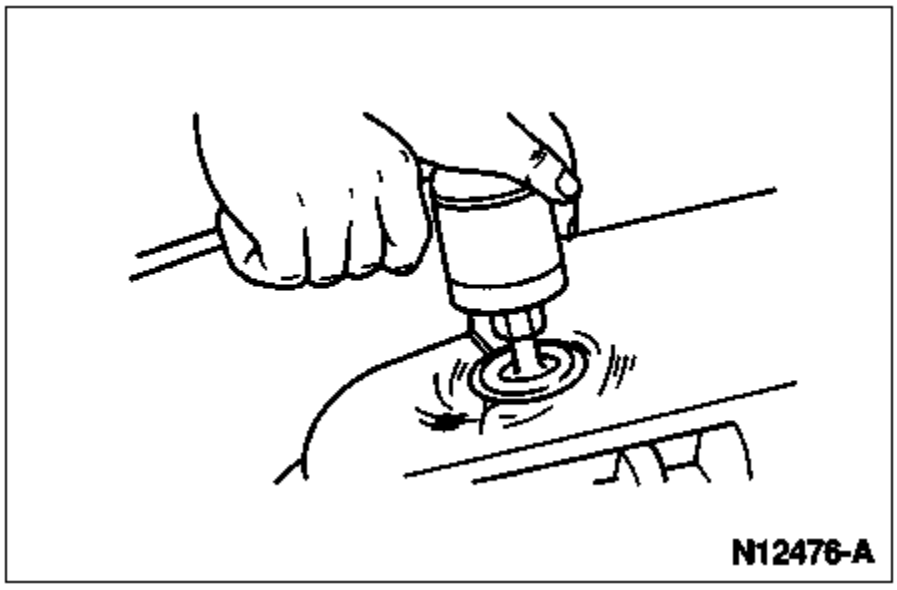
Substrate Material Removed

1. Clean the repair with soap and water. Next, use Multi-Purpose Paint Precleaner VC-542-A or equivalent to remove grease and tar.

tomsn048@gmail.com

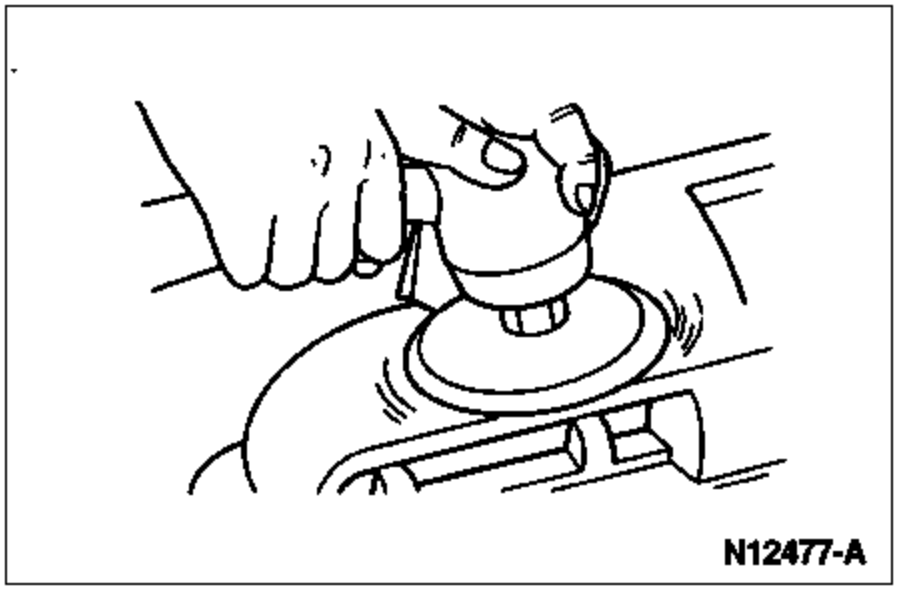


2. Grind the surface of the repair with a grade 36 disc or coarse abrasive paper. Grind about 38mm (1-1/2 inches) around the actual damage to obtain a taper for best adhesion.



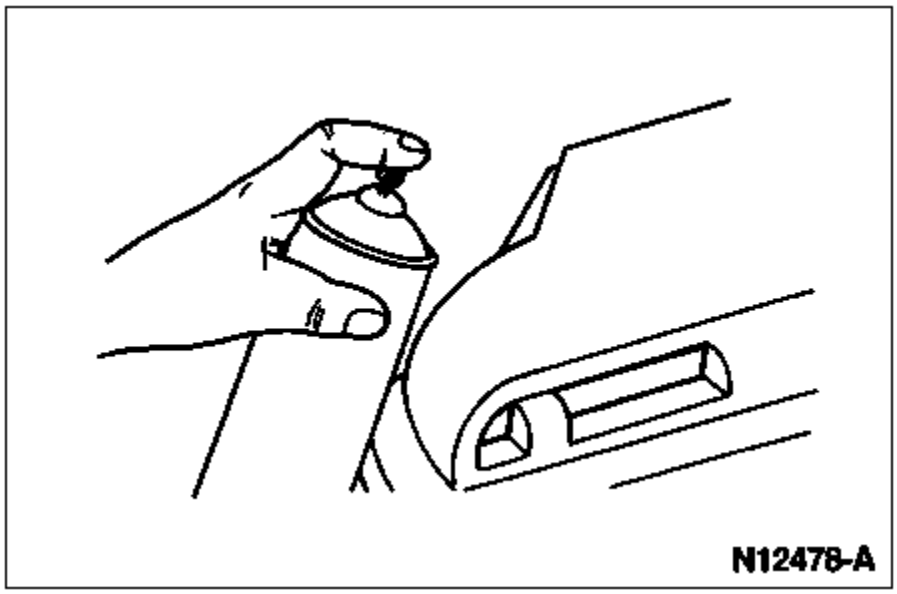
3. Featheredge the paint around the repair with grade 180A sandpaper. Wipe with a clean dry rag and blow off with an air hose.

tomsn048@gmail.com



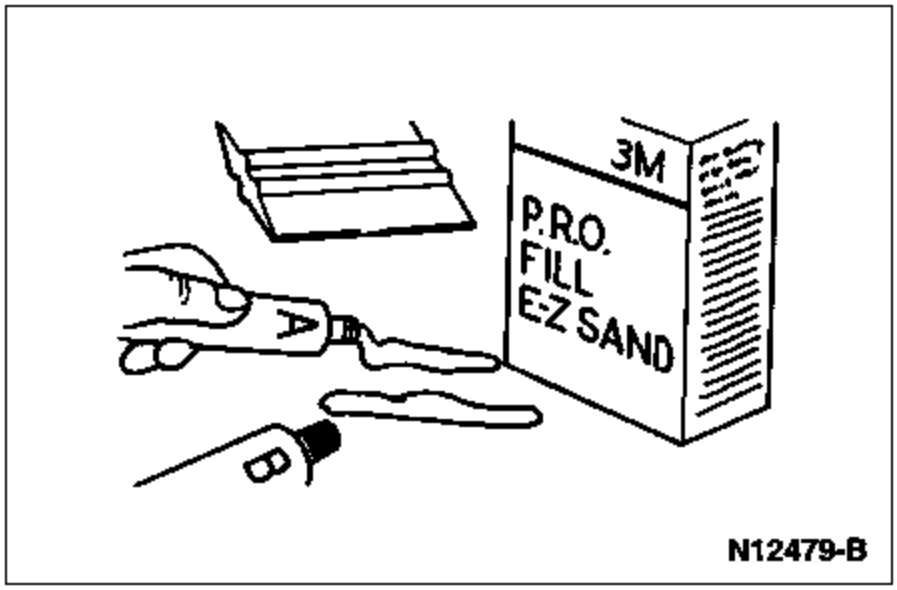
4. **NOTE: It will be necessary to reapply polyolefin adhesion promoter after any sanding step.**

   Apply one wet coat of polyolefin adhesion promoter over the sanded surface and allow to dry for 10 minutes.

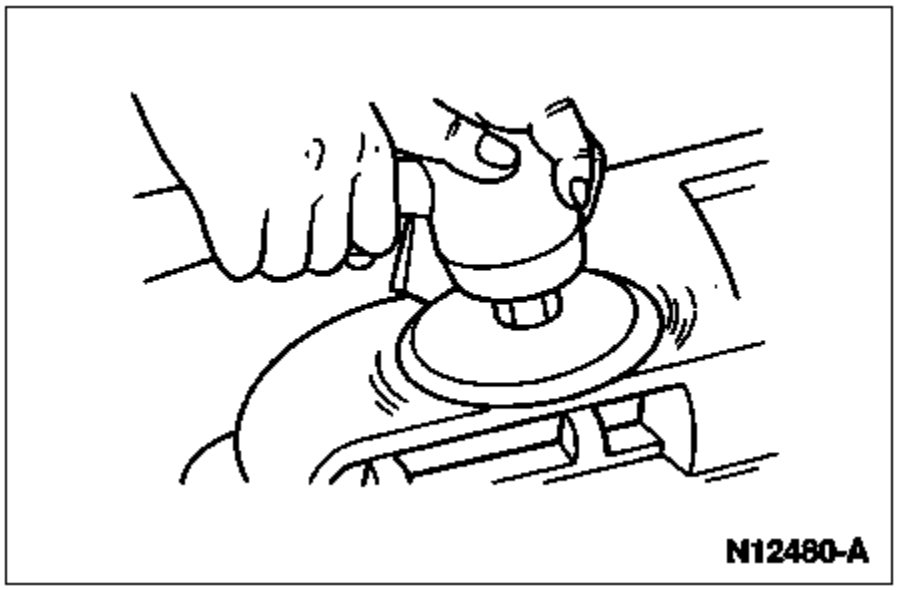


5. Mix 3M P.R.O. Fill EZ-Sand repair material according to instructions and apply to the repair with a squeegee. Apply the material, building it up higher than the undamaged area. Allow it to cure for 20-30 minutes at 18°-21°C (60-80°F).

tomsn048@gmail.com

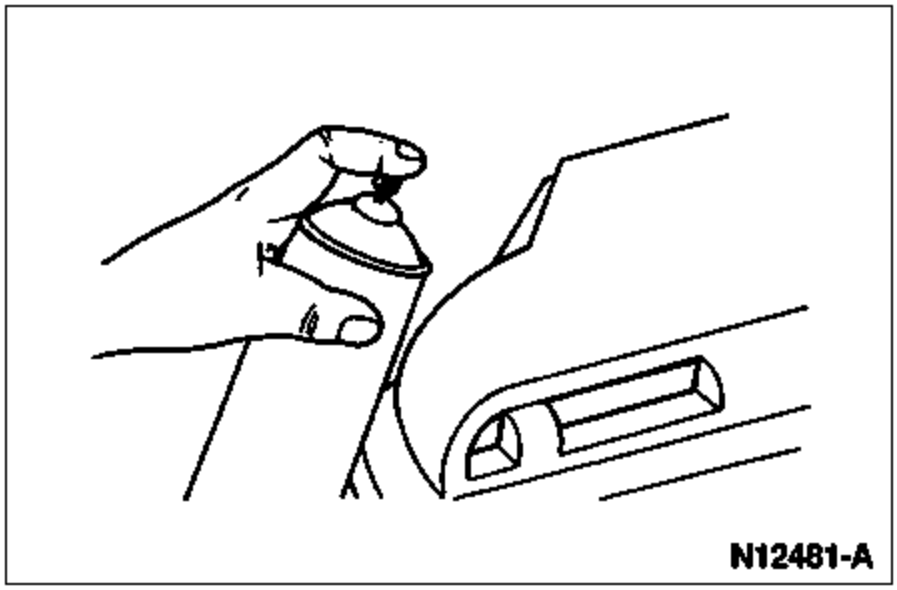


6. After curing, sand with grade 180A sandpaper, followed by grade 240A discs.

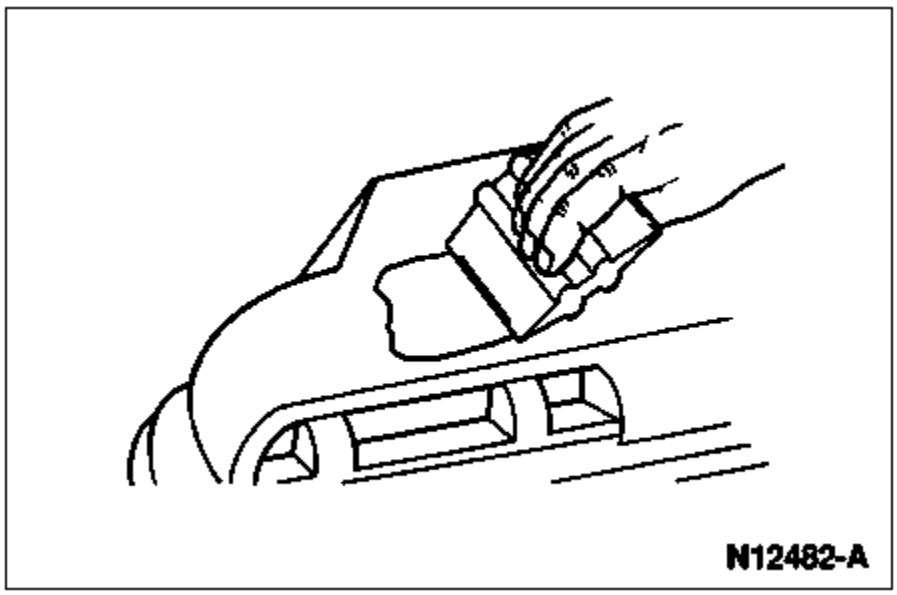


7. Reapply polyolefin adhesion promoter and let dry.

tomsn048@gmail.com



8. Sand scratches and pinholes must be filled with a skin coat of 3M P.R.O. Fill EZ-Sand repair material. Do not use flexible parts putty. After curing, sand with grade 320A sandpaper.



9. Reapply polyolefin adhesion promoter and let dry.

10. Apply a double wet coat of 3M P.R.O. Fill EZ-Sand coating. After a 10 minute flash time, apply a second double coat. Let dry for 45 minutes and lightly scuff sand the coating with grade 320A sandpaper. Apply color coats recommended for plastic body parts.

Bumper Covers, Reinforcement Procedure

If minor holes or punctures are large enough to allow the flexible parts repair material to escape, apply

tomsn048@gmail.com

autobody repair tape to the underside of the repair.

If holes, punctures or cracks are extensive and require permanent reinforcement, follow this procedure:

1. Scuff the backside with grade 180 abrasives. Apply Adhesion Improving Sealer D7AZ-19000-C or equivalent, meeting Ford specification ESR-M2P93-A.

2. Cut a glass cloth patch to cover repair area.

3. Mix a quantity of 3M P.R.O. Fill EZ-Sand repair material. Lay glass cloth on a clean surface. Use a squeegee to force the 3M P.R.O. Fill EZ-Sand repair material into the glass cloth.

4. Apply glass cloth patch to backside of repair area.

5. Apply additional 3M P.R.O. Fill EZ-Sand repair material over surface of glass cloth patch.

---

tomsn048@gmail.com

Exterior Parts, Flexible — Refinishing

Elastomeric flex additive is intended for use with air dry service paints to refinish flexible parts.

This material adds flexibility to air dry repair paints so that the same paint with additive can also be used for repair of soft, plastic type parts. The use of non-flexed service automotive finishes on flexible parts is impractical as these finishes form a rigid coating when paint cures. This additive allows the paint coating to adhere to the part when flexed or compressed and return to normal appearance as the part recovers to its original shape.

WARNING: THE ADDITIVE MUST BE HANDLED WITH CAUTION. IT IS INTENDED FOR INDUSTRIAL USE ONLY BY QUALIFIED PERSONNEL AND IS NOT INTENDED FOR THE GENERAL PUBLIC. THE PRODUCT LABEL PROVIDES INFORMATION ON RECOMMENDED SAFETY PRECAUTIONS AND PROPER APPLICATION. THE ELASTOMERIC ADDITIVE SHOULD NOT BE USED UNTIL THIS INFORMATION IS READ AND UNDERSTOOD. OBSERVE ALL APPLICABLE PRECAUTIONS.

THE VAPOR AND MIST SPRAY CAN BE HARMFUL. WHEN MIXED, IT SHOULD BE, IF POSSIBLE, USED IN A SPRAY BOOTH WITH ADEQUATE RESPIRATOR PROTECTION. THE RECOMMENDED PROTECTION IS A NIOSH-APPROVED POSITIVE PRESSURE AIR-SUPPLIED RESPIRATOR. IF THIS IS NOT AVAILABLE, USE A VAPOR/PARTICLE RESPIRATOR SUCH AS 3M MODEL NO. 6984 OR ITS EQUIVALENT, RECOMMENDED BY THE MANUFACTURER AS EFFECTIVE FOR VAPORS AND MIST. RESPIRATOR PROTECTION IS RECOMMENDED FOR USE DURING THE WHOLE TIME OF SPRAYING AND UNTIL ALL VAPOR AND MIST IS GONE. THE 3M RESPIRATOR PACKAGE HAS SPECIFIC FITTING AND USAGE INSTRUCTIONS THAT MUST BE FOLLOWED TO ENSURE MAXIMUM PROTECTION WITH THE RESPIRATOR.

The additive should be kept away from water or moist air because it may react with water and form a gel-like material which can make the product useless. The flexibility of the coating may be adversely affected if relative humidity of air is high during application. The container must be kept closed when not in use.

To avoid waste of material, mix only the quantity required. Clean all spray equipment with solvent immediately after use. Allow part to cure two to four hours after final coat before handling. After curing for 24 hours, the coating can be rubbed out by hand to improve the finish. Do not use a machine for rubbing; it may cause burring.

Surface Preparation

If the flexible part is preprimed, no special priming is required. It only requires cleaning with a silicone and wax remover and scuff sanding with 400-grit paper to remove gloss. The conductive black primer coating applied in the factory requires only light sanding to promote adhesion of the air dry service paints.

Mixing and Application

The additive is highly recommended for use with urethanes.

Apply full wet coats with 10 to 15 minutes flash time between coats or follow paint manufacturers label instructions for mixing and application procedures.

Fiberglass Structural Repair

Fiberglass Repair

Safety Precautions

WARNING: ALWAYS WORK IN A WELL-VENTILATED AREA IN ORDER TO AVOID POSSIBLE TOXIC FUMES THAT MAY RESULT FROM USING RESIN MIXTURES. EXERCISE CARE SO AS NOT TO GET ANY RESIN ON CLOTHING.

CAUTION: Remove any resin from hands as soon as possible and particularly before the mixture starts to gel.

Always use rubber gloves or the special hand cream supplied with epoxy resin repair kits. Any resin that adheres to the hands may be removed with lacquer thinner followed by a thorough washing with soap and water.

Use a respirator when grinding the surface and use a vacuum attachment when operating a belt sander.

Keep all materials, utensils and the work area clean and dry as resin repairs involve chemical reactions. Any dirt, foreign material or moisture may upset the chemical reaction and result in an unsatisfactory repair.

Repair Procedure

Grind or sand away all loose or broken material at the damaged area. Scuff sand the surface approximately 25mm (1 inch) around the area to provide a good bonding surface. Make sure the surface to be repaired is clean, dry, oil and paint free.

For cracks, form a shallow V-shape along the crack with a file or grinder. Fill the area with a good quality body repair compound. Follow the manufacturer's directions with regard to mixing procedures. Allow the compound to harden and then sand smooth. If the surface is not level or smooth, use an additional filling and sand to a final smooth finish.

For larger broken areas use fiberglass cloth (five layers) impregnated with the resin, to cover the area. Overlap the damaged portion by 25-50mm (1-2 inches). When the material has hardened, file or grind and sand smooth. If low spots exist, fill them with resin mixture to which short fibers cut from the fiberglass cloth have been added. Add enough of the cloth to form a putty-like resin mixture.

Painting

After the desired repaired surface has been obtained, prime and paint the surface in the normal manner.

Repairs From Backside (Procedure A)

Components with large cracked or broken areas must be repaired from the backside first. Perform backside repairs following fiberglass repair procedure in this section.

When backside repair is completed, repeat operation on front side of component.

tomsn048@gmail.com

Backside Not Accessible

Should vehicle component requiring backside repair not permit access to backside, it must be removed from vehicle to perform repair. Use extreme caution when repairing components while off the vehicle to ensure proper alignment when reinstalling repaired component on the vehicle.

Follow all procedures previously outlined in this section.

Cosmetic Repair (Procedure B)

Minor damage (damage which does not affect the structural integrity of the component) is considered a cosmetic repair and is performed on the exterior of the component only. Perform these repairs using the following procedure.

1. Grind or sand away all loose or broken material at the damaged area.
2. Remove all paint approximately 50mm (2 inches) around the area to provide a good bonding surface. Make sure the surface to be repaired is clean, dry and oil free.
3. Form a shallow V-shape along cracks with a file or grinder.
4. Fill the area with a good quality epoxy based body repair compound. Follow the manufacturer's guidelines for proper mixing procedures.
5. Allow the compound to harden and sand to the proper contour. Use additional compound if the surface is not smooth, level and to contour.
6. Prime and top coat following paint manufacturers label instructions.

Laminate Separation (Procedure C)

Occasionally fiberglass components may experience laminate separation damage. This condition can be repaired following the cosmetic repair procedures previously outlined providing the extent of laminate separation is not too severe. If the laminate separation condition is extensive it may be more practical to replace the component.

tomsn048@gmail.com

tomsn048@gmail.com

Paint Damage from Airborne Materials

The following information gives detailed descriptions of paint damage caused by chemical or organic materials. If service is required, identify the source of the damage and follow the recommended service procedure.

Chemical

The effects of chemical airborne materials can be seen as:

- Dark blotches in the paint where the pigment in the paint surface has been attacked.
- Irregular spots that are cracked or etched around the edges and dull in the centers.
- Small orange colored spots caused by iron particles may appear on the paint surface.

Generally, materials that attack a paint film are either acidic or alkaline in nature.

Sulfuric and nitric acids, in general, cause extreme damage to automotive paint finishes. Even very small concentrations of the same materials can cause chemical spotting damage. Due to evaporation and condensation, these acids can create severe etching "spots" that may eventually crack or lift the paint film after some time in service.

Although some automotive finishes are more resistant than others, none are completely immune to these chemicals. The most resistant paints used today are the urethanes because their resin system is least likely to react with chemicals. Air-dry coatings are more susceptible to attack only when they are fresh. The longer the paint dries the more resistant it becomes.

Metallic colors are more intolerant to chemicals because aluminum flake is fairly reactive with either an acid or alkali.

The following pH chart shows the relationship between acidic and alkaline chemicals and their corresponding pH values. This chart is provided for informational reference only.

ACIDS/ALKALIES AND pH CHART

pH Scale Value	Examples
2.0 — Very Strong Acids	Hydrochloric, Nitric Sulfuric, Phosphoric, Hydrofluoric and Some Wire Wheel Cleaners
3.0 — Strong Acids	Citric, Chromic, Sulfonic, and Human Gastric Juices
4.0 — Acidic	Oxalic, Gluconic, Tartaric Fallout Remover
5.0 — Slightly Acidic	Lactic, Uric, Acid Rain
6.0 — Very Slightly Acidic	Carbonic
7.0 — Neutral	Blood, Most Body Fluids, Distilled Water
8.0 — Very Slightly Alkaline	Urine, Wash Concentrate
9.0 — Slightly Alkaline	Baking Soda

tomsn048@gmail.com

10.0 — Alkaline	Soda Ash, Carb-Kleen
11.0 — Strong Alkaline	Lye, Potash, Tire Cleaner

Organic

Organic damage is generally easier to identify. Organic damage is mostly due to tree sap, bird and insect droppings, dead insects and pollen. Tree sap is easily identified by clear raised drops that may be hard or sticky. Bee or bug dropping spots may appear brownish or yellow in color, about 3-6mm (1/8 to 1/4 inch) in diameter. Dead and decomposing insect bodies are readily visible to the eye. Pollen deposits are small yellow clusters. Each of these items is potentially damage to any currently available paint system. Other noticeable traits of organic damage are spots that are raised (swelling), micro-crazing (cracked) and pitting due to pollen eating into the paint film. The active ingredients in most organic contaminants are tannic and formic acids. These acids are found in berries and bodily fluids of insects and birds.

Investigations completed at dealerships show that the bright lot lights tend to attract insects. The use of "soft lights" for display and storage lot illumination will help reduce damage resulting from decomposing bugs and droppings by decreasing the number of bugs attracted to these lights. Organic damage is accelerated by heat. During very hot weather conditions, it is important to wash vehicles more often.

tomsn048@gmail.com

Chemical or Organic Damage Repair

Iron dust particles may imbed themselves into the paint film. On some light colored vehicles after some weathering, tiny dots of rust start to appear. They feel rough to the touch and are difficult to remove. The best way to remove these particles is by treating the finish with a multi-acid-detergent-water wash. Use the following procedure to perform this service repair.

NOTE: Acid washes are also prepackaged in various strengths under various brand names.

CAUTION: Do not use oxalic acid washes. This material will damage paint and trim if used incorrectly. Use only multi-acid washes such as Finish Kare for removal of iron particles. Follow manufacturers mixing instructions.

1. Wash and degrease the vehicle first, using Ford Multi-Purpose Cleaner Concentrate B8A-19523-B or equivalent meeting Ford specification ESR-M14P4-A, and a suitable wax and grease remover. If this does not remove all of the iron particles, proceed with the acid wash.

2. Apply this solution liberally to all affected surfaces of the vehicle with a large sponge. Keep the surface wet until the technician can no longer feel any surface roughness with bare or gloved fingertips. If this is not done thoroughly, staining may redevelop if iron particles are left behind.

3. **CAUTION: Failure to thoroughly rinse this surface could result in corrosion of anodized aluminum or stainless steel parts with prolonged contact.**

   Rinse the area with clean water.

4. If the iron particles are not totally removed after two washings, use one or both of the procedures listed for minor chemical contamination.

   The use of polishing (with wax), sanding with microfine sandpaper (1500 grit or greater) or buffing with very light compound should only be done as a last resort.

Wet Sanding — After Acid Wash

1. Clean the exterior surface of the vehicle with Ford Multi-Purpose Cleaner Concentrate B8A-19523-B or equivalent meeting Ford specification ESR-M14P4-A to remove all contamination.

2. Apply 1500 grit sandpaper to a rubber padded sanding block to sand the paint surface.

3. Use a squirt bottle filled with water to lubricate the 1500 grit sandpaper as you begin to sand only the damaged areas. Water is an abrasive as well as a lubricant in this step.

   If the damage has gone deeply into the paint film and it will not polish or sand out, then refinishing is required.

Paint Reconditioning

Acrylic urethane enamel base/clear paint systems should be painted by using the following procedure.

tomsn048@gmail.com

1. Prepare the area as follows:

    a. Neutralize the affected areas with baking soda (sodium bicarbonate) and water.
    b. Rinse the surface off with plain water.
    c. Wash the panel with a mild soapy detergent.
    d. Dry the panel completely.

    If the damage is through the top coat finish and into the primers, the panel must be sanded down to bare metal or plastic and then refinished.

2. Apply a self-etching primer for **metal surfaces only** .

    A flex additive may be necessary when working with flexible plastics. Then proceed as follows:

    a. Apply a two component urethane primer surfacer. Let dry per instructions.
    b. Sand the surface with 400 grit sandpaper to get proper finish.
    c. Finish sanding with 600 grit sandpaper.

3. Solvent wash the panel with wax and grease remover. Tack wipe it.

    The use of acrylic urethane enamel is highly recommended for this type of repair.

4. Apply base coat or top coat material per applicable paint system.

5. Apply clear acrylic urethane if you are using a base/clear paint system.

---

tomsn048@gmail.com

Inspection and Verification

Leaks

Visually inspect for dust and water leaks. Any unsealed crevice or small opening in the lower section of the body will permit dust and water to be drawn into the body.

To determine the exact location of a dust/water leak, remove the following trim from the vehicle:

- Cowl trim panel. Refer to Section 01-05A or Section 01-05B .
- Quarter trim panel.
- Rear seat back and seat cushion. Refer to Section 01-10 .
- Carpet and side trim panel. Refer to Section 01-05A or Section 01-05B .
- Spare tire.
- Center pillar trim. Refer to Section 01-05A or Section 01-05B .
- Scuff plates. Refer to Section 01-05A or Section 01-05B .

After removing the trim, the location of most leaks will be evident. The entrance of dust is usually indicated by a pointed shaft of dust or silt. Seal these leaks, then road test the vehicle on a dusty road to make sure all leaks are sealed.

Noise

Wind noise, rattles and their sources are detected by driving the vehicle at highway speeds in four different directions. Listen for sources of noise with all windows closed, radio off, heater and air conditioner blower motor turned off and ventilation ducts open. A stethoscope can be used to pinpoint the source of wind noise.

Most wind noise-producing leaks will occur at the door and window seals or at sheet metal joints in the door or the door opening in the body.

Symptom Chart — Body Service

BODY SERVICE

Condition	Possible Source	Action
• Dust Leak	• Cowl trim panel, kick pads, and floor mats.	• REMOVE trim. CHECK for leaks and SEAL with appropriate sealer. ROAD TEST for leaks. RECHECK trim for leaks, or USE light under vehicle with trim removed. CHECK interior of body at joints and weld lines.
• Dust/Water Leaks at Floorpan and Grommets	• Missing or damaged plugs and/or grommets.	• CHECK plugs for proper installation.
• Drain Holes Collecting Water	• Holes clogged with mud or road tar.	• CHECK drain holes regularly. CLEAN drain holes of dirt and foreign material with a punch or screwdriver.
• Wind Noise, Air Entering Vehicle Through Small Holes in Body	• Leaks at door and window seals or sheet metal joints in doors or door openings.	• SEAL leaks with RTV sealant and foam tape. ROAD TEST, or USE Vacuum Leak Detector 164-R0256 or equivalent to obtain a water leak reading. RECHECK for leaks using detector. ROAD TEST.
• Rattles	• Loose screws, nuts, bolts, small pieces of body deadener in door wells, pillars, and quarter panels.	• CHECK doors by carefully striking underside of door with a mallet. LISTEN for loose objects in door. REPAIR. TIGHTEN body bolts and screws.
	• If tightening bolts and screws does not eliminate rattle, cause could be misalignment.	• REFER to Section 01-03 for adjustment and alignment procedures.
	• Weatherstripping and anti-squeak material has slipped out of position.	• APPLY additional cement or other adhesive; INSTALL in proper location to eliminate rattle.

Dust and Water Leaks

After trim removal has revealed the location of leaks, seal these leaks, and road test the vehicle on a dusty road to make sure all leaks are sealed. Dust entry is usually indicated by a pointed shaft of dust or silt at the point of entrance. After the road test, check for indications of a dust pattern around the door openings, cowl panel, and cowl side panel.

Sometimes leaks can be located by putting bright lights under the vehicle, with the above components removed, and checking the interior of the body at joints and weld lines. The light will show through where leaks exist. The Vacuum Leak Detector 164-R0256 or equivalent can locate dust and water leaks.

Wind Noise

Seal all leaks with RTV sealant foam tape or by positioning or replacing the seals. Road test the vehicle to make sure all leaks have been adequately sealed.

An alternate method of verifying corrective actions involves the use of Rotunda Combination Engine EAR/Chassis EAR 107-R2102 or equivalent. After identifying the leak point through a drive evaluation, obtain a meter reading by using the leak detector. A check with the leak detector after repairing the leak will verify the effectiveness of the corrective action. A final test drive may still be advisable to make sure other objectionable leaks, not noticed because of a major leak, do not exist.

Rattle Elimination

All bolts and screws should be tightened periodically. In the event that tightening the bolts and screws, located on such assemblies as the doors, hood and door does not eliminate the rattles. Refer to Section 01-02 and Section 01-03 .

Rattles and squeaks are sometimes caused by weatherstripping and anti-squeak material that has slipped out of position. Apply additional cement or other adhesive.

Body Sealant Locations

The body sealant locations are as follows:

- front floorpan and rear floorpan
- quarter wheelhouse inner panel and quarter wheelhouse outer panel
- dash panel
- running boards
- door openings
- roof side drip rail

Body Side Stone Protection Vinyl, Lower

Materials Required

- Abrasion Resistant Coating available from paint companies and other aftermarket coating manufactures.
- Color Coat Paint System
- Silicone and Wax Remover
- Multi-Purpose Paint Precleaner (Spray Gun Cleanup) VC-542-A

Equipment, Suggested

- Rotunda Spray Gun 085-R1626 (No. 63 Air Cap, No. SS Fluid Tip, No. 363 AN needle) or equivalent
- Rotunda Detached Pressure Cup 085-R1617, 1.89 liter (2 quarts), with Air-Adjusting Gauge or equivalent
- Rotunda Dual Action Sander 107-R1619 or equivalent
- Rotunda Heat Gun 107-R0300 or equivalent
- No. 180-Grit Paper
- Lint-Free Cloth
- Tack Cloth
- Regular Masking Tape
- No. 80 Disc for Disc Sander
- No. 220/240 Disc

A large area resulting from peeling or damage will necessitate removal of the factory sprayed-on vinyl coating. The following procedure is suggested.

NOTE: Where sheet metal is damaged to the extent that fender, door or quarter panel replacement is required (or in initial installation), disregard Steps 1 and 2.

NOTE: Approximately 1.89L (2 quarts) is required for an initial installation on a vehicle similar to a factory-applied system. The specified dry film thickness of 15 to 20 mils will require at least three, or possibly four, applications of coating material, with flash-off time allowed between coats. As with painting, spray coat the complete lower panel.

As the adherence of this coating to properly prepared sheet metal is excellent, the necessity of prime painting the sheet metal prior to protective coating is eliminated. However, adhesion will be adversely affected unless the sheet metal area to be covered (either repaired or new) is prepared in accordance with the following procedure.

1. Using Rotunda Heat Gun 107-R0300 or equivalent, or lamp, soften the vinyl coating until it is pliable. Scrape off the softened vinyl with a putty knife or similar tool. If necessary, sand off any hard-to-remove vinyl coating using an orbital disc sander (No. 80 disc). (Abrasion resistant coating is not suitable for "spot" corrections.)

2. Perform the necessary repairs to correct the sheet metal damage.

Vehicle, Masking

Suitable covers should be installed over the wheels. Mask off all upper exterior body sheet metal. Remove wheel opening stone shields and mask mouldings.

NOTE: If the vehicle has lower body side mouldings above the "turn under" of the rocker panel, the moulding can serve as the upper margin of the area to be coated. If the vehicle does not have suitable mouldings, a sculpture or break line in the sheet metal can be used. However, the method used in masking off the upper coating margin line will depend on the presence or absence of mouldings in this area.

Masking tape should be positioned so that the moulding lower side is also covered. However, do not cover the sheet metal immediately below the moulding.

It is not necessary to mask off the body door openings in the coating area, as they will be uniformly coated where the door margins allow the coating to enter. However, these door opening areas should be cleaned to make sure of coating adherence.

Sheet Metal

Sheet Metal, Serviced

1. Scuff sand (No. 180 grit paper) the glossy surface of the painted areas to be coated.
2. Remove sanding dust using a lint-free tack cloth and compressed air.
3. Using a clean, lint-free cloth, solvent wipe the area to be coated with Multi-Purpose Paint Precleaner VC-542-A or equivalent, or wax and grease remover, and allow to flash-off.

Sheet Metal, New

1. The glossy surface of the paint in the coating area must be ground off with an air-driven D/A sander such as Rotunda Dual Action Sander 107-R1619 or equivalent. A 220/240 grit-disc does a good, fast job. **Do not** sand through the primer.
2. Scuff sand (No. 180 grit paper) the primer. Do not sand through the primer.
3. Remove sanding dust using a lint-free tack cloth and compressed air.
4. Using a clean, lint-free cloth, solvent wipe the area to be coated with Multi-Purpose Paint Precleaner VC-542-A or equivalent, and allow to flash-off.

Coating Spray Procedure

The coating must be applied by an experienced automotive painter. The coating must be thoroughly agitated and used without thinning. As the material is reasonably heavy-bodied, a pressure cup equipped spray gun is recommended or appropriate equipment recommended by the coating manufacturer. Satisfactory coating appearance (minimal orange peel and sag) has resulted with gun air pressures of approximately 207 kPa (30 psi) and cup pressures of approximately 103 kPa (15 psi).

To protect the lower exposed painted fender, rocker, and quarter panel down flanges, the vehicle must be elevated high enough so that the painter can spray this area effectively. When an initial installation is to be made, a remote 1.89L (2-quart) capacity pressure cup makes a much more efficient tool, as the spray gun can be used closer to the floor. The spray gun, fluid hose and/or cup must be cleaned immediately after use. While lacquer thinner can be used when the suggested cleanup material is unavailable, the Multi-Purpose Paint Precleaner or equivalent is quicker and much more efficient. With the spray gun at 207 kPa (30 psi) and pressure feed cup at 103 kPa (15 psi) follow this procedure:

1. Apply a wet, sag-free coat. Allow three to five minutes flash-off time.
2. Apply the second wet, sag-free coat. Allow three to five minutes flash off-time.
3. Apply the third wet, sag-free coat. Allow three to five minutes flash off-time.
4. Apply the final wet, sag-free coat. Allow three to five minutes flash-off time and pull off the fine line tape, exposing the raw upper edge of the coating.
5. Immediately clean the spray equipment using Multi-Purpose Paint Precleaner VC-542-A or equivalent.
6. Allow at least two hours drying time at approximately 21°C (70°F).

Color Coat

The complete coated area, as well as the upper raw edge, must be covered with color coat. Mask off the upper margin line using fine line tape positioned 1.59mm (1/16 inch) above coating edge. Using appropriate repair paint and application procedures (to include both prime and color coat), the protective coating area can now be finish painted.

If damaged sheet metal extends above the protective coating area, normal prime/color paint procedures should be followed.

Bumpers, Plastic

Where substrate material has not been removed, cuts and cracks to the radiator grille opening panel or rear bumper covers can be repaired using the approved service material: 3M P.R.O. Fill EZ-Sand, No. 05895 or equivalent.

The following repair procedures can be used for either the radiator grille opening panel or the rear bumper covers.

Bumpers, Polypropylene

The following three types of damaged bumpers are considered repairable:

- A bumper with a hole less than 50mm (1.97 inches) in diameter.
- A bumper with a crack less than 100mm (3.94 inches) in length.
- A bumper with a crack less than 100mm (3.94 inches) in length that is less than half of the width of the bumper.

Although a bumper which has been damaged greater than this could also be repaired, it should be replaced with a new one. This is because such repair would detract from the beauty and quality of the bumper due to the decrease of the adhesive strength, etc. In addition, such repair is not considered reasonable in terms of work load.

Repair polypropylene bumpers having flaws that have reached the surface of the polypropylene and are too serious to be restored by painting.

1. Cut the rough edges around the flaw with a knife to make it smooth. Sand the area with a sander to make an angle of about 45 degrees.

2. **NOTE: Heat only the shaded area to melt it.**

   Weld damaged area.

   - For repair of a cracked area, melt the crack together using Rotunda Airless Plastic Welder 107-01250 or equivalent.
   - For repair of a hole, degrease the area and the reverse side of the damaged area. Install aluminum tape on reverse side of damaged area.

3. **CAUTION: Do not move the welding rod until the welded part cools.**

   NOTE: Take care not to excessively melt the welding rod. If the part is welded with the welding rod melted like jelly, the welding strength will be lowered.

   Melt the polypropylene welding rod with Rotunda Airless Plastic Welder 107-01250 or equivalent, and deposit it in the cracked area. Operate a heat gun 2-51mm (.5-2.0 inches) away from the part that will be welded.

4. **NOTE: Do not sand part continuously.**

   Sand the surface of the polypropylene little by little, since it is easily melted even by the abrasion heat. If melted, remove the melted area. Sand the areas to which repair agent will be applied.

5. Apply polypropylene primer uniformly to an area larger than the re paired area with a brush. It will take about 10 minutes to dry at 20°C (68°F).

6. **NOTE: When mixing the main and stiffening agents, be careful not to allow bubbles to form.**

   NOTE: Since the repairing agent hardens fast (about five minutes), proceed with the work

immediately after mixing the agents.

It will take about 30 minutes to dry at 20°C (68°F) before it can be sanded.

Mix the main agent and the stiffening agent in a ratio of one to one. Apply the mixed repair agent to the damaged area.

7. **NOTE: If excessive force is applied to the area when sanding, the surface will not become smooth.**

   NOTE: If there is fuzz around the repaired area, melt it by heating it slightly with a heat gun.

   Sand the area with No. 180-No. 240 sandpaper.

8. **NOTE: Polypropylene primer will dissolve, even after drying, if it is wiped with solvent. Use only water to clean.**

   Degrease the painted surface.

9. Dry the part.

10. Add the flex agent to the urethane primer surfacer and spray it on the repair.

11. Air dry at 20°C (68°F) for eight hours.

    Force dry at 60°C (140°F) for one hour.

12. Lightly sand the area on which the primer surfacer is sprayed and the complete surface of the bumper with No. 400-No. 600 sandpaper. Do not expose the surface of the polypropylene. Wet sanding or dry sanding is acceptable.

13. **CAUTION: Use only polypropylene primer for a polypropylene bumper.**

    Wipe the complete surface of the bumper with degreasing agent. Quickly wipe the surface with a clean rag to degrease it.

14. Apply a matching coat of paint to the polypropylene bumper.

15. Force dry at 60°C (140°F) for one hour. Air dry at 20°C (68°F) for eight hours.

Bumper Covers Plastic, Flair Mouldings

Where substrate material has not been removed, cuts and cracks to the bumper covers can be repaired using the approved service material: 3M P.R.O. Fill EZ-Sand, No. 05895 or equivalent.

The following repair procedures can be used for bumper covers.

Procedure 1 — Substrate Cuts or Cracks

Substrate Material Not Removed

1. Wipe repair area with silicone and wax remover, to ensure clean surfaces.

2. Apply a thin coating of Instant Adhesive E8AZ-19554-A or equivalent meeting Ford specification WSK-M2G402-A4 to one surface of the cut or crack. Position the surfaces very carefully together in their original position. Quickly and firmly press the two surfaces together for at least one minute. Good bond strength is developed after one minute but maximum strength requires 3 to 12 hours cure time. **Note the precautions on adhesive container.**

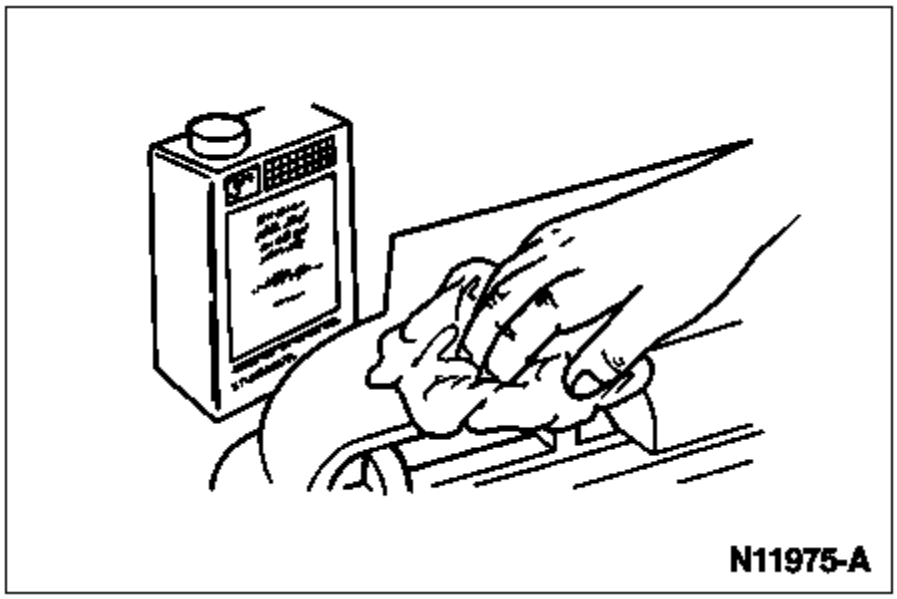
3. If the part did not have paint damage and the part was properly positioned, painting may not be required. However, if painting is necessary, proceed as follows:

    a. Scuff-sand the repair area with a sanding block and No. 400 paper. Be careful not to sand through the color coat surface. Usually dulling the surface is sufficient. Wipe off or clean the repair area with a clean, dry cloth or an air gun.
    b. Wipe the sanded surface with silicone and wax remover or equivalent.
    c. Refinish as described in this section under Refinishing Flexible Exterior Parts.

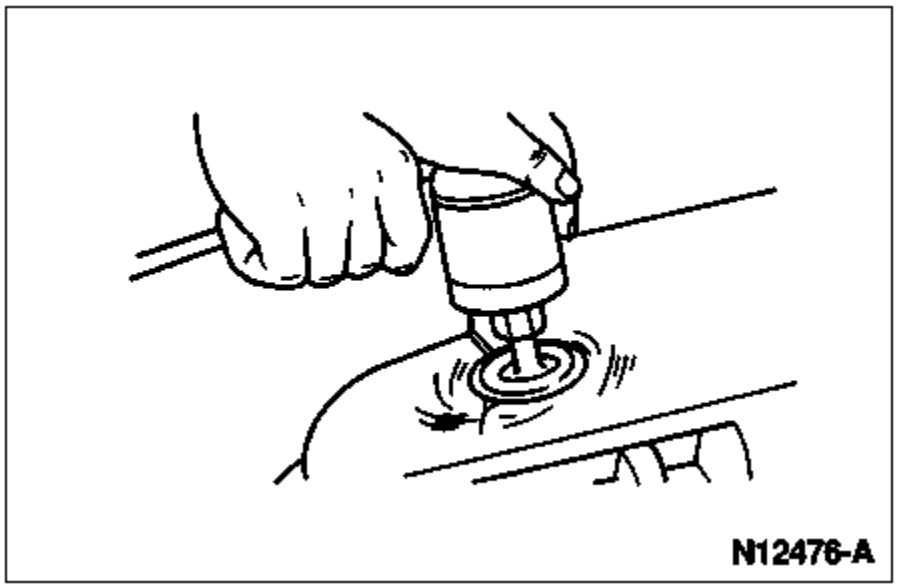
Procedure 2 — Substrate Holes, Gouges and Tears

Substrate Material Removed

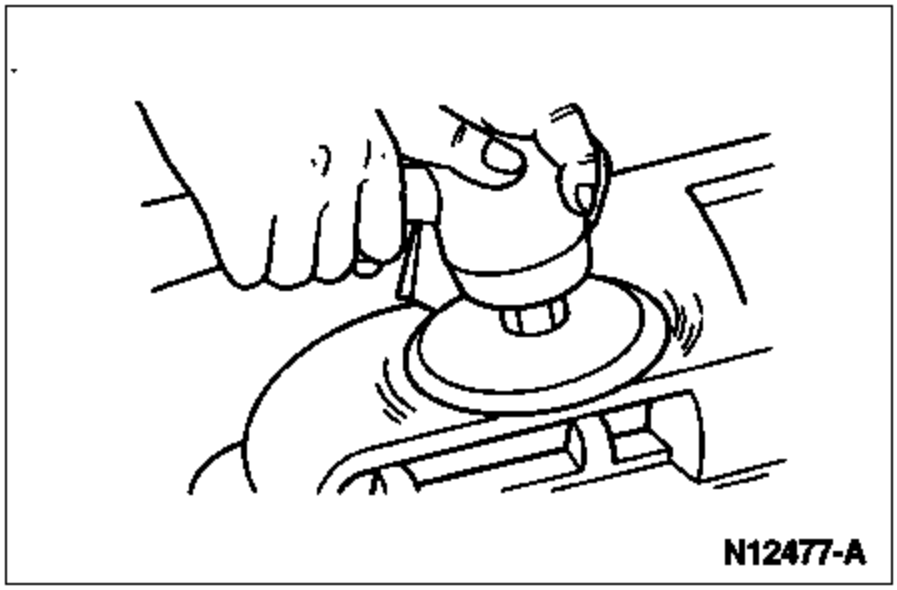
1. Clean the repair with soap and water. Next, use Multi-Purpose Paint Precleaner VC-542-A or equivalent to remove grease and tar.



2. Grind the surface of the repair with a grade 36 disc or coarse abrasive paper. Grind about 38mm (1-1/2 inches) around the actual damage to obtain a taper for best adhesion.

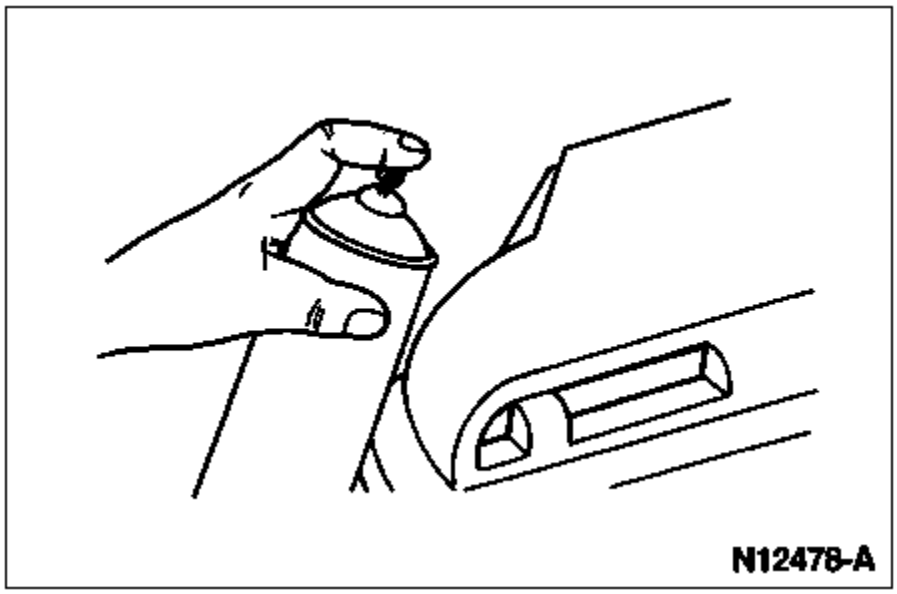


3. Featheredge the paint around the repair with grade 180A sandpaper. Wipe with a clean dry rag and blow off with an air hose.

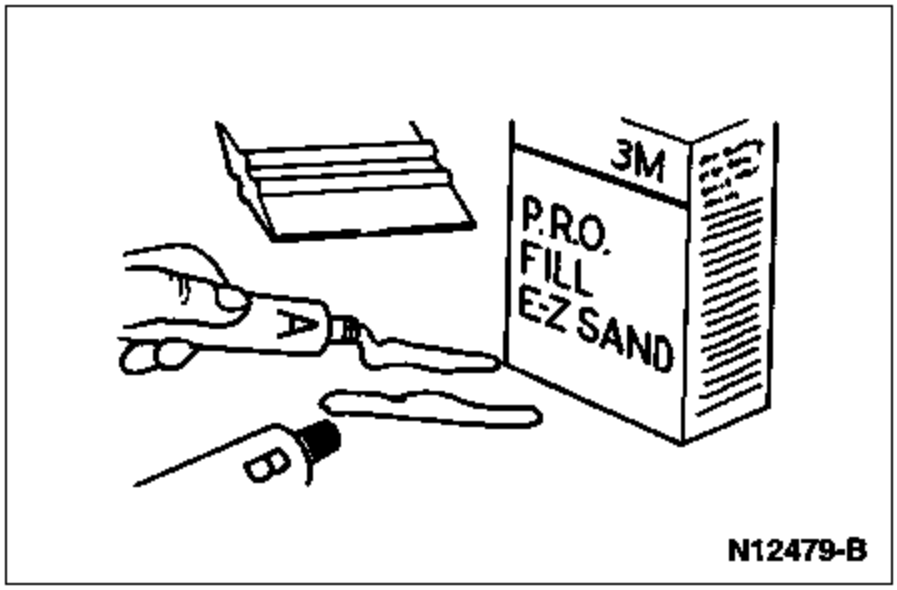


4. **NOTE: It will be necessary to reapply polyolefin adhesion promoter after any sanding step.**

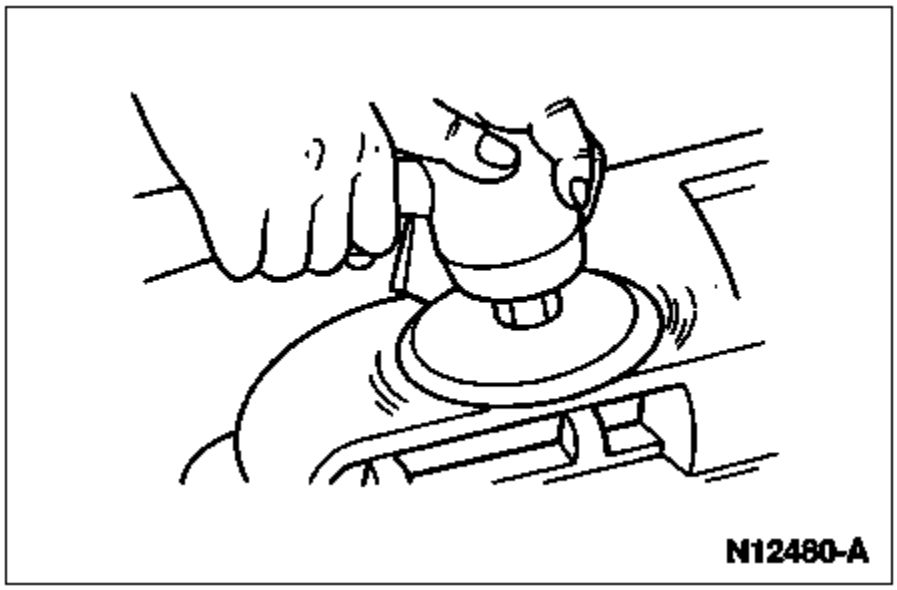
   Apply one wet coat of polyolefin adhesion promoter over the sanded surface and allow to dry for 10 minutes.



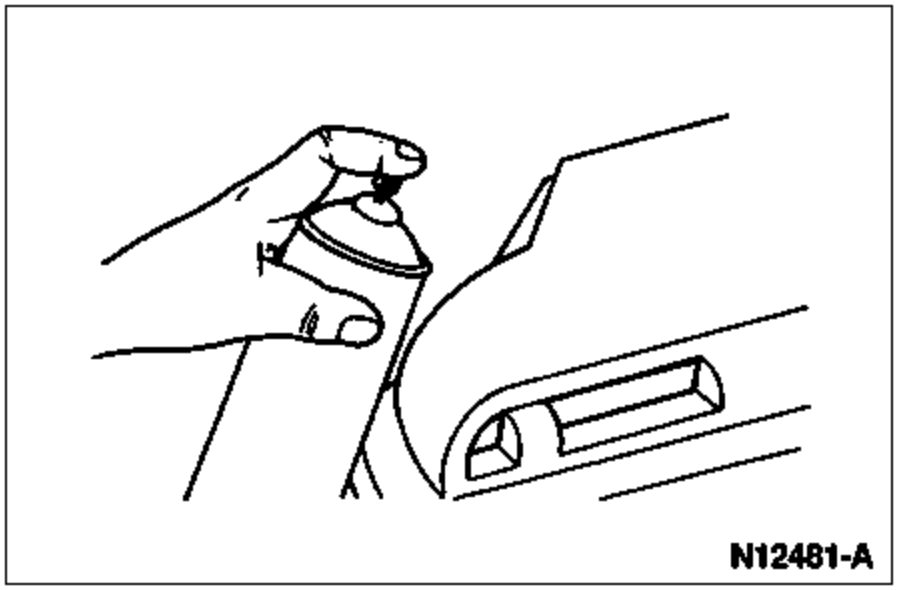
5. Mix 3M P.R.O. Fill EZ-Sand repair material according to instructions and apply to the repair with a squeegee. Apply the material, building it up higher than the undamaged area. Allow it to cure for 20-30 minutes at 18°-21°C (60-80°F).



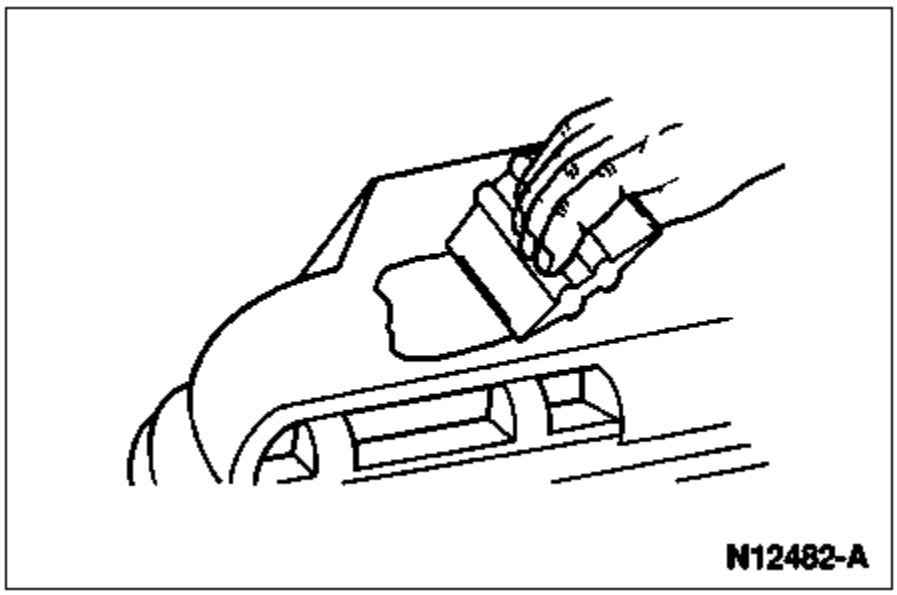
6. After curing, sand with grade 180A sandpaper, followed by grade 240A discs.



7. Reapply polyolefin adhesion promoter and let dry.



8. Sand scratches and pinholes must be filled with a skin coat of 3M P.R.O. Fill EZ-Sand repair material. Do not use flexible parts putty. After curing, sand with grade 320A sandpaper.



9. Reapply polyolefin adhesion promoter and let dry.

10. Apply a double wet coat of 3M P.R.O. Fill EZ-Sand coating. After a 10 minute flash time, apply a second double coat. Let dry for 45 minutes and lightly scuff sand the coating with grade 320A sandpaper. Apply color coats recommended for plastic body parts.

Bumper Covers, Reinforcement Procedure

If minor holes or punctures are large enough to allow the flexible parts repair material to escape, apply

autobody repair tape to the underside of the repair.

If holes, punctures or cracks are extensive and require permanent reinforcement, follow this procedure:

1. Scuff the backside with grade 180 abrasives. Apply Adhesion Improving Sealer D7AZ-19000-C or equivalent, meeting Ford specification ESR-M2P93-A.

2. Cut a glass cloth patch to cover repair area.

3. Mix a quantity of 3M P.R.O. Fill EZ-Sand repair material. Lay glass cloth on a clean surface. Use a squeegee to force the 3M P.R.O. Fill EZ-Sand repair material into the glass cloth.

4. Apply glass cloth patch to backside of repair area.

5. Apply additional 3M P.R.O. Fill EZ-Sand repair material over surface of glass cloth patch.

Exterior Parts, Flexible — Refinishing

Elastomeric flex additive is intended for use with air dry service paints to refinish flexible parts.

This material adds flexibility to air dry repair paints so that the same paint with additive can also be used for repair of soft, plastic type parts. The use of non-flexed service automotive finishes on flexible parts is impractical as these finishes form a rigid coating when paint cures. This additive allows the paint coating to adhere to the part when flexed or compressed and return to normal appearance as the part recovers to its original shape.

WARNING: THE ADDITIVE MUST BE HANDLED WITH CAUTION. IT IS INTENDED FOR INDUSTRIAL USE ONLY BY QUALIFIED PERSONNEL AND IS NOT INTENDED FOR THE GENERAL PUBLIC. THE PRODUCT LABEL PROVIDES INFORMATION ON RECOMMENDED SAFETY PRECAUTIONS AND PROPER APPLICATION. THE ELASTOMERIC ADDITIVE SHOULD NOT BE USED UNTIL THIS INFORMATION IS READ AND UNDERSTOOD. OBSERVE ALL APPLICABLE PRECAUTIONS.

THE VAPOR AND MIST SPRAY CAN BE HARMFUL. WHEN MIXED, IT SHOULD BE, IF POSSIBLE, USED IN A SPRAY BOOTH WITH ADEQUATE RESPIRATOR PROTECTION. THE RECOMMENDED PROTECTION IS A NIOSH-APPROVED POSITIVE PRESSURE AIR-SUPPLIED RESPIRATOR. IF THIS IS NOT AVAILABLE, USE A VAPOR/PARTICLE RESPIRATOR SUCH AS 3M MODEL NO. 6984 OR ITS EQUIVALENT, RECOMMENDED BY THE MANUFACTURER AS EFFECTIVE FOR VAPORS AND MIST. RESPIRATOR PROTECTION IS RECOMMENDED FOR USE DURING THE WHOLE TIME OF SPRAYING AND UNTIL ALL VAPOR AND MIST IS GONE. THE 3M RESPIRATOR PACKAGE HAS SPECIFIC FITTING AND USAGE INSTRUCTIONS THAT MUST BE FOLLOWED TO ENSURE MAXIMUM PROTECTION WITH THE RESPIRATOR.

The additive should be kept away from water or moist air because it may react with water and form a gel-like material which can make the product useless. The flexibility of the coating may be adversely affected if relative humidity of air is high during application. The container must be kept closed when not in use.

To avoid waste of material, mix only the quantity required. Clean all spray equipment with solvent immediately after use. Allow part to cure two to four hours after final coat before handling. After curing for 24 hours, the coating can be rubbed out by hand to improve the finish. Do not use a machine for rubbing; it may cause burring.

Surface Preparation

If the flexible part is preprimed, no special priming is required. It only requires cleaning with a silicone and wax remover and scuff sanding with 400-grit paper to remove gloss. The conductive black primer coating applied in the factory requires only light sanding to promote adhesion of the air dry service paints.

Mixing and Application

The additive is highly recommended for use with urethanes.

Apply full wet coats with 10 to 15 minutes flash time between coats or follow paint manufacturers label instructions for mixing and application procedures.

Fiberglass Structural Repair

Fiberglass Repair

Safety Precautions

WARNING: ALWAYS WORK IN A WELL-VENTILATED AREA IN ORDER TO AVOID POSSIBLE TOXIC FUMES THAT MAY RESULT FROM USING RESIN MIXTURES. EXERCISE CARE SO AS NOT TO GET ANY RESIN ON CLOTHING.

CAUTION: Remove any resin from hands as soon as possible and particularly before the mixture starts to gel.

Always use rubber gloves or the special hand cream supplied with epoxy resin repair kits. Any resin that adheres to the hands may be removed with lacquer thinner followed by a thorough washing with soap and water.

Use a respirator when grinding the surface and use a vacuum attachment when operating a belt sander.

Keep all materials, utensils and the work area clean and dry as resin repairs involve chemical reactions. Any dirt, foreign material or moisture may upset the chemical reaction and result in an unsatisfactory repair.

Repair Procedure

Grind or sand away all loose or broken material at the damaged area. Scuff sand the surface approximately 25mm (1 inch) around the area to provide a good bonding surface. Make sure the surface to be repaired is clean, dry, oil and paint free.

For cracks, form a shallow V-shape along the crack with a file or grinder. Fill the area with a good quality body repair compound. Follow the manufacturer's directions with regard to mixing procedures. Allow the compound to harden and then sand smooth. If the surface is not level or smooth, use an additional filling and sand to a final smooth finish.

For larger broken areas use fiberglass cloth (five layers) impregnated with the resin, to cover the area. Overlap the damaged portion by 25-50mm (1-2 inches). When the material has hardened, file or grind and sand smooth. If low spots exist, fill them with resin mixture to which short fibers cut from the fiberglass cloth have been added. Add enough of the cloth to form a putty-like resin mixture.

Painting

After the desired repaired surface has been obtained, prime and paint the surface in the normal manner.

Repairs From Backside (Procedure A)

Components with large cracked or broken areas must be repaired from the backside first. Perform backside repairs following fiberglass repair procedure in this section.

When backside repair is completed, repeat operation on front side of component.

Backside Not Accessible

Should vehicle component requiring backside repair not permit access to backside, it must be removed from vehicle to perform repair. Use extreme caution when repairing components while off the vehicle to ensure proper alignment when reinstalling repaired component on the vehicle.

Follow all procedures previously outlined in this section.

Cosmetic Repair (Procedure B)

Minor damage (damage which does not affect the structural integrity of the component) is considered a cosmetic repair and is performed on the exterior of the component only. Perform these repairs using the following procedure.

1. Grind or sand away all loose or broken material at the damaged area.
2. Remove all paint approximately 50mm (2 inches) around the area to provide a good bonding surface. Make sure the surface to be repaired is clean, dry and oil free.
3. Form a shallow V-shape along cracks with a file or grinder.
4. Fill the area with a good quality epoxy based body repair compound. Follow the manufacturer's guidelines for proper mixing procedures.
5. Allow the compound to harden and sand to the proper contour. Use additional compound if the surface is not smooth, level and to contour.
6. Prime and top coat following paint manufacturers label instructions.

Laminate Separation (Procedure C)

Occasionally fiberglass components may experience laminate separation damage. This condition can be repaired following the cosmetic repair procedures previously outlined providing the extent of laminate separation is not too severe. If the laminate separation condition is extensive it may be more practical to replace the component.

Paint Damage from Airborne Materials

The following information gives detailed descriptions of paint damage caused by chemical or organic materials. If service is required, identify the source of the damage and follow the recommended service procedure.

Chemical

The effects of chemical airborne materials can be seen as:

- Dark blotches in the paint where the pigment in the paint surface has been attacked.
- Irregular spots that are cracked or etched around the edges and dull in the centers.
- Small orange colored spots caused by iron particles may appear on the paint surface.

Generally, materials that attack a paint film are either acidic or alkaline in nature.

Sulfuric and nitric acids, in general, cause extreme damage to automotive paint finishes. Even very small concentrations of the same materials can cause chemical spotting damage. Due to evaporation and condensation, these acids can create severe etching "spots" that may eventually crack or lift the paint film after some time in service.

Although some automotive finishes are more resistant than others, none are completely immune to these chemicals. The most resistant paints used today are the urethanes because their resin system is least likely to react with chemicals. Air-dry coatings are more susceptible to attack only when they are fresh. The longer the paint dries the more resistant it becomes.

Metallic colors are more intolerant to chemicals because aluminum flake is fairly reactive with either an acid or alkali.

The following pH chart shows the relationship between acidic and alkaline chemicals and their corresponding pH values. This chart is provided for informational reference only.

ACIDS/ALKALIES AND pH CHART

pH Scale Value	Examples
2.0 — Very Strong Acids	Hydrochloric, Nitric Sulfuric, Phosphoric, Hydrofluoric and Some Wire Wheel Cleaners
3.0 — Strong Acids	Citric, Chromic, Sulfonic, and Human Gastric Juices
4.0 — Acidic	Oxalic, Gluconic, Tartaric Fallout Remover
5.0 — Slightly Acidic	Lactic, Uric, Acid Rain
6.0 — Very Slightly Acidic	Carbonic
7.0 — Neutral	Blood, Most Body Fluids, Distilled Water
8.0 — Very Slightly Alkaline	Urine, Wash Concentrate
9.0 — Slightly Alkaline	Baking Soda

10.0 — Alkaline	Soda Ash, Carb-Kleen
11.0 — Strong Alkaline	Lye, Potash, Tire Cleaner

Organic

Organic damage is generally easier to identify. Organic damage is mostly due to tree sap, bird and insect droppings, dead insects and pollen. Tree sap is easily identified by clear raised drops that may be hard or sticky. Bee or bug dropping spots may appear brownish or yellow in color, about 3-6mm (1/8 to 1/4 inch) in diameter. Dead and decomposing insect bodies are readily visible to the eye. Pollen deposits are small yellow clusters. Each of these items is potentially damage to any currently available paint system. Other noticeable traits of organic damage are spots that are raised (swelling), micro-crazing (cracked) and pitting due to pollen eating into the paint film. The active ingredients in most organic contaminants are tannic and formic acids. These acids are found in berries and bodily fluids of insects and birds.

Investigations completed at dealerships show that the bright lot lights tend to attract insects. The use of "soft lights" for display and storage lot illumination will help reduce damage resulting from decomposing bugs and droppings by decreasing the number of bugs attracted to these lights. Organic damage is accelerated by heat. During very hot weather conditions, it is important to wash vehicles more often.

Chemical or Organic Damage Repair

Iron dust particles may imbed themselves into the paint film. On some light colored vehicles after some weathering, tiny dots of rust start to appear. They feel rough to the touch and are difficult to remove. The best way to remove these particles is by treating the finish with a multi-acid-detergent-water wash. Use the following procedure to perform this service repair.

NOTE: Acid washes are also prepackaged in various strengths under various brand names.

CAUTION: Do not use oxalic acid washes. This material will damage paint and trim if used incorrectly. Use only multi-acid washes such as Finish Kare for removal of iron particles. Follow manufacturers mixing instructions.

1. Wash and degrease the vehicle first, using Ford Multi-Purpose Cleaner Concentrate B8A-19523-B or equivalent meeting Ford specification ESR-M14P4-A, and a suitable wax and grease remover. If this does not remove all of the iron particles, proceed with the acid wash.

2. Apply this solution liberally to all affected surfaces of the vehicle with a large sponge. Keep the surface wet until the technician can no longer feel any surface roughness with bare or gloved fingertips. If this is not done thoroughly, staining may redevelop if iron particles are left behind.

3. **CAUTION: Failure to thoroughly rinse this surface could result in corrosion of anodized aluminum or stainless steel parts with prolonged contact.**

   Rinse the area with clean water.

4. If the iron particles are not totally removed after two washings, use one or both of the procedures listed for minor chemical contamination.

   The use of polishing (with wax), sanding with microfine sandpaper (1500 grit or greater) or buffing with very light compound should only be done as a last resort.

Wet Sanding — After Acid Wash

1. Clean the exterior surface of the vehicle with Ford Multi-Purpose Cleaner Concentrate B8A-19523-B or equivalent meeting Ford specification ESR-M14P4-A to remove all contamination.

2. Apply 1500 grit sandpaper to a rubber padded sanding block to sand the paint surface.

3. Use a squirt bottle filled with water to lubricate the 1500 grit sandpaper as you begin to sand only the damaged areas. Water is an abrasive as well as a lubricant in this step.

   If the damage has gone deeply into the paint film and it will not polish or sand out, then refinishing is required.

Paint Reconditioning

Acrylic urethane enamel base/clear paint systems should be painted by using the following procedure.

1. Prepare the area as follows:

    a. Neutralize the affected areas with baking soda (sodium bicarbonate) and water.
    b. Rinse the surface off with plain water.
    c. Wash the panel with a mild soapy detergent.
    d. Dry the panel completely.

    If the damage is through the top coat finish and into the primers, the panel must be sanded down to bare metal or plastic and then refinished.

2. Apply a self-etching primer for **metal surfaces only** .

    A flex additive may be necessary when working with flexible plastics. Then proceed as follows:

    a. Apply a two component urethane primer surfacer. Let dry per instructions.
    b. Sand the surface with 400 grit sandpaper to get proper finish.
    c. Finish sanding with 600 grit sandpaper.

3. Solvent wash the panel with wax and grease remover. Tack wipe it.

    The use of acrylic urethane enamel is highly recommended for this type of repair.

4. Apply base coat or top coat material per applicable paint system.

5. Apply clear acrylic urethane if you are using a base/clear paint system.

Alignment, Unitized Body, Aerostar

CAUTION: Do not attempt to correct any serious misalignment with one jacking operation. This is particularly true if other sections of the body also require aligning. Align each section proportionately until the proper dimensions are obtained.

To align or square-up a body, take two opposite diagonal measurements between pillars. Use a measuring tram for these measurements. Take the measurements between reference points such as crease lines or weld joints which are diagonally opposite each other on the two pillars being measured. Since all measurements should be made from the bare metal, remove all interior trim from the checking points.

In some cases, it is difficult to obtain proper body alignment when repairing a body that is damaged on both sides. In these cases, horizontal and vertical measurements can be taken from a body of the same body style. Once these basic dimensions are taken and established on the damaged body, alignment can be made by diagonal measurements taken from points on two pillars.

Door openings are checked in the same manner as the body. Horizontal, vertical, and diagonal checking points are established on all four sides of the door opening that is being measured.

Exhaust System Shield

For removal and installation of exhaust system shield, refer to Section 09-00 .

SPECIAL SERVICE TOOLS/EQUIPMENT

ROTUNDA EQUIPMENT

Model	Description
077-00018	Car/Truck Stands
107-R0600	Blind Fastener Installation Tool
106-00053	MIG Wire Feed Welder
073-R0450	Complete Laser Measuring System

Straightening Operations

Misalignment can be corrected by straightening the out-of-line parts or by replacing the crossmembers, braces, or brackets if they are badly damaged.

Straightening should be attempted on frames that fail to meet specification of the diagonal checking method or where damage is visually apparent.

CAUTION: If heat is needed to straighten a frame member, keep the temperature below 649°C (1200°F) (a dull red glow). Excessive heat may weak en the metal and cause permanent damage.

However, to prevent internal stresses in the metal, straightening should be limited to parts which are not severely bent.

Underbody Heat Deflectors

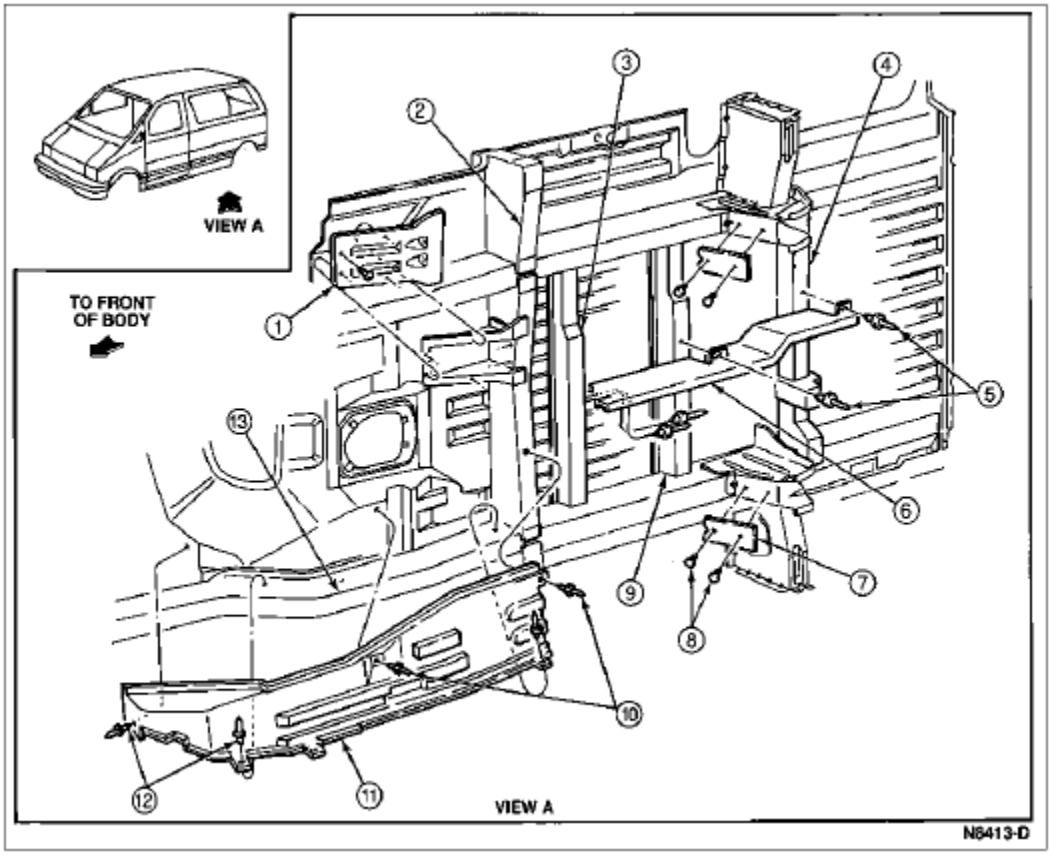
Removal

1. Raise the vehicle and secure with Rotunda Car/Truck Stands 077-00018 or equivalent.
2. Remove all components necessary to gain access to heat deflectors.
3. Using a correct size drill bit, drill out the heat deflector rivets.
4. Remove the heat deflectors.

Installation

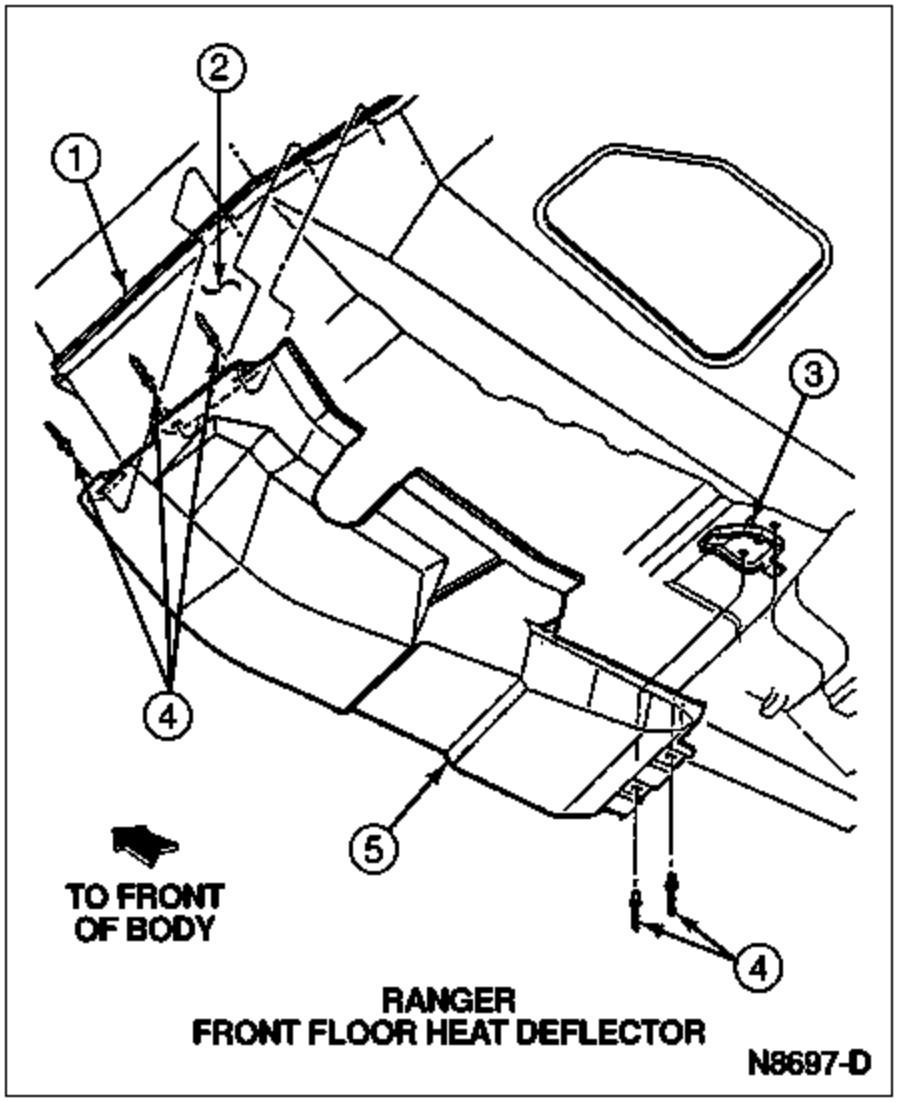
1. Align the heat deflector rivet holes with their corresponding holes.
2. Install rivets using Rotunda Blind Fastener Installation Tool 107-R0600 or equivalent. Make sure floor holes are properly sealed after rivets are installed.
3. Install components that were removed to access heat deflectors.
4. Remove the safety stands and lower the vehicle.

Underbody Heat Deflectors, Aerostar



Item	Part Number	Description
1	016B90	Parking Brake Opening Cover Plate
2	101C19	Front Floor Rear Crossmember Extension
3	11644	Rear Floor Front Crossmember
4	102A24	Rear Floor Center Crossmember
5	388869	Rivet (4 Req'd)
6	112B22	Rear Floor Heat Deflector
7	5A976	Rear Suspension Lower Arm Shield
8	N804379-S	Pushpin
9	10926	Rear Floor Intermediate Crossmember
10	388869	Rivet (6 Req'd)
11	11398	Front Floor Pan Heat Deflector
12	388869	Rivet (6 Req'd)
13	101A14	Rear Floor Side Member

Underbody Heat Deflectors, Ranger



Item	Part Number	Description
1	01610	Dash Panel
2	11135	Front Floor Pan
3	10617C50	Floor Pan Seat Track Reinforcement (Bucket Seats Only)
4	388869-S	Rivets
5	11398	Front Floor Pan Heat Deflector (Front RH Only)

Underbody Misalignment Check

The dimensions of the underbody must be restored in repairing major body damage to provide correct front and rear wheel geometry. Refer to the following illustration for the underbody dimensions. Once the frame and suspension members are aligned, other operations in this section can be performed.

Underbody Dimensions

Underbody dimensions are shown in the following illustrations. Dimensions can be measured using Rotunda Complete Laser Measuring System 073-R0450 or equivalent.

Frame Repairs/Alignment, Ranger

Frame misalignment is the result of damaged or loose frame components.

Before checking frame alignment, inspect the frame for damage and loose parts. Inspect all frame members for cracks, twists, or bends. Check all welded connections for cracks. Inspect all rivets, bolts, and body support brackets for looseness. Make all necessary repairs or replacements.

Welding

CAUTION: Disconnect the battery ground cable (14301) (14301) before using any electrical welding equipment.

Perform all welding using Rotunda MIG Wire Feed Welder 106-0053 or equivalent, and welding wire meeting AWS-E-70S specification.

Because more extensive panel deformation results from oxyacetylene welding than from MIG welding or spot welding, perform sectional welding using MIG welding or spot welding equipment only.

Perform spot welding operations in locations that are inaccessible with spot welding tongs using the plug weld method. Drill or punch 8mm (5/16-inch) holes in one side of the flange and weld.

Varying factors determine plate thickness, panel design, cross-sectionals and sizes, joining method, welding method, and welding locations during manufacturing. To apply the most suitable repair method, it is most important to completely understand the body design, concept, and construction.

It is essential that repair welds, particularly on load-bearing parts or parts contributing to the strength of the assembly, are equivalent to the originals in size, type, and strength.

Low-Alloy Steel Components

NOTE: When cutting salvage or repairable components, use a grinding disc, air chisel, or metal cutting saw.

NOTE: All welding should be done with a Rotunda MIG Wire Feed Welder 106-00053 or equivalent with welding wire meeting AWS-E-70S specification.

1. **CAUTION: Disconnect the battery ground cable before using any electric welding equipment.**

   Because of associated high heat buildup, do not use oxyacetylene when welding high-tensile or high-strength, low-alloy steel components. Use spot or MIG. During MIG welding, use a temperature-indicating crayon to ensure that the temperature does not exceed 750°C (1400°F).

2. Replace spot-welded components by spot welding where possible. If spot welding equipment is not available, or if the location is not accessible, plug weld the panels.

3. Use MIG welding rather than conventional arc welding when welding high-strength, high-tensile, or conventional mild steel. Use .024 or .030 diameter wire and conform to Classification AWS, E70S. MIG welding is also known as GMAW (Gas Metal Arc Welding).

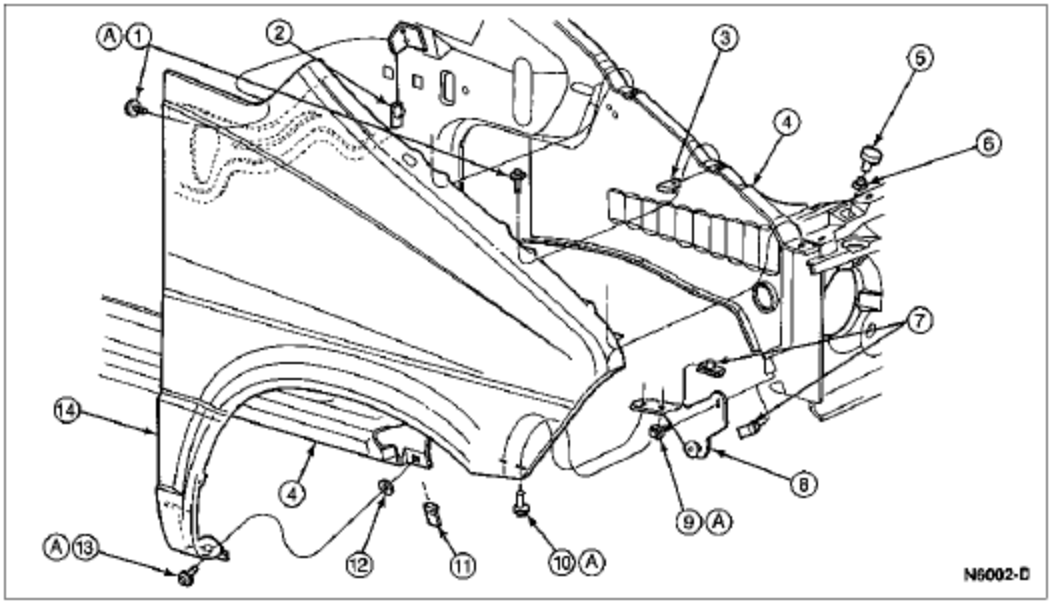
Front Fender, Aerostar

Removal

1. Clean all dirt from the radiator support (16138) attaching screws, bolts and nuts.
2. Remove bolts attaching the front of the front fender (16005) to the radiator support at upper and lower locations.
3. Remove one bolt attaching the rear lower end of the fender to the lower corner of the body side.
4. Remove one bolt (access by opening door) attaching the rear end of the fender to the cowl.
5. Remove the screws around the wheel opening attaching the front fender splash shield (16102).
6. Remove bolts along top of front fender splash shield attaching the front fender.
7. Remove the front fender.

For installation, follow removal procedures in reverse order. Install all fender attaching screw and washer assemblies hand-tight and align the front fender before tightening to specifications. Tighten all fender attaching screw and washer assemblies to 7-11 Nm (62-97 lb-in).

Front Fender, Aerostar

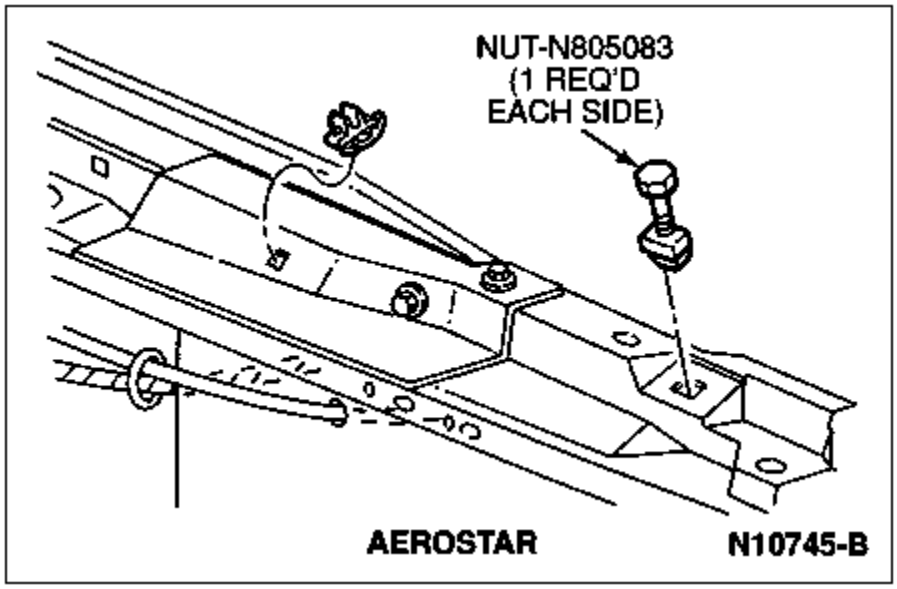


Item	Part Number	Description
1	—	Screw and Washer (8 Req'd Each Side) (Part of

		Fender Assembly)
2	N623342-S100	Spring Nut (8 Req'd Each Side)
3	N623342-S100	Spring Nut (8 Req'd Each Side)
4	10462	Body Side Assembly
5	N806044-S	Bumper Assembly
6	N800428-S	Nut and Retainer
7	N623342-S100	Spring Nut (8 Req'd Each Side)
8	17B749	Front Bumper Mounting Bracket
9	—	Screw and Washer (8 Req'd Each Side) (Part of Bumper Mounting Bracket)
10	—	Screw and Washer (8 Req'd Each Side) (Part of Bracket to Fender Assembly)
11	N800428-S	Nut and Retainer
12	389346-S	Flatwasher
13	—	Screw and Washer (8 Req'd Each Side) (Part of Fender to Body Side Assembly)
14	16005	Fender
A	—	Tighten to 7-11 Nm (62-97 Lb-In)

Hood Alignment

The hood (16612) can be adjusted fore and aft and side to side by loosening the hood-to-hinge attaching bolts and repositioning the hood. To raise or lower the hood, loosen the hinge hood-to-body attaching bolts and turn bumpers clockwise to lower or counterclockwise to raise.



Hood Bumpers

Hood bumpers (16758) located on the top RH and top LH surfaces of the radiator support (16138) can be adjusted up and down to provide a flush surface alignment of the hood (16612) with the front fenders (16005).

Hood Latch, Aerostar

Removal

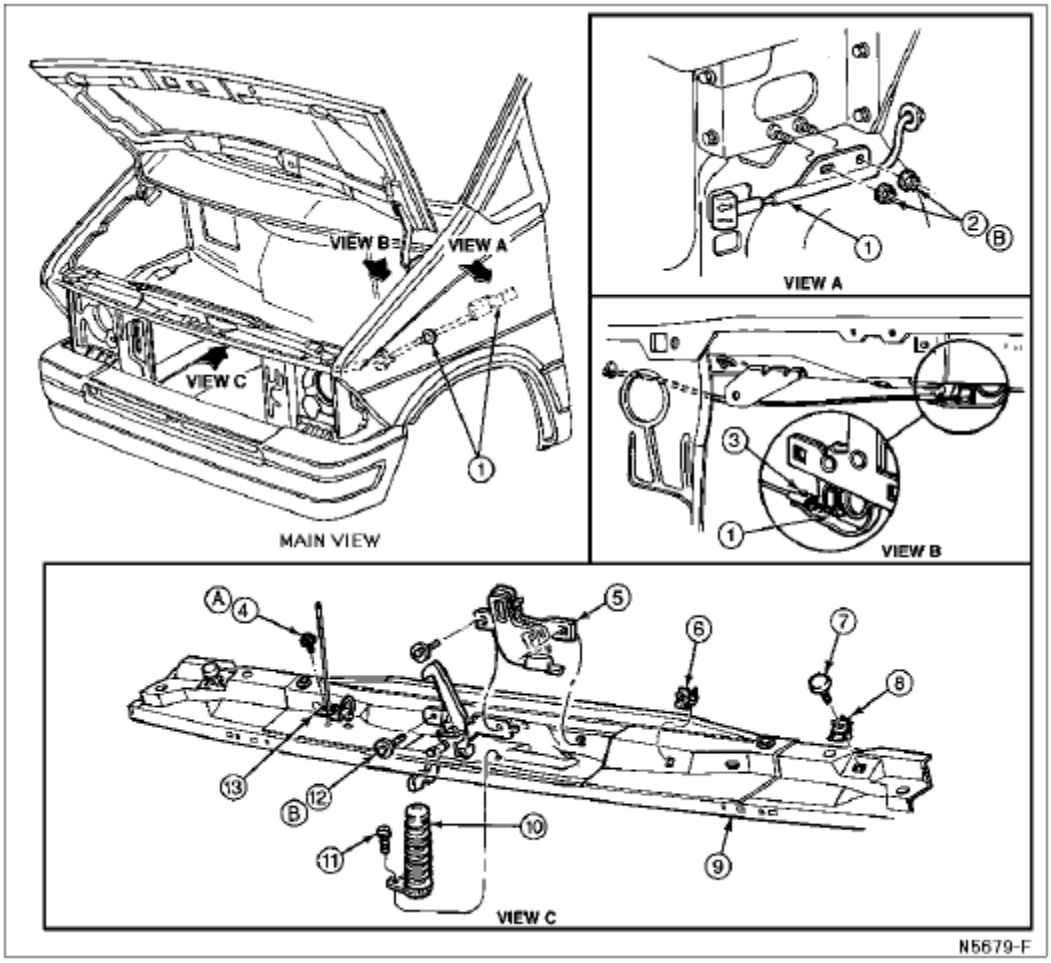
1. Mark location of bracket for installation.
2. Remove two hood latch attaching screws.
3. Disconnect cable from latch, routing cable and fitting through return spring.
4. Remove hood latch (16700).

Installation

1. Maneuver hood release cable terminal through curled return spring on back side of hood latch.
2. Locate square cable bushing tab in hood latch housing keyhole slot and fasten screw snug, but do not overtighten 1.8-2.6 Nm (16-23 lb-in).
3. Adjust the hood latch for positive engagement with the hood latch striker (16K689). Also, make sure that secondary hook engages hood latch striker smoothly. Tighten the latch attaching screws to 10-14 Nm (7-10 lb-ft).
4. **NOTE: Make sure lubricant has effectively worked into the pivot points and bearing surfaces.**

   Lubricate the latch handle pivot, catch pawls and spring with Multi-Purpose Grease spray D7AZ-19584-AA, or equivalent meeting Ford specification ESB-M1C106-B. Recheck the functional operation of the hood latch and safety latch by opening and closing the hood (16612) several times to make sure latch function is correct.

Hood Latch, Aerostar



Item	Part Number	Description
1	16916	Hood Latch Control Handle and Cable
2	N620481-S8	Nut
3	56930-S2	Screw
4	N606676-S55	Screw
5	16700	Hood Latch
6	16828	Hood Support Rod Retainer Clip
7	N806044-S	Bumper Assembly
8	N800428-S100	Nut and Retainer
9	16138	Radiator Support
10	16C644	Hood Assist Spring
11	56928	Screw
12	N802850-S55	Screw and Washer
13	16826	Hood Support Rod
A	—	Tighten to 9-14 Nm (7-10 Lb-Ft)
B	—	Tighten to 10-14 Nm

		(8-10 Lb-Ft)

Hood Latch

1. **NOTE: Before adjusting the hood latch (16700), make certain that the hood (16612) is properly aligned. The hood latch can be moved from side to side, up and down and laterally to obtain a snug fit.**

   Loosen the hood latch attaching screws just enough to move the hood latch.

2. Move the hood latch until it is aligned with the hood latch striker (16K689). Then, tighten the hood latch attaching screws. Check hood-to-fender fit.

3. Check the hood latch to make sure it makes full engagement with the hood latch striker. If the hood latch does not make full engagement with the hood latch striker, loosen the hood latch attaching screws and reposition the hood latch to obtain full engagement. Then, tighten the attaching screws.

4. **NOTE: Make sure lubricant has effectively worked into the pivot points and bearing surfaces.**

   Lubricate the latch handle pivot, catch pawls and spring with Multi-Purpose Grease spray D7AZ-19584-AA or equivalent meeting Ford specification ESB-M1C106-B. Recheck the functional operation of the hood latch mechanism and safety latch by operating and closing the hood several times to make sure function is correct.

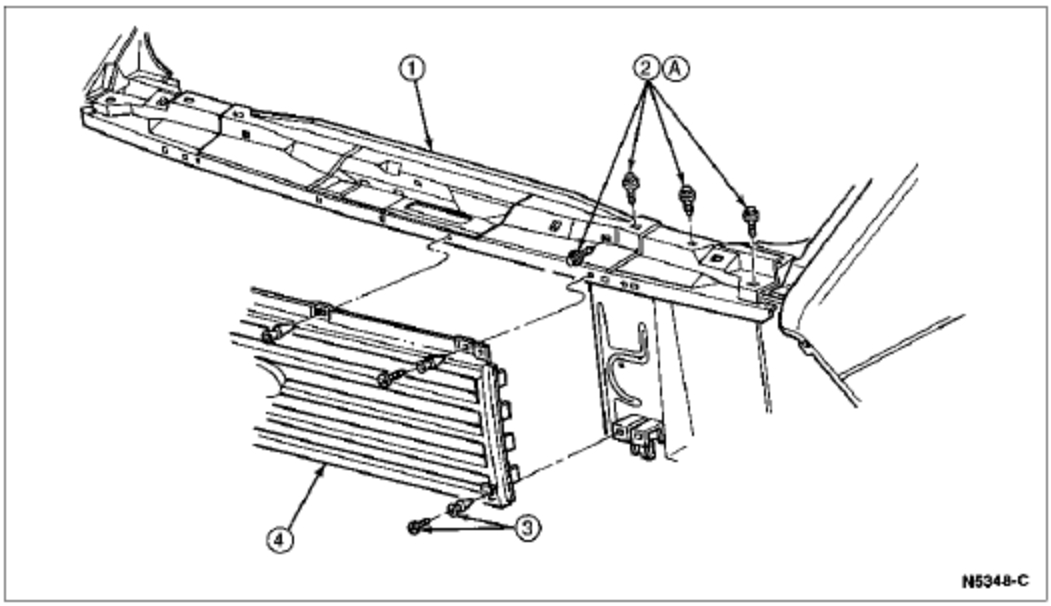
Radiator Grille, Aerostar

Removal and Installation

1. Open the hood (16612) of the vehicle.
2. Remove the six screws from the radiator grille (8200) and remove the radiator grille.

For installation, follow removal procedures in reverse order.

Radiator Grille, Aerostar



Item	Part Number	Description

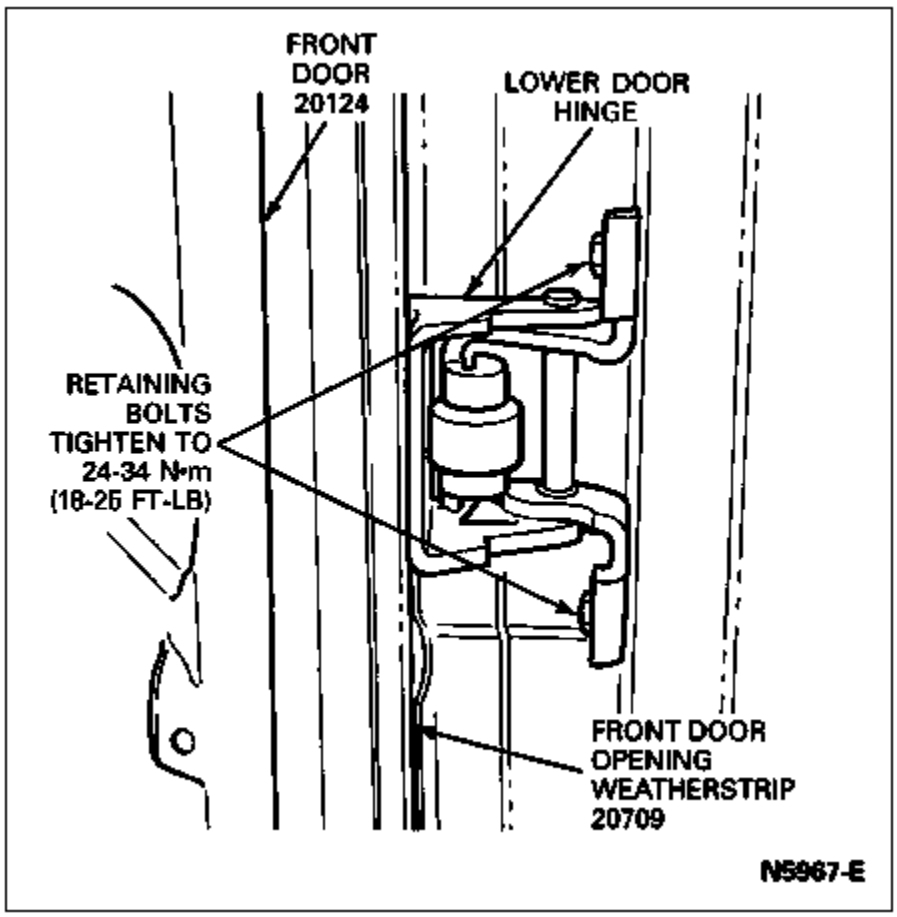
Doors

Front Doors

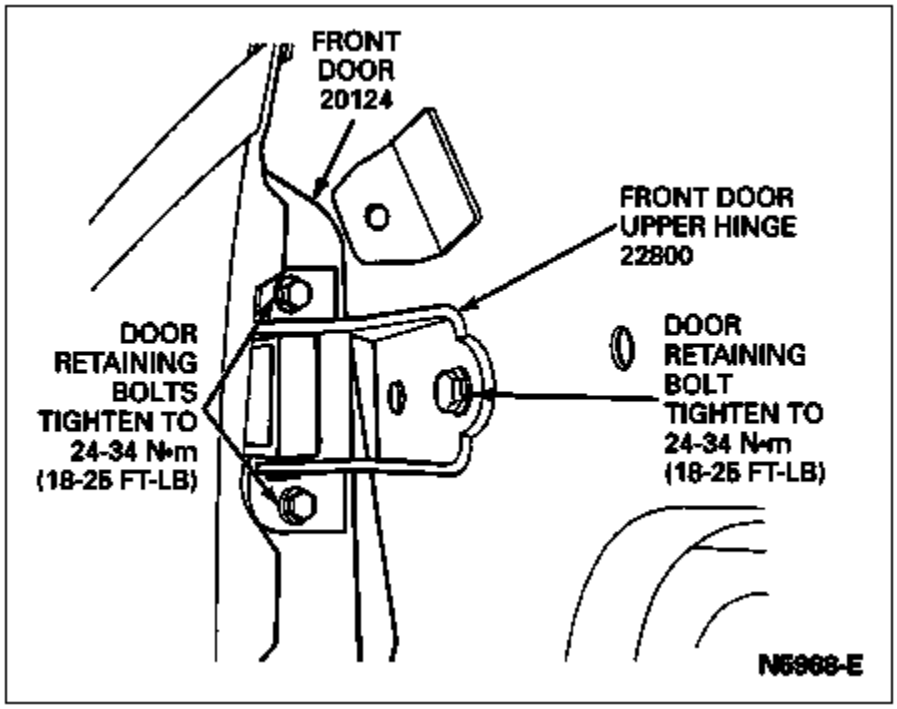
Removal and Installation

1. Open front door (20124) and support using Rotunda Flexi-Work Table 156-00070 or equivalent.
2. If installing a newfront door, remove all usable hardware, trim and glass parts from old door. Refer to Section 01-05A , Section 01-05B or Section 01-11 .
3. Remove the upper and lower hinge access hole cover plate, if so equipped, and mark the location of the hinge on the door and body.
4. Remove bolts retaining front door to lower hinge.



5. Remove bolts attaching front door to front door upper hinge (22800).

tomsn048@gmail.com



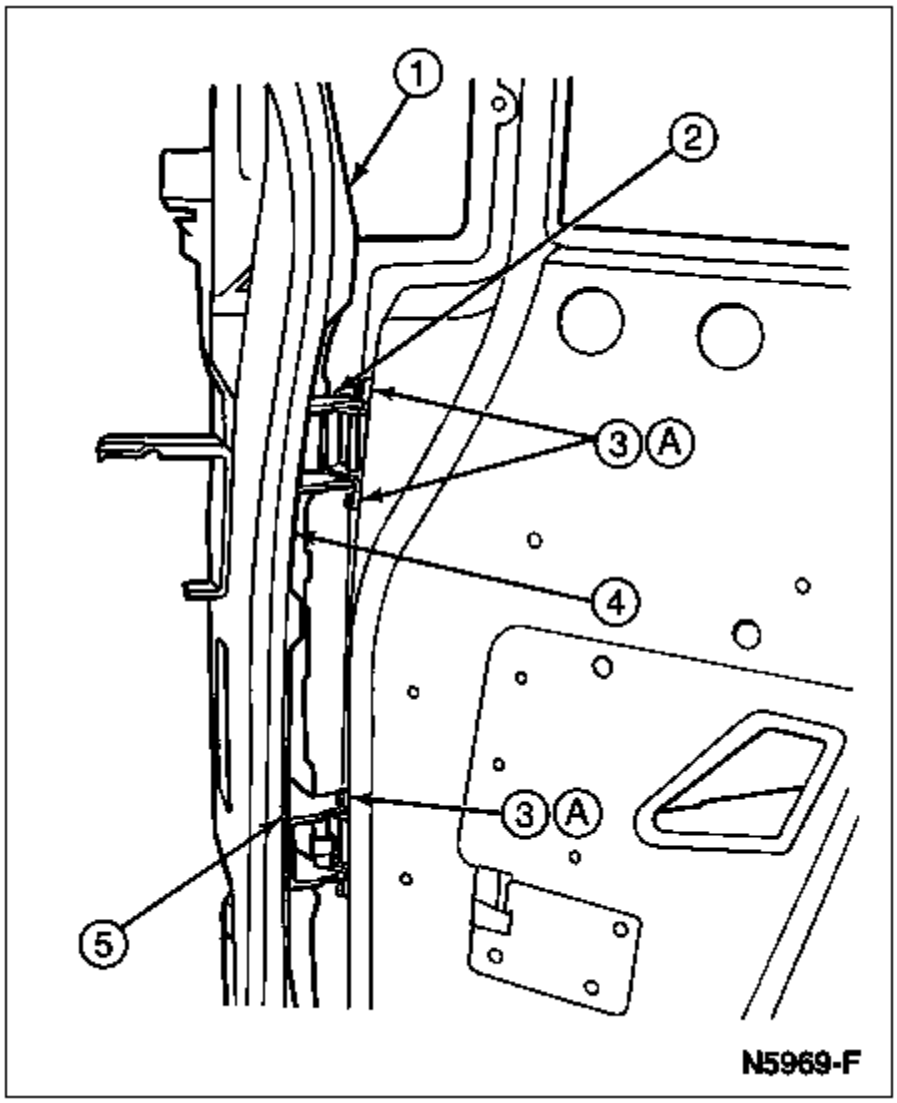
6. If a hinge is to be replaced, remove the bolts attaching hinge to pillar. Remove hinge.

7. For installation, follow removal procedures in reverse order.

8. Adhere thefront door opening weatherstrip (20709) in proper position on thefront door. Use Weatherstrip Adhesive E8AZ-19552-A or equivalent meeting Ford specification ESB-M2G14-A. Include the belt seals.

9. Adjust front door. Refer to Adjustments in this section.

tomsn048@gmail.com



Item	Part Number	Description
1	20124	Front Door
2	22800	Front Door Upper Hinge
3	N800949-S2	Retaining Bolts
4	20709	Front Door Opening Weatherstrip
5	22806	Lower Hinge
A	—	Tighten to 25-35 Nm (18-26 Lb-Ft)

Sliding Side Door

Removal and Installation

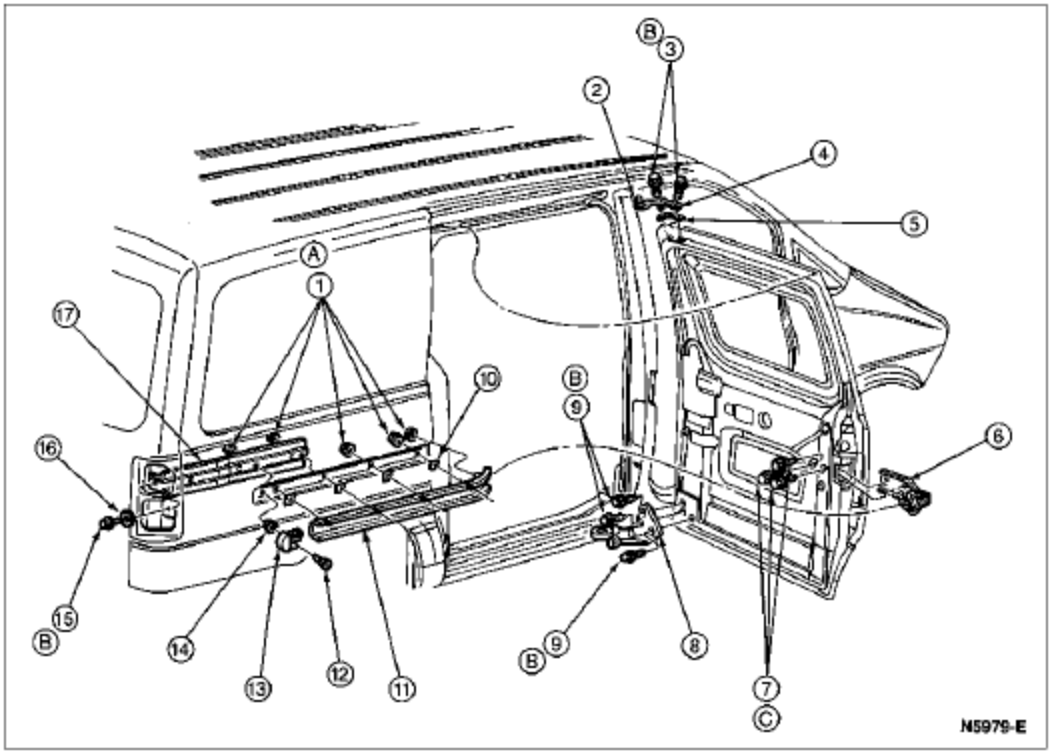
1. Remove quarter trim panel (31012) or access hole cover plate. Refer to Section 01-05B .

tomsn048@gmail.com

2. Mark the position of upper guide bracket, lower guide bracket and the body side hinge bracket.
3. Remove the three bolts holding the body side hinge bracket.
4. Release the door latch, pull the body side hinge from the door and swing the door straight out to the side.
5. While supporting the door, remove the upper guide bracket bolts.
6. Remove the lower guide bolts, and remove the door.

For installation, follow removal procedures in reverse order. Align upper and lower hinge brackets to disassembly marks. Tighten attaching bolts to 22-34 Nm (16-25 lb-ft).

Sliding Side Door



Item	Part Number	Description
1	N621926-S36	Nut

C	—	Tighten to 17-20 Nm (13-15 Lb-Ft)

Dual Rear Doors, Aerostar

Removal and Installation

1. Open and support the door with Rotunda Flexi-Work Table 156-00070 or equivalent.
2. Mark lower hinge to rear door (24630) location.
3. Remove three screw and washer assemblies retaining upper hinge torear door.
4. Remove two screw and washer assemblies retaining lower hinge torear door.
5. Slide rear door offsliding door hinge and roller (26800). Retain the back door hinge spacer(s) from sliding door hinge and roller to rear door.

For installation, follow removal procedures in reverse order. If adjustments are needed, refer to Door Hinge adjustment procedure in this section.

Hinges Dual Rear Door, Aerostar

NOTE: The lower hinge need not be removed to remove upper hinge and vice versa.

Upper Hinge

Removal and Installation

1. Open and support the door with Rotunda Flexi-Work Table 156-00070 or equivalent.
2. Mark location of upper and lower hinges on door and body.
3. Remove plug button for hinge mounting driver access holes in pillar-inner rear corner and remove nut and washer assembly.

tomsn048@gmail.com

4. Remove five screw and washer assemblies retaining sliding door hinge and roller to door and body.
5. Slide upper hinge from vehicle. Retain door hinge spacer(s).

For installation, follow removal procedures in reverse order.

Lower Hinge

Removal and Installation

1. Remove five screw and washer assemblies retaining lower hinge to sliding door hinge and roller and body.
2. Slide lower hinge from vehicle.

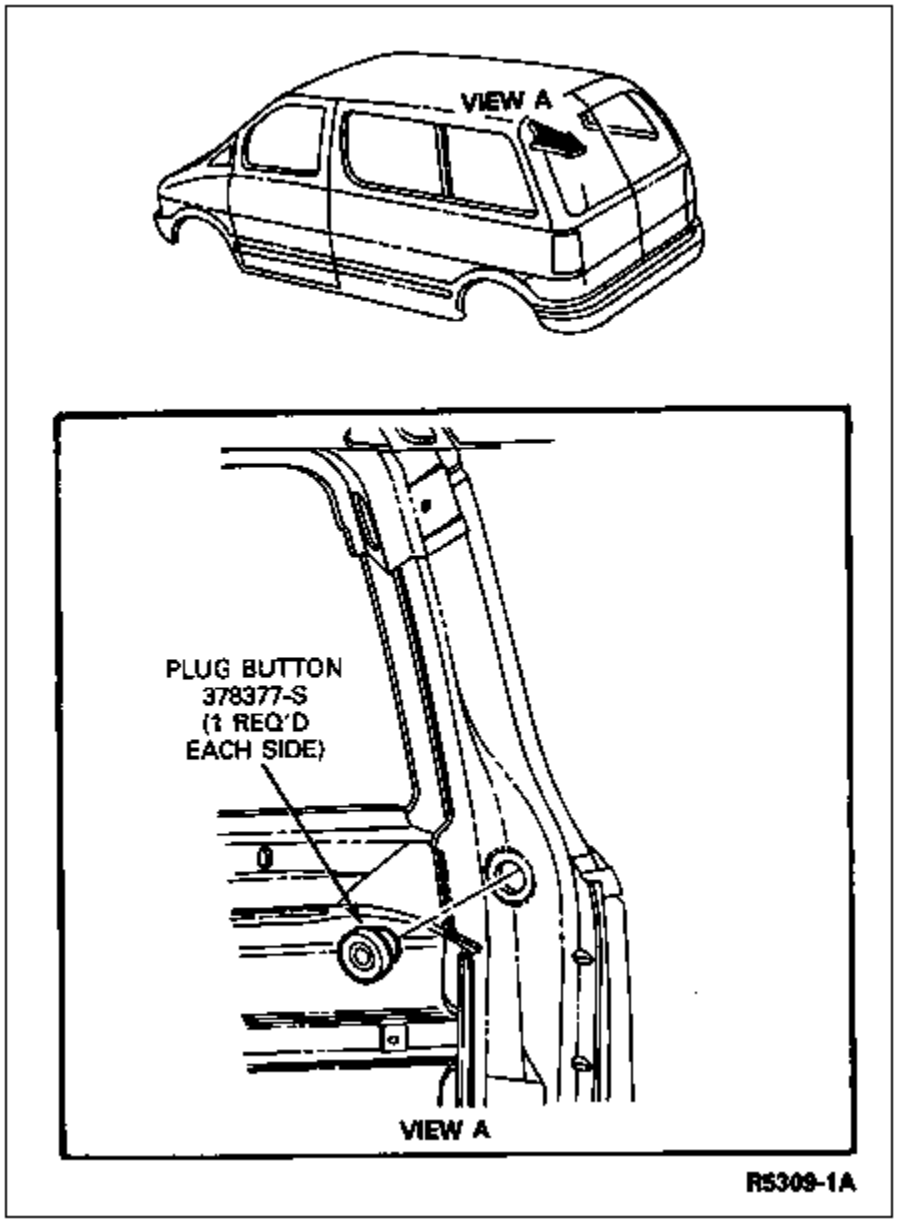
For installation, follow removal procedures in reverse order.

tomsn048@gmail.com

Dual Rear Door Alignment, Aerostar

CAUTION: Do not cover up poor rear door (24630) alignment with a latch striker adjustment.

1. From inside of vehicle, remove plug button for hinge mounting driver access holes in pillar rear cover.



2. From inside the vehicle, loosen hinge screw and washer assembly just enough to permit movement

tomsn048@gmail.com

of the door with a padded pry bar. Retain sliding door hinge and roller (26800) to body for side-to-side or up-and-down adjustments.

3. Remove two screw and washer assemblies and loosen screw and washer assembly at the spacer slot location, retaining sliding door hinge and roller to rear door, to remove or insert backdoor hinge spacer(s) for fore and aft adjustments.

4. Loosen three screw and washer assemblies retaining lower hinge to body for up and down or fore and aft adjustment.

5. Loosen two screw and washer assemblies retaining lower hinge torear door for side to side adjustments.

6. Adjust rear door, as necessary. Tighten screw and washer assemblies, and nut and washer assembly.

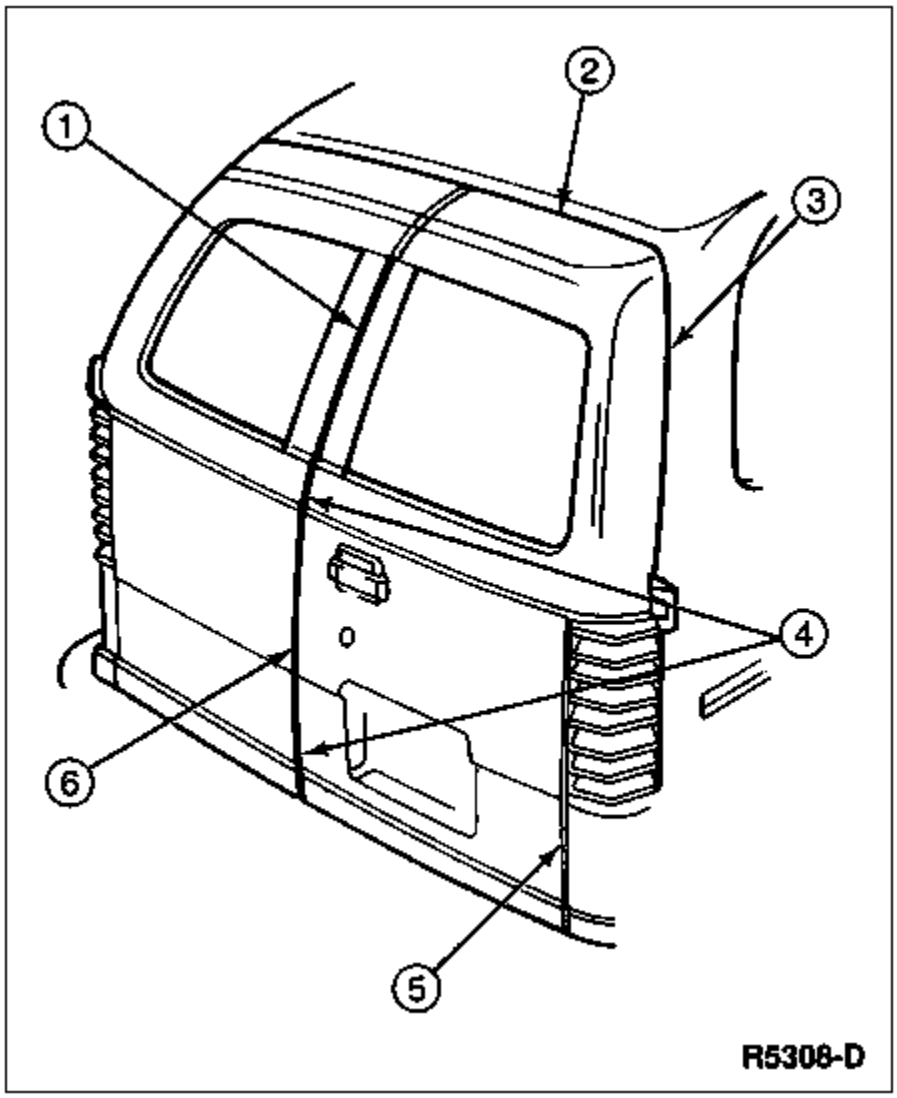
7. Check the rear door fit to make sure there is no bind or interference with the adjacent panel.

8. Repeat operation until desired fit is obtained in terms of flushness and gap.

9. Check door latch striker plate (22008) alignment for proper rear door closing.

Dual Rear Doors, Aerostar

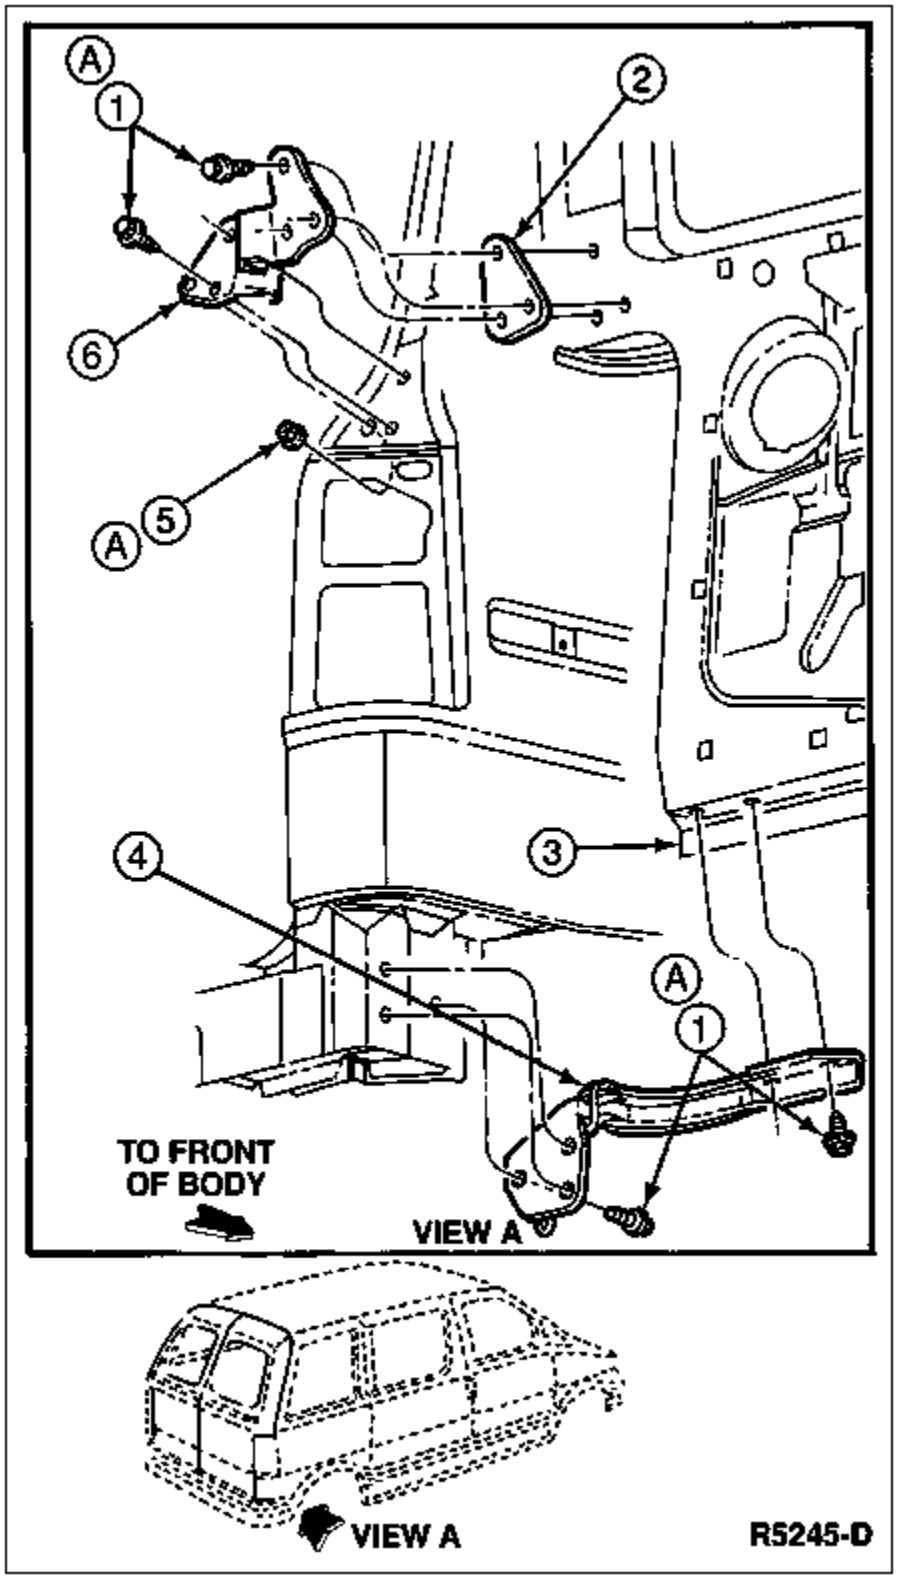
tomsn048@gmail.com



Item	Description	Flushness	Gap
1	Margin Between Window Modules	Flush ± 2.5mm (0.08 In.)	6mm ± 3.5mm (0.23 In. ± 0.13 In.)
2	Door Below Roof	1.5mm ± 2.5mm (0.05 In. ± 0.09 In.)	5.0mm ± 2.5mm (0.19 In. ± 0.09 In.)
3	Door Inboard	1.5mm ± 2.5mm (0.05 In. ± 0.09 In.)	5.0mm ± 2.0mm (0.19 In. ± 0.08 In.)
4	Character Line	Alignment ± 2.0mm (0.07 In.)	— —
5	Door Inboard Lower	Flush ± 2.5mm (0.08 In.)	5.0mm ± 2mm (0.19 In. ± 0.07 In.)
6	Margin Between Doors	Flush ± 2.0mm (0.07 In.)	6.0mm ± 2.5mm (0.23 In. ± 0.08 In.)

Note: Margins must be parallel within 1.5mm (0.06 in.).

tomsn048@gmail.com



Item	Part Number	Description

A	—	Tighten to 22-34 Nm (16-25 Lb-Ft)

Door Striker, Upper

NOTE: Use an M-11 socket to loosen or tighten the nut and washer assemblies which attach the upper striker assemblies.

The strikers can be adjusted laterally, and vertically, and shimmed fore and aft. Do not use more than four shims. To adjust striker, loosen attaching nuts so that striker can be moved around by hand. Close door firmly (thereby moving striker into proper position) and tighten retaining nuts.

Door Striker, Lower

NOTE: Use M-8 socket to loosen or tighten striker bolts.

CAUTION: No more than four shims should be used to adjust clearance.

The strikers can be adjusted fore and aft, and shimmed vertically. The latch striker should not be adjusted to correct door sag. The latch striker should be shimmed to achieve correct clearance between latch striker and latch. To check this clearance, close one door at a time and observe the alignment as the latch engages the striker. Move the striker assembly fore and aft to provide a flush fit at the door and the body.

Front Door Alignment

CAUTION: Do not cover up a poor door alignment with a latch striker adjustment.

1. Determine which hinge bolts must be loosened to move the door in the desired direction. Mark hinge with pen or pencil for reference point.
2. Loosen the hinge bolts just enough to permit movement of the door with a padded pry bar.
3. Move the front door (20124) the distance estimated to obtain the desired fit.
4. Tighten bolts to specifications.
5. Check the door fit to make sure there is no bind or interference with the adjacent panel.
6. Repeat the operation until the desired fit is obtained.
7. Check the striker plate alignment for proper door closing. Refer to Section 01-14A for striker adjustment.

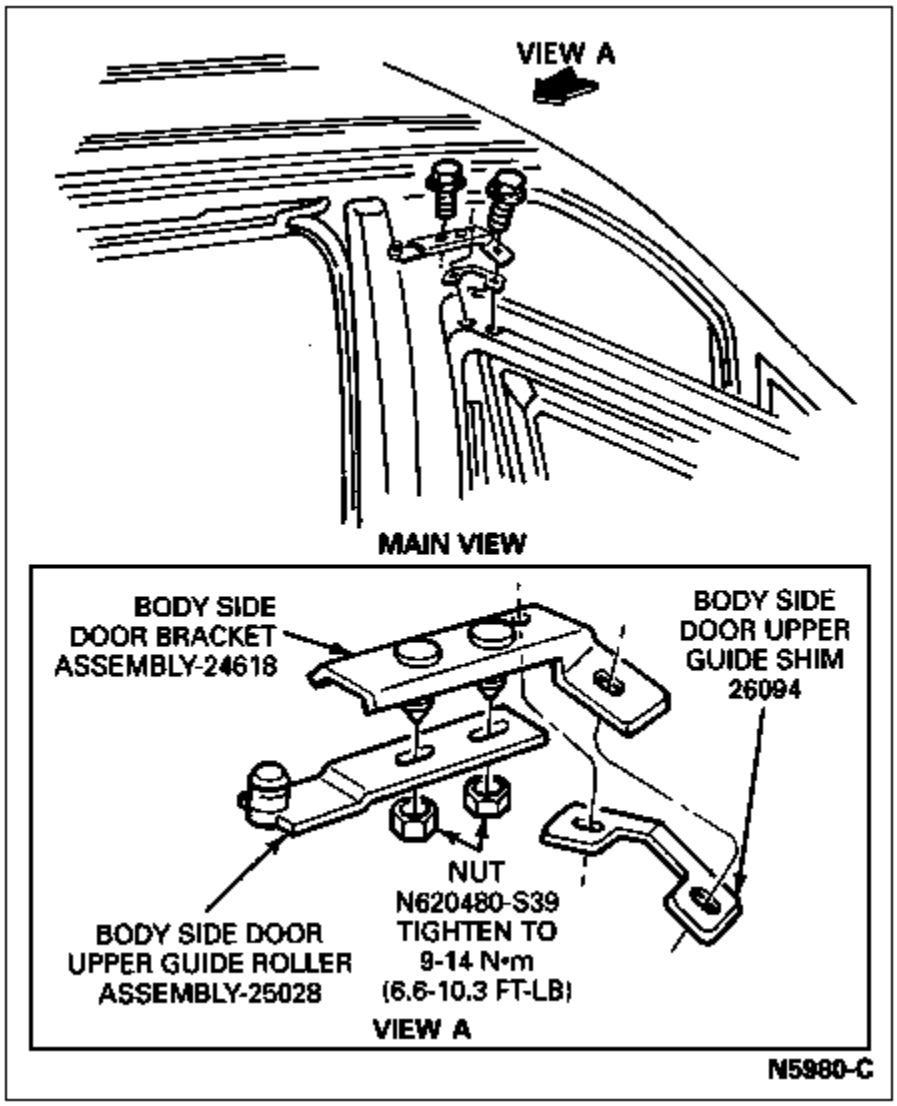
Guides and Wedges, Body Side Door, Aerostar

Guide Bracket and Roller, Upper

Removal and Installation

1. Open and support the door.
2. Mark the location of the upper bracket assembly to the door.
3. Remove the two bolts attaching the bracket assembly to the door. Remove roller assembly by backing it out of the track opening at the back.
4. If a new bracket assembly is being installed, transfer the roller assembly to the bracket assembly and set at the same location on brackets.
5. Position the roller assembly into the track. Set the new bracket assembly to the location marks. Install retaining bolts.
6. Adjust as described in this section.

tomsn048@gmail.com

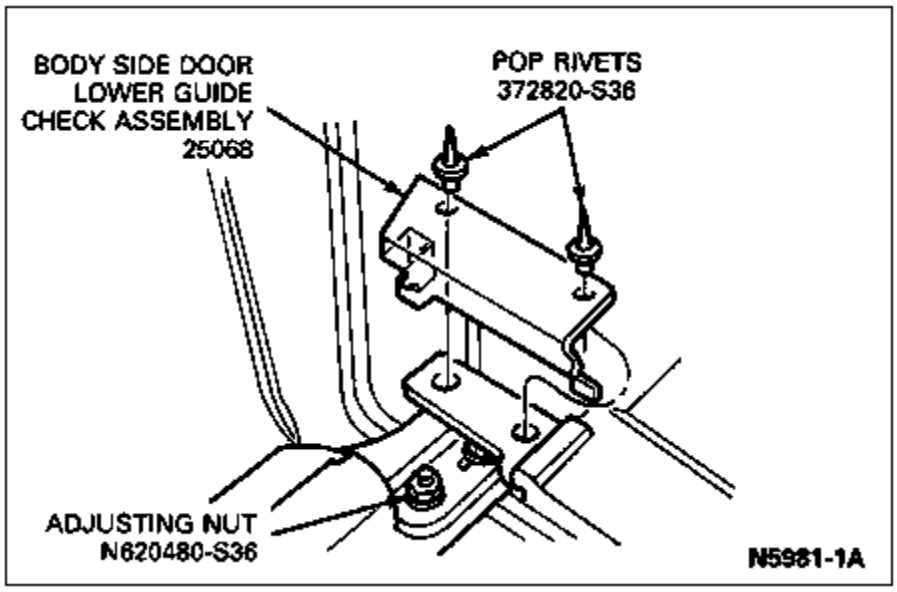


Guide, Lower

Removal and Installation

1. Open and support the door.
2. Mark the location of the lower guide bracket to the door. Remove three screws attaching guide.
3. Slide the guide forward in the track and tilt upward to remove from the front portion of the track.
4. Install new guide assembly into the front end of the lower track and slide guide to the door. Attach at the same location marks made in Step 2.
5. Adjust lower guide as described in this section.

tomsn048@gmail.com



Wedge Striker Plate, Aerostar

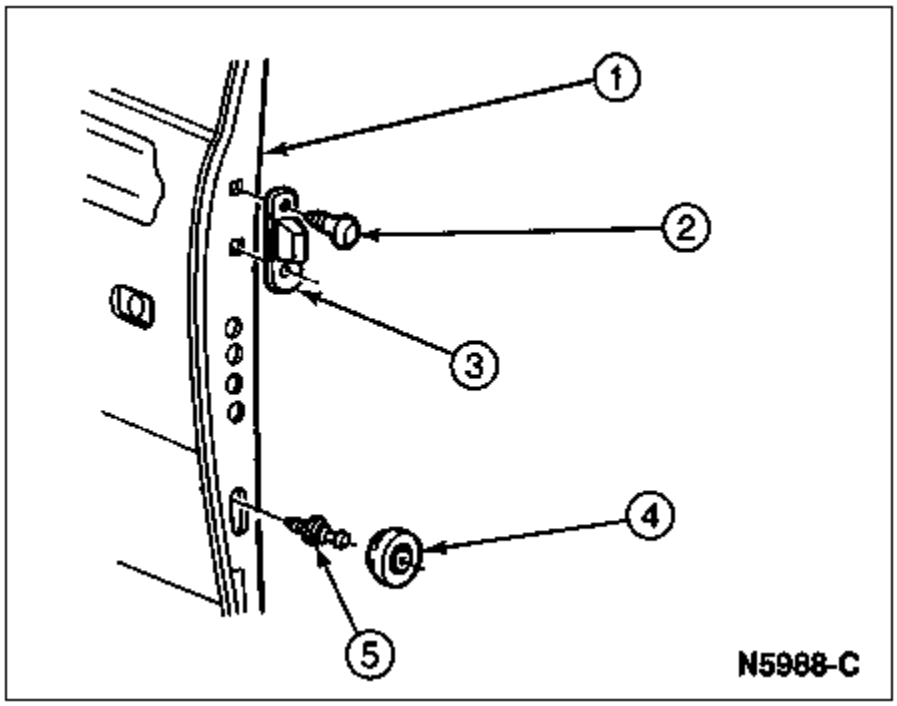
CAUTION: For proper sliding door operation, it is critical that the door adjuster wedge (25342) and door latch striker, on the front face of the sliding door fit smoothly into the wedge pocket and door latch plate located in the B-pillar. If any of the following adjustments are made, realignment of the wedge and striker may be necessary.

Removal and Installation

1. Open sliding door and mark location of each wedge and striker located on sliding door.
2. Remove the two attaching screws to remove striker wedge. Remove striker by turning.

For installation, follow removal procedures in reverse order.

tomsn048@gmail.com



Item	Part Number	Description
1	24602	Body Side Door
2	N803756-S36	Screw
3	25318	Wedge Striker Plate
4	200A31	Plug
5	431C04	Striker

Wedge Pocket Plate, Aerostar

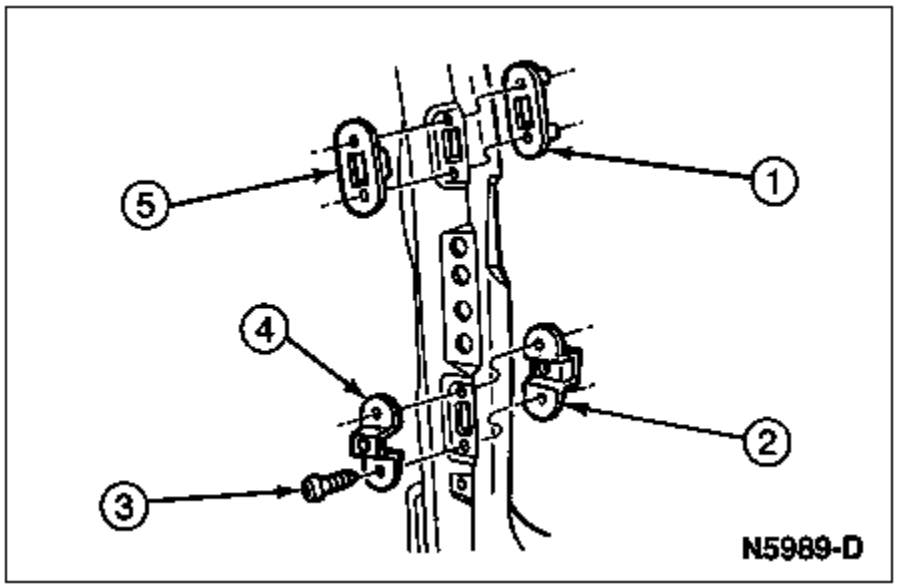
CAUTION: For proper sliding door operation, it is critical that the wedge and striker on the front face of the sliding door fit smoothly in the wedge pocket and plate located in the B-pillar. If any of the following adjustments are made, realignment of the wedge and striker may be necessary.

Removal and Installation

1. Open the sliding door.
2. Remove B-pillar trim panel or access hole cover plate.
3. Remove the two attaching screws and remove all hardware (plates, wedges, etc.)

For installation, follow removal procedures in reverse order.

tomsn048@gmail.com



Item	Part Number	Description
1	N803762-S2	Nut Plate
2	211A66	Reinforcement
3	N803756-S39	Screw
4	264B54	Door Latch Plate
5	25342	Wedge

Center Body Side Track, Aerostar

Removal and Installation

1. Remove quarter trim panel (31012) or access hole cover plates.
2. Remove screw and nut attaching center track filler assembly at rear of center track.
3. Remove the five attaching nuts securing the center track assembly to the body. Remove track.

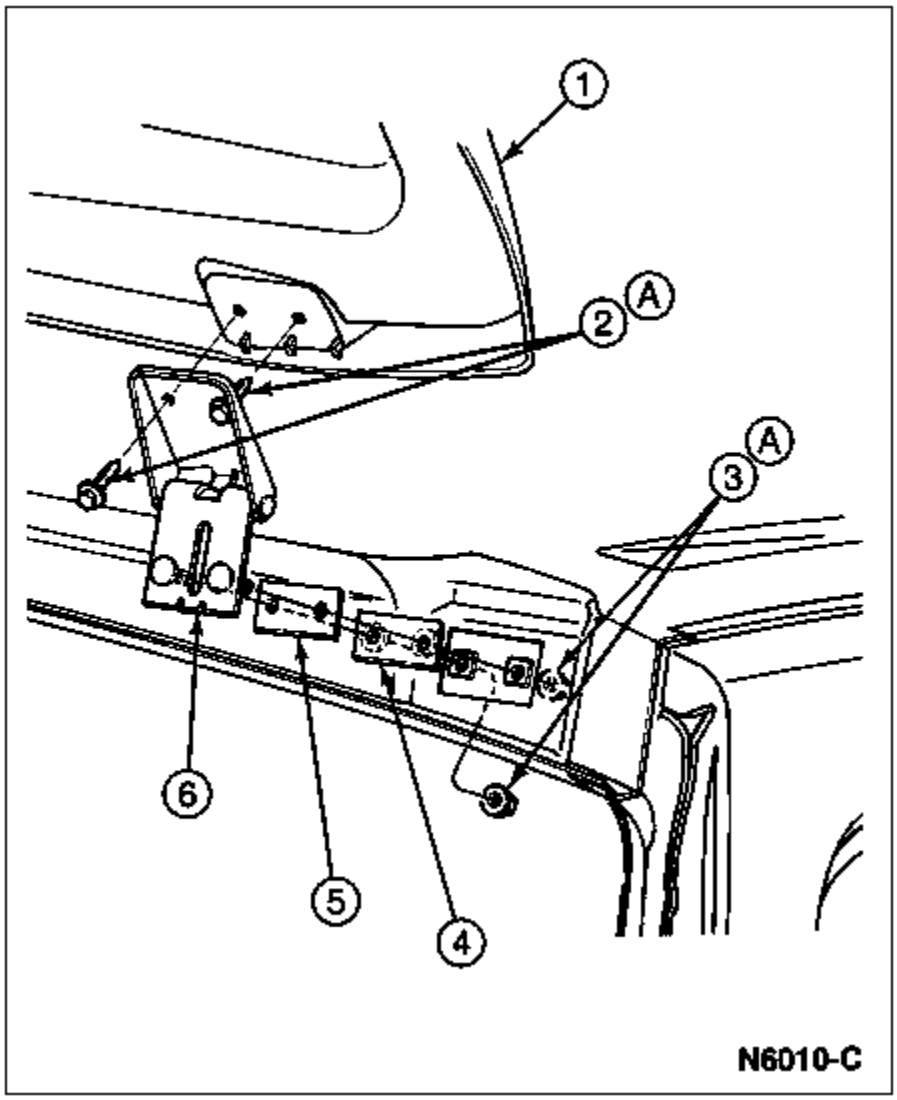
For installation, follow removal procedures in reverse order.

tomsn048@gmail.com

tomsn048@gmail.com

Liftgate Alignment, Aerostar

The liftgate (40010) can be adjusted side to side and up and down by loosening the bolt and washer attaching the liftgate hinge (42900) to the body to roof trim panel (51968). Adding spacers permits in/out adjustment as required. The liftgate should be adjusted for an even and parallel fit with the door opening. Tighten nuts to 17-27 Nm (13-20 lb-ft).



Item	Part Number	Description
1	40010	Liftgate
2	N605904-S	Screw and Washer
3	N802793-S	Nut and Washer
4	51968	Roof Trim Panel

tomsn048@gmail.com

5	44384	Spacer
6	42900	Liftgate Hinge
A	—	Tighten to 17-27 Nm (13-20 Lb-Ft)

The liftgate/luggage compartment latch strikers (404A42) can be moved 4.0mm (5/32 inch) radially (side to side/back and forth) as necessary. After the adjustment, tighten fasteners to 40-60 Nm (30-44 lb-ft).

tomsn048@gmail.com

Liftgate and Hinge, Aerostar

Removal and Installation

1. Open liftgate (40010).
2. Remove upper rear header moulding.
3. Support liftgate in open position.
4. Disconnect liftgate lift support cylinders as described in this section.
5. Move roof trim panel (51968) out of position. Remove nut attaching hinge to roof trim panel.
6. Remove retaining screws and washers from liftgate hinge (42900) on each side of the liftgate.
7. Remove liftgate hinge.

For installation, follow removal procedures in reverse order. Tighten fasteners to specifications.

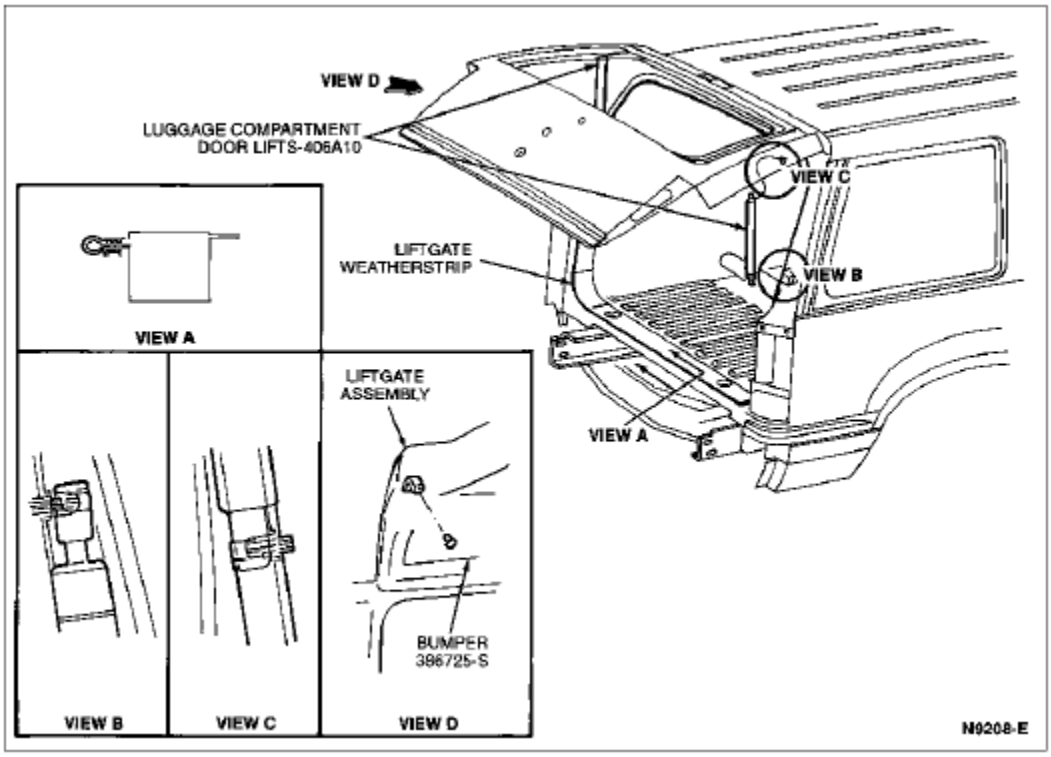
Liftgate Gas Cylinder Retainers, Aerostar

Removal and Installation

1. Open and support liftgate (40010).
2. Remove liftgate lift support cylinders as described in this section.
3. Remove retainer assembly.

For installation, follow removal procedures in reverse order. Tighten the retainers to 20-28 Nm (15-21 lb-ft).

Liftgate Gas Cylinder Retainers, Aerostar



tomsn048@gmail.com

tomsn048@gmail.com

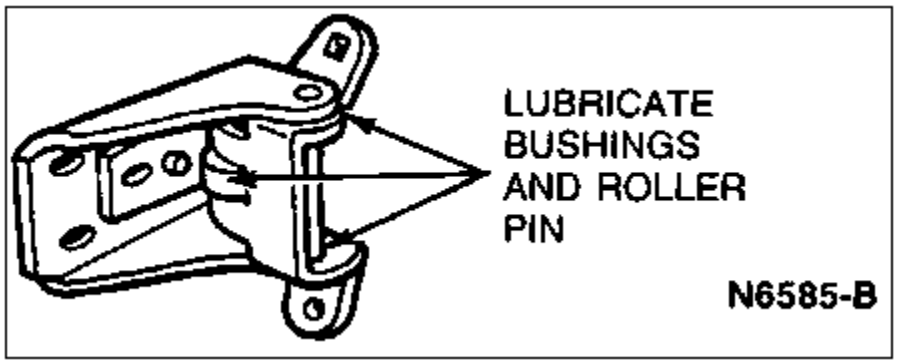
Lubricant

Weatherstrip, Door and Roof Side Rail

Use Silicone Lubricant C0AZ-19553-AA (Jelly) or D7AZ-19553-AA (Spray) or equivalent meeting Ford specification ESR-M13P4-A on the door and window weatherstrips. It is recommended that silicone lubricant be applied to the weatherstrips whenever necessary. Silicone lubricant helps avoid weatherstrip squeaks, and retards excess weatherstrip wear caused by chafing between the door glass upper frame and the weatherstrip. It also helps to retain door window alignment by reducing friction between the glass frame and the rubber weatherstrip.

Hinge, Door

Use Multi-Purpose Grease Spray D7AZ-19584-AA or equivalent meeting Ford specification ESB-M1C93-A to lubricate door hinges.



Hinge, Luggage Compartment Door

Multi-Purpose Grease Spray D7AZ-19584-AA or equivalent meeting Ford specification ESB-M1C93-A is used to lubricate luggage compartment door hinges. Apply an even coat to all movable hinge surfaces when a binding condition occurs.

tomsn048@gmail.com

tomsn048@gmail.com

Sliding Door Alignment, Aerostar

CAUTION: For proper sliding door operation it is critical that the door adjuster wedge and striker on the front face of the sliding door fit smoothly into the wedge pocket and plate located in the B-pillar. If any of the following adjustments are made, re-alignment of the wedge and striker may be necessary.

In or Out Adjustment

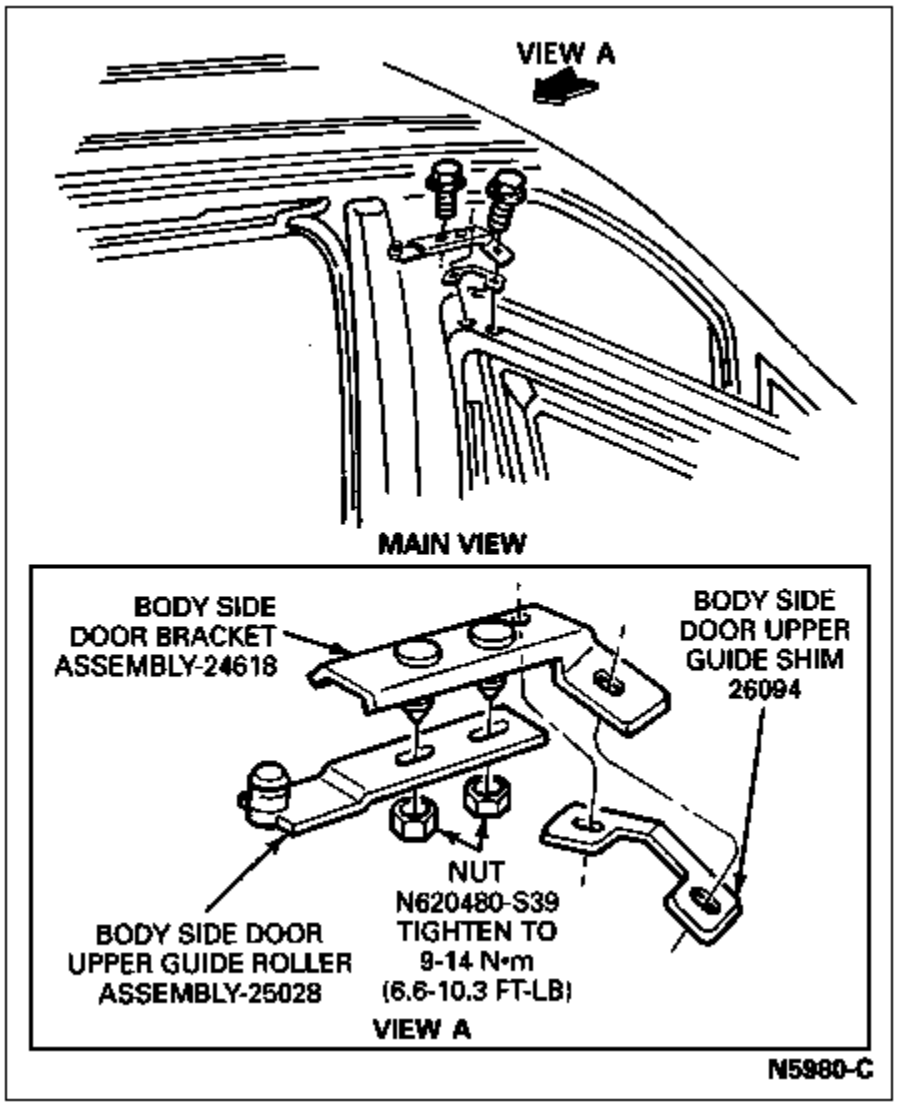
NOTE: Support the sliding door to prevent up or down movement during adjustment.

Front Upper

1. To adjust the front of the sliding door, loosen two nuts retaining the body side door bracket assembly to the upper guide roller assembly.

2. Move the roller assembly in or out as required to obtain a flush fit of the door to body.

tomsn048@gmail.com



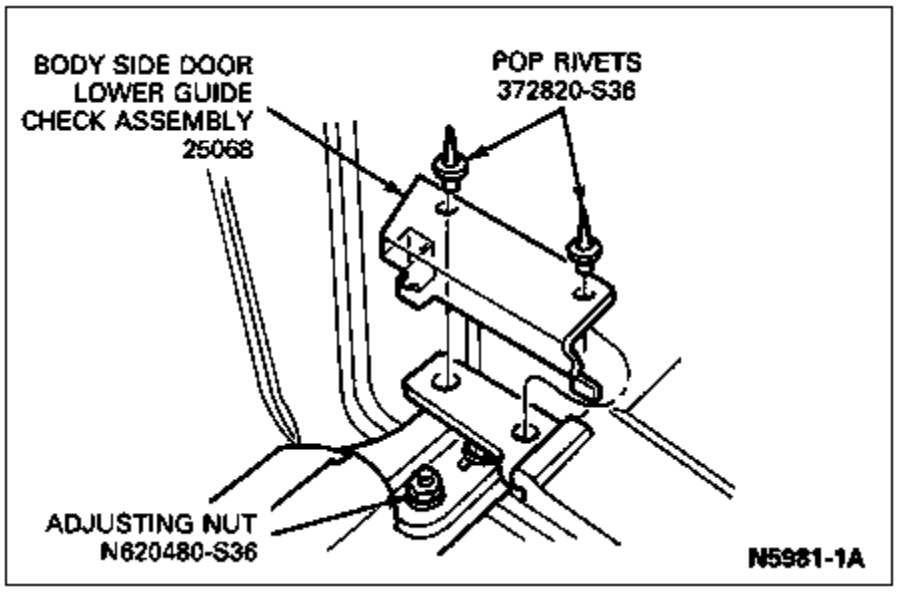
Front Lower

1. Mark surface before loosening adjusting nut. Adjust lower front edge of the sliding door by loosening the adjusting nut on the lower guide assembly and move the door in or out as required to obtain a flush fit. The lower guide vertical roller is a load bearing roller and should roll easily within the lower track as the sliding door is opened or closed.

2. Vertical adjustment of lower guide is accomplished by loosening three bolts and moving base of guide.

3. If vertical adjustment is made to lower guide, inspect the upper guide to make sure the upper guide does not contact the bottom of the track housing or the upper guide roller contacts the top of the upper track.

tomsn048@gmail.com

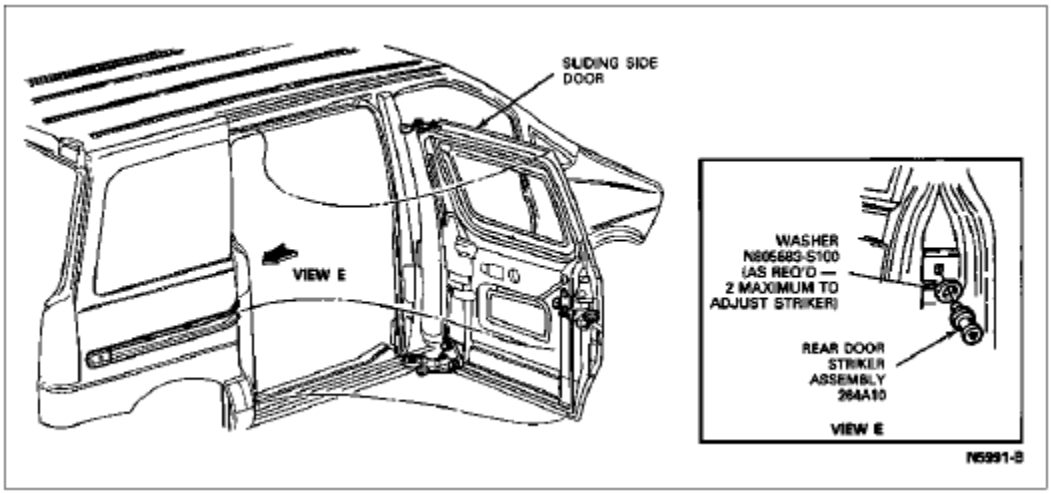


Striker Rear Latch

CAUTION: Striker adjusts in or out only. Up and down adjustment is obtained with rear hinge and lower front guide.

The sliding door latch is located at the rear of the door. When the door is closed the latch engages the striker which positions the rear of the door to the body. Adjusting the striker in or out will position the rear edge of the sliding door as required to obtain the proper fit to the body.

Striker Rear Latch, Aerostar



Hinge Assembly

To adjust the sliding door fore or aft, loosen three bolts retaining the center door hinge to the door and adjust

tomsn048@gmail.com

hinge fore or aft as required to secure a proper door fit.

Some up/down adjustment may be obtained from the center hinge by moving the center hinge strap up or down as desired prior to securing the retainer bolts.

The vertical hinge rollers within the body center track assembly must be parallel to the top of the track and maintain a minimum clearance of 1mm (0.040 inch) from the top of the track from smooth operation. If hinge is adjusted vertically, evaluate striker setting for fit and centering.

Weatherstrips, Aerostar

Removal

1. Cut or separatefront door opening weatherstrip (20709) andrear door body weatherstrip (253A10) around opening at seam.
2. Loosen and pry away from body flange with a flat tool such as a putty knife or equivalent.
3. Pull front door opening weatherstrip and rear door body weatherstrip outward and away from flange working upward, along the top, and around the opening.

Installation

1. **NOTE: Do not stretch weatherstrip during installation.**

   Clean any residual adhesive or material from flange or body surface by scraping carefully with a flat tool such as a putty knife or wipe with a cloth using Extra Strength Tar and Road Oil Remover B7A-19520-AA or equivalent meeting Ford specification ESR-M5B106-A.
2. Start installation at the proper area indicated in the illustration. Compress the front door opening weatherstrip and rear door body weatherstrip onto the flange and continue working across or around the opening.
3. Insert sponge plug into loose end of front door opening weatherstrip and rear door body weatherstrip.
4. Cut front door opening weatherstrip andrear door body weatherstrip, if necessary, 6-12mm longer than required and butt ends together. Avoid overlapping.
5. To install roof side rail weatherstrip (51222), apply Weatherstrip Adhesive E8AZ-19552-A or equivalent meeting Ford specification ESB-M2G14-A to forward pushpin only if required.
6. Insert pushpin near front at paint mark, then work outward and rearward installing weatherstrip carrier onto flange.
7. Peel protective backing off adhesive tape at rear molded seal or where required.
8. Aerostar body lock pillar cover installation should be started at top, then down lock pillar with adhesive tape protective backing removed, ending above the rocker panel.
9. Installation of back door opening weatherstrip assembly is same as body door openings. Clean surfaces with alcohol before applying adhesives. Remove protective backing from adhesive tape where required and apply pressure to installed assembly at these areas.

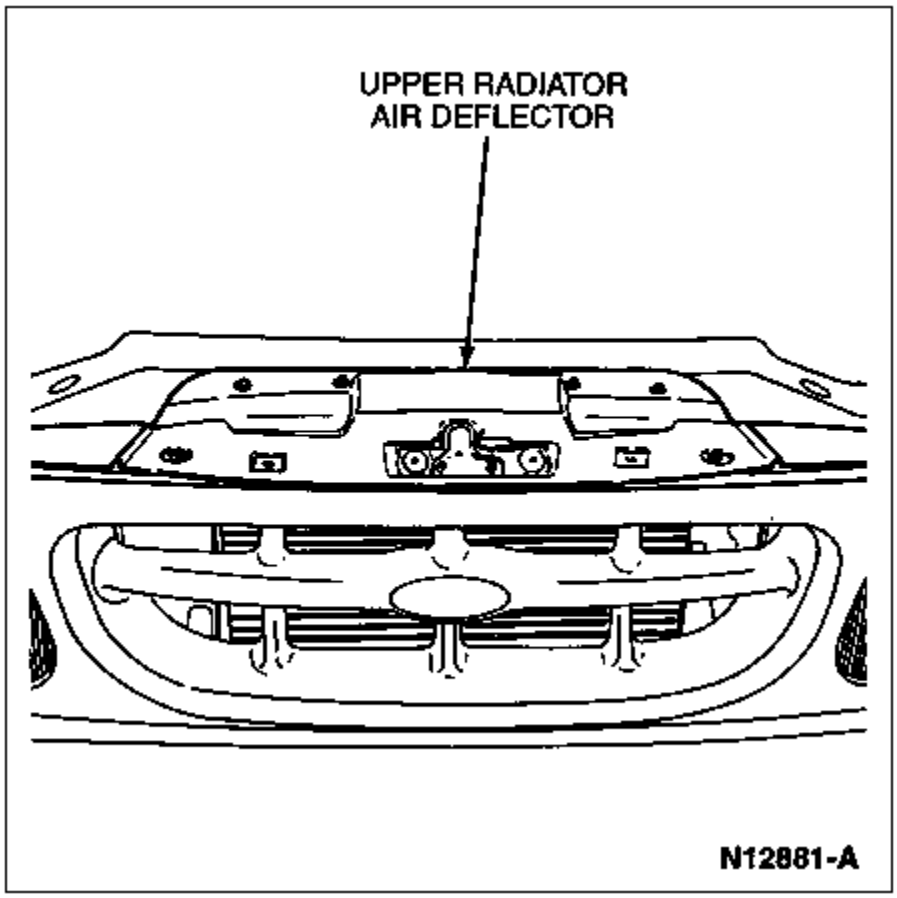
3. Remove radiator upper sight shield assembly.

For installation, follow removal procedure in reverse order.

Air Deflector, Radiator — Upper

Removal and Installation

1. Open vehicle hood.
2. Remove upper radiator air deflector retainers.



3. Remove upper radiator air deflector.

For installation, follow removal procedure in reverse order.

Cowl Top Vent Grille, Aerostar

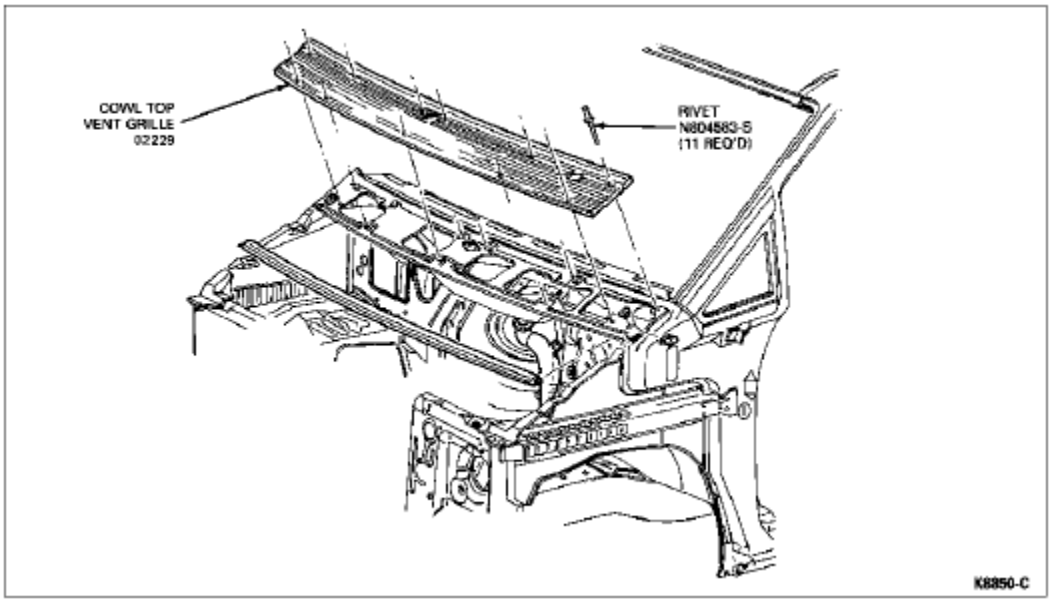
Removal and Installation

NOTE: The cowl top vent grille (02229) is held in place with plastic expansion rivets.

Remove expansion rivets by inserting a small punch in the rivet center hole, and carefully driving the pin out of the center.

Install the new rivets with Rotunda Blind Fastener Installation Tool 107-00600 or equivalent.

Cowl Top Vent Grille, Aerostar



Moulding, Lower Side and Front Valance

The Aerostar vehicle with XLS trim has a large plastic front valance panel (17626) and wide plastic lower body side mouldings. Ranger vehicles have a large plasticfront valance panel. The parts are moulded from TPO thermoplastic polyolefin.

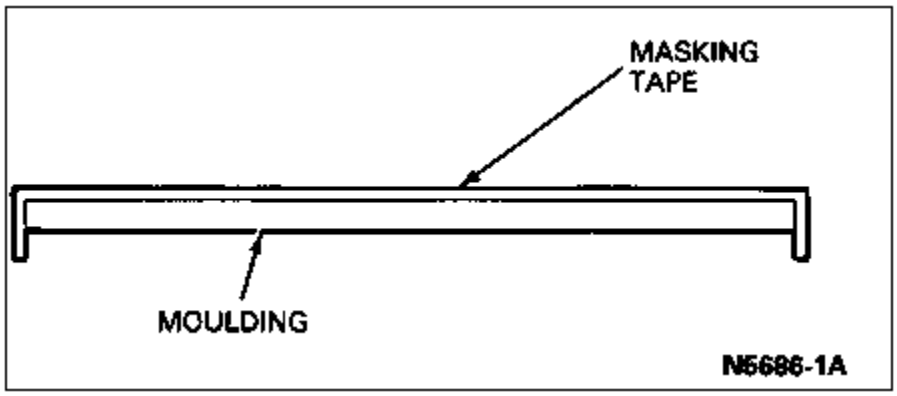
Adhesive Removal/Repair Body Side Mouldings/Nameplates

1. Completely clean sheet metal surface area around moulding using isopropyl alcohol and a clean soft cloth.

2. Before removing moulding, mark moulding location on top and each end of moulding with masking tape. Do not heat moulding or sheet metal surface; this only increases the adhesion. Temperatures of -18°C (0°F) and below allow easier removal of moul ding.



3. Using a nylon wedge tool, start at rear of door and wedge tool between moulding and door. At the same time, pull moulding away with steady tension. Remove and replace one moulding at a time.

4. Once a few inches of moulding are free, grip moulding with both hands and pull the moulding slowly toward the front of vehicle, being careful not to damage paint or sheet metal surface.

5. **NOTE: Not all of the tape will come off with moulding; white or gray acrylic tape is most easily removed by gently stretching.**

   Grip tape at one end, lifting and pulling away slowly about 12mm (0.5 inch) at a time; then grip and pull again. Small pieces can be removed by rolling with thumb across sheet metal surface.

6. When all tape is removed, wipe area with isopropyl alcohol and clean soft cloth, making sure all tape residue and road dirt is removed. A clean surface is required for application of new moulding. Should paint surface be damaged during moulding removal, surface should be repaired using paint repair procedure.

7. **NOTE: Mouldings should not be installed on vehicle unless sheet metal surface temperature exceeds 27°C (80°F) and moulding is at 21°C (70°F) minimum.**

   New moulding is now ready to be applied. Start at front of door moulding, pull back tape protective liner approximately 19mm (0.75 inch). Do not touch or contaminate tape surface. Line moulding up with marks on masking tape at rear of door and press gently forward on door, removing protective liner as you proceed forward. Be sure part is lined up correctly.

8. Remove masking tape and wipe area under masking tape with isopropyl alcohol to remove residue.

9. Press moulding on with hand roller applying a minimum of 138 kPa (20 psi) pressure to assure positive tape adhesion.

Mirror, Outside Rearview, Power

The outside rear view mirror control (17B676) for the dual electric mirrors is located in the upper front area of the front door trim panel (23942). The same outside rear view mirror control controls both the left and right outside rear view mirrors (17682).

Mirror position may be adjusted by first moving the selector switch to the L or R position. Then, adjust the outside rear view mirrors by pressing the appropriate arrow.

When not adjusting, the outside selector switch should be kept in center OFF position to avoid inadvertent adjustment.

Inspection and Verification

1. Verify the concern by operating the outside rear view mirrors.
2. Visually inspect for obvious signs of mechanical and electrical damage; refer to the following chart.

VISUAL INSPECTION CHART

Mechanical	Electrical
• Damaged mirrors. • Damaged remote control mirror switch.	• Blown fuse: • No. 1 (7.5 Amp) (Ranger) • No. 8 (15A) (Aerostar) • Damage to wiring harness. • Loose or corroded connections.

3. If the visual inspection reveals no obvious concerns; refer to the following Symptom Chart.

Symptom Chart — Rearview Mirrors

NOTE: Use Rotunda 73 Digital Multimeter 105-R0051 or equivalent to perform electrical Pinpoint Tests.

REARVIEW MIRRORS

Condition	Possible Source	Action
• Both RH and LH Mirrors Inoperative	• Fuse. • Circuitry open/shorted. • Damaged outside rearview mirror control.	• GO to Pinpoint Test A for Aerostar. • GO to Pinpoint Test B for Ranger.
• Single Mirror Inoperative	• Circuitry open/shorted. • Damaged outside rearview mirror control. • Damaged outside rearview mirror motor.	• GO to Pinpoint Test C for Aerostar. • GO to Pinpoint Test D for Ranger.
• Single Mirror Does Not Function with Switch Logic	• Circuitry open/shorted. • Damaged outside rearview mirror control. • Damaged outside rearview mirror motor.	• GO to Pinpoint Test E for Aerostar and Ranger.

Pinpoint Tests

PINPOINT TEST A: BOTH RH AND LH MIRRORS INOPERATIVE (AEROSTAR)

A1 CHECK FOR A BLOWN FUSE

- Key OFF.
- Remove fuse and inspect.

Is the fuse blown?

Yes	No
REPLACE and RETEST mirrors. If the fuse fails again, REPAIR Circuit 54 (LG/Y).	REINSTALL fuse. GO to **A2** .

A2 CHECK FOR VOLTAGE AT HARNESS CONNECTOR TO SWITCH

- Disconnect outside rear view mirror control.
- Using Rotunda 73 Digital Multimeter 105-R0051 or equivalent, check for voltage across Circuits 54 (LG/Y) and 57 (BK).

Is voltage present?

Yes	No
CHECK outside rear view mirror control. REFER to the Component Test in this section.	GO to **A3** .

A3 CHECK CIRCUIT 54 (LG/Y) FOR VOLTAGE

- Check for voltage between Circuit 54 (LG/Y) and ground.

Is there voltage?

Yes	No
GO to **A4** .	TRACE back through Circuit 54 (LG/Y) and REPAIR as required.

A4 CHECK FOR CONTINUITY OF CIRCUIT 542 (Y)

- Use Rotunda 73 Digital Multimeter 105-R0051 or equivalent to check continuity of circuit 542 (Y) between the outside rear view mirrors and the outside rear view mirror control.

Does continuity exist?

Yes	No
GO to **A5** .	TRACE back through circuit 542 (Y) and REPAIR as required.

A5 CHECK FOR SHORT ON CIRCUIT 542 (Y)

- Use Rotunda 73 Digital Multimeter 105-R0051 or equivalent to check circuit 542 (Y) for short to ground.

Is circuit shorted to ground?

Yes	No
TRACE back through circuit 542 (Y) and REPAIR as required.	TRACE back through circuit 57 (BK) and REPAIR as required.

PINPOINT TEST B: BOTH RH AND LH MIRRORS INOPERATIVE (RANGER)

B1 CHECK FOR A BLOWN FUSE

- Key OFF.
- Remove fuse and inspect.

Is the fuse blown?

Yes	No
REPLACE and RETEST mirrors. If the fuse fails again, REPAIR Circuit 956 (O/LG).	GO to **B2** .

B2 CHECK FOR VOLTAGE AT HARNESS CONNECTOR TO SWITCH

- Disconnect outside rear view mirror control.
- Using Rotunda 73 Digital Multimeter 105-R0051 or equivalent, check for voltage across Circuits 956 (O/LG) and 57 (BK).

Is voltage present?

Yes	No
CHECK outside rear view mirror control. Refer to Component Test in this section.	GO to **B3**.

B3 CHECK CIRCUIT 956 (O/LG) FOR VOLTAGE

- Check for voltage between Circuit 956 (O/LG) and ground.

Is there voltage?

Yes	No
GO to **B4**.	TRACE back through Circuit 956 (O/LG) and REPAIR as required.

B4 CHECK FOR CONTINUITY OF CIRCUIT 542 (Y)

- Use Rotunda 73 Digital Multimeter 105-R0051 or equivalent to check continuity of circuit 542 (Y), between the outside rear view mirrors and the outside rear view mirror control.

Does continuity exist?

Yes	No
GO to **B5**.	TRACE back through circuit 542 (Y) and REPAIR as required.

B5 CHECK FOR SHORT ON CIRCUIT 542 (Y)

- Use Rotunda 73 Digital Multimeter 105-R0051 or equivalent to check circuit 542 (Y) for short to ground.

Is circuit shorted to ground?

Yes	No
TRACE back through circuit 542 (Y) and REPAIR as required.	TRACE back through circuit 57 (BK) and REPAIR as required.

PINPOINT TEST C: SINGLE MIRROR INOPERATIVE (AEROSTAR)

C1 VERIFY THAT HARNESS IS CONNECTED TO MIRROR

- Key OFF.
- Remove front door trim panel and verify that outside mirror control wiring is connected.

Is harness connected?

Yes	No
GO to C2 .	CHECK outside mirror control wiring connector for damage and RECONNECT. CHECK outside rear view mirror for proper operation. If the concern remains, GO to C2 .

C2 CHECK CONTINUITY OF CIRCUITS IN HARNESS CONNECTOR

- Using Rotunda 73 Digital Multimeter 105-R0051 or equivalent, check continuity of Circuits 540 (R), 541 (DB) and 542 (Y) for left outside rear view mirror, 542 (Y), 543 (DG) and 544 (P) for right outside rear view mirror, in outside mirror control wiring connector to outside rear view mirror.

Do circuits have continuity?

Yes	No
REPLACE the outside rear view mirror.	TRACE circuits and REPAIR as required.

PINPOINT TEST D: SINGLE MIRROR INOPERATIVE (RANGER)

D1 VERIFY THAT HARNESS IS CONNECTED TO MIRROR

- Key OFF.
- Remove front door trim panel and verify that outside mirror control wiring is connected.

Is harness connected?

Yes	No
GO to D2 .	CHECK outside mirror control wiring connector for damage and RECONNECT. CHECK outside rear view mirror for proper operation. If the concern remains, GO to D2 .

D2 CHECK CONTINUITY OF CIRCUITS IN HARNESS CONNECTOR

- Using Rotunda 73 Digital Multimeter 105-R0051 or equivalent, check continuity of Circuits 540 (R), 541 (DB) and 542 (Y) for left outside rear view mirror, 542 (Y), 543 (DG) and 544 (P) for right outside rear view mirror, in outside mirror control wiring connector to outside rear view mirror.

Do circuits have continuity?

Yes	No
REPLACE the outside rear view mirror.	TRACE circuits and REPAIR as required.

PINPOINT TEST E: SINGLE MIRROR DOES NOT FUNCTION WITH SWITCH LOGIC (AEROSTAR AND RANGER)

E1 VERIFY THAT HARNESS IS CONNECTED TO MIRROR

- Key OFF.
- Remove front door trim panel and verify that outside mirror control wiring is connected.

Is harness connected?

Yes	No
GO to **E2** .	CHECK outside mirror control wiring connector for damage and RECONNECT. CHECK outside rear view mirror for proper operation. If the concern remains, GO to **E2** .

E2 CHECK CONTINUITY OF CIRCUITS IN HARNESS CONNECTOR

- Disconnect the outside rear view mirror control and the inoperative outside rear view mirror.
- Using Rotunda 73 Digital Multimeter 105-R0051 or equivalent, check continuity of Circuits 540 (R), 541 (DB) and 542 (Y) for left outside rear view mirror, or Circuits 542 (Y), 543 (DG) and 544 (P) for right or left outside rear view mirror, and outside rear view mirror control.

Do circuits have continuity?

Yes	No
GO to **E3** .	TRACE circuits to connector and REPAIR as required.

E3 CHECK OUTSIDE REAR VIEW MIRROR CONTROL

- Check the outside rear view control. Refer to the Component Test in this section.

Does outside rear view mirror control operate properly?

Yes	No
GO to **E4** .	REPLACE the outside rear view mirror control.

E4 CHECK CIRCUIT LOGIC AT SWITCH CONNECTOR

- Using Rotunda 73 Digital Multimeter 105-R0051 or equivalent, verify that the outside rear view mirror motor is working properly. Refer to Component Test — Aerostar or Component Test — Ranger in this section.

Is logic OK at outside rear view mirror motor?

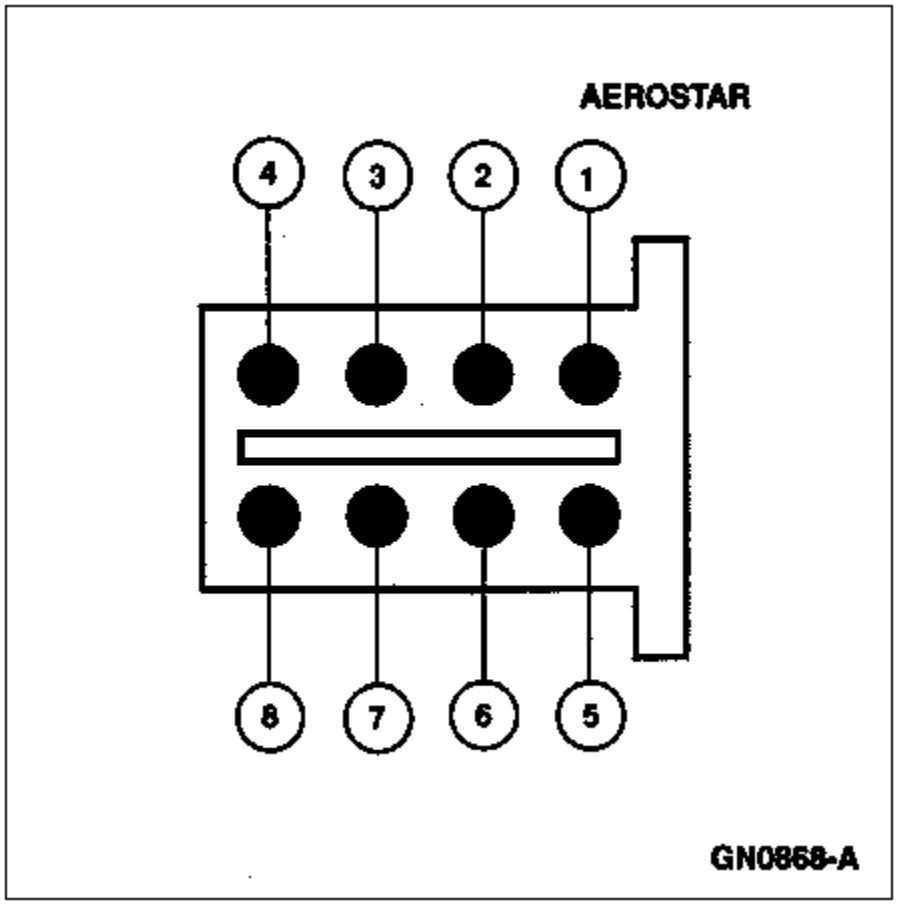
Yes	No
TRACE along outside mirror control wiring to DETERMINE where cross circuitry took place. REPAIR as required.	REPLACE the outside rear view mirror and RETEST mirror operation.

Component Test — Outside Rear View Mirror Control

Mirror Control

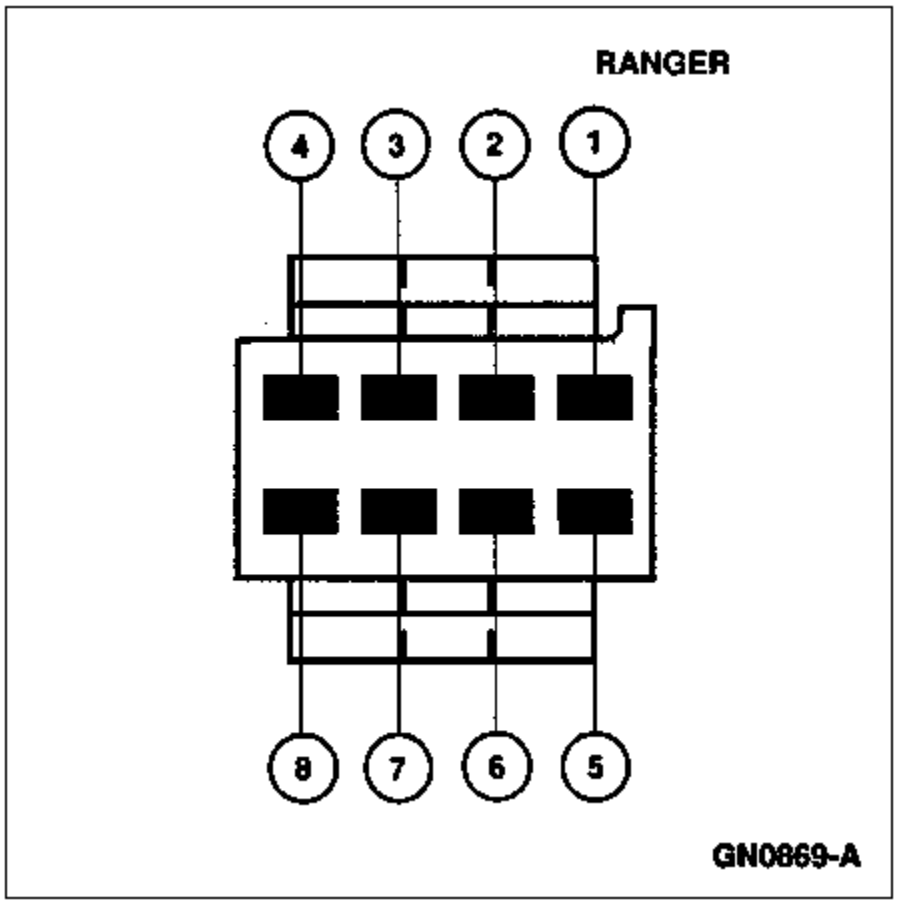
1. Key OFF.
2. Disconnect the outside rear view mirror control connector.
3. **NOTE: All resistances not specified in the chart for a switch position should be greater than 10,000 ohms.**

   Measure the resistance between the following terminals at the outside rear view mirror control under the following conditions:



OUTSIDE REAR VIEW MIRROR CONTROL

Mirror Select	Mirror Direction	Terminal From	Terminal To	Resistance
Left	Up	6 5	8 1	Less than 5 ohms
Left	Down	5 6	8 1	Less than 5 ohms
Left	Left	2 5	8 1	Less than 5 ohms
Left	Right	5 2	8 1	Less than 5 ohms
Right	Up	7 5	8 1	Less than 5 ohms
Right	Down	5 7	8 1	Less than 5 ohms
Right	Left	3 5	8 1	Less than 5 ohms
Right	Right	5 3	8 1	Less than 5 ohms



OUTSIDE REAR VIEW MIRROR CONTROL

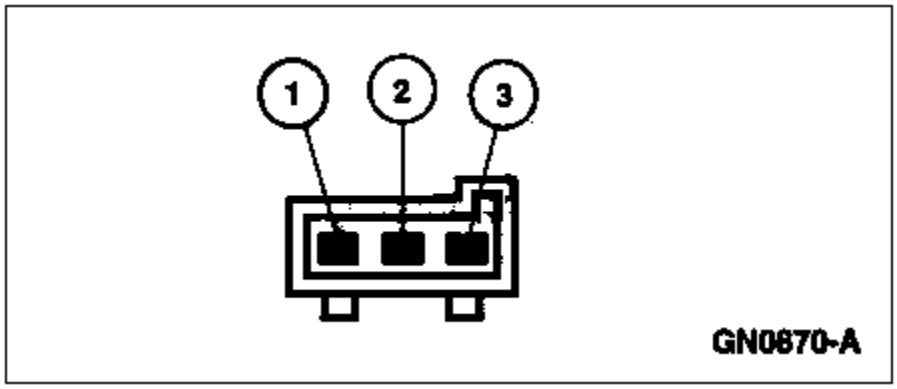
Mirror Select	Mirror Direction	Terminal From	Terminal To	Resistance
Left	Up	7 6	1 5	Less than 5 ohms
Left	Down	6 7	1 5	Less than 5 ohms
Left	Left	4 6	1 5	Less than 5 ohms
Left	Right	6 4	1 5	Less than 5 ohms
Right	Up	8 6	1 5	Less than 5 ohms
Right	Down	6 8	1 5	Less than 5 ohms
Right	Left	3 6	1 5	Less than 5 ohms
Right	Right	6 3	1 5	Less than 5 ohms

4. If the resistances are not as specified, replace the outside rear view mirror control. Otherwise, return to the Pinpoint Tests.

Component Test — Aerostar

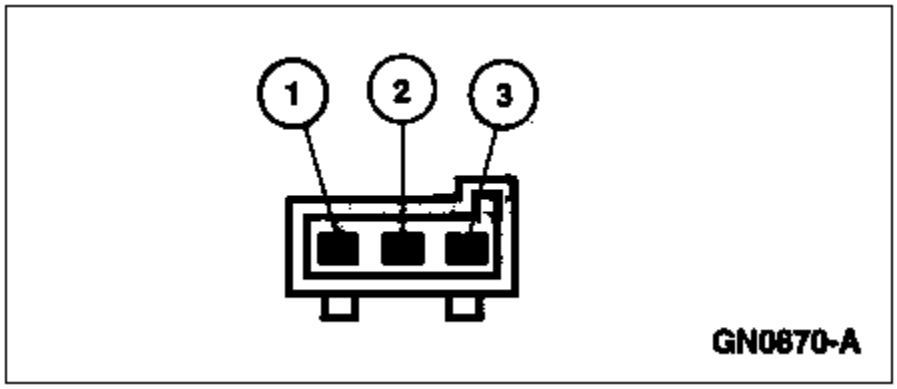
Power Outside Rear View Mirror Motor

1. Key OFF.
2. Disconnect the LH or RH power outside rear view mirror motor connector.
3. Apply 12 volts to the 2 terminal and ground to the following terminals and verify mirror operates in the specified direction.



Terminal	Mirror Direction
3	Right
1	Down

4. Apply ground to the 2 terminal and 12 volts to the following terminals and verify power outside rear view mirror operates in the specified direction.



Terminal	Mirror Direction
3	Left
1	Up

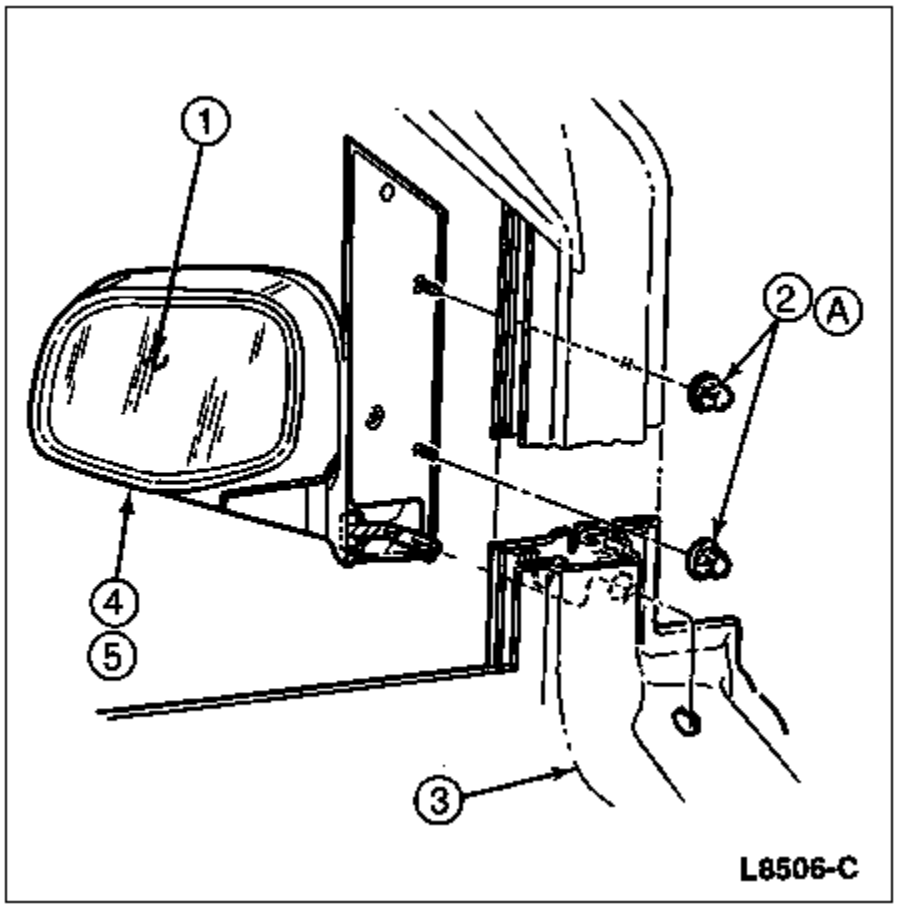
5. If the power outside rear view mirror does not operate as specified, replace the power outside rear view mirror in question. Otherwise, return to the Pinpoint Tests.

Mirror, Power, Outside Rearview, Aerostar

Removal and Installation

1. Disconnect wiring from behind outside rear view mirror (17682) with front door (20124) open.
2. Remove two nuts attaching outside rear view mirror to front door.
3. Remove outside rear view mirror from front door.

For installation, follow removal procedures in reverse order. Tighten mirror attaching nuts to 8-10 Nm (6-7 lb-ft).



Item	Part Number	Description
1	17K707	Outside Rear View Mirror Glass
2	N805169-S100	Nut
3	20124	Front Door
4	17682	Outside Rear View Mirror (LH)

5	17682	Outside Rear View Mirror (RH)
A	—	Tighten to 8-10 Nm (71-88 Lb-In)

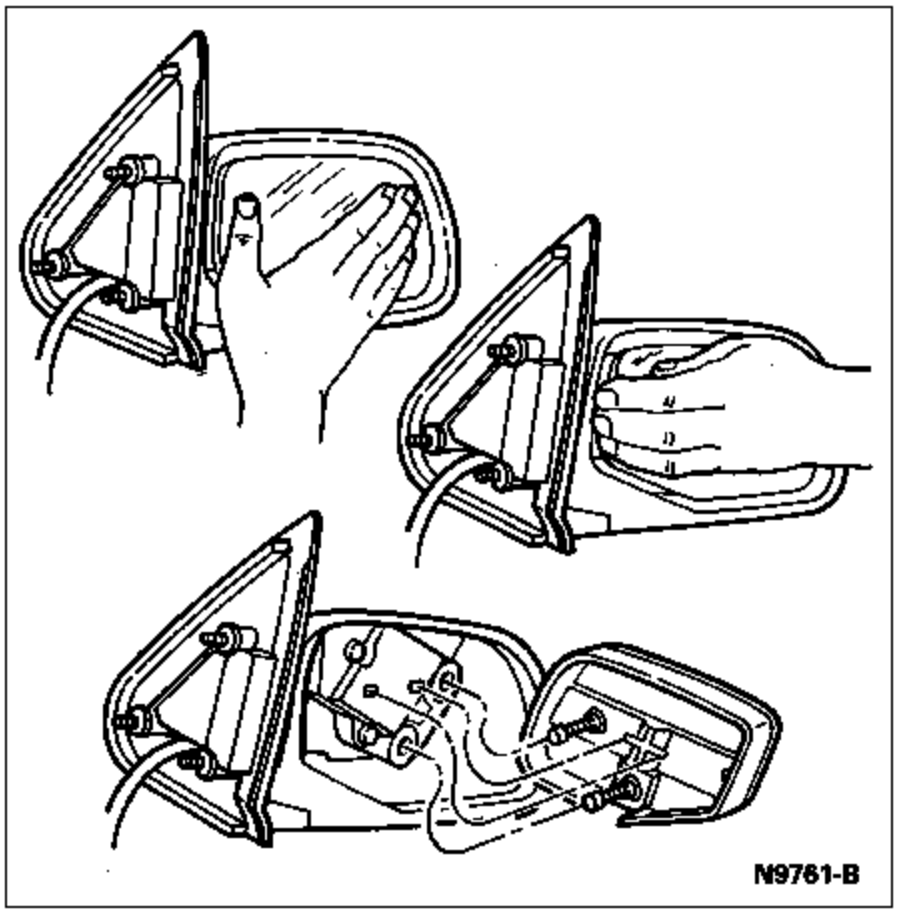
Glass, Outside Mirror, Aerostar and Ranger

Removal and Installation

1. Push outer edge of outside rear view mirror glass (17K707) into outside rear view mirror.
2. Grip inner edge of outside rear view mirror glass and pull out until outside rear view mirror glass snaps out of motor assembly.

   On some vehicles, the cross-tee pivot or drive screw(s) may remain attached to the outside rear view mirror motor (17D696) kit. In this case, carefully pry the pivot out of the outside rear view mirror motor kit and turn the drive screw(s) (counterclockwise) out of the outside rear view mirror motor kit.
3. Position the outside rear view mirror glass as shown. Firmly push the outside rear view mirror glass into place with the palm of the hand, until it locks.

Power Outside Mirror, Ranger Shown, Aerostar Similar



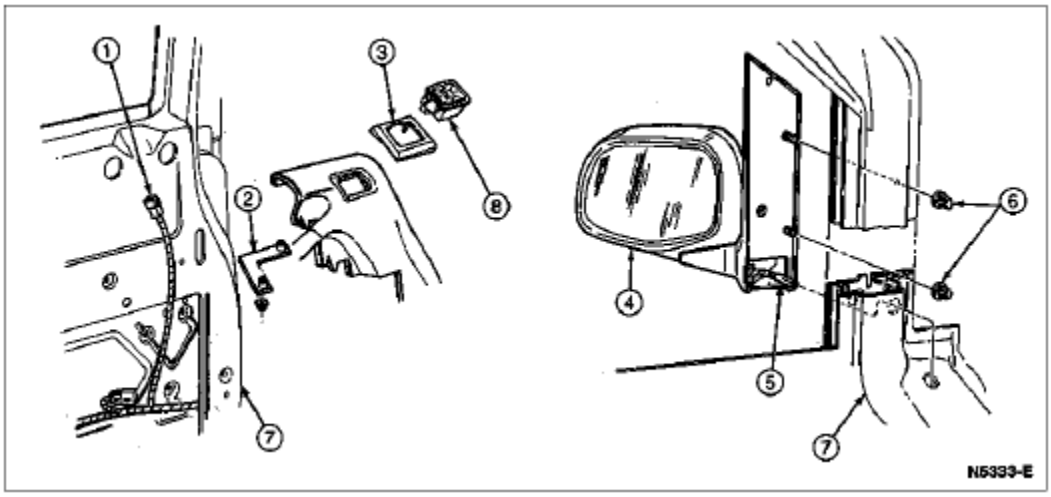
Mirror Control, Aerostar

Removal and Installation

1. Remove driver's side door trim panel with outside rear view mirror control (17B676) switch pigtail still attached to harness.
2. Reach around door trim panel and disengage switch harness from the main wire harness.
3. Using a putty knife, pry the outside rear view mirror control switch up from the bezel.
4. Remove outside rear view mirror control switch.

For installation, follow the removal procedures in reverse order.

Power Mirror Control Switch and Wiring, Aerostar



Item	Part Number	Description
1	17D708	Power Mirrors Wiring Assembly Connector
2	17K682	Mirror Control Retainer
3	17530	Outside Rear View Mirror Bezel
4	17682	Outside Rear View Mirror
5	17D708	Mirror Harness
6	N805169-S100	Nuts (2 Req'd)
7	20124	Front Door
8	17B676	Outside Rear View Mirror Control Switch

Mirror Control, Ranger

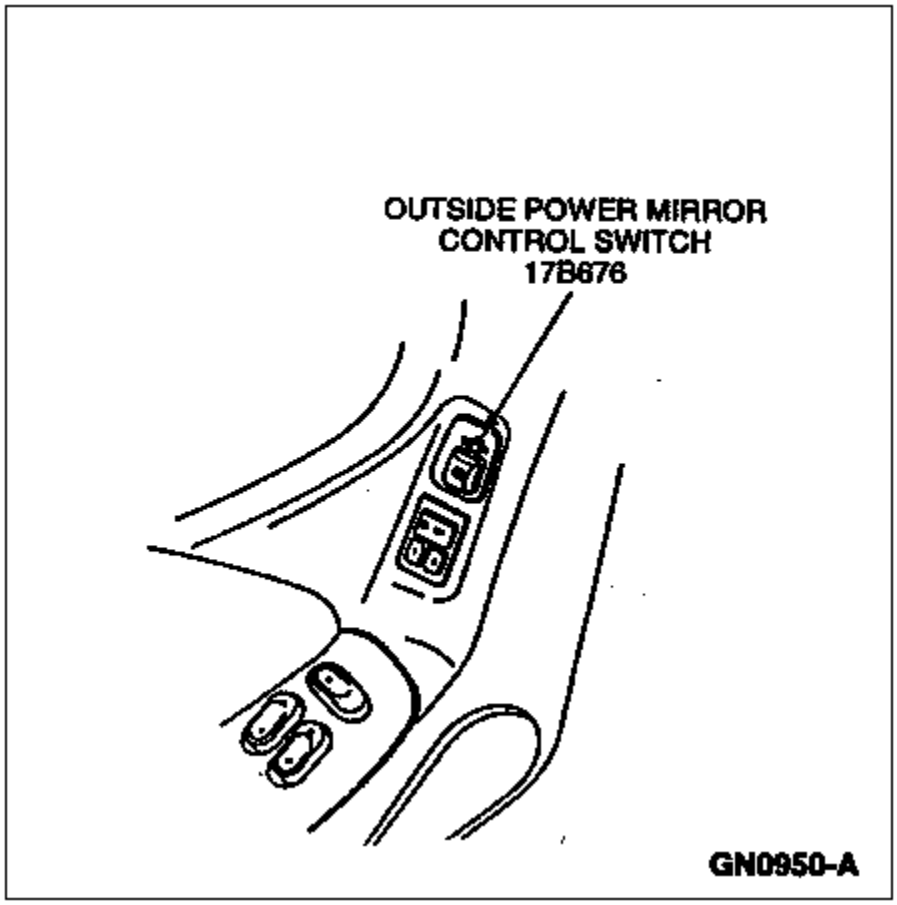
Removal

1. The outside rear view mirror control is held in place by snap action fingers. To remove the outside rear view mirror control, carefully pry the outside rear view mirror control from the top and left side with a putty knife.

2. With a thin-bladed screwdriver, lift connector retainer and disengage wire harness connector. Remove switch.

For installation, follow removal procedures in reverse order. The outside rear view mirror control is installed by pressing into place.

Power Mirror Control Switch, Ranger



Mirror, Power, Outside Rearview, Aerostar

Removal and Installation

1. Disconnect wiring from behind outside rear view mirror (17682) with front door (20124) open.
2. Remove two nuts attaching outside rear view mirror to front door.
3. Remove outside rear view mirror from front door.

For installation, follow removal procedures in reverse order. Tighten mirror attaching nuts to 8-10 Nm (6-7 lb-ft).

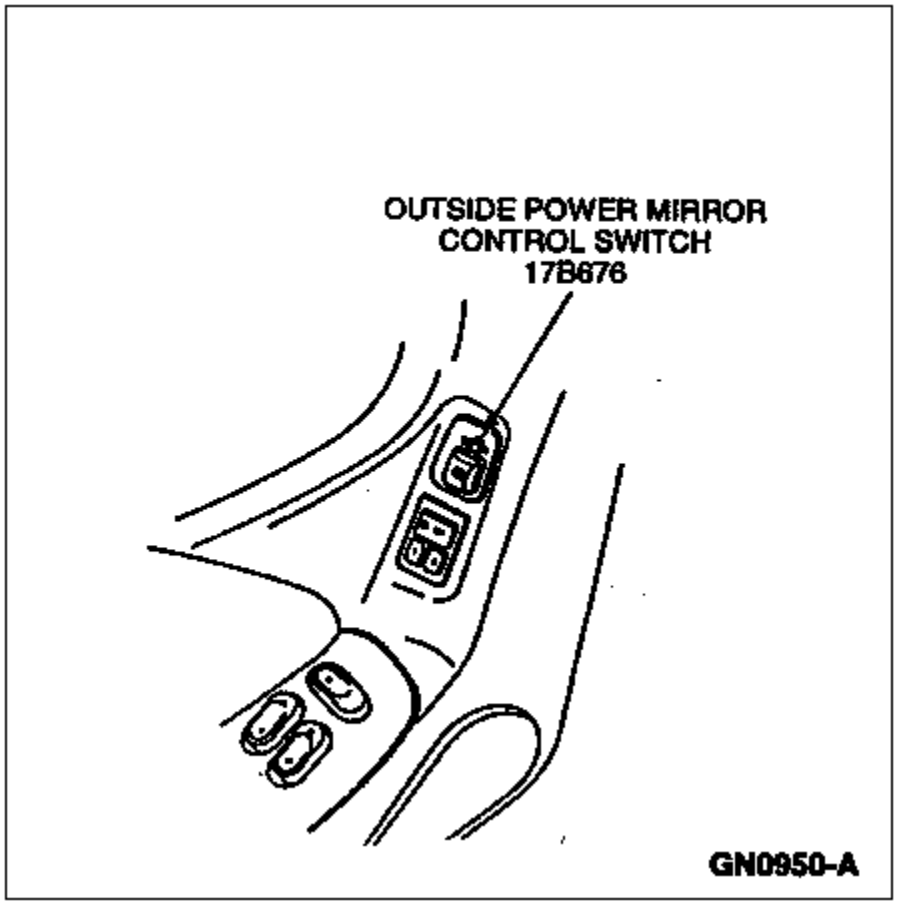
For installation, follow removal procedures in reverse order. The outside rear view mirror control is installed by pressing into place.

Power Mirror Control Switch, Ranger



Mirrors, Inside, Rearview

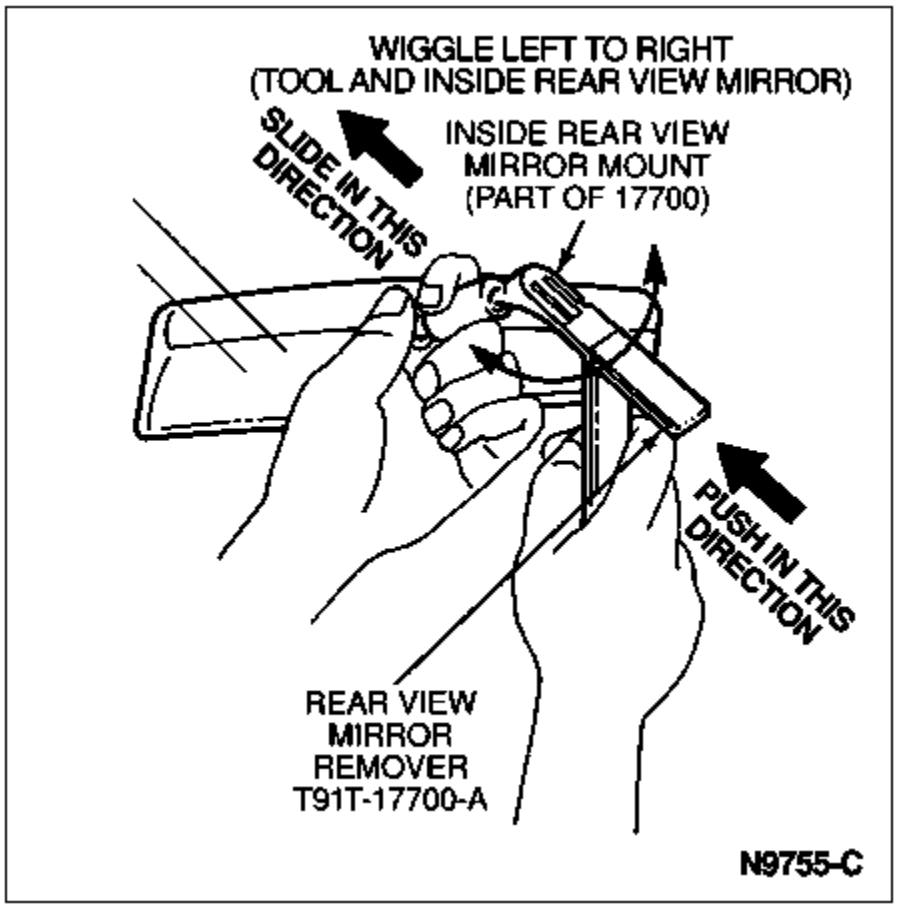
Manual

SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
Rearview Mirror Remover	T91T-17700-A

Removal

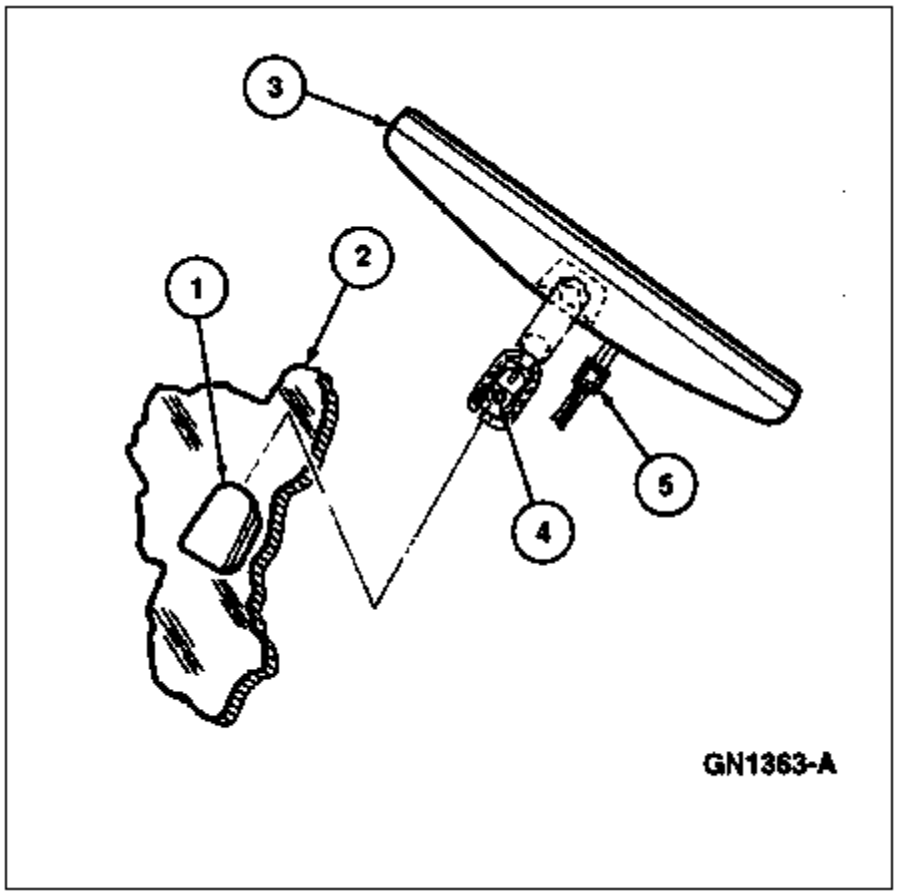
1. Grasp inside rear view mirror (17700) firmly as shown.
2. Insert Rearview Mirror Remover T91T-17700-A between inside rear view mirror windshield pad (17A720) and inside rear view mirror.
3. Slide tool completely in to release inside rear view mirror retainer (17C700).
4. Remove inside rear view mirror by using an upward force, while wiggling inside rear view mirror and Rearview Mirror Remover T91T-17700-A from left to right.



Optional Electrochromic

Removal

1. Disconnect the inside rear view mirror electrical connector.
2. Turn the inside rear view mirror to the vertical position.
3. Remove the inside rear view mirror by twisting the mirror horizontally until the tube assembly bottoms out and the spring releases off the mounting button.

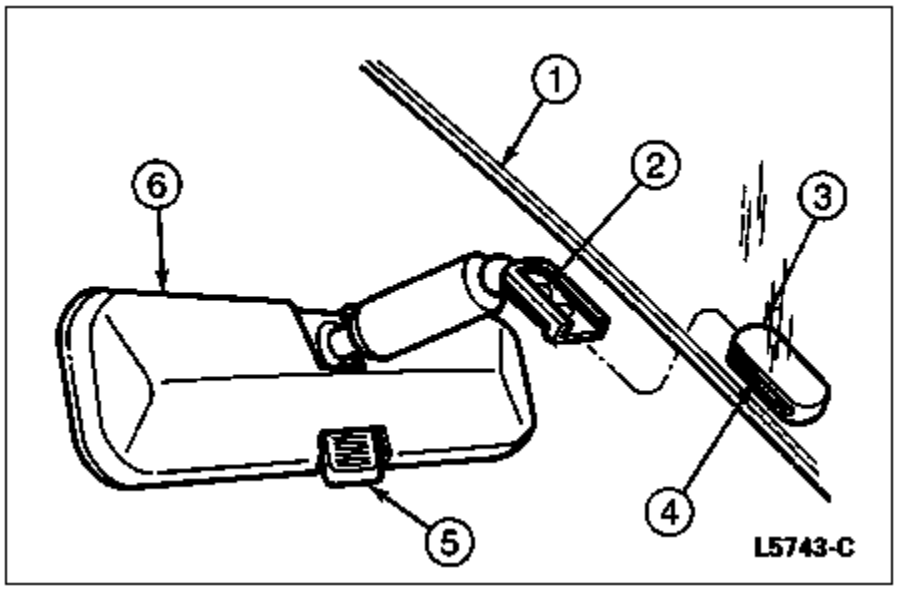


Item	Part Number	Description
1	17698	Inside Rear View Mirror Bracket
2	03100	Windshield Glass
3	17700	Inside Rear View Mirror
4	—	Spring Clip (Part of 17A694)
5	—	Electrical Connector

Installation

NOTE: The mirror mount is designed to detach from the button during air bag deployment. Excessive force or adjustment can cause the mirror to detach from the windshield.

1. Position the inside rear view mirror onto the mounting button.
2. Make sure the inside rear view mirror is parallel with the windshield glass and slide it onto the mounting button while applying holding force against the button until an audible click is heard.
3. Connect the inside rear view mirror electrical connector.
4. Check the inside rear view mirror for normal operation.



Item	Part Number	Description
1	03100	Windshield Glass
2	17698	Locking Tab
3	19554	Vinyl Pad
4	17698	Inside Rear View Mirror Bracket
5	—	Day/Night Lever (Part of 17700)
6	17700	Inside Rear View Mirror

Mirror Mounting Bracket, Inside Rearview Mirror

1. Locate and mark the location ofinside rear view mirror bracket (17698) on the outside surface of the windshield glass (03100) with a wax pencil.

2. If the clear vinyl wafer remained on the windshield glass, apply low heat (heat gun) until the wafer softens. Peel the vinyl wafer from the windshield glass taking care not to scratch or mar the windshield glass surface.

3. Thoroughly clean inside of the windshield glass with mild abrasive cleaning powder and clean cloth saturated in alcohol to remove old adhesive. Then, use a paper towel and remove all cleaner from the windshield glass. Do not contaminate clean area. Roughen the bonding surface of the inside rear view mirror bracket with fine grit sandpaper. Then, wipe the surface clean with a paper towel soaked in alcohol. Do not contaminate cleaned bracket.

4. If vinyl wafer is still adhered to theinside rear view mirror bracket, use low heat (heat gun) until the wafer softens and peel it off.

5. Use fine sandpaper on inside rear view mirror bracket to lightly scuff the surface. Wipe clean with alcohol-moistened cloth.

6. **CAUTION: Do not touch the mounting surfaces.**

   Using the applicator, apply a generous amount of Rearview Mirror Adhesive D9AZ-19554-CA or equivalent meeting Ford specification ESB-M2G176-A to the bonding surface of the inside rear view mirror bracket and the windshield glass. Allow the adhesive material to dry for three minutes.

7. Apply two drops of Rearview Mirror Adhesive D9AZ-19554-CA or equivalent meeting Ford specification ESB-M2G176-A to the mounting surface of the inside rear view mirror bracket. Using a clean toothpick or wooden match, quickly spread the adhesive evenly over the mounting surface of the inside rear view mirror bracket.

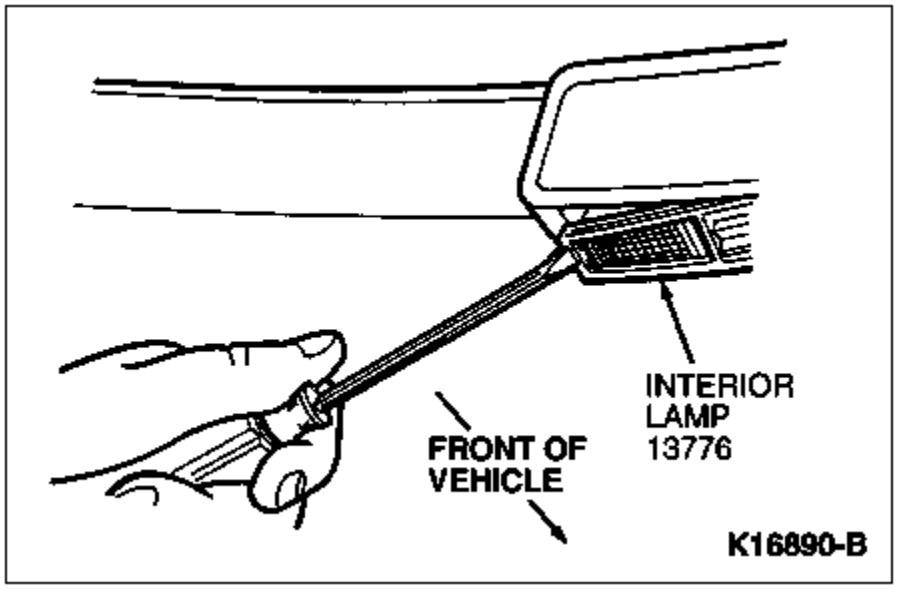
8. Quickly position the inside rear view mirror bracket on the windshield glass, using the locator marked on the outside of the windshield glass. The 9.525mm (3/8-inch) circular depression in the inside rear view mirror bracket must be down and toward the inside of the passenger compartment. Press the inside rear view mirror bracket against the windshield glass for about one minute.

9. Allow the adhesive to set for five minutes. Then remove any excess adhesive material from the windshield glass with an alcohol-dampened rag.

Bulb, Mirror Lamp

Removal and Installation

1. Carefully pry interior lamp (13776) out of bottom of inside rear view mirror (17700).



2. Disengage miniature bulb (13465) and socket assembly from interior lamp.
3. Replace miniature bulb (13466).
4. To install, reverse removal procedure.

Inspection and Verification

1. Verify the vehicle owner's original concern by operating the power seat(s) to duplicate the vehicle owner's concern.

2. Inspect to determine if one of the following mechanical or electrical concerns apply:

VISUAL INSPECTION CHART

Mechanical	Electrical
• Seat tracks obstructed	• Open high current fuse 5 located in the power distribution box
• Seat at limit(s) of travel	
• Damaged front seat back pad adjusting hose	• Loose, corroded or damaged connectors
• Damaged seat regulator control switch • Damaged seat regulator motor	

3. If the concern(s) remains after the inspection, determine the symptom(s) and proceed to the following symptom chart.

tomsn048@gmail.com

Symptom Chart — Power Seat Diagnosis

NOTE: Use Rotunda 73 Digital Multimeter 105-R0051 or equivalent to perform electrical pinpoint tests.

POWER SEAT DIAGNOSIS

Condition	Possible Source	Action
• Power Seat Moves, Noisy Operation	• Dirty tracks. • Damaged seat regulator motor.	• CLEAN tracks. • REPLACE seat regulator motor. • GO to Pinpoint Test A .
• Power Seat Moves But Is Loose	• Loose attaching hardware. • Worn or damaged tracks.	• TIGHTEN attaching hardware. • REPLACE track unit. • GO to Pinpoint Test B .
• Power Seat Does Not Make Full Travel	• Obstructed track. • Wiring harness. • Motor(s). • Seat switch. • Ground(s).	• REMOVE obstruction. • GO to Pinpoint Test C .
• Power Seat Track Does Not Move Horizontally and/or Vertically	• Harness. • Seat switch. • Motor. • Grounds.	• GO to Pinpoint Test D .
• Power Seat Switch Does Not Function Properly	• Motor. • Circuit.	• GO to Pinpoint Test E .
• Front Seat Back Pad Adjusting Pump Inoperative	• Fuse burned out. • Loose electrical connections. • Worn or damaged motor. • Worn or damaged seat back control	• REPLACE fuse. If fuse blows again, CHECK for short circuit. • SECURE connections at front seat back pad adjusting pump, seat back control switch and floor harness. • REPLACE motor. • REPLACE front seat back control switch.

tomsn048@gmail.com

	switch.	
• Front Seat Back Pad Adjuster Only Partially Inflates	• Loose air line connections.	• SECURE all connections as necessary.
	• Cuts in front seat back pad adjusting hoses or tubes.	• SERVICE or REPLACE as necessary.
	• Kinked front seat back pad adjusting hoses or tubes.	• ROUTE front seat back pad adjusting hoses or tubes as necessary.
	• Worn or damaged seat back control switch.	• REPLACE seat back control switch.
	• Worn or damaged front seat back pad adjuster.	• REPLACE bolster support bag.
	• Worn or damaged front seat back pad adjusting pump.	• REPLACE pump.
	• Air lines reversed at seat back control switch.	• REVERSE air lines at switch.
• Front Seat Back Pad Adjuster Will Not Maintain Inflated Position	• Improper tube/front seat back pad adjusting hose connections.	• Properly CONNECT all front seat back pad adjusting hoses.
	• Worn or damaged seat back control switch.	• REPLACE seat back control switch.
	• Worn or damaged front seat back pad adjuster.	• REPLACE front seat back pad adjuster.
• Seat Back Control Switch Inflates Lumbar	• Air lines reversed.	• REVERSE air lines where connected at front seat back.
• Front Seat Back Pad Adjuster Inflates but Does Not Deflate	• Worn or damaged seat back control switch.	• REPLACE seat back control switch.
	• Worn or missing front seat back pad adjuster return springs.	• REPLACE return springs.
		• Worn or damaged mechanism to front seat back pad adjuster.
		• REPLACE mechanism to front seat back pad adjuster.
	• Kinked air hoses or tubes.	• ROUTE front seat back pad adjusting hoses or tubes as necessary.

tomsn048@gmail.com

• Front Seat Back Pad AdjusterDetaches from Front Seat Back	• Front seat back pad adjuster stops damaged.	• REPLACE mechanism.

tomsn048@gmail.com

Pinpoint Tests

PINPOINT TEST INDEX

Symptom	Test
Power Seat Moves, Noisy Operation	A
Power Seat Moves but Is Loose	B
Power Seat Does Not Make Full Travel	C
Power Seat Track Does Not Move Horizontally and/or Vertically	D
Seat Regulator Control Switch Does Not Function Properly	E

PINPOINT TEST A: POWER SEAT MOVES, NOISY OPERATION

A1 CHECK FRONT SEAT OPERATION

- Operate power seat and listen for noise.

Is power seat noisy?

Yes	No
REPAIR or REPLACE front seat track assembly as required.	Power seat OK.

PINPOINT TEST B: POWER SEAT MOVES BUT IS LOOSE

B1 CHECK FRONT SEAT OPERATION

- Operate power seat and check for looseness.

Is power seat loose?

Yes	No
RETIGHTEN all attachment hardware. GO to **B2** .	Power seat OK.

B2 CHECK FOR CORRECTED CONDITION

tomsn048@gmail.com

- Check if loose condition has been corrected.

Is loose seat condition corrected?

Yes	No
Power seat OK.	REPLACE front seat track.

PINPOINT TEST C: POWER SEAT DOES NOT MAKE FULL TRAVEL

C1 CHECK SEAT TRAVEL

- Operate power seat and verify that front seat does not make full travel.

Does seat make full travel?

Yes	No
Power seat OK.	GO to C2 .

C2 FRONT SEAT TRACK OBSTRUCTION

- Check for an obstruction in front seat track mechanism.

Is obstruction present?

Yes	No
REMOVE obstruction. REPEAT Step C1 .	REPAIR or REPLACE track assembly as required.

PINPOINT TEST D: POWER SEAT TRACK DOES NOT MOVE HORIZONTALLY/VERTICALLY

D1 CHECK FRONT SEAT OPERATION

- Operate power seat and verify condition.

Does power seat operate?

Yes	No
Power seat OK.	GO to D2 .

tomsn048@gmail.com

D2 CHECK CABLE DEFLECTION

- Check power seat track drive cables for deflection when the seat control switch is activated.

Do cables deflect?

Yes	No
REPAIR or REPLACE front seat track as required.	GO to **D3** .

D3 POWER CHECK

- Check fuse. Disconnect seat motor leads from harness. Check for voltage at power seat harness when seat control switch is activated.

Is voltage present at power seat harness?

Yes	No
REMOVE and REPLACE front seat track. REPEAT Step **D1** .	GO to **D4** .

D4 CHECK SEAT REGULATOR MOTOR GROUND CONNECTIONS

- Check power seat motor for tight ground connections.

Are ground connections OK?

Yes	No
CHECK for damaged connectors, shorts or open circuit. SERVICE as necessary. GO to Pinpoint Test E .	TIGHTEN ground connection. REPEAT Step **D1** .

PINPOINT TEST E: SEAT REGULATOR CONTROL SWITCH DOES NOT FUNCTION PROPERLY

E1 CHECK VEHICLE

Are you troubleshooting the left seat control switch?

Yes	No
GO to **E2** .	System OK.

tomsn048@gmail.com

E2 CHECK LEFT SEAT CONTROL SWITCH

- Disconnect seat motor connector and seat control switch connector.
- Using a Rotunda 73 Digital Multimeter 105-R0051 or equivalent check continuity between Pin 2 of seat control switch and all other pins.

Is continuity present?

Yes	No
Internal short circuit. REPLACE seat control switch.	GO to **E3** .

E3 CHECK LEFT FRONT MOTOR UP

- Depress the front of seat button to the UP position.
- Check continuity between Pins 2, 7 and Pins 1, 4 of the seat control switch.

Is continuity present?

Yes	No
GO to **E4** .	Internal open circuit. REPLACE seat control switch.

E4 CHECK LEFT FRONT MOTOR DOWN

- Depress the front of seat button to the DOWN position.
- Check continuity between Pins 1, 2 and Pins 4, 7 of the seat control switch.

Is continuity present?

Yes	No
GO to **E5** .	Internal open circuit. REPLACE seat control switch.

E5 CHECK LEFT REAR MOTOR UP

- Depress the rear of seat button to the UP position.
- Check continuity between Pins 2, 8 and Pins 3, 4 of the seat control switch.

Is continuity present?

Yes	No
GO to **E6** .	Internal open circuit. REPLACE seat control switch.

tomsn048@gmail.com

E6 CHECK LEFT REAR MOTOR DOWN

- Depress the rear of the seat button to the DOWN position.
- Check continuity between Pins 2, 3 and Pins 4, 8 of the seat control switch.

Is continuity present?

Yes	No
GO to **E7** .	Internal open circuit. REPLACE seat control switch.

E7 CHECK LEFT LEVEL UP

- Depress the entire seat button to the UP position.
- Check continuity between Pins 2, 7, 8 and Pins 1, 3, 4 of the seat control switch.

Is continuity present?

Yes	No
GO to **E8** .	Internal open circuit. REPLACE seat control switch.

E8 CHECK LEFT LEVEL DOWN

- Depress the entire seat button to the DOWN position.
- Check continuity between Pins 1, 2, 3 and Pins 4, 7, 8 of the seat control switch.

Is continuity present?

Yes	No
GO to **E9** .	Internal open circuit. REPLACE seat control switch.

E9 CHECK LEFT HORIZONTAL MOTOR FORWARD

- Depress the entire seat button to the FWD position.
- Check continuity between Pins 2, 5 and Pins 4, 6 of the seat control switch.

Is continuity present?

Yes	No
GO to **E10** .	Internal open circuit. REPLACE seat control switch.

tomsn048@gmail.com

E10 CHECK LEFT HORIZONTAL MOTOR REVERSE

- Depress the entire seat button to the RWD position.
- Check continuity between Pins 2, 6 and Pins 4, 5 of the seat control switch.

Is continuity present?

Yes	No
Seat control switch checks OK.	Internal open circuit. REPLACE seat control switch.

tomsn048@gmail.com

Component Test

Folding Bench Seats with Inertia Latch Assemblies, Ranger

In the event the front seat back latch (62648) does not pass the functional check, the entire front seat back latch must be replaced. Service of the components is not acceptable and should not be attempted.

1. With the seat installed in the vehicle, push down and hold the adjuster handle. Tilt the front seat back latch forward until it is in a vertical position.

2. Grasp the front seat back (64811) and bounce it against its rear stop while holding the adjuster handle (62622) down (the front seat back will bounce forward from the stop, momentarily engaging the front seat back latch, and then return to its normal rearward position).

3. **NOTE: The following check verifies that the front seat back latch pawl (62606) is free to move and lock-up (for folding seat backs with inertia latch assemblies).**

   Hold the front seat back and jerk it forward as soon as it contacts and bounces from the rear stop. The front seat back will now be restricted from tilting full forward.

4. With the front seat cushion and with the front seat back latch removed from the vehicle and supported in a horizontal position, the upper portion of the front seat back latch should be free to rotate and not be engaged by the lower portion.

5. Rotate the front seat cushion with the front seat back latch forward 37 degrees from the horizontal, and rotate the movable portion of the front seat back latch up into the latched position.

6. The movable portion must engage the lower fixed portion of the front seat back latch and remain engaged.

Latch Sensitivity Test, Bench Seat with Inertia Latch

In the event the above checks cannot be satisfactorily performed, the following sensitivity test must be made prior to replacing suspect latch assemblies.

NOTE: For bench seat applications, remove the inboard safety belt attachments.

1. Remove the front seat (60012) and front seat track (61705) from the vehicle.

2. With the front seat and front seat track, positioned on a flat surface, slowly tilt the front seat forward enough to cause the front seat back to tilt forward (through gravity).

3. The front seat back latch should engage at this point (11 degrees from original front seat back position), restricting the front seat back from tilting to its full forward position.

tomsn048@gmail.com

tomsn048@gmail.com

Seat, Driver, Front, Aerostar

Removal and Installation

1. Remove screw attaching front seat track (61705) to floor insulator.
2. Remove the three front seat-to-floor support attaching bolts and one seat belt bolt.
3. Remove the front seat (60012) from vehicle.
4. Position the front seat upside down on a clean bench.
5. Remove four nuts attaching seat support-to-front seat track. Remove seat support from front seat.
6. To remove the front seat track to floor insulator, disconnect the front set track latch tie rod from both front seat tracks.
7. Remove four attaching screws. Remove both front seat tracks from the front seat.

For installation, follow removal procedures in reverse order.

- Tighten screws that hold front seat track to floor insulator to front seat cushion frame (60326) 15-20 Nm (11-15 lb-ft).
- Tighten nuts attaching seat support to front seat track to 19-26 Nm (14-19 lb-ft).
- Tighten bolts attaching front seat to floor support to 19-26 Nm (14-19 lb-ft).

tomsn048@gmail.com

Seat, Passenger, Front, Aerostar

Removal and Installation

1. Remove screw attaching front seat track (61705) to floor insulator.
2. Remove the three bolts attaching front seat to floor support and one seat belt bolt.
3. Remove the front seat (60012) from vehicle.
4. Position the front seat upside down on a clean bench.
5. Remove four bolts attaching seat support to front seat cushion frame attaching bolts. Remove the seat support from front seat.

For installation, follow removal procedures in reverse order.

- Tighten bolts attaching seat support to front seat cushion frame (60326) to 19-26 Nm (14-19 lb-ft).

tomsn048@gmail.com

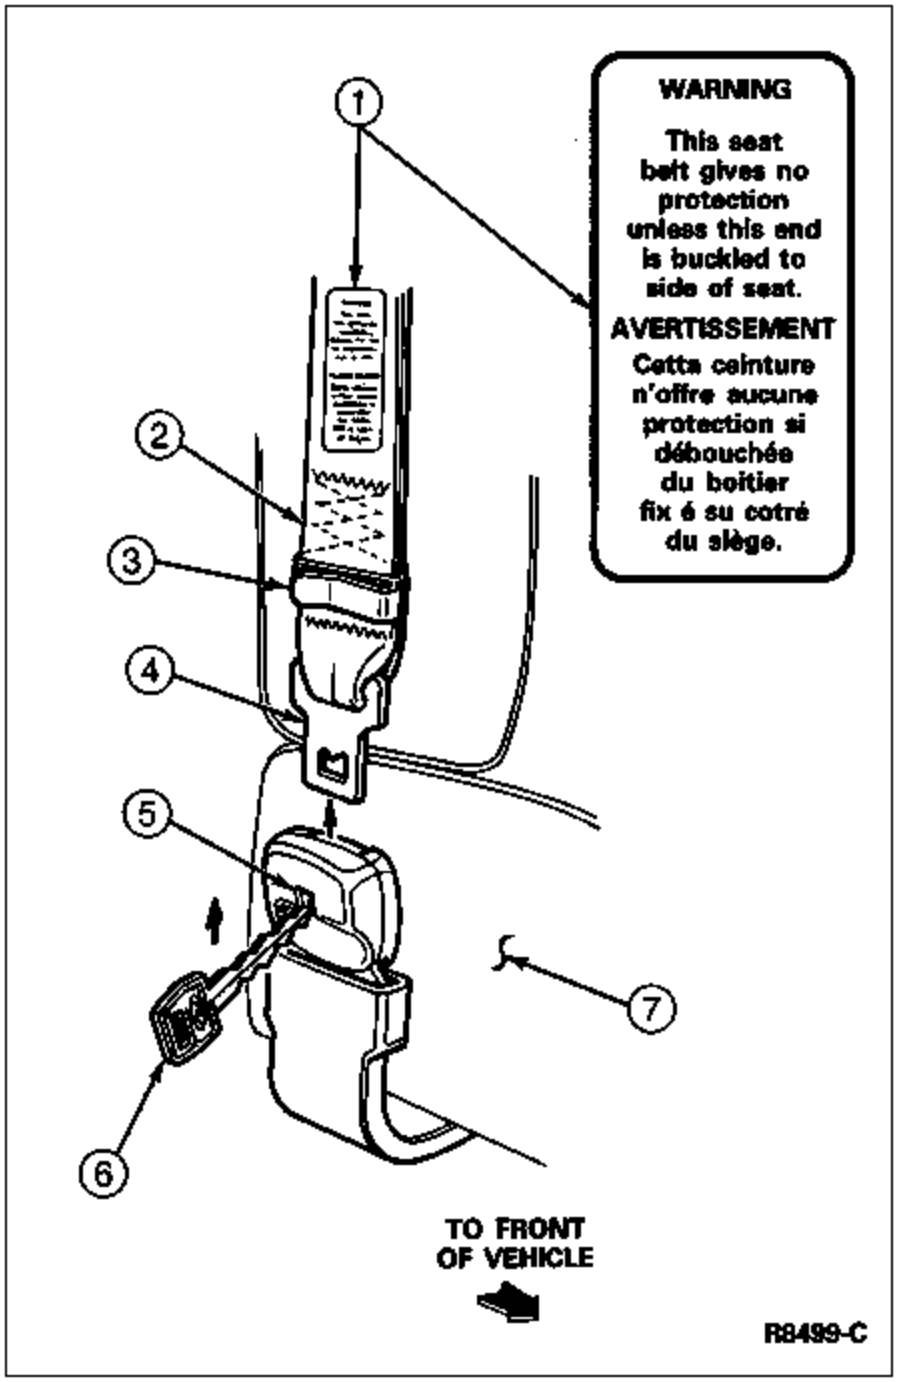
Seats, Rear Bucket, Aerostar

WARNING: KEEP FLOOR ATTACHING PLATE AREA FREE OF FOREIGN OBJECTS THAT WOULD PREVENT FRONT AND REAR FLOOR HOOKS FROM ENGAGING PROPERLY. NEVER ATTEMPT TO ADJUST THE SEAT LATCH WHILE THE VEHICLE IS IN MOTION. PRIOR TO OCCUPYING THE SEAT, CHECK TO SEE THAT THE HOOK END OF THE J-ROD HOOKS AND HANDLES ARE LATCHED SECURELY IN POSITION TO ENSURE PROPER SEAT RETENTION.

Removal and Installation

1. On left-hand seat, disengage the lap/shoulder seat belt from the seat by inserting a key or small screwdriver into the slot in the detachable anchor and lifting upward. Stow the tongue end of the detachable anchor as shown.

tomsn048@gmail.com



Item	Part Number	Description
1	—	Detachable Anchor Warning Label on Safety Belt
2	—	Rear Safety Belt (Detached Position)
3	—	Shoulder Safety Belt Stowage Retainer
4	—	Tongue End of Detachable Anchor
5	—	Slot in Detachable Anchor
6	—	Key or Small Screwdriver

tomsn048@gmail.com

7	—	Rear Seat Cushion Frame

2. Lift and rotate the rear seat back latch handle (62418) rearward, causing the J-hook to disengage from the front floor well retainer.
3. Push seat rearward to disengage front and rear floor hooks.
4. Remove the seat assembly from the vehicle.

For installation follow removal procedure in reverse order. Continue rotation of rear seat back latch handle until it comes to a complete stop on the top of the tube. This causes the seat assembly to slide forward engaging the front and rear floor hooks with the floor well retainers.

Seats, Rear Two- and Three-Passenger Bench and Bed, Aerostar

Removal

1. Disengage the lap/shoulder seat belt from the seat by inserting a key or a small screwdriver into the slot in the detachable anchor and lifting upward. Stow the tongue end of the detachable anchor.
2. On bench seat, fold seat back forward and latch it in the down position.
3. Rotate the adjuster handles (located under seat near floor) upward simultaneously to disengage latch hooks from floor attachment.
4. Lift seat at rear and rotate about the forward attachment. When adjuster handles are clear of floor attachments, release the adjuster handles.
5. Pull the seat rearward to disengage it from the front floor pins.

Installation

CAUTION: Care should be taken when storing seats out of the vehicle so the latches are not damaged.

WARNING: WHEN REINSTALLING A REAR SEAT IN YOUR VEHICLE IT MUST BE PLACED IN ITS ORIGINAL POSITION. IMPROPER INSTALLATION OF THE SEAT WILL PREVENT CORRECT USE OF THE SAFETY BELTS AND COULD INCREASE THE RISK AND/OR SEVERITY OF INJURY IN AN ACCIDENT. REFER TO THE WARNING LABEL ON THE SAFETY BELT.

1. With the seat back in a folded and latched position (bench seat only), place the seat assembly in your vehicle and engage the front seat hooks onto the forward attachment pin in the floor wells.
2. Rotate the seat downward and engage the rear seat back latch handle (62418) into the rear floor attachment. Lifting of the adjuster handles is not required for installation.
3. Make sure that the adjuster handles are fully seated in the down position.
4. Before you engage the safety belt, be sure it is not twisted. Remove any twist, then insert the tongue end of the detachable anchor into the detachable anchor until you hear a "snap" and feel the latch engage.

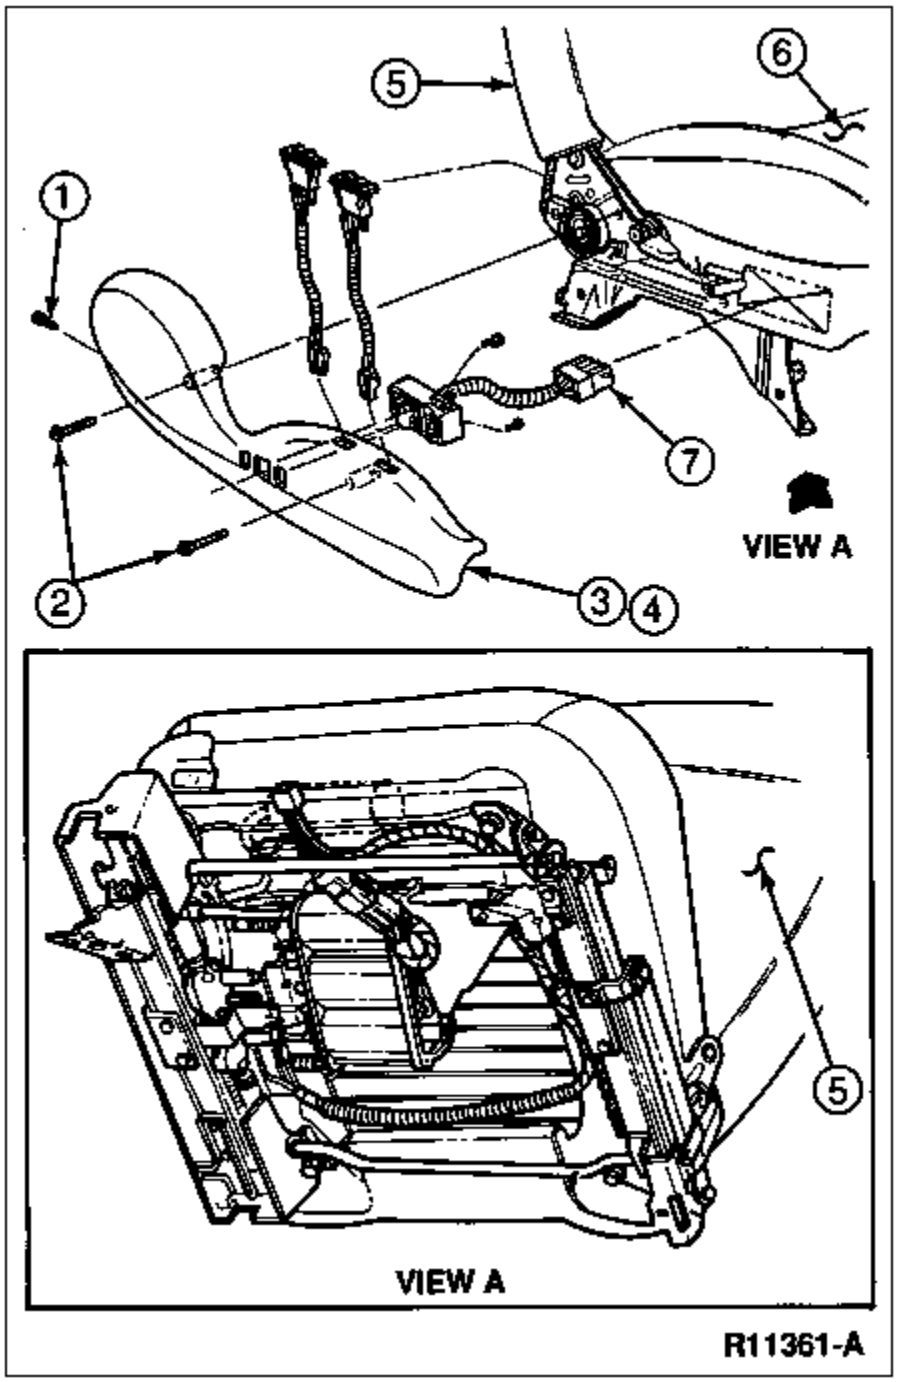
7	65530	Front Seat Back Pad Adjusting Pump

9. Remove front seat cushion side shield (62186) from front seat back pad adjusting pump (65530) and disconnect front seat back pad adjusting hoses (65528) from seat back control switch.

tomsn048@gmail.com

Side Shield Cover, Power Six-Way Seat



Item	Part Number	Description
1	56904-S2	Screw (1 Req'd)
2	383204-S2	Screw (2 Req'd)
3	62186	Front Seat Cushion Side Shield (RH)

tomsn048@gmail.com

4	62187	Front Seat Cushion Side Shield (LH)
5	60136	Seat Back Cover and Pad
6	60052	Front Seat Cushion and Cover
7	14A701	Seat Regulator Switch Wiring (RH)

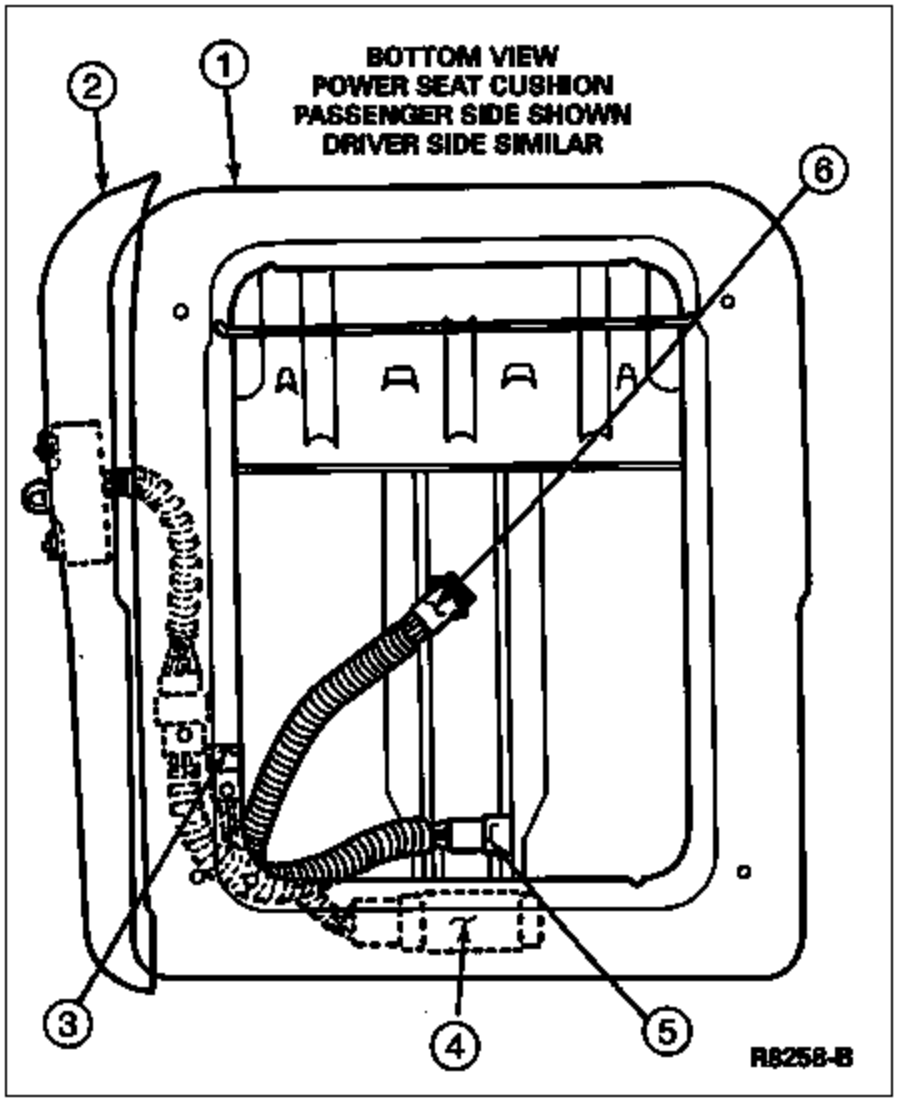
10. **CAUTION: Use care when handling front seat and front seat track. Dropping the assembly or sitting on front seat not secured in vehicle may result in damaged components.**

    Remove the four bolts retaining the front seat tracks to the front seat cushion frame and spring (63101). Remove the front seat track.

Installation

1. Position the front seat track to the front seat cushion frame and spring.
2. Secure the front seat track to the front seat cushion frame and spring using the four previously removed attaching bolts.Tighten the bolts to 17-23 Nm (12-17 lb-ft).
3. Secure inboard buckle and slide bar assembly to front seat track with previously removed bolt and nut.
4. Install seat regulator control switch (14A701) to front seat cushion side shield.
5. Reattach front seat back pad adjusting hoses to seat back control switch front seat cushion frame and spring.
6. Connect to seat wiring harness.

tomsn048@gmail.com



Item	Part Number	Description
1	63100	Seat Cushion Frame, Front
2	62186	Side Shield
3	—	Wiring to Power Lumbar Switch (Part of 14C719)
4	2875	Compressor
5	—	Power Feed from Vehicle (No Connection) (Part of 14C719)
6	—	Wiring to Power Seat Track Motors (Part of 14C719)

7. Install front seat cushion side shield to front seat cushion frame and spring using screws and fastener tab on cushion frame and side shield.

8. Position the front seat and front seat track in vehicle.

9. Connect wire harness.

tomsn048@gmail.com

10. Install the seat track-to-floorpan front attaching bolts, then rear attaching bolts. Tighten the bolts to 19-26 Nm (14-19 lb-ft).
11. Install front seat cushion side shield.
12. Install boot to slide bar and secure slide bar to floorpan with bolt previously removed. Tighten to specification.
13. Install plug to slide bar boot.
14. Check front seat tracks for proper operation.

---

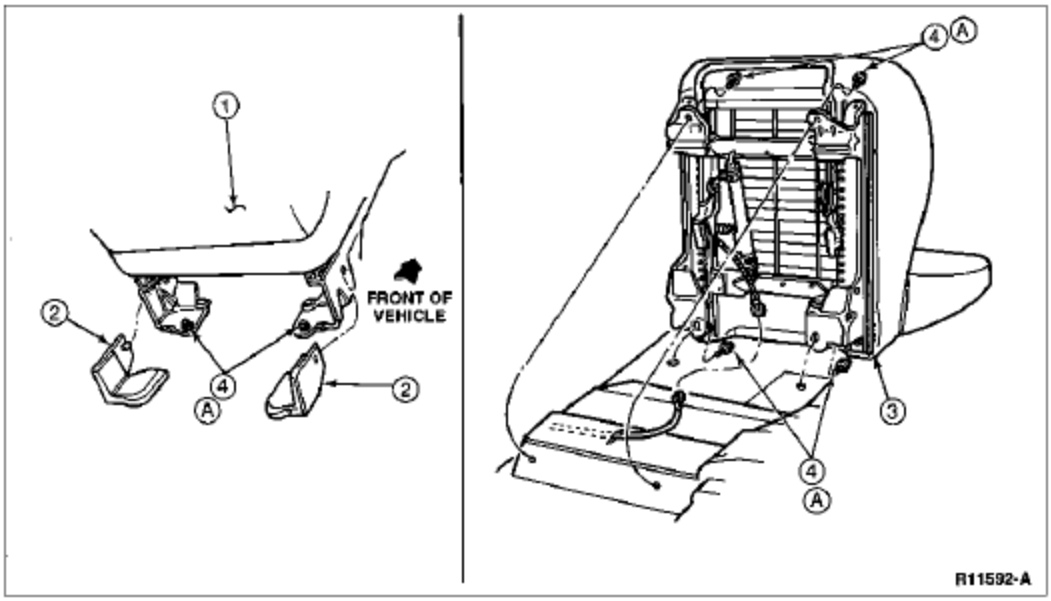
tomsn048@gmail.com

Support Assembly, Front Seat, Ranger SuperCab

Removal

1. Remove the two front bolts attaching the front seat to floor support (61708).
2. Lift the adjuster handle upward to tilt the front seat back latch forward, applying force at the lower central portion of the backrest. Push steadily forward.
3. Remove rear outboard shield to the front seat to floor support. Remove the rear outboard shield.

Seat, Tilt Slide, Ranger SuperCab

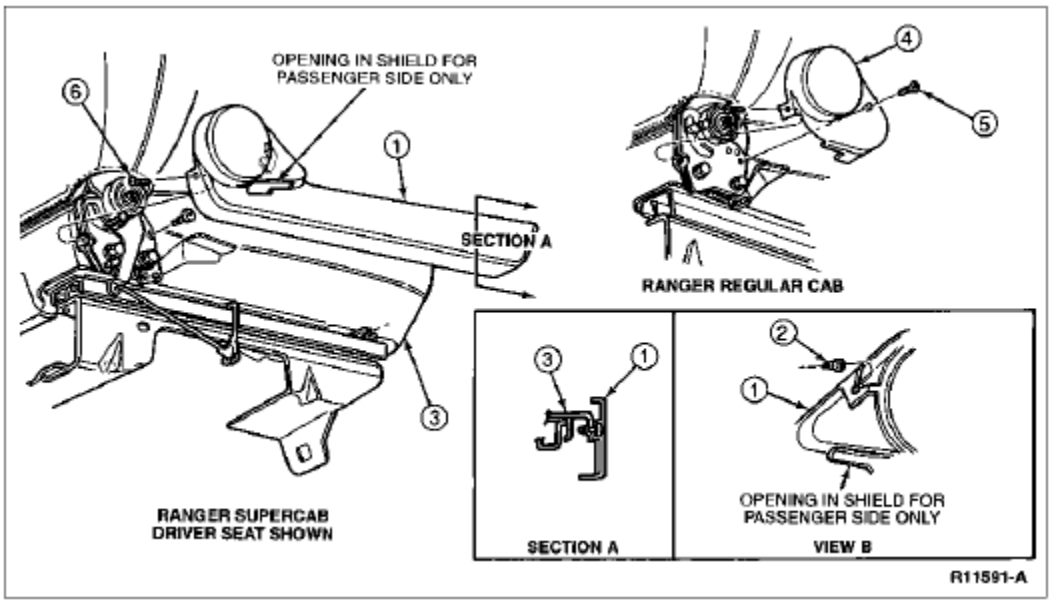


Item	Part Number	Description
1	63100	Front Seat Cushion and Frame
2	619C10/11	Front Seat Track to Floor Outer Insulator (RH)
	619C82/3	Front Seat Track to Floor Outer Insulator (LH)
3	62506	Front Seat Support
4	N801921-S58	Screw
A	—	Tighten to 19-25 Nm (14-18 Lb-Ft)

tomsn048@gmail.com

4. Remove one pushpin attaching the rear inboard shield to the front seat to floor support. Remove the rear inboard shield.
5. Remove the shoulder bolt attaching the slide bar to the support assembly bracket.
6. Remove the two rear bolts attaching the front seat to floor support.
7. Disconnect electrical connection for front seat back pad adjuster (65500), if so equipped.
8. Remove the front seat (60012) and front seat to floor support from the vehicle.
9. Unscrew the right rear screw on the back side of the seat side shield. Carefully pull the front edge of the side shield outward to remove the X-mas tree fastener, located behind the side shield. Once the right rear and front of the side shield is loose, pull the complete shield to the right rear to release the remaining hidden fastener.
10. Place front seat upside down on a clean bench.
11. Remove the front two screws attaching the front seat cushion frame and spring to the front seat to floor support.
12. Locating and holding the front seat firmly, push rear support forward until the latch clicks.
13. Rotate the rear clip attaching the rod-to-recliner mechanism downward.
14. Rotate (clockwise) the front clip attaching the rod to the front seat to floor support.
15. Remove the rod from the front seat to floor support and the front seat back latch (62648).

Front Seat, Ranger



tomsn048@gmail.com

Item	Part Number	Description
1	62186	Shield Assembly, Front Seat Track, Upper (RH) (Ranger SuperCab)
2	N808578-S424	Screw
3	60012	Front Seat
4	62768	Cover, Front Seat Back Latch Cover (Ranger Regular Cab Only)
5	51764-S58	Screw
6	51764-S58	Screw

16. Remove the two rear screws attaching the front seat cushion frame and spring (63101) to the front seat to floor support.

Installation

NOTE: First install front inboard bolt attaching seat to floorpan. Then, install front outboard bolt. Next install rear inboard bolt, and finally install rear outboard. Always use this sequence when installing seats.

1. Place support on front seat. Make sure all latches are locked. Insert the two rear screws attaching the front seat to floor support to the seat cushion. Tighten to 17-23 Nm (13-17 lb-ft).

2. Insert one end of rod into the plastic clip. Rotate clip counterclockwise to lock rod in position. Insert other end of rod into recliner plastic clip. Rotate clip to lock rod. With right hand, activate recliner to dump front seat back latch forward.

3. Push the support fully rearward. Insert the two front screws attaching the front seat cushion frame and spring to the front seat to floor support. Tighten to 17-23 Nm (13-17 lb-ft).

4. Clip the side shield over the recliner shoulder bolt, and push the front edge of the shield X-mas tree fastener into the track mounting hole. Align back side of shield and install previously removed screw.

5. Place the front seat and front seat to floor support in the vehicle.

6. Install the two rear bolts attaching the front seat to floor support. Tighten to 17-23 Nm (13-17 lb-ft).

7. Push the seat cushion rearward until the latch clicks. Install two front bolts attaching the front seat to floor support. Tighten to 17-23 Nm (13-17 lb-ft).

8. Install shoulder bolt attaching the slide bar to support assembly bracket. Lift the recliner handle upward to tilt the front seat back latch forward. Applying force at the lower central portion of the front seat back latch, push steadily all the way.

9. Tighten the two rear seat screws to 17-23 Nm (13-17 lb-ft).

10. Install the rear inboard seat track shield in position. Install rear outboard seat track shield.

11. Push the front seat back latch rearward until the latch clicks.

Motor and Drive Assembly

Power seat motors are not serviceable. If the power seat motor is defective, the entire power seat track must be replaced.

tomsn048@gmail.com

Storage Bin, Underseat, Aerostar

Removal and Installation

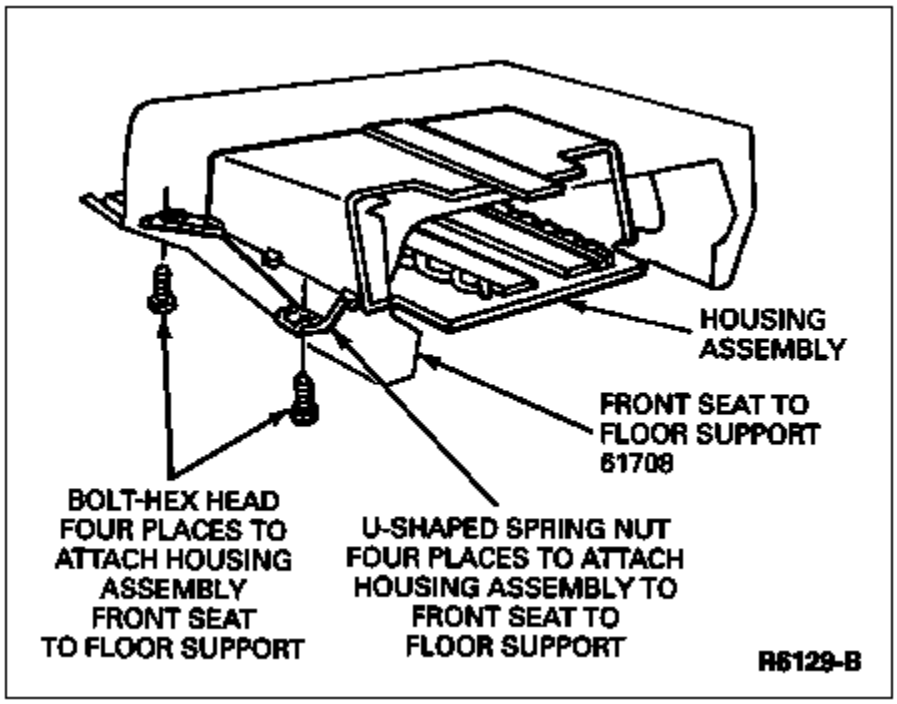
1. The passenger front seat to floor support must be removed to gain access to the storage bin housing assembly attaching bolts. To remove the passenger seat support assembly refer to Removal and Installation, Seat, Passenger, Front, Aerostar in this section.

2. **NOTE: Four U-shaped spring nuts are used to attach the storage bin housing bolts to the front seat to floor support.**

   Position the front seat (60012) and front seat to floor support (61708) on a bench with the bottom of the support facing up and remove the four bolts that attach the storage bin housing to the front seat to floor support.

3. Remove the storage bin housing from the front seat to floor support.

For installation, follow removal procedures in reverse order.



tomsn048@gmail.com

tomsn048@gmail.com

Switch, Seat Control, Six-Way Power, Ranger SuperCab

Removal and Installation

1. Remove seat from vehicle as described in this section.
2. Remove side shield attachment.
3. Place seat assembly upside down on a clean table and remove two screws, located behind the shield, attaching the shield to the cushion frame.
4. Remove two screws securing seat control switch.
5. Disconnect the wiring to seat control switch.

For installation, follow removal steps in reverse order.

Lumbar Support Pad, Aerostar

Manual

Removal

1. Remove the front seat (60012) and front seat track (61705) from the vehicle. Refer to Removal and Installation Seat, Bucket in this section. Place front seat on a clean surface.
2. Remove front seat cushion and cover (60052) and disconnect front seat back pad adjusting cable.
3. Remove the front seat back cover and pad from the front seat back frame (61018).
4. Using a screwdriver or similar tool, pry the two lumbar support pad retaining hooks outward and lift the retainer wire from lower attachment holes. Remove the pad from the front seat back frame.

Installation

1. Position the front seat cushion pad to the front seat back frame and install the retaining hooks into the frame assembly.
2. Install the front seat cushion pad and front seat back cover.
3. Install the front seat cushion and cover and connect the front seat back pad adjusting cable. Tighten the inboard pivot screw to 19-27 Nm (15-19 lb-ft). Tighten the two outboard retaining screws to 44-60 Nm (33-44 lb-ft).
4. If the front seat is equipped with an inertia seat back latch, check the latch for proper operation (sensitivity test) before installing the seat as follows:
5. Install the front seat and front seat track.
6. Check the front seat tracks and safety belts for proper operation.

tomsn048@gmail.com

tomsn048@gmail.com

Pump, Front Seat Back Pad Adjusting

Removal and Installation

1. Remove seat support bolt insulator and front seat (60012) from vehicle.
2. Remove front seat to floor supports (61708) from front seat cushion cover, if so equipped.
3. Remove front seat cushion and cover (60052) as necessary to gain access to front seat back pad adjusting pump (65530) mounting screws.
4. Remove mounting screws, disconnect front seat back pad adjusting hose (65528) and seat back control wiring and remove front seat back pad adjusting pump.

For installation, follow removal procedures in reverse order. Tighten all mounting bolts to specifications. Check front seat to floor supports, if equipped, for proper operation.

Seats and Tracks

Unless otherwise noted, the disassembly and assembly illustrations shown in this section are typical of all seats. If some of the steps do not apply to the particular vehicle being serviced, proceed to the next step and review the appropriate illustration shown.

Seat trim replacement requires removal and installation of seat components such as seat support bolt insulators, tracks and floor supports, and seat belts.

For safety belt removal and installation procedures, refer to Section 01-20A .

NOTE: Repairs to seat cushions or seat backs are performed out of the vehicle and are usually limited to replacement of torn or burned seat covers. In a few instances, the pads may be damaged and require replacement.

When installing new seats or cushions and covers, refer to the applicable illustration for the location of listing wires, hog rings, anti-squeak pads, and seat pad stack-up.

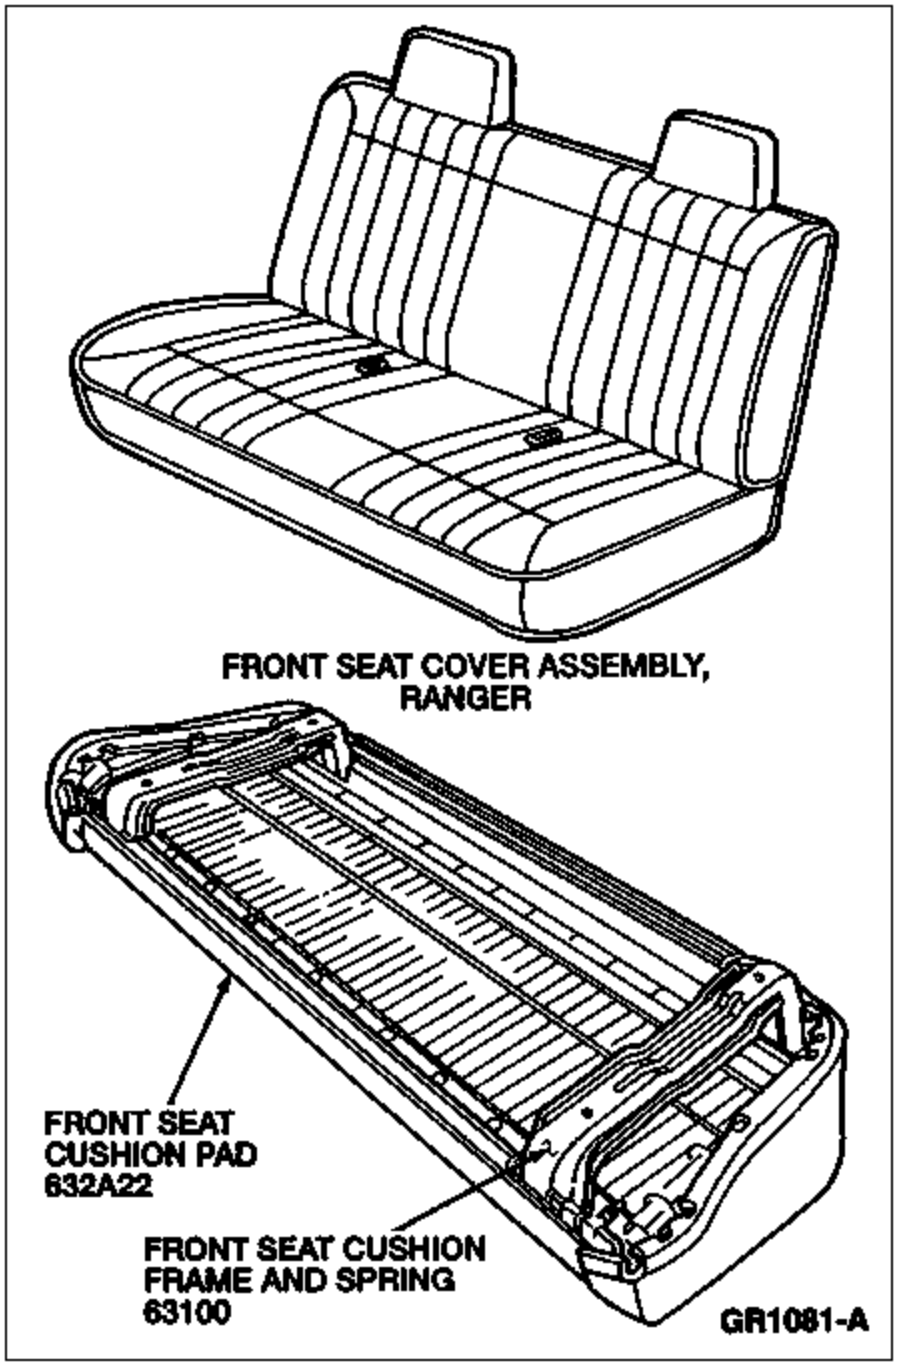
tomsn048@gmail.com

Seat, Bench, Cushion Cover, Front

Disassembly and Assembly

1. Remove the front seat track (61705) from the vehicle.
2. Remove front seat back head restraint. Refer to Removal and Installation, Head Restraints, Front Seat Back in this section.
3. Remove the front seat back (64811) from the front seat cushion frame and spring (63101).
4. Cut the hog rings and/or disengage plastic retainers, and/or disengage hook-loop retaining the front seat cushion and cover to the front seat cushion frame and spring and remove the cover.
5. If the front seat cushion pad is being replaced, cut the hog rings that attach the front seat cushion pad to the front seat cushion frame and spring (63100). Remove the padding.
6. Position the new front seat cushion pad to the front seat cushion frame and spring and fasten it in place with hog rings.
7. Transfer the listing wires to the new front seat cushion frame and spring.
8. Position the front seat cushion frame and spring over the front seat cushion frame and spring. Fasten the front seat cushion frame and spring with hog rings and/or plastic retainers, and/or hook and loop.
9. Install the front seat back to the front seat cushion frame and spring.
10. Install the front seat (60012) and front seat track into the vehicle. Tighten the attaching screws and washers to specifications.

tomsn048@gmail.com



tomsn048@gmail.com

tomsn048@gmail.com

Seat Bench, Cushion Cover and/or Pad, Rear

Disassembly

1. Remove seat support bolt insulator and seat assembly from vehicle.
2. Remove support from rear seat back latch cover (61349), if so equipped.
3. Remove seat back latch cover and remove screws attaching rear seat back frame (613A38) to rear seat back latch cover, if so equipped.
4. Cut hog rings from rear seat cushion cover (63804) and/or disconnect plastic retainers from cushion frame. Remove rear seat cushion cover.
5. Remove rear seat cushion pad, if necessary.
6. Transfer tiedown wires to new rear seat cushion cover.

For assembly, follow disassembly procedures in reverse order.

Tighten inboard seat back pivot screw to 19-26 Nm (14-19 lb-ft). Tighten the two seat back latch-to-seat cushion bolts to 47-63 Nm (34-46 lb-ft).

tomsn048@gmail.com

Seat, Bench Back Cover, Rear

Disassembly and Assembly

1. **NOTE: The rear seat is easy to remove from the vehicle, allowing easier service.**

   Remove the rear seat back frame (613A38)-to-rear seat cushion frame (63160) mounting bolts. Separate the back from the rear seat cushion frame and lift the rear seat back frame out of the vehicle.

2. Unhook the hog rings and/or plastic retainers and/or hook and loop retainers attaching the rear seat cushion cover (63804) to the seat back. Remove the rear seat back cover.

3. Remove plastic retainers and rear seat back panel, if so equipped.

4. Transfer the listing wires to the new cover.

5. Position the new rear seat cushion cover over the rear seat back pad, pull the rear seat back cover tight, and fasten the rear seat back cover to the spring assembly with hog rings and J-retainers and/or hook and loop retainers.

6. Install rear seat back panel, if so equipped.

7. Install the rear seat back frame to the rear seat cushion frame assembly.

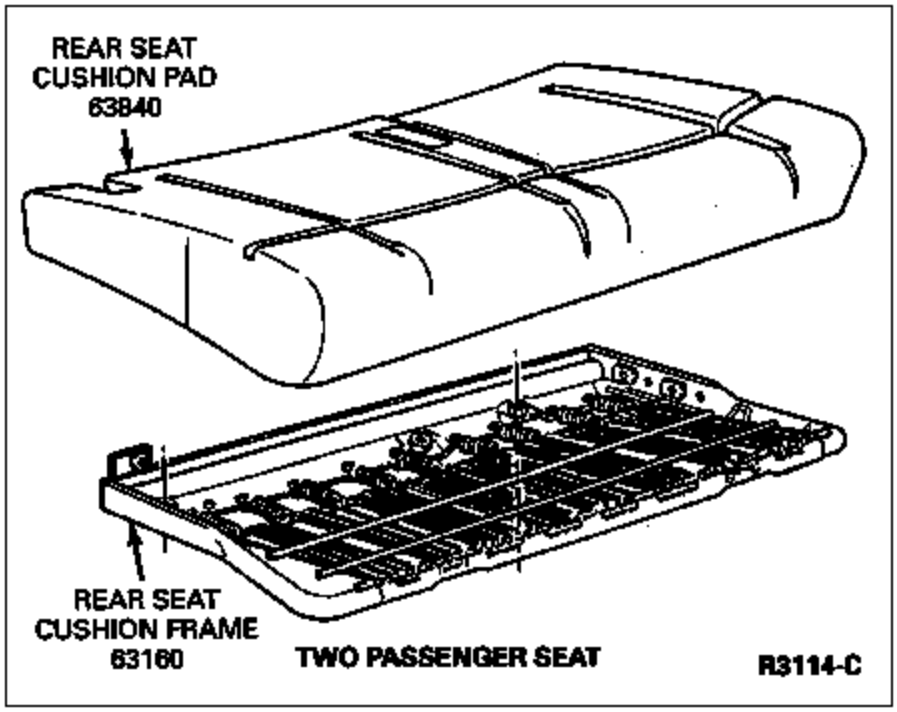
tomsn048@gmail.com

Seat, Bench, Rear Seat Cushion/Rear Seat Back, Aerostar

Disassembly

1. Remove the seat assembly from the vehicle as described in Removal and Installation, Seat, Rear, Bench in this section.
2. Remove the rear seat back frame (613A38)-to-rear seat cushion frame (63160).
3. Remove rear seat cushion frame and rear seat cushion pad from rear seat cushion frame.

Seat Cushion and Frame Assembly

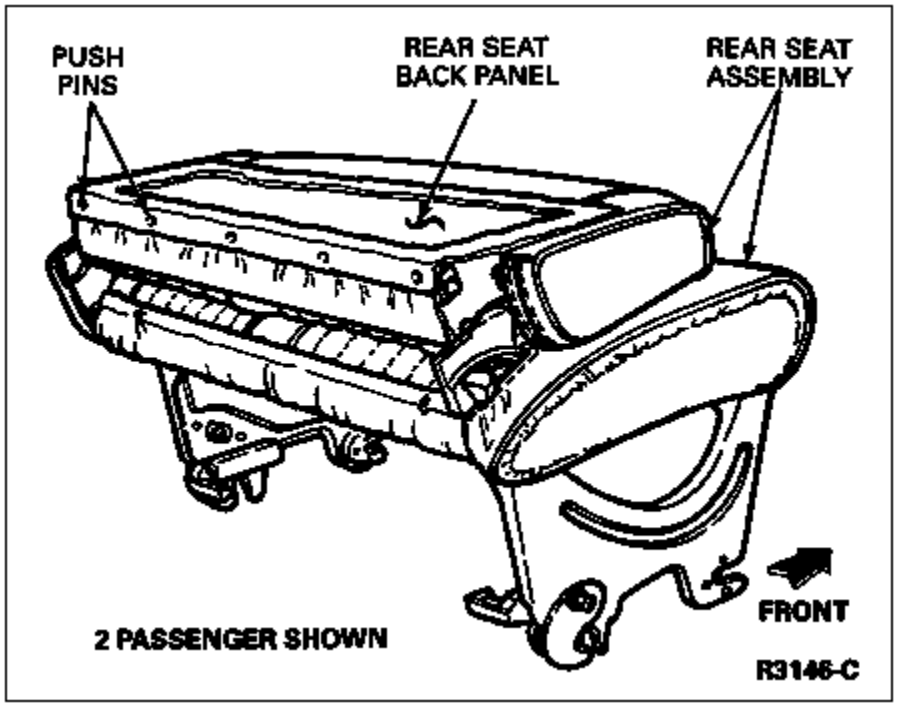


Assembly

1. Install rear seat cushion pad and rear seat cushion cover (63804) on rear seat cushion frame.
2. Install bolts. Tighten to 30-43 Nm (22-32 lb-ft).
3. Install seat assembly in vehicle.

Rear Seat Cushion/Rear Seat Back, Aerostar

tomsn048@gmail.com



tomsn048@gmail.com

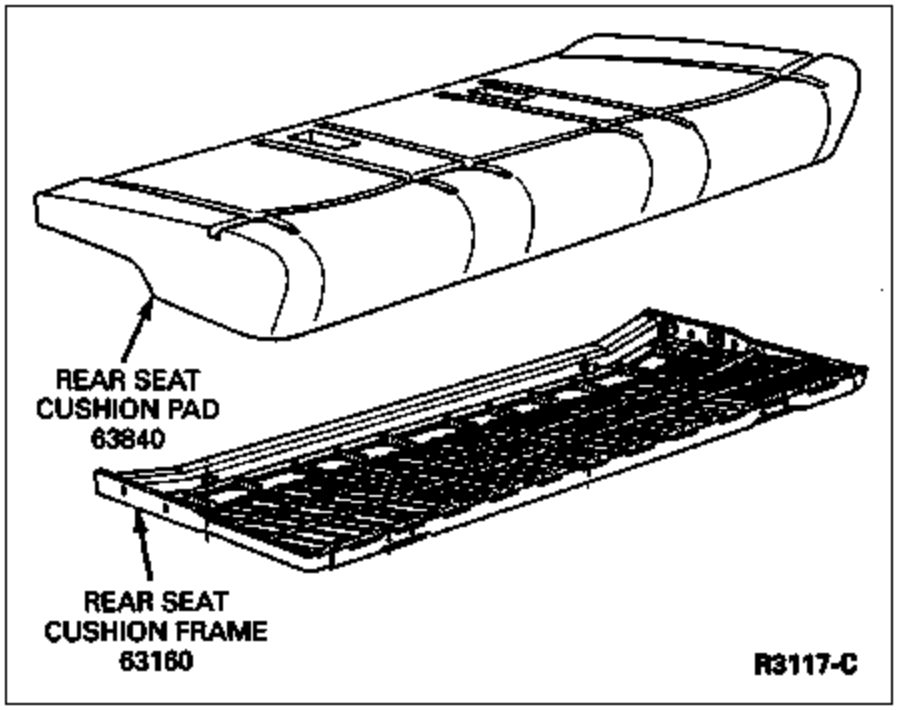
Seat Cushion and Frame Assembly

tomsn048@gmail.com



tomsn048@gmail.com

Seat, Split Bench, Cushion Cover and Pad, Front

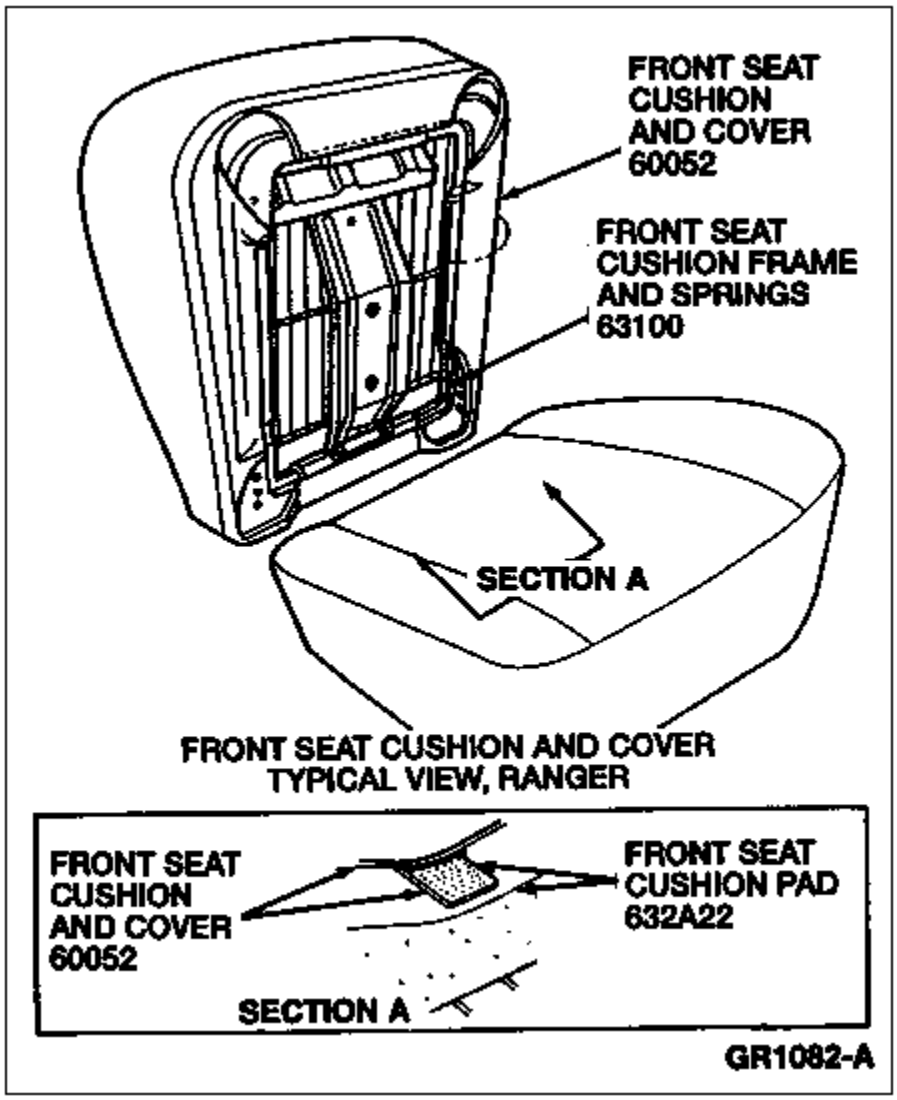
Disassembly

1. Remove seat support bolt insulator and front seat (60012) from vehicle.
2. Remove front seat tracks (61705)/support from front seat cushion and cover (60052).
3. Disconnect front seat back pad adjusting hose at lower portion of front seat back, if so equipped.
4. Remove front seat back latch lower cover and remove bolts attaching to front seat cushion and cover to front seat cushion and cover, if equipped.
5. Remove seat cushion side shield and disconnect wire connectors.
6. Cut hog rings from cushion trim cover and/or disconnect plastic retainers from front seat cushion frame and spring (63101) and remove front seat cushion and cover.
7. Remove front seat cushion pad, if necessary.
8. Transfer tiedown wires to new front seat cushion and cover.

Assembly

1. Install front seat cushion pad, if removed.
2. Position front seat cushion and cover on front seat cushion pad. Using hog rings and/or plastic retainers, secure front seat cushion and cover to front seat cushion frame (60326).
3. Install front seat cushion and cover on front seat cushion frame and spring. Tighten inboard seat back pivot bolt to 19-26 Nm (14-19 lb-ft). Tighten the two bolts attaching front seat back latch (62648) to front seat cushion frame and spring to 30-43 Nm (22-32 lb-ft).
4. Install front seat back side shield.
5. Install front seat tracks support to front seat cushion frame and spring. Tighten attaching nuts/bolts to specifications.
6. Install front seat and seat support bolt insulator in vehicle, as described in Removal and Installation, Seats, Front Bucket in this section. Tighten mounting bolts to specifications.

tomsn048@gmail.com



tomsn048@gmail.com

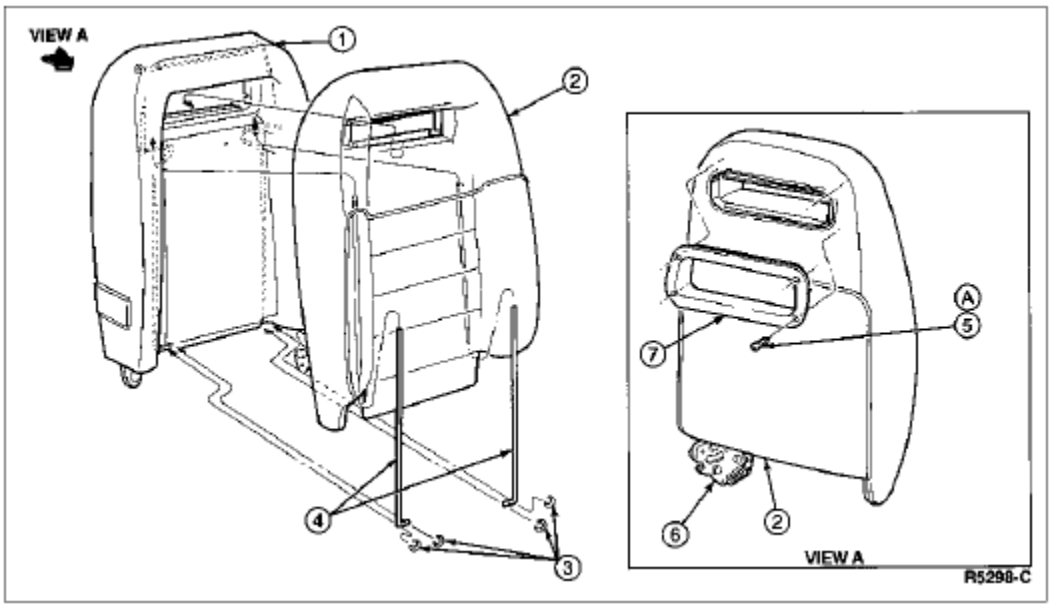
Seat, Bucket, Back Cover, Front

Disassembly and Assembly

1. Remove the front seat back latch cover and pivot side inner cover.
2. Remove the bolts mounting front seat back (64811) to front seat back cover. Separate the front seat back from the front seat back cover and lift the seat back out of the vehicle.
3. Remove the armrest.
4. Remove plastic retainers and front seat back trim panel, if so equipped.
5. Unhook the hog rings and/or plastic retainers and/or hook and loop retainers attaching the front seat back cover to the front seat back or cushion spring assembly.
6. Remove the hog rings and the listing wires.
7. Remove the front seat back cover.
8. Position front seat back cover and front seat cushion pad and fasten to front seat cushion frame and spring (63101) with hog rings and J-retainers and/or hook and loop retainers.
9. Install listing wires and hog rings.
10. Install front seat back trim panel, if equipped.
11. Install the armrest.
12. Install the front seat back to the front seat back cover.
13. Install front seat back latch lower cover and pivot side inner cover.

Seat Back, Aerostar

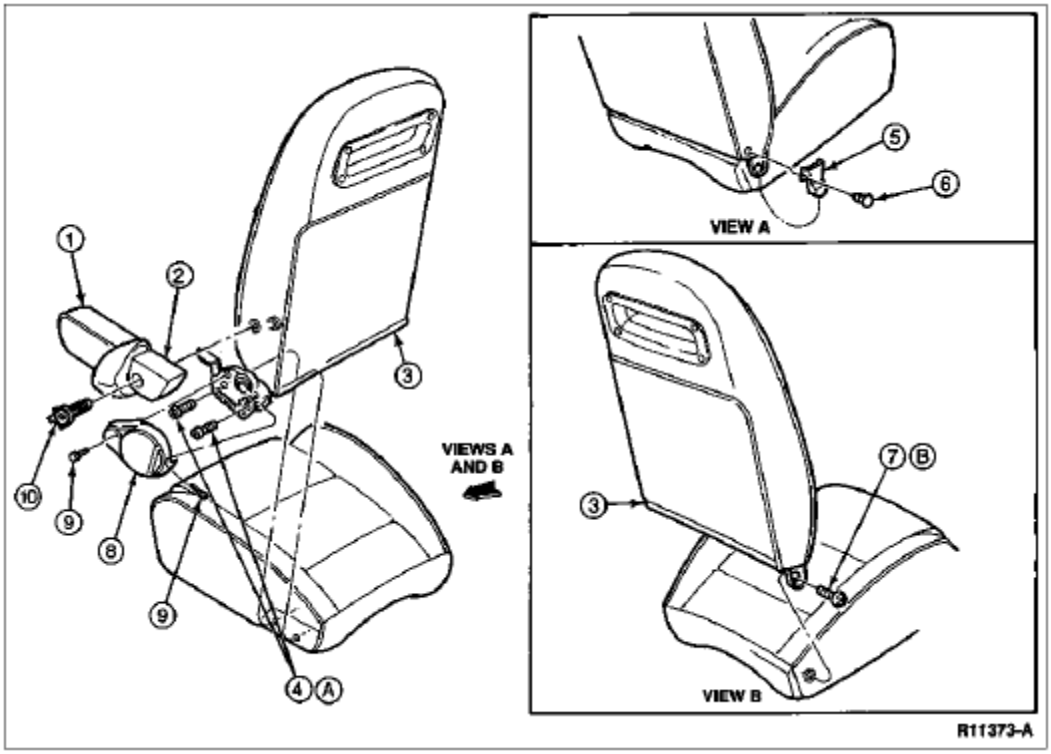
tomsn048@gmail.com



Item	Part Number	Description
1	64810	Pad, Front Seat
2	64416	Cover, Front Seat
3	—	Hog Rings (Part of 64416)
4	—	Retainer Side Wire (Part of 64416)
5	N803247-S2	Screw
6	617C04	Adjuster Assembly
7	616A86	Moulding
A	—	Tighten to 8-24 Nm (71-212 Lb-In)

Rear Seat Assembly, Aerostar

tomsn048@gmail.com



Item	Part Number	Description
1	64340	Cover Assembly, Armrest
2	64606	Pad Assembly, Armrest
3	64416	Seat Back Cover
4	N803463-S2	Screw
5	61692	Cover, Back Pivot Side Inner
6	390964-S	Pushpin
7	802280-S2	Screw
8	61348	Rear Seat Back Latch Cover
9	N610019-S58	Screw
10	391132-S58	Bolt and Retainer
A	—	Tighten to 47-63 Nm 34-46 Lb-Ft)
B	—	Tighten to 19-26 Nm (14-19 Lb-Ft)

tomsn048@gmail.com

tomsn048@gmail.com

Seat, Back Cover and/or Pad, Bucket Seat, Rear, Aerostar

Disassembly

1. Remove seat support bolt insulator and seat assembly from the vehicle.
2. Remove seat support from rear seat cushion cover, if so equipped.
3. Remove rear seat back latch cover. Remove bolts attaching rear seat cushion frame (63160) to rear seat cushion cover.
4. Remove armrest, if so equipped.
5. Unzip rear seat cushion cover at bottom of rear seat cushion frame or unhook J-retainer at bottom of rear seat cushion frame.
6. Remove mouldings from rear seat cushion frame, if so equipped.
7. Cut hog rings from rear seat cushion cover and/or disengage plastic retainers from rear seat cushion frame. Remove rear seat cushion cover.
8. Remove rear seat cushion pad (63840) if necessary.
9. Transfer tiedown wires to new rear seat cushion cover.

Assembly

1. Install rear seat cushion pad assembly, if removed.
2. With the exception of the top portion (approximately 203.2mm [8 inches]), turn trim cover inside out.
3. Work rear seat cushion cover down until horizontal tiedown listing is aligned with retaining wire in rear seat cushion pad. Install tiedown wire in listing, then secure tiedown to pad.
4. Position remaining portion of rear seat cushion cover to rear seat cushion pad. Install vertical tiedown wires in listings, then secure ends of tiedown wires to pad assembly.
5. Zip rear seat cushion cover closed.
6. Install seat back mouldings, if so equipped.
7. Install seat back on rear seat back latch cover (61348). Tighten inboard seat back pivot bolt to 19-26 Nm (14-19 lb-ft). Tighten the two seat back latch-to-seat cushion bolts to 47-63 Nm (34-46 lb-ft).
8. Install rear seat back latch cover.
9. Install armrest, if so equipped.
10. Install support on rear seat back latch cover. Tighten attaching bolts/nuts to specifications.

tomsn048@gmail.com

11. Install seat and seat support bolt insulator in vehicle as outlined in this section. Tighten mounting bolts/nuts to specifications.

12. Check seat backs for proper operation.

---

tomsn048@gmail.com

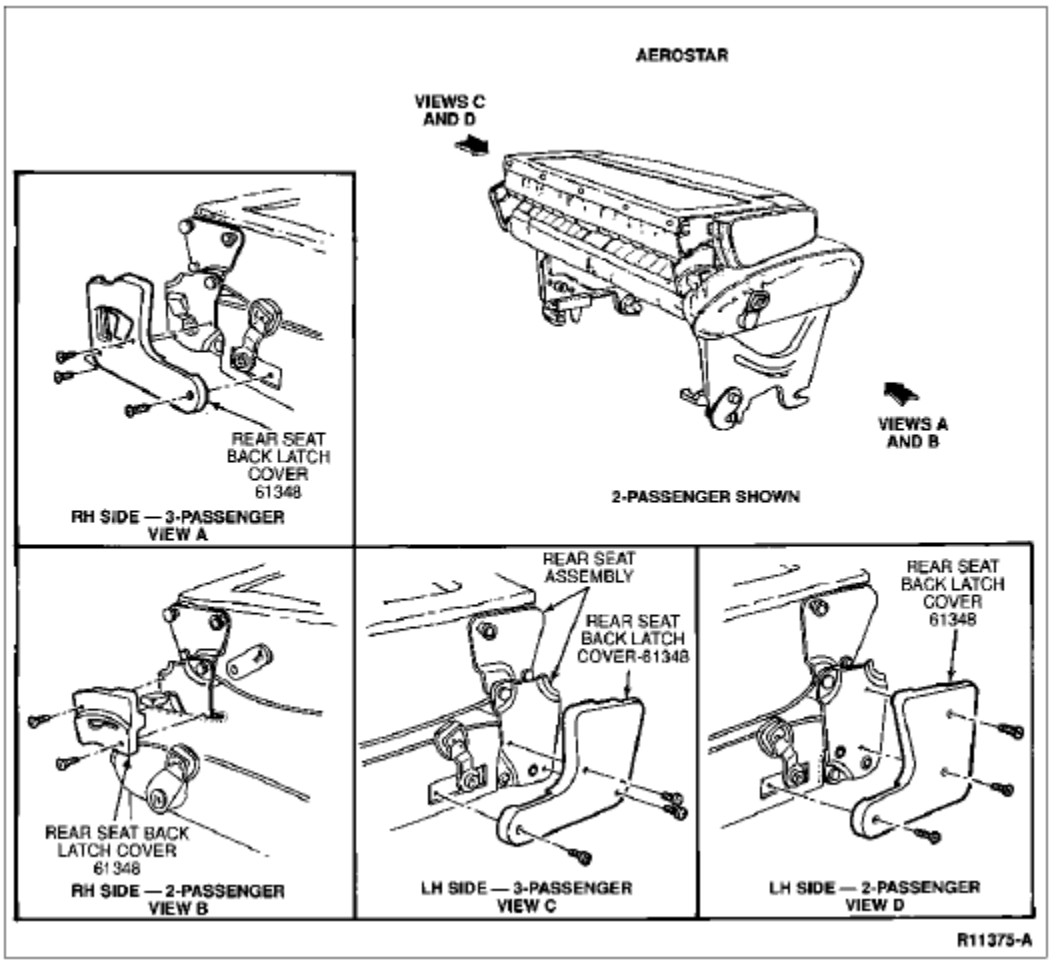
Seat, Rear, Folding, Aerostar

Disassembly and Assembly

1. Remove screws securing rear seat back latch covers (61348). Remove cover.
2. Position rear seat back latch covers and install mounting screws.

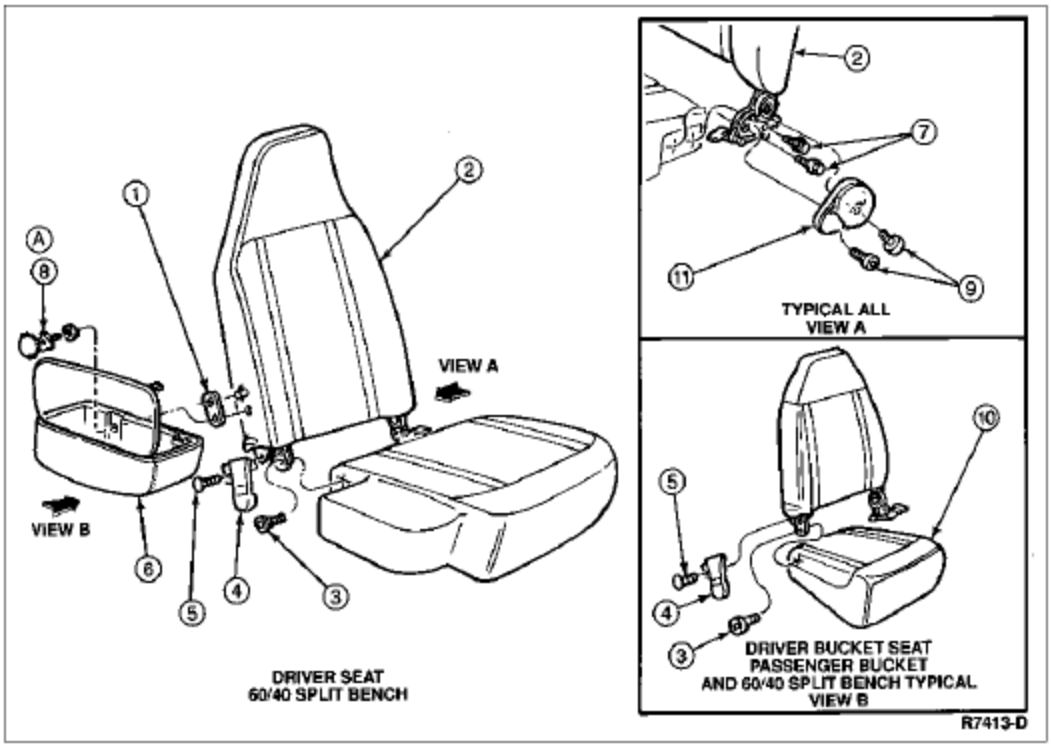
To assemble, reverse Steps 1 and 2.

Folding Bench Seat



Driver and Passenger Bucket Seat and 60/40 Split Bench, Front, Ranger

tomsn048@gmail.com



Item	Part Number	Description
1	64684	Link
2	64810	Front Seat Back
3	N802280-S58	Screw
4	861692	Cover, Front Seat Back Pivot
5	390964	Pushpin
6	644A22	Front Seat Center Armrest
7	N804850-S58	Screw
8	391716-S303	Bolt and Retainer
9	51764-S58	Screw
10	60052	Front Seat Cushion and Cover
11	62768	Front Seat Back Latch Lower Cover (RH)
A	—	Tighten to 30-35 Nm (22-26 Lb-Ft)

tomsn048@gmail.com

tomsn048@gmail.com

Backrest Cover and Pad, Front

Disassembly

1. Remove seat support bolt insulator and front seat (60012) from the vehicle.
2. Remove front seat tracks (61705) and front seat to floor support (61708) from front seat cushion frame and spring (63101), if equipped.
3. Disconnect front seat back pad adjusting hose (65528) at the lower rear portion of front seat back (64810), if equipped.
4. Remove front seat back latch lower cover and remove bolts attaching front seat back to front seat cushion frame and spring.
5. Remove front seat center armrest (644A22), if so equipped.
6. Unzip trim cover at bottom of front seat back or unhook J-retainer at bottom of front seat back.
7. Remove mouldings from front seat back, if equipped.
8. Cut hog rings from front seat back cover and/or disengage plastic retainers from front seat back frame (61018). Remove front seat back cover.
9. Remove front seat cushion pad if necessary.
10. Transfer tiedown wires to new front seat cushion extender pad, if equipped.

Assembly

1. Install front seat cushion pad, if removed.
2. With the exception of the top portion (approximately 203.2mm [8 inches]), turn trim cover inside out.
3. Work front seat back cover down until horizontal tiedown listing is aligned with retaining wire in front seat cushion pad assembly. Install tiedown wire in listing, then secure tiedown to front seat cushion pad.
4. Position remaining portion of front seat back cover to front seat cushion pad. Install vertical tiedown wires in listings, then secure ends of tiedown wires to front seat cushion pad.
5. Clip/zip front seat back cover closed.
6. Install seat back mouldings, if so equipped.
7. Install front seat back frame on seat cushion assembly. Tighten inboard pivot bolt to 19-26 Nm (14-19 lb-ft). Tighten the two bolts attaching front seat back to front seat cushion frame and spring to 44-60 Nm (32-44 lb-ft).

tomsn048@gmail.com

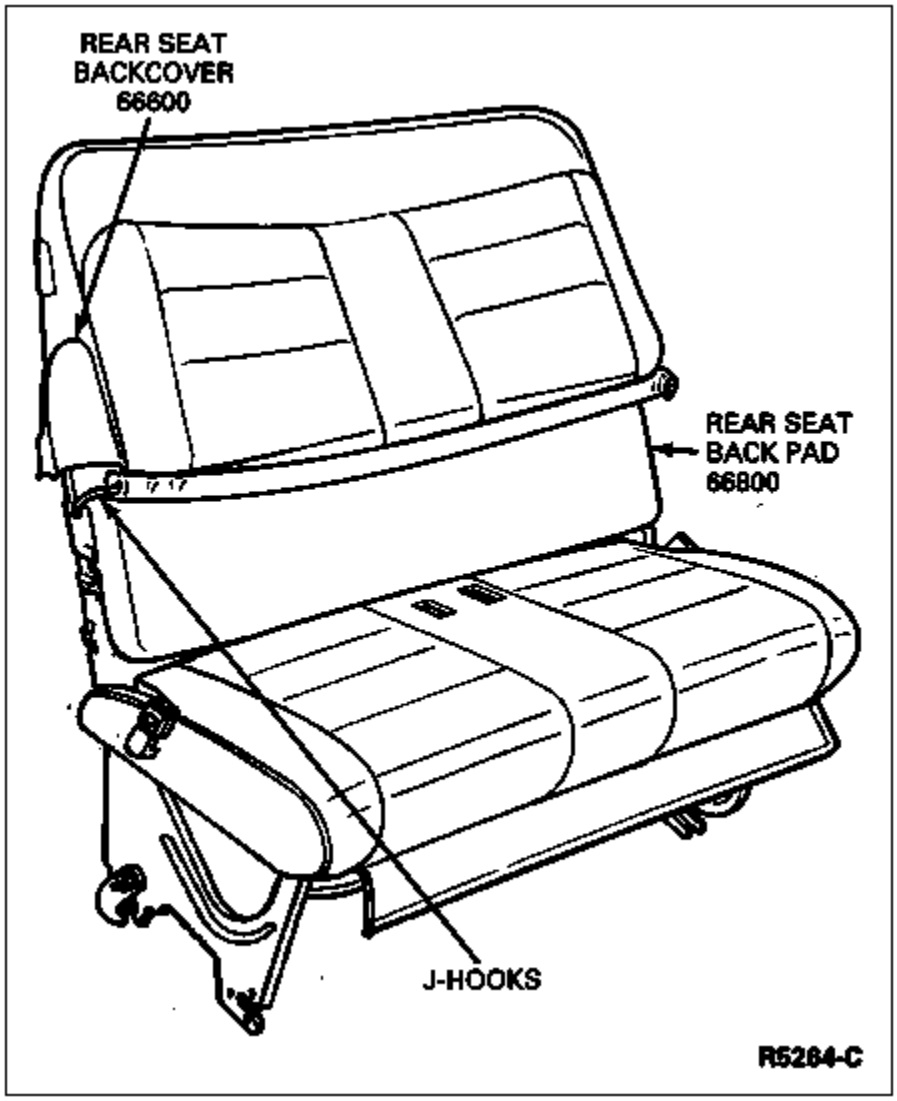
tomsn048@gmail.com

Backrest Cover and Pad, Rear, Aerostar

Disassembly and Assembly

1. Locate interlocking J-hooks at lower edge of backrest. Unhook interlocking J-hooks along entire length of backrest.

2. Gently lift rear seat back frame (613A38) upward and disengage from rear seat back cover.

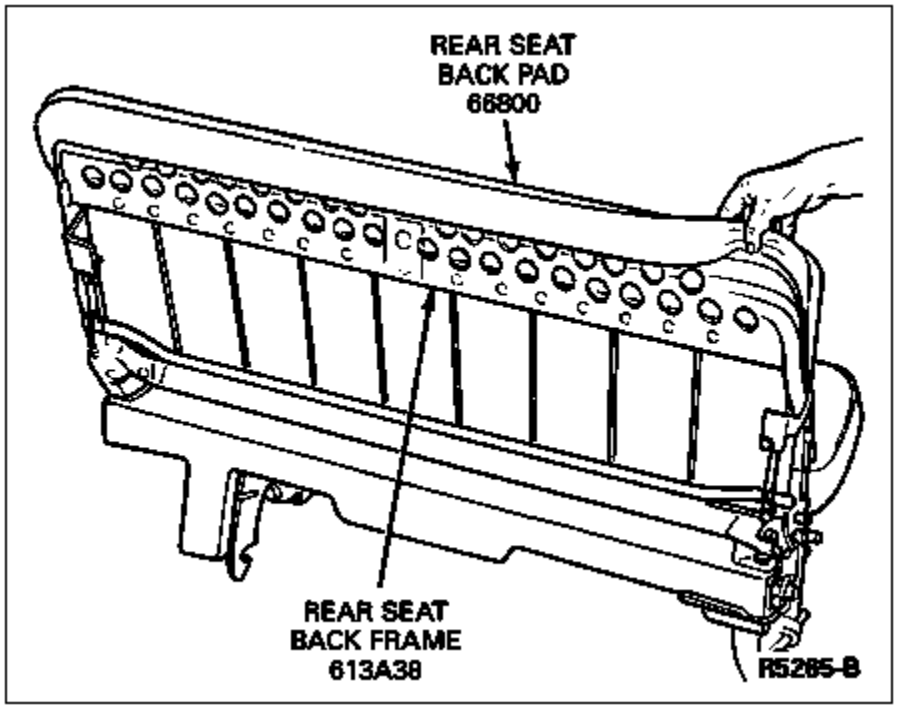


3. **NOTE: Foam rear seat back pad may be retained to rear seat back frame with adhesive.**

   If necessary, disengage foam rear seat back pad from rear seat back frame.

tomsn048@gmail.com

To assemble, follow disassembly procedures in reverse order.



tomsn048@gmail.com

Backrest Frame, Aerostar Two-Passenger Bedseat

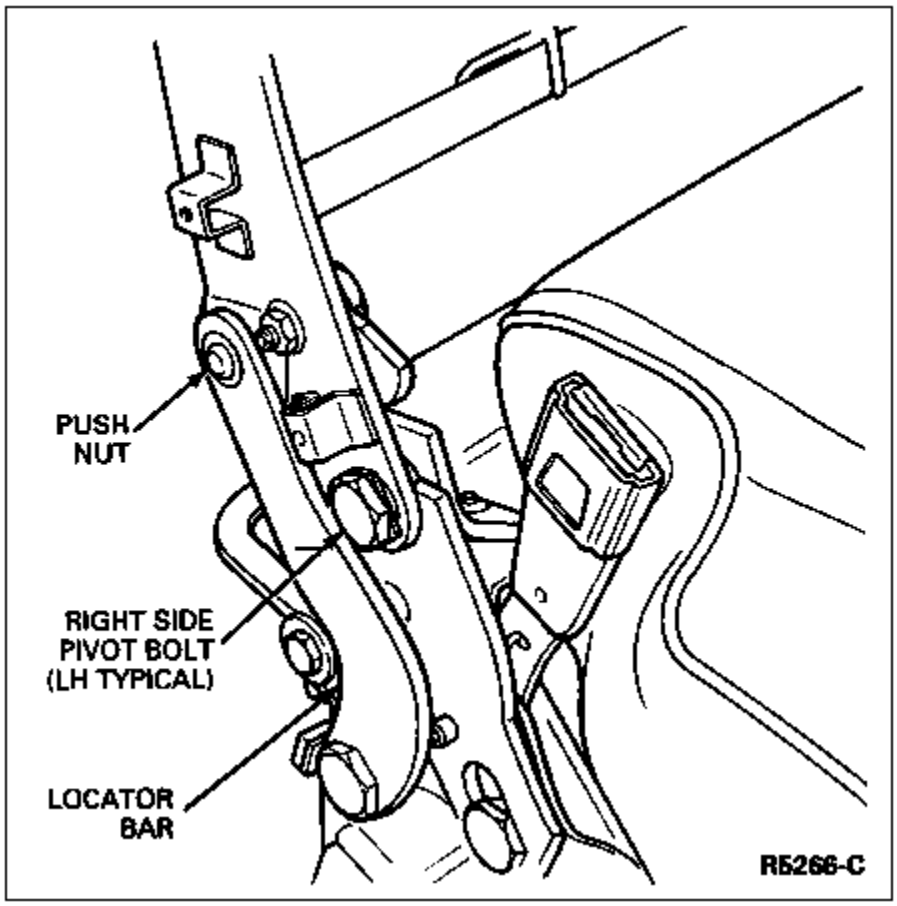
Disassembly and Assembly

1. Remove right pivot bolt, bushing, and wave washer from rear seat back frame using a socket wrench and a 1/2-inch combination wrench.

2. **NOTE: Use a 1/2-inch combination wrench to hold inboard nut retaining backrest pivot bolt.**

   Remove left pivot bolt, bushing and wave washer using a socket wrench and a 1/2-inch combination wrench.

3. Remove right pushnut retaining rear seat back frame to locator bar. Remove left pushnut retaining rear seat back frame to locator bar.



4. Detach locator bars from rear seat back frame by gently pulling forward.

5. Lift rear seat back frame away from rear seat back cover frame.

tomsn048@gmail.com

To assemble, follow disassembly procedures in reverse order.

tomsn048@gmail.com

Backrest Frame, Aerostar Two-Passenger Bedseat

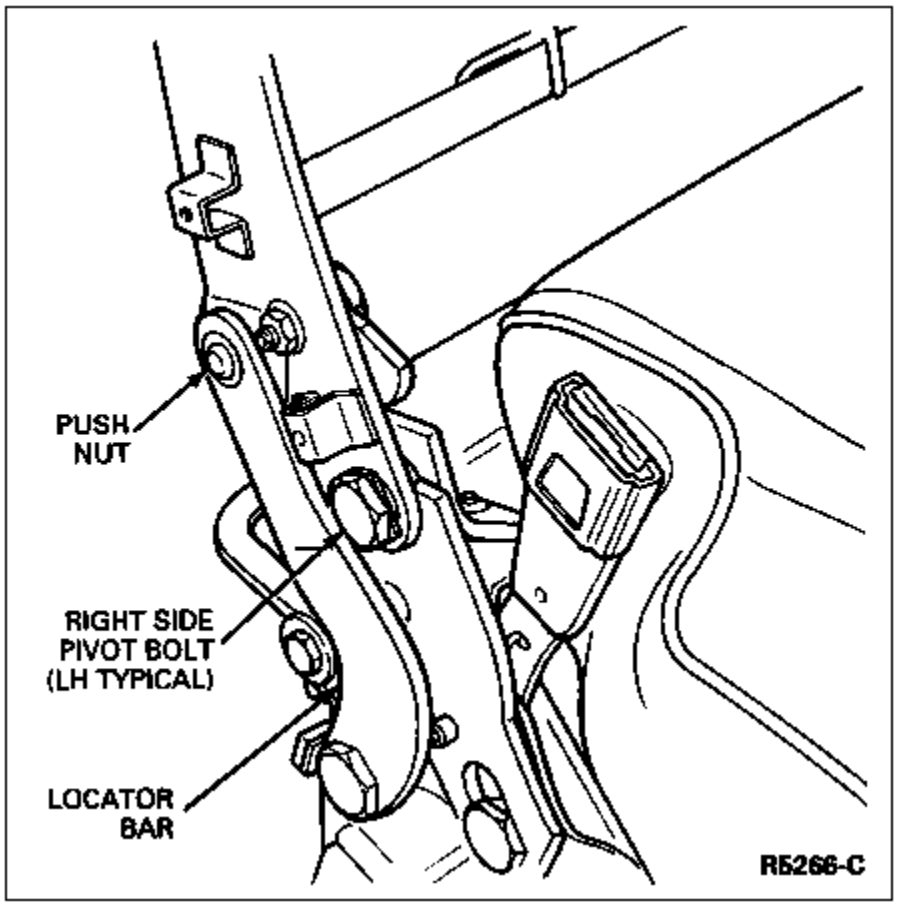
Disassembly and Assembly

1. Remove right pivot bolt, bushing, and wave washer from rear seat back frame using a socket wrench and a 1/2-inch combination wrench.

2. **NOTE: Use a 1/2-inch combination wrench to hold inboard nut retaining backrest pivot bolt.**

   Remove left pivot bolt, bushing and wave washer using a socket wrench and a 1/2-inch combination wrench.

3. Remove right pushnut retaining rear seat back frame to locator bar. Remove left pushnut retaining rear seat back frame to locator bar.



4. Detach locator bars from rear seat back frame by gently pulling forward.

5. Lift rear seat back frame away from rear seat back cover frame.

tomsn048@gmail.com

To assemble, follow disassembly procedures in reverse order.

tomsn048@gmail.com

Seat Cushion Locator, Rear

Disassembly and Assembly

1. Remove right and left rear seat cushion side trim.
2. Remove snap ring retaining upper end of right locator to rear seat back frame (613A38). Remove snap ring retaining left locator to rear seat back frame.
3. Remove right and left locator bar retaining bolts using a socket wrench.
4. Remove locator bar.

To assemble, follow disassembly procedures in reverse order.

tomsn048@gmail.com

Seat Cushion Frame, Rear

Disassembly and Assembly

1. Remove rear seat cushion cover (7863804) and rear seat cushion pad (7863840) as described in Disassembly and Assembly, Seat, Rear Seat Cushion/Rear Seat Back, Aerostar in this section.
2. Remove two pivot bolts retaining rear seat back frame (78613A38) as described in Dissassembly and Assembly, Backrest, Aerostar (Three-Passenger Bed Seat) in this section.
3. Detach two seat belt and buckle assemblies from rear seat cushion frame (7863160) if required.
4. Remove flexilator, if necessary, as described in Disassembly and Assembly, Flexilator in this section.
5. Remove bolts, bushings and wave washers retaining seat cushion frame. Remove rear seat cushion frame.

To assemble, follow disassembly procedures in reverse order.

tomsn048@gmail.com

Hook and Handle Assembly, Rear

Disassembly and Assembly

1. Remove handle and hook assembly pivot bolt using a T45 Torx® wrench.
2. Remove handle and hook assembly.

For assembly, follow disassembly procedures in reverse order.

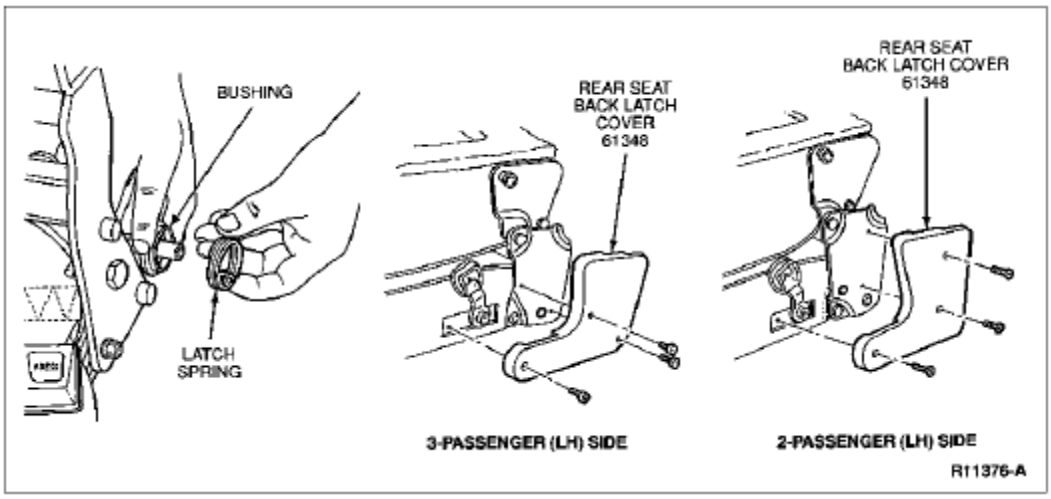
tomsn048@gmail.com

Latch and Handle Assembly, Aerostar

Disassembly and Assembly

1. Remove right and left rear seat back latch covers.
2. Remove pushnut, by cutting, retaining right rear seat back latch handle and rear seat cushion frame to rear seat back pivot. Remove right latch lever and rear seat cushion frame (63160), spring and bushing.
3. Remove pushnut, by cutting, retaining left rear seat back latch cover to latch lever pivot rod.
4. Remove left rear seat back latch cover.
5. Remove spring and bushing.

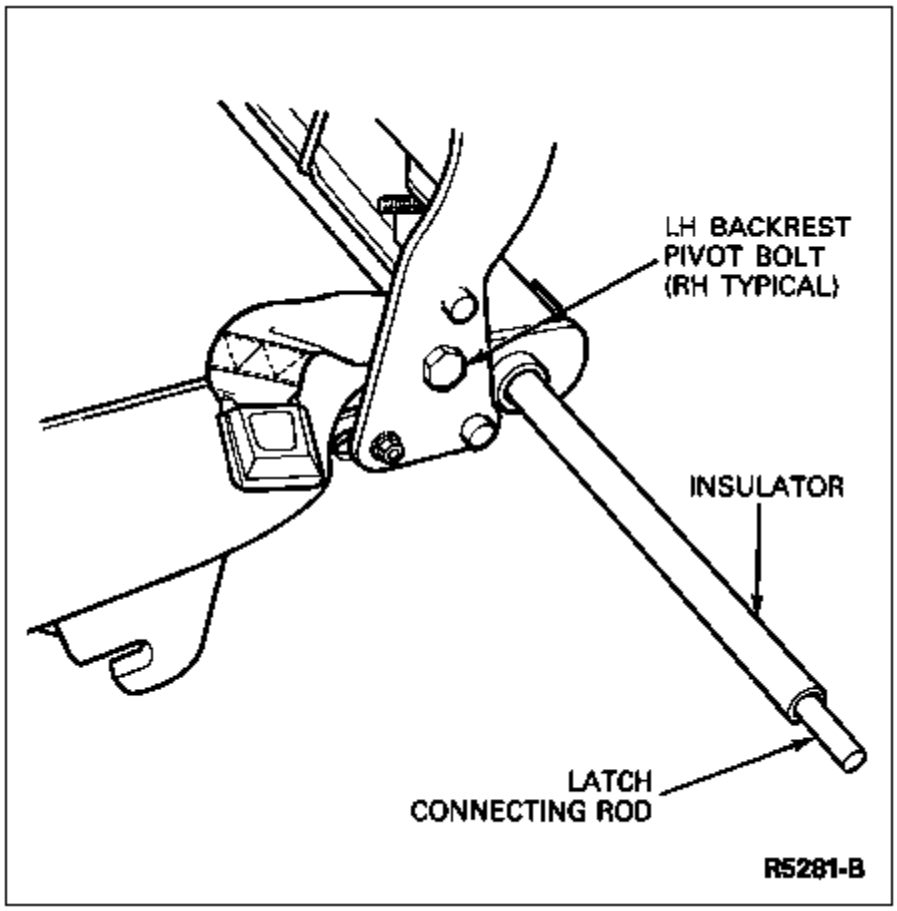
Rear Seat Back Latch Assembly, Aerostar



6. If necessary, slide latch lever pivot rod and insulator from rear seat cushion frame.

To assemble, follow disassembly procedures in reverse order. Install new pushnuts.

tomsn048@gmail.com

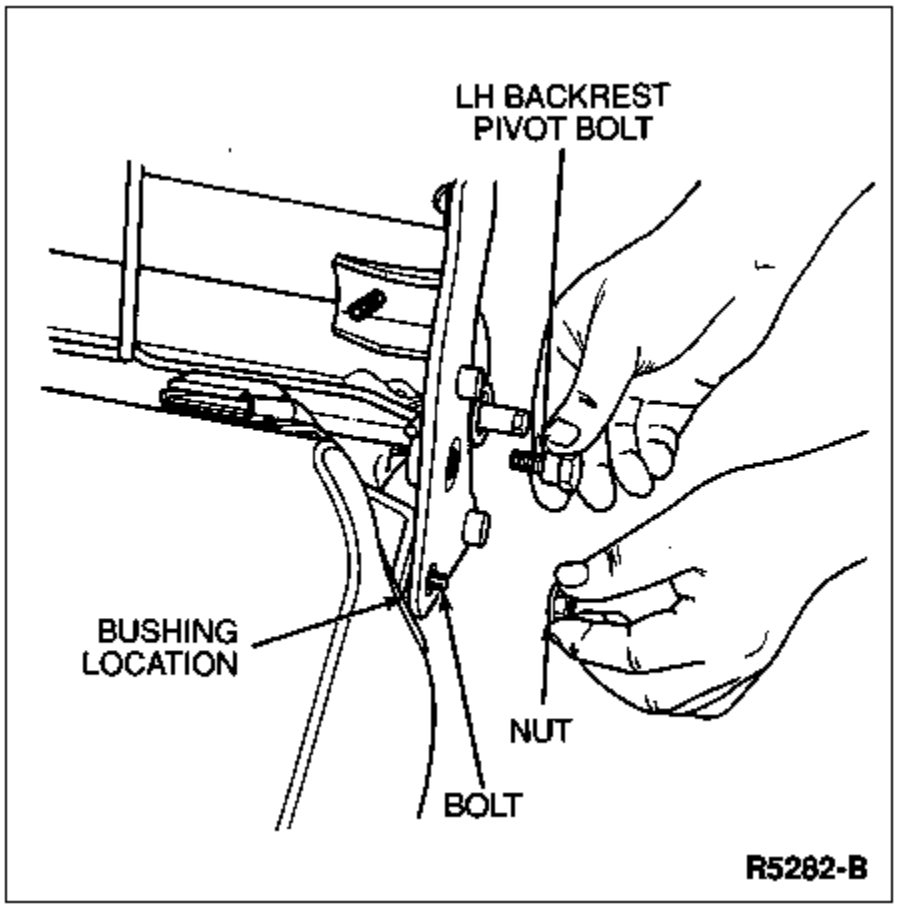


tomsn048@gmail.com

Backrest, Aerostar (Three-Passenger Bed Seat)

Disassembly and Assembly

1. Remove rear seat back latch cover (61348) as described in Removal and Installation in this section.
2. Remove left and right backrest pivot bolts from rear seat back frame (613A38) using a socket wrench.
3. Remove seat cushion elevator cam retaining bolt, bushing, and nut from rear seat back frame.



4. Remove rear seat back frame from rear seat cushion frame (63160).

To assemble, follow disassembly procedures in reverse order.

tomsn048@gmail.com

tomsn048@gmail.com

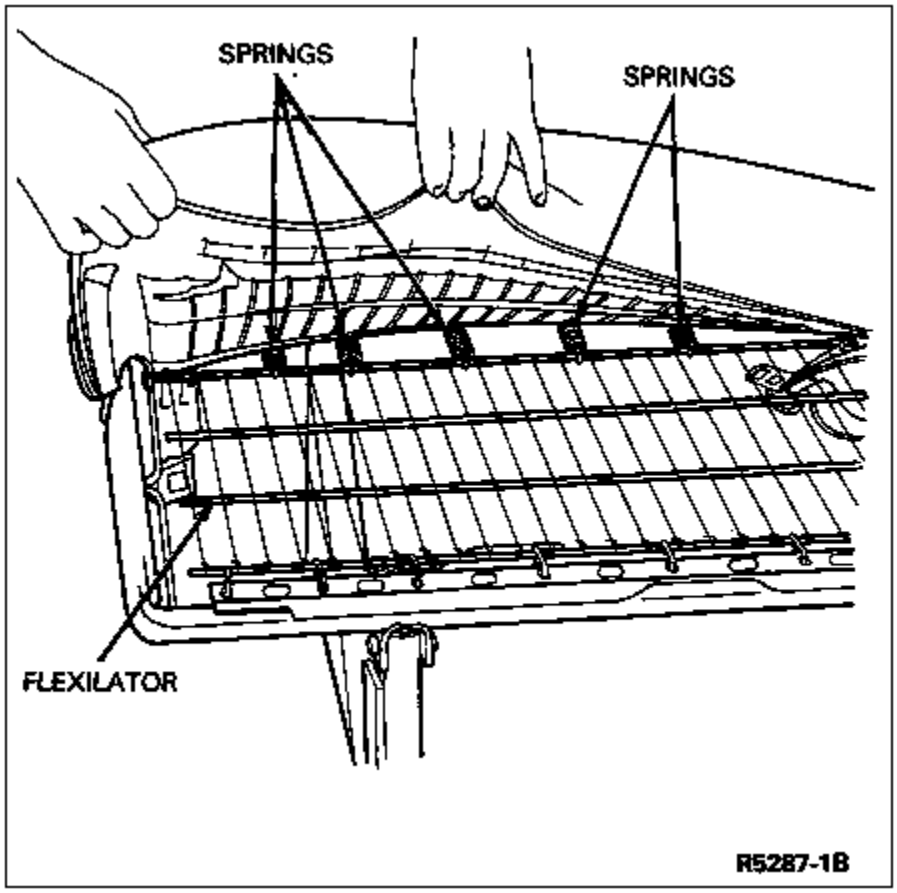
Flexilator

Disassembly and Assembly

1. Remove seat cushion cover as described in Disassembly and Assembly, Seat Cushion Cover, Bench, Rear in this section.
2. **NOTE: Flexilator J-hooks are readily detached by inserting fingers through flexilator wires, placing palm of hand against forward edge of seat cushion frame, and squeezing.**

   Disengage J-hooks from forward edge of flexilator.
3. Disengage springs retaining rear edge of flexilator to seat back cover.
4. Remove flexilator from seat back cover.

To assemble, follow disassembly procedures in reverse order.



tomsn048@gmail.com

tomsn048@gmail.com

Storage Bin, Underseat, Aerostar

Disassembly

1. Remove the seat and support assembly from the vehicle as described in Removal and Installation, Seat, Passenger, Front, Aerostar in this section.
2. Remove the storage bin from the seat support assembly as described in Removal and Installation, Storage Bin, Underseat, Aerostar in this section.
3. Position the storage bin assembly on a bench with the bottom of the storage bin housing facing up.
4. **NOTE: The drawer front must be removed to gain access to the latch assembly.**

   Remove the four screws that retain the drawer front to the housing assembly.
5. Remove the latch assembly from the storage housing drawer assembly.

Assembly

1. Install the latch assembly in the storage housing drawer assembly.
2. Position the drawer front to the storage housing assembly and install the four screws that retain the front to the housing.
3. Install the storage bin assembly to the seat support as described in Removal and Installation, Storage Bin, Underseat, Aerostar in this section.

Inspection and Verification

1. Visually inspect the components of the power window system to determine if any of the following electrical or mechanical concerns apply.

VISUAL INSPECTION CHART

Mechanical	Electrical
• Window alignment	• Blown fuse
• Window mounting (regulator and bracket) • Window frame interference	• Damage to wiring harness • Loose or corroded connections • Damaged switches

2. Check the wiring harness for obvious signs of shorts, opens, bad connections or damage.

3. If fault is not visually evident, determine the symptom and proceed to the Symptom Chart.

tomsn048@gmail.com

Symptom Charts

ONE-TOUCH DOWN

Condition	Possible Source	Action
• Accessory Delay is Not Timing Out, DTC B1405, B1302	• Circuit.	• GO to Pinpoint Test A.
• One-Touch Down Feature Inoperative, DTC B1398, B1400, B1404, B1410	• Circuit. • One-touch relay. • Current sense resistor.	• GO to Pinpoint Test B.
• Power Windows Completely Inoperative, DTC B1302, B1398, B1404, B1405, B1408, B1410, B1478	• Fuse. • Circuit. • Control switch. • Delayed accessory relay. • One-touch relay. • Current sense resistor. • Power window motor.	• GO to Pinpoint Test C.
• Window Stuck/Binding	• Glass run channel. • Regulator and guides. • Power window motor.	• GO to Pinpoint Test D.

REAR WINDOW DEFROST

Condition	Possible Source	Action
• Rear Window Defrost Does Not Work, DTC B1345, B1347, B1349, B1355	• Battery. • Fuse. • Circuit. • Rear defrost grid. • Rear defrost relay.	• GO to Pinpoint Test E.
• Rear Window Defrost Will Not Shut Off, DTC B1345, B1347	• Circuit. • Rear defrost relay.	• GO to Pinpoint Test F.
• Rear Window Defrost/Relay Inoperative, DTC B1347, B1349	• Control switch. • Circuit. • Rear defrost relay.	• GO to Pinpoint Test G.

tomsn048@gmail.com

• Rear Window Defrost Relay Open Circuit, DTC B1347 Self Test	• Circuit. • Rear defrost relay.	• GO to Pinpoint Test H.
• Ignition Run Circuit DTC B1355	• Circuit. • Fuse. • Ignition switch.	• GO to Pinpoint Test J.

tomsn048@gmail.com

Pinpoint Tests

PINPOINT TEST A: ACCESSORY DELAY IS NOT TIMING OUT, DTC B1405, B1302

A1 PRELIMINARY CHECKS

- Check connections for clean, tight fit.
- Check for loose or damaged wires.

Are connections and wiring OK?

Yes	No
GO to **A2** .	SERVICE connectors and wiring as required. GO to **A2** .

A2 ON-DEMAND SELF TEST

- Connect Rotunda New Generation Star (NGS) tester 007-00500 or equivalent to data link connector (DLC).
- Retrieve continuous DTCs.
- Perform on-demand self test. Refer to Section 18-04A .

Is DTC B1405 retrieved?

Yes	No
GO to **A3** .	DTC B1302 self test and continuous — REPAIR ground short in Circuit 1004 (LB/R) between GEM and delayed accessory relay.

A3 CHECK POWER FEED CIRCUIT

- Disconnect battery negative cable.

  NOTE: Some abnormal drive symptoms may occur after the battery has been disconnected and reconnected. The vehicle may need to be driven 16 km (10 miles) or more to allow the powertrain control module to relearn the adaptive strategy.

- Check for short between battery B+ terminal and Circuit 400 (LB/BK) in power feed to window regulator control switch.

tomsn048@gmail.com

Is circuit OK?

Yes	No
CHECK delayed accessory relay contacts for short. REPLACE window relay.	REPAIR battery short in Circuit 400 (LB/BK).

PINPOINT TEST B: ONE-TOUCH DOWN FEATURE INOPERATIVE, DTC B1398, B1400, B1404, B1410

B1 PRELIMINARY CHECKS

- Check connections for clean, tight fit.
- Check for loose or damaged wires.

Are connections and wiring OK?

Yes	No
GO to **B2** .	SERVICE connectors and wiring as required. GO to **B2** .

B2 ON-DEMAND SELF TEST

- Connect Rotunda New Generation Star (NGS) tester 007-00500 or equivalent to data link connector (DLC).
- Retrieve continuous DTCs.
- Perform on-demand self test. Refer to Section 18-04A .

Are any DTCs retrieved?

Yes	No
DTC B1398 self test and continuous — GO to **B3** . DTC B1400 self test and continuous, and B1475 self test — REPAIR battery short in Circuit 1007 (Y/R) between GEM and one-touch relay. DTC B1404 continuous — REPAIR open in Circuit 991 (T/LB) between GEM down window command input and SPLICE to master window regulator control switch and one-touch relay. DTC B1410 continuous — GO to **B5** .	CHECK for open in Circuit 996 (O/W) between GEM and LH front window motor. REPAIR as required.

B3 CHECK CIRCUIT 1007 (Y/R)

tomsn048@gmail.com

- Read PID LFPWRLY.

Does tester indicate Off O-G?

Yes	No
REPAIR open in Circuit 1007 (Y/R) between GEM and one-touch relay.	GO to **B4** .

B4 CHECK CIRCUIT 400 (LB/BK)

- Check for open in Circuit 400 (LB/BK) between one-touch relay and master window regulator control switch.

Is circuit OK?

Yes	No
CHECK for open coil in one-touch relay. REPLACE one-touch relay.	REPAIR open in Circuit 400 (LB/BK) between one-touch relay and master window regulator control switch.

B5 CHECK CIRCUIT 995 (GY)

- Disconnect battery ground cable.

  NOTE: Some abnormal drive symptoms may occur after the battery has been disconnected and reconnected. The vehicle may need to be driven 16 km (10 miles) or more to allow the powertrain control module to relearn the adaptive strategy.

- Check for open in Circuit 995 (GY) between GEM and LH front window motor.

Is circuit OK?

Yes	No
CHECK circuits for intermittent condition. RETEST.	REPAIR open in Circuit 995 (GY) between GEM and LH front window motor.

PINPOINT TEST C: POWER WINDOWS COMPLETELY INOPERATIVE, DTC B1302, B1398, B1404, B1405, B1408, B1410, B1478

C1 PRELIMINARY CHECKS

- Check fuse.
- Check connections for clean, tight fit.
- Check for loose or damaged wires.

tomsn048@gmail.com

Are connections and wiring OK?

Yes	No
GO to **C2** .	SERVICE connectors and wiring as required. If fuse is blown, GO to **C2** .

C2 ON-DEMAND SELF TEST

- Connect Rotunda New Generation Star (NGS) tester 007-00500 or equivalent to data link connector (DLC).
- Retrieve continuous DTCs.
- Perform on-demand self test. Refer to Section 18-04A .

Are any DTCs received?

Yes	No
DTC B1302 self test and B1398 continuous — GO to **C3** . DTC B1398 self test and continuous, and B1304 self test — REPAIR battery short in Circuit 1004 (LB/R) between GEM and delayed accessory relay. DTC B1398 self test and continuous — GO to **C5** . DTC B1398 self test and continuous and DTC B1404 continuous — REPAIR ground short in Circuit 1007 (Y/R) between GEM and one-touch relay. If fuse was open, REPLACE fuse. CLEAR all DTCs and RETEST. DTC B1404 continuous — GO to **C12** . DTC B1405 self test — GO to **C13** . DTC B1408 self test. Window regulator control switch stuck open. REPLACE window regulator control switch. DTC B1410 self test and continuous — GO to **C14** . DTC B1478 continuous — GO to **C3** . DTC B1408 self test — REPAIR battery short in Circuit 996 (O/W) between GEM and driver window motor.	GO to **C16** .

tomsn048@gmail.com

C3 CHECK CIRCUIT 705 (LG/O)

- Check for B+ on Circuit 705 (LG/O) between battery saver relay and window relay.

Is B+ present?

Yes	No
GO to **C4** .	REPAIR open in Circuit 705 (LG/O).

C4 CHECK CIRCUIT 1004 (LB/R) FOR OPEN

- Disconnect window relay.
- Check relay coil for open.

Is relay OK?

Yes	No
REPAIR open in Circuit 1004 (LB/R) between GEM and delayed accessory relay.	REPLACE window relay.

C5 CHECK CIRCUIT 171 (BK/W) FOR BATTERY VOLTAGE

- Check for B+ on Circuit 171 (BK/W) between window relay and fuse panel.

Is B+ present?

Yes	No
GO to **C6** .	REPAIR open in circuit 171 (BK/W) between delayed accessory relay and fuse panel.

C6 CHECK OPEN CIRCUIT

- Check for open in circuit between fuse panel and power distribution box.

Is circuit OK?

Yes	No
GO to **C7** .	REPAIR open in circuit between fuse panel and power distribution box.

C7 CHECK POWER TO FUSE

- Check for B+ to fuse in power distribution box.

tomsn048@gmail.com

Is B+ present?

Yes	No
GO to **C8** .	REPAIR open in power feed circuit to fuse in power distribution box.

C8 CHECK FOR GROUND SHORT

- Check for ground short in circuit between fuse panel and power distribution box.

Is circuit OK?

Yes	No
GO to **C9** .	REPAIR ground short in circuit between fuse panel and power distribution box.

C9 CHECK CIRCUIT 171 (BK/W)

- Check for ground short in Circuit 171 (BK/W) between fuse panel and window relay.

Is circuit OK?

Yes	No
GO to **C10** .	REPAIR ground short in Circuit 171 (BK/W) between fuse panel and delayed accessory relay.

C10 CHECK FOR OPEN IN CIRCUIT

- Check for open in Circuit 400 (LB/BK) between window relay and master window regulator control switch.

Is circuit OK?

Yes	No
GO to **C11** .	REPAIR open in Circuit 400 (LB/BK) between delayed accessory relay and master window control switch.

C11 CHECK FOR GROUND SHORT IN CIRCUIT

- Check for ground short in Circuit 400 (LB/BK) between window relay and master window regulator control switch.

Is circuit OK?

tomsn048@gmail.com

Yes	No
GO to C12 .	REPAIR ground short in Circuit 400 (LB/BK).

C12 CHECK CIRCUIT 995 (GY) FOR OPEN

- Disconnect battery ground cable.

  NOTE: Some abnormal drive symptoms may occur after the battery has been disconnected and reconnected. The vehicle may need to be driven 16 km (10 miles) or more to allow the powertrain control module to relearn the adaptive strategy.

- Check for open in Circuit 995 (GY) between one-touch relay and LH front window motor.

Is circuit OK?

Yes	No
GO to C13 .	REPAIR open in Circuit 995 (GY) between one-touch relay and LH front window motor.

C13 CHECK ONE-TOUCH RELAY

- Disconnect battery ground cable.

  NOTE: Some abnormal drive symptoms may occur after the battery has been disconnected and reconnected. The vehicle may need to be driven 16 km (10 miles) or more to allow the powertrain control module to relearn the adaptive strategy.

- Check one-touch relay for shorted closed contacts.

Is one-touch relay OK?

Yes	No
GO to C14 .	REPLACE one-touch relay.

C14 CHECK CIRCUIT 992 (W/BK) FOR OPEN

- Check for open in Circuit 992 (W/BK) between window motor and master window regulator control switch.

Is circuit OK?

Yes	No
GO to C15 .	REPAIR Circuit 992 (W/BK) between window motor and master window regulator control switch.

tomsn048@gmail.com

C15 VERIFY MOTOR OPEN WINDING

- Reconnect all connectors.
- Reconnect battery ground cable.
- Perform one-touch window functional test. Refer to Section 18-04A .
- Energize one-touch relay.

Does window go down?

Yes	No
WIGGLE connectors for all affected circuits to isolate any intermittent connections and RERUN self test for any DTCs.	CHECK window motor for open winding. SERVICE or REPLACE as required.

C16 CHECK CIRCUIT 991 (T/LB)

- Disconnect battery ground cable.

  NOTE: Some abnormal drive symptoms may occur after the battery has been disconnected and reconnected. The vehicle may need to be driven 16 km (10 miles) or more to allow the powertrain control module to relearn the adaptive strategy.

- Check for open in Circuit 991 (T/LB) between master window regulator control switch and one-touch relay.

Is circuit OK?

Yes	No
LOCATE open in Circuit 991 (T/LB) between one-touch relay and GEM. REPAIR as required.	REPAIR open in Circuit 991 (T/LB) between master window regulator control switch and one-touch relay.

PINPOINT TEST D: WINDOW STUCK/BINDING

D1 CHECK FOR OBSTRUCTION

- Inspect the glass run for foreign objects or debris.
- Inspect inside the door for possible obstruction of the window regulator movement.

Is there a door window glass obstruction?

Yes	No
REMOVE obstruction and RETEST.	GO to **D2** .

tomsn048@gmail.com

D2 LUBRICATION CHECK

- Observe window movement to determine if condition is caused only by lack of lubrication: No obstructions, damaged, loose or misaligned parts.

Is there a lubrication concern?

Yes	No
LUBRICATE as necessary. REFER to the procedures in Lubrication in this section.	GO to **D3**.

D3 FRONT DOOR BELT LINE WEATHERSTRIP CHECK

- Inspect both front door belt line weatherstrip for proper installation.

Is there a weatherstrip concern?

Yes	No
ALIGN and INSTALL the weatherstrip and RETEST.	GO to **D4**.

D4 CHECK DOOR GLASS RUN RETAINERS AND WINDOW REGULATOR

- Inspect the door glass run retainers inside the door for proper installation and alignment.
- Inspect the window regulator for proper installation.

Is there a run retainer or regulator concern?

Yes	No
CORRECT installation or alignment as necessary. REFER to the procedures in Adjustments, Door Window Glass in this section.	DETERMINE the worn or damaged component and REPAIR or REPLACE as necessary.

PINPOINT TEST E: REAR WINDOW DEFROST DOES NOT WORK, DTC B1345, B1347, B1349, B1355

E1 PRELIMINARY TEST

- Make sure battery is fully charged.
- Check battery connections for clean tight fit.
- Check fuse or rear window defrost relay in power distribution box.
- Check fuse to rear window defrost relay in fuse panel.

tomsn048@gmail.com

Do components check OK?

Yes	No
GO to **E2** .	SERVICE or REPLACE as required.

E2 ON-DEMAND SELF TEST

- Connect Rotunda New Generation Star (NGS) tester 007-00500 or equivalent to Data Link Connector (DLC).
- Retrieve continuous diagnostic trouble codes (DTCs).
- Run on-demand self test. Refer to Section 18-04A .
- Record DTCs.

NOTE: Perform the individual tests for each DTC retrieved during the on-demand self test.

Are any DTCs received?

Yes	No
DTC B1345 self test — GO to **G5** . DTC B1347 self test and continuous — GO to **G1** . DTC B1349 self test and continuous — GO to **G1** . DTC B1355 — GO to **J1** .	GO to **E3** .

E3 FUNCTIONAL TEST

- Energize rear window defrost relay.
- Check for B+ on Circuit 186 (BR/LB) between rear window defrost grid connector and rear window defrost relay.

Is B+ present?

Yes	No
GO to **E4** .	GO to **E5** .

E4 CHECK GROUND

- Check for continuity between rear window defrost grid (ground side) and ground.

Is there continuity?

Yes	No

tomsn048@gmail.com

REPAIR or REPLACE rear window defrost grid.	REPAIR rear window defrost ground circuit.

E5 CHECK CIRCUIT 186 (BR/LB)

- Check continuity between rear window defrost grid connector and rear window defrost relay on Circuit 186 (BR/LB).

Is there continuity?

Yes	No
GO to **E6** .	REPAIR open in Circuit 186 (BR/LB).

E6 CHECK CIRCUIT 298 (P/O)

- Check continuity along circuit between rear window defrost relay and power I/P fuse panel.

Is there continuity?

Yes	No
Rear window defrost relay stuck open. REPLACE rear window defrost relay.	REPAIR open in Circuit 298 (P/O). If system is still inoperative, GO to Pinpoint Test J .

PINPOINT TEST F: REAR WINDOW DEFROST WILL NOT SHUT OFF, DTC B1345, B1347

F1 ON-DEMAND SELF TEST

- Connect Rotunda New Generation Star (NGS) tester 007-00500 or equivalent to Data Link Connector (DLC).
- Retrieve continuous diagnostic trouble codes (DTCs).
- Run on-demand self test. Refer to Section 18-04A .
- Record DTCs.

NOTE: Perform the individual tests for each DTC retrieved during the on-demand self test.

Are any DTCs received?

Yes	No
DTC B1345 self test — GO to **G5** . DTC B1347 self test and continuous — GO to **G1** .	GO to **F2** .

tomsn048@gmail.com

F2 CHECK REAR WINDOW DEFROST RELAY CONTACTS

- Disconnect rear window defrost relay.
- Check for continuity between rear window defrost relay contact terminals 1 and 5.

Is there continuity?

Yes	No
REPLACE rear window defrost relay.	REPAIR battery short to rear window defrost Circuit 186 (BR/LB).

PINPOINT TEST G: REAR WINDOW DEFROST/RELAY INOPERATIVE, DTC B1347, B1349

G1 CHECK CIRCUIT 1009 (O/Y)

- Key OFF.
- Disconnect rear window defrost relay connector.
- Read PID RDEFRLY.

Does tester indicate OFF?

Yes	No
REPAIR battery short in Circuit 1009 (O/Y).	GO to G2 .

G2 CHECK CIRCUIT 186 (BR/LB)

- Key OFF.
- Check for battery short in Circuit 186 (BR/LB) between rear window defrost relay and fuse panel.

Is circuit OK?

Yes	No
GO to G3 .	REPAIR battery short in Circuit 186 (BR/LB).

G3 CHECK CIRCUIT 1010 (DB/O) FOR OPEN

- Disconnect rear window defrost relay connector.
- Check for continuity to ground in Circuit 1010 (DB/O).

Is there continuity?

Yes	No

tomsn048@gmail.com

REPAIR open in Circuit 1010 (DB/O).	GO to **G4** .

G4 CHECK FOR INTERMITTENT SHORT

- Wiggle Circuit 1010 (DB/O) between rear window defrost relay and GEM.
- Wiggle Circuit 298 (P/O) between heated backlite relay coil and fuse panel.
- Rerun self test.

Is DTC B1347 set?

Yes	No
GO to **G5** .	Rear window defrost relay circuit OK.

G5 CHECK CIRCUIT 1010 (DB/O) FOR SHORT

- Disconnect rear window defrost switch and light from harness connector.
- Read PID RDEF-SW.

Does tester indicate rear window defrost switch and light ON?

Yes	No
REPAIR ground short in Circuit 1010 (DB/O).	REPLACE rear window defrost switch and light.

PINPOINT TEST H: REAR WINDOW DEFROST RELAY OPEN CIRCUIT, DTC B1347 SELF TEST

H1 DETERMINE IF CONDITION IS INTERMITTENT

- Compare continuous DTCs with on-demand self test DTCs.

Was DTC B1347 set during on-demand self test?

Yes	No
GO to **H2** .	GO to **H4** .

H2 CHECK REAR WINDOW DEFROST RELAY

- Disconnect rear window defrost relay.
- Check rear window defrost relay for open coil.

Is rear window defrost relay OK?

tomsn048@gmail.com

Yes	No
GO to H3 .	REPLACE rear window defrost relay.

H3 CHECK CIRCUIT 298 (P10)

- Check for continuity in Circuit 298 (P10) between rear window defrost relay and fuse panel.

Is there continuity?

Yes	No
REPAIR open in Circuit 1009 (O/Y).	REPLACE open in Circuit 298 (P10).

H4 CHECK FOR INTERMITTENT OPEN

- Wiggle Circuit 1009 (O/Y) between rear window defrost relay and GEM.

Is DTC B1347 set?

Yes	No
GO to H2 .	Rear window defrost relay circuit OK.

PINPOINT TEST J: IGNITION RUN CIRCUIT DTC B1355

J1 CHECK FUSE 32

- Disconnect battery ground cable.

  NOTE: When the battery is disconnected, some abnormal drive symptoms may occur. The vehicle may need to be driven 16 km (10 miles) or more so the powertrain control module can relearn the adaptive strategy.

- Check fuse 32 to Circuit 186 (BR/LB).

Is fuse OK?

Yes	No
CHECK for continuity in Circuit 186 (BR/LB) between heated backlite relay and fuse panel. REPAIR as required. GO to J2 .	REPAIR short to ground in Circuit 186 (BR/LB) between fuse panel and rear window defrost relay. REPLACE fuse. GO to J2 .

J2 CHECK FUSE TO IGNITION SWITCH

tomsn048@gmail.com

- Check fuse to ignition switch power feed Circuit 687 (GY/Y).

Is fuse OK?

Yes	No
CHECK continuity from fuse to ignition switch. REPAIR as required. GO to **J5** .	GO to **J3** .

J3 CHECK FOR GROUND SHORT IN CIRCUIT

- Disconnect harness from ignition switch.
- Check for ground short in circuit from fuse in power distribution box to ignition switch.

Is circuit OK?

Yes	No
GO to **J4** .	REPAIR ground short in circuit. REPLACE fuse. GO to **J5** .

J4 CHECK FOR GROUND SHORT

- Check for ground short in circuit from ignition switch to fuse in fuse panel.

Is circuit OK?

Yes	No
SERVICE or REPAIR ignition switch as required.	CHECK continuity from ignition switch to fuse panel. REPAIR as required. GO to **J5** .

J5 CHECK FUSE

- Check fuse to Circuit 298 (P/O).

Is fuse OK?

Yes	No
CHECK continuity in Circuit 298 (P/O) from fuse panel to heated backlite relay. REPAIR as required. RECONNECT battery.	CHECK for ground short in Circuit 298 (P/O) from fuse panel to heated backlite relay. SERVICE as required. REPLACE fuse. RECONNECT battery.

tomsn048@gmail.com

tomsn048@gmail.com

Component Tests

Switch Tests, Window

Master Switch, Aerostar

Testing of the power window multiple switch should be performed with the switch removed from the vehicle. Refer to the appropriate procedures in this section. Use a self-powered test lamp or an ohmmeter such as Rotunda Digital Volt-Ohmmeter 014-00407 or equivalent.

1. Clip one test lead probe on Pin No. 6 which is grounded.
2. With both switches in the neutral position, Pins No. 1 through 4 should have continuity to Pin No. 6.
3. Push both window switches upward (toward window when in installed position). Both Pins No. 1 and 3 should have no continuity to Pin No. 6.
4. Push both window switches downward (away from window when in installed position). Both Pins No. 2 and 4 should have no continuity to Pin No. 6.
5. Remove the test lead from Pin No. 6 and connect to Pin No. 5 (hot feed pin). With both switches in the neutral position, Pin No. 5 should have continuity only with itself.
6. Push both window switches upward (toward the window when in installed position). Both Pins No. 1 and 3 should have continuity to Pin No. 5.
7. Push both window switches downward (away from the window when in installed position). Both Pins No. 2 and 4 should have continuity to Pin No. 5.
8. If any one switch does not test as stated, replace the complete switch assembly.

Power Window Multiple Pin Connections and Locations, Aerostar

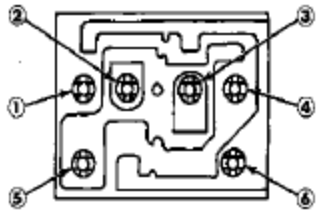
tomsn048@gmail.com

CONNECT ONE SIDE OF AN OHMMETER SELF-POWERED OR TEST LAMP TO TERMINAL NO. 5 (BATTERY TERMINAL) AND THE OTHER SIDE TO THE TERMINALS SHOWN BELOW.

WINDOW SWITCH POSITION	CONTINUITY BETWEEN TERMINALS
NEUTRAL	NO. 5
RIGHT FRONT — UP	NO. 3
RIGHT FRONT — DOWN	NO. 4
LEFT FRONT — UP	NO. 1
LEFT FRONT — DOWN	NO. 2

CONNECT ONE SIDE OF AN OHMMETER SELF-POWERED OR TEST LAMP TO TERMINAL NO. 6 (GROUND TERMINAL) AND THE OTHER SIDE TO THE TERMINALS SHOWN BELOW.

WINDOW SWITCH POSITION	CONTINUITY BETWEEN TERMINALS
NEUTRAL	NOS. 1, 2, 3, 4
RIGHT FRONT — UP	NOS. 1, 2 AND 4
RIGHT FRONT — DOWN	NOS. 1, 2 AND 3
LEFT FRONT — UP	NOS. 2, 3 AND 4
LEFT FRONT — DOWN	NOS. 1, 3 AND 4



1. LEFT FRONT "UP" TERMINAL
2. LEFT FRONT "DOWN" TERMINAL
3. RIGHT FRONT "UP" TERMINAL
4. RIGHT FRONT "DOWN" TERMINAL
5. HOT FEED WHEN IGNITION SWITCH IS "ON"
6. GROUND TERMINAL

N5031-2F

Master Switch, Ranger

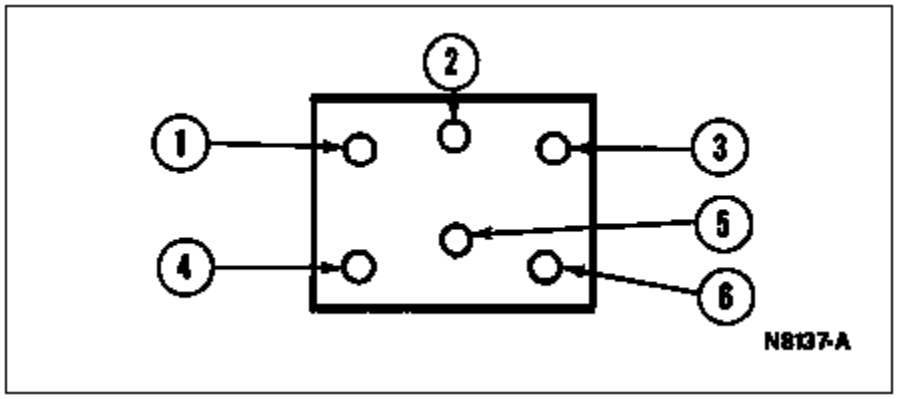
1. **NOTE: Use a self-powered test lamp or an ohmmeter such as Rotunda Digital Volt-Ohmmeter 014-00407 or equivalent to test the power window switch.**

   With the switch in the NEUTRAL position, there should be continuity between terminals 1, 3, 4, 5 and 6.

2. When the ribbed portions of the switch rocker knobs are pushed (to close the windows), there should be continuity between terminals 1, 2, and 3 and terminals 4, 5 and 6.

3. When the flat portions of the switch rocker knobs are pushed (to open the windows), there should be continuity between terminals 1, 3 and 5 and terminals 2, 4 and 6.

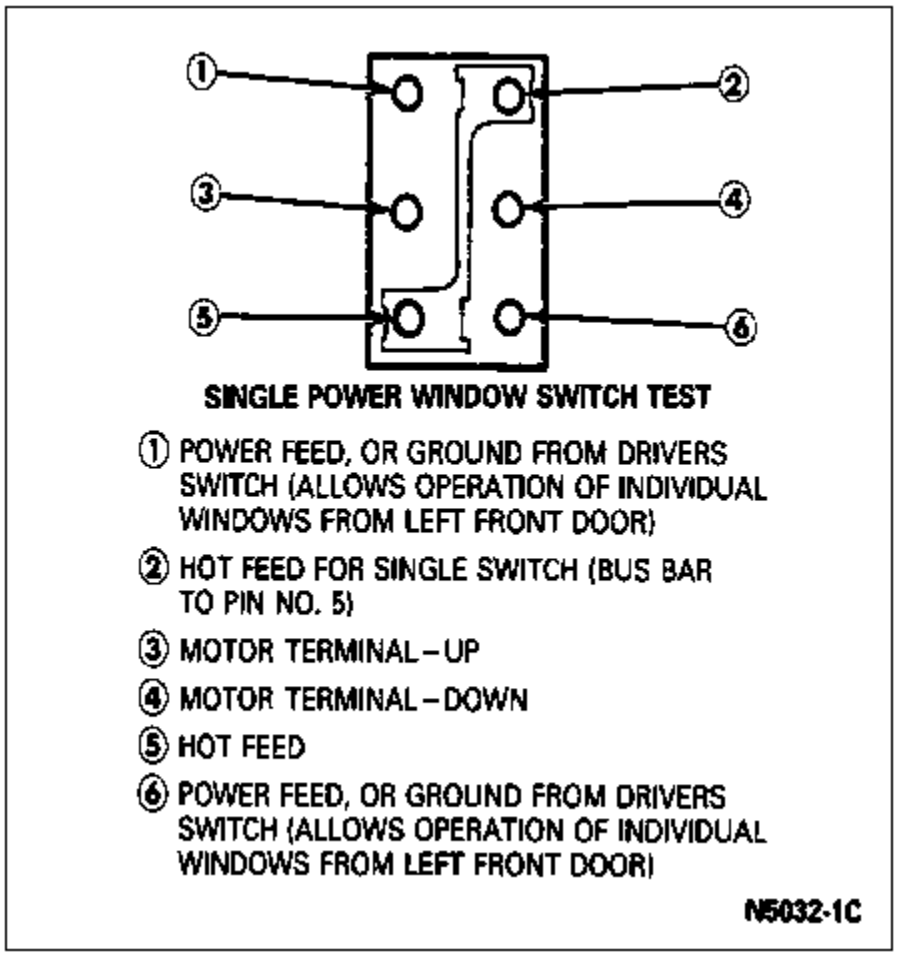
4. If the switch assembly does not test as outlined, replace the switch.



tomsn048@gmail.com

Single Switch

1. Use a self-powered test light or an ohmmeter such as Rotunda Digital Volt-Ohmmeter 014-00407 or equivalent to test the window regulator control switch.
2. With the switch in the neutral position, there should be continuity between terminals 1 and 3, 2 and 5 and 4 and 6.
3. With the toggle switch pushed downward, there should be continuity between terminals 2, 4 and 5, and 1 and 3. Terminal 6 should be disconnected from any other terminal.
4. With the toggle switch pushed upward, there should be continuity between terminals 2, 3 and 5, and 4 and 6. Terminal 1 should be disconnected from any other terminal.
5. If the window regulator control switch does not test as stated, replace the window regulator control switch.



SINGLE POWER WINDOW SWITCH TEST

① POWER FEED, OR GROUND FROM DRIVERS SWITCH (ALLOWS OPERATION OF INDIVIDUAL WINDOWS FROM LEFT FRONT DOOR)
② HOT FEED FOR SINGLE SWITCH (BUS BAR TO PIN NO. 5)
③ MOTOR TERMINAL – UP
④ MOTOR TERMINAL – DOWN
⑤ HOT FEED
⑥ POWER FEED, OR GROUND FROM DRIVERS SWITCH (ALLOWS OPERATION OF INDIVIDUAL WINDOWS FROM LEFT FRONT DOOR)

N5032-1C

Heated Back Window Switch and Light, Aerostar

1. Ground Pin 4 and connect a jumper wire between Pins 3 and 2. Connect a 12-volt test light between

tomsn048@gmail.com

Pin 1 and ground.

2. Apply power to Pin 2. The test light and the ON indicator should **not** come on.

3. Momentarily push the right side of the rocker button to the ON position. The test light and the ON indicator should come on and stay on after the rocker button returns to the normal position.

4. The test light and the ON indicator should go off under one or more of the following conditions:

    - Left side of rocker button is moved to OFF position.
    - Approximately ten minutes have elapsed.
    - Jumper wire between Pin 3 and 2 is disconnected.

Window Regulator Electric Drive

To test the current draw of a power window motor, remove the door trim panel. Refer to Section 01-05A or Section 01-05B .

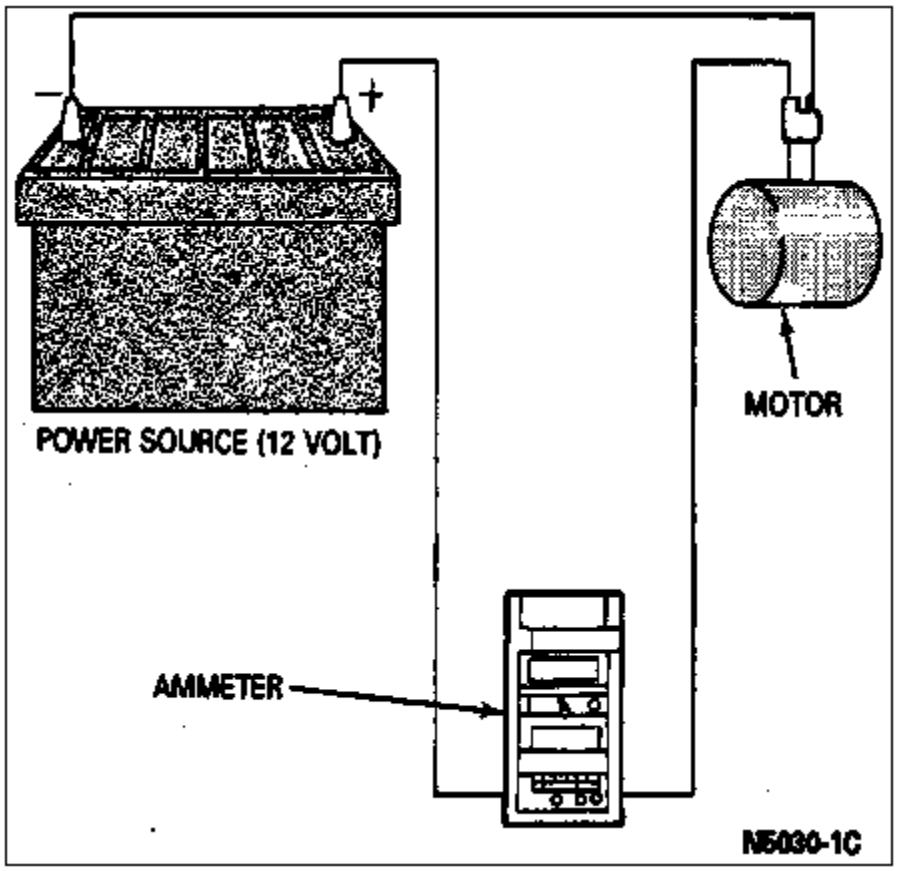
1. Disconnect the motor lead.

2. Disconnect the regulator mechanism from the motor.

3. Supply power to motor lead connector with an ammeter in series.

4. Operate the motor and observe the current draw. The current draw for the no-load test should not exceed four amps and should not fluctuate. Reversal of the motor wire connections will reverse the direction of motor rotation. Replace the motor if the current draw exceeds four amps.

tomsn048@gmail.com



Heated Back Window Grid Wire Test, Aerostar

1. Using a strong light inside the vehicle, visually inspect the wire grid from the outside. A broken grid wire will appear as a brown spot.

2. Run the engine on idle. Set the control switch to ON. The indicator light should come on.

3. Working inside the vehicle with a 12-volt DC voltmeter, contact the broad red-brown strips (bus bars) on the rear window. (Positive lead to battery side and negative lead to ground side. The meter should read 10-13 volts. A lower voltage reading indicates a poor connection or a low battery.

4. Contact a good ground point with the negative lead of the meter. The voltage reading should not change.

5. With the negative lead of the meter grounded, touch each grid line of the heated rear window at its midpoint with the positive ground lead. A reading of approximately 6 volts indicates that the line is good. A reading of zero (0) volts indicates that the line is broken between the midpoint and the B+ side of the grid line. A reading of 12 volts indicates that the circuit is broken between the midpoint of the grid line and ground.

tomsn048@gmail.com

tomsn048@gmail.com

Door Window Glass, Ranger, Aerostar

Removal

1. Remove front door trim panel (23942) and front door trim shield (237A04). Refer to Section 01-05A or Section 01-05B .
2. Raise front door window glass (21410) to full up position.
3. Remove rear glass run retainer from front door (20124).
4. Lower front door window glass to gain access to front door window channel bracket and glass retention rivets.
5. **NOTE: Use care when drilling not to damage glass bracket and spacer/retainers.**

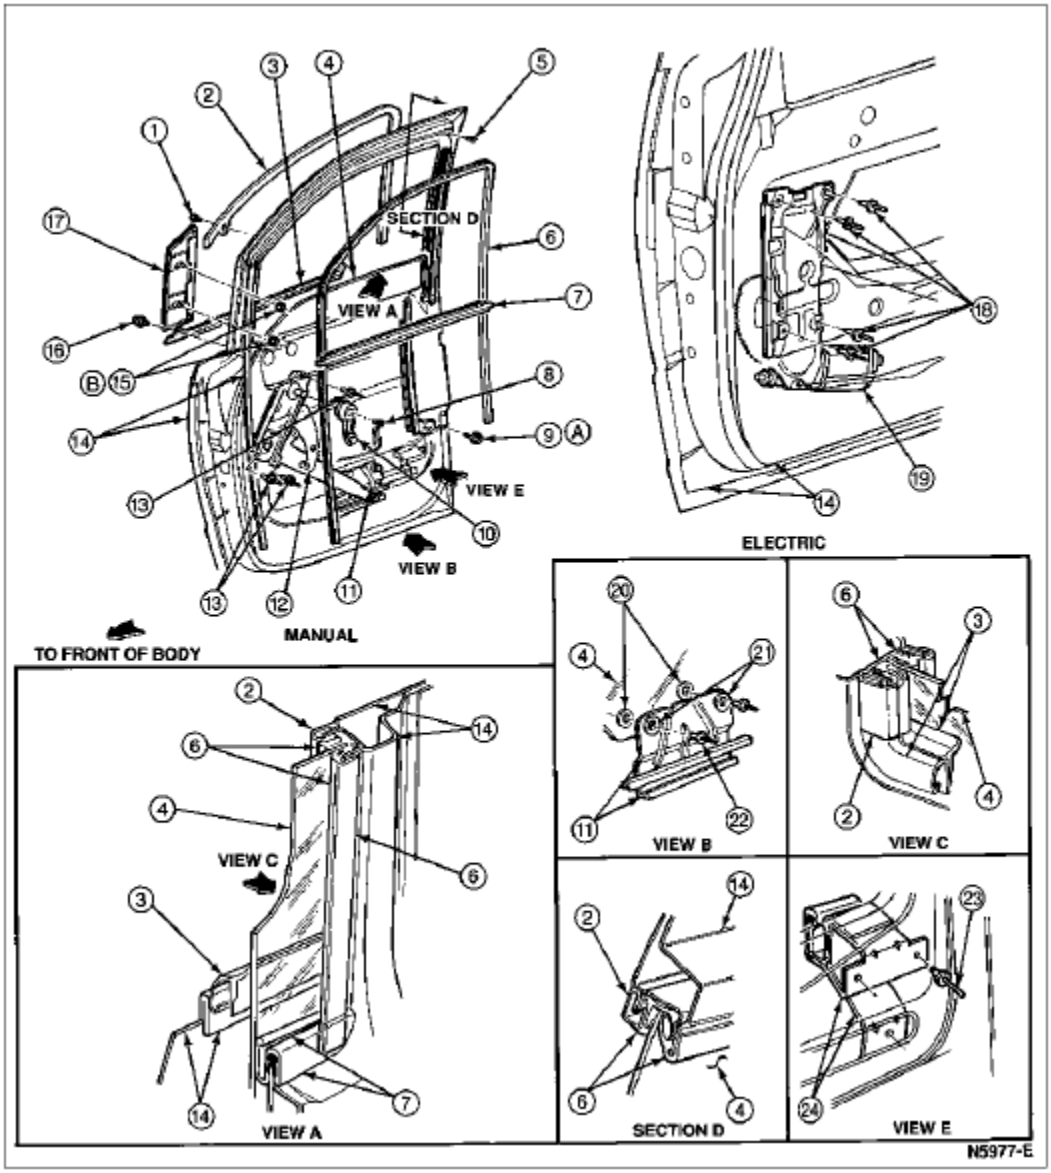
   Remove center pin from the glass retention rivets using a drift punch. Then, use a 6.35mm (1/4-inch) diameter drill and drill out each rivet.
6. Remove the front door window glass through the door window opening.

Installation

1. Install spacer and retainer into glass retention holes.
2. Install front door window glass into front door through the door window opening.
3. Position the front door window glass to the front door window channel bracket and align with the retaining holes.
4. Install retaining rivets.
5. Raise front door window glass to full up position.
6. Install the rear glass run retainer.
7. Cycle front door window glass up and down to check operation.
8. Install front door trim shield and front door trim panel.

Front Door, Aerostar

tomsn048@gmail.com



Item	Part Number	Description

Window Regulator, Power, Manual, Ranger

Removal and Installation

1. **NOTE: Refer to illustration in Removal and Installation, Door Window Glass, Ranger, Aerostar .**

   If removing a power window regulator, disconnect the battery ground cable.

2. Remove the front door window glass (21410). Refer to the procedure in this section.

3. If equipped, disconnect the window regulator electric drive from the door wiring.

4. Drill out the window regulator-to-front door rivets (three for manual, five for electric).

5. Remove the upper and lower door glass guide track-to-front door nuts.

6. If removing the power window regulator, remove the window regulator electric drive and the power window regulator as an assembly.

7. Remove the window regulator from the vehicle.

8. If necessary, remove the window regulator electric drive from the power window regulator.

To install, use new rivets (or equivalent threaded fasteners), and reverse the removal procedure. Tighten window regulator fasteners to 11-13 Nm (91-122 lb-in).

tomsn048@gmail.com

Window Regulator, Aerostar

Front Door

Removal

1. **NOTE: Refer to illustration in Removal and Installation, Door Window Glass, Ranger, Aerostar .**

   Remove the front door trim panel and front door trim shield. Refer to Section 01-05B .

2. If equipped with power windows, disconnect the wire from the window regulator electric drive.

3. Remove the front door window glass (21410) as described in this section.

4. Remove the front door glass run latch side retainer, if equipped (one screw), and remove it through the door window opening.

5. Remove the glass bracket assembly, from the front door (20124), sliding the bracket C-channel off the regulator arm side/roller.

6. **NOTE: Be careful not to damage sheet metal holes during drilling.**

   Remove the center pin from the regulator attaching rivets (three for manual, four for power) with drift punch. Then, drill out remainder of rivet heads using a 6.35mm (1/4-inch) drill.

7. Remove the window regulator from the front door.

Installation

1. Position the window regulator in the front door. Align retention holes to door inner panel.

2. Install three (four rivets for power window) rivets attaching the window regulator to door inner panel using Rotunda Blind Fastener Installation Tool or equivalent. Equivalent threaded fasteners may be used in place of rivets.

3. Assemble glass bracket to regulator arm slide.

4. Install front door window glass as described in this section.

5. Install the front door glass run latch side retainer. Make sure the front door window glass is seated in the retainer's C-channel.

6. Adjust the front door glass run latch side retainer so that the front door window glass can move freely but not loosely.

7. Tighten the front door glass run latch side retainer bolt to 7-11 Nm (62-92 lb-in).

8. Reconnect wire to regulator for power window if equipped.

9. Check operation of window regulator.

tomsn048@gmail.com

10. Install front door trim shield and trim panel. Refer to Section 01-05B .

tomsn048@gmail.com

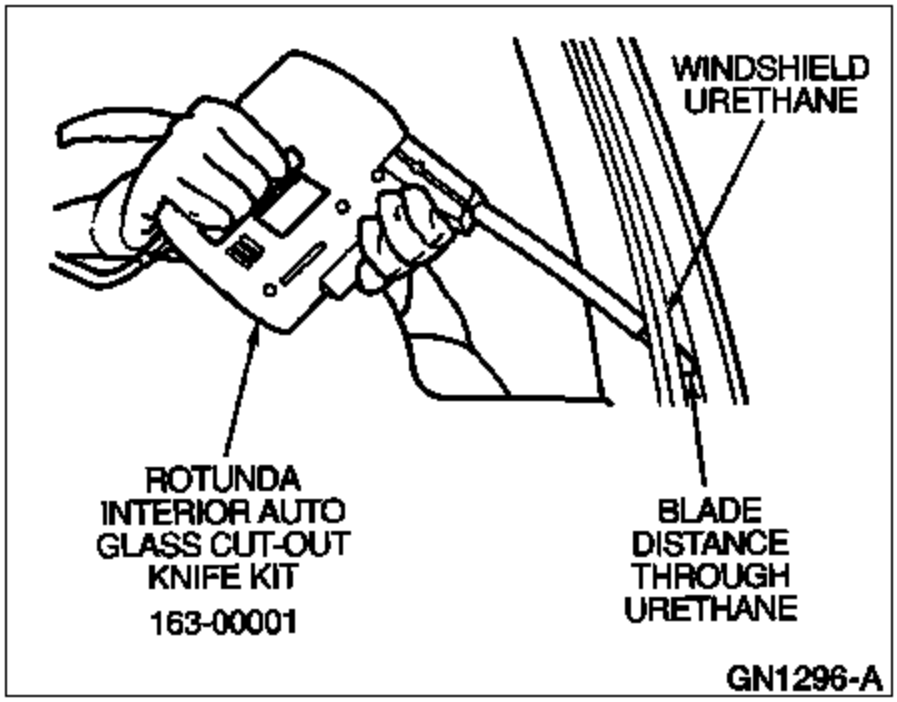
Windshield Glass

Removal

1. Lift the lock tabs and remove the windshield wiper pivot arms (17526).
2. Remove windshield moulding, glass stops and retainers as described in this section.
3. Remove interior trim to prevent damage during windshield glass removal.
4. Remove inside visors (04100). Disconnect electrical connector to vanity mirror (17A679), if equipped.
5. Use a thin-bladed screwdriver to insert through access hole to remove inside rear view mirror (17700) from windshield glass (03100).
6. Loosen roof trim panel near windshield glass. Insert styrofoam blocks under roof trim panel to move it away from windshield glass and prevent damage.
7. Spray lubricant ECL-784 around urethane cutting area.
8. Insert a four-inch blade into a Rotunda Interior Auto Glass Cut-Out Knife Kit 164-R2450 or equivalent. From interior of vehicle, cut urethane beginning at upper center and continuing to lower driver side, then from center to passenger side.
9. **NOTE: Be careful to cut through urethane in corner of windshield glass, where urethane is thicker.**

   Insert a 12-inch blade into cutting tool and bend blade to match contour of dash. Cut around the bottom portion of the urethane sealant.

tomsn048@gmail.com



10. Using a long-handled razor knife, remove any remaining stringers.
11. Remove windshield glass.
12. Clean pinchweld. Do not damage dress moulding.

Installation

CAUTION: When replacing urethane-installed glass parts, the vehicle should not be driven until the urethane has cured. This will prevent the windshield from being jarred out of position.

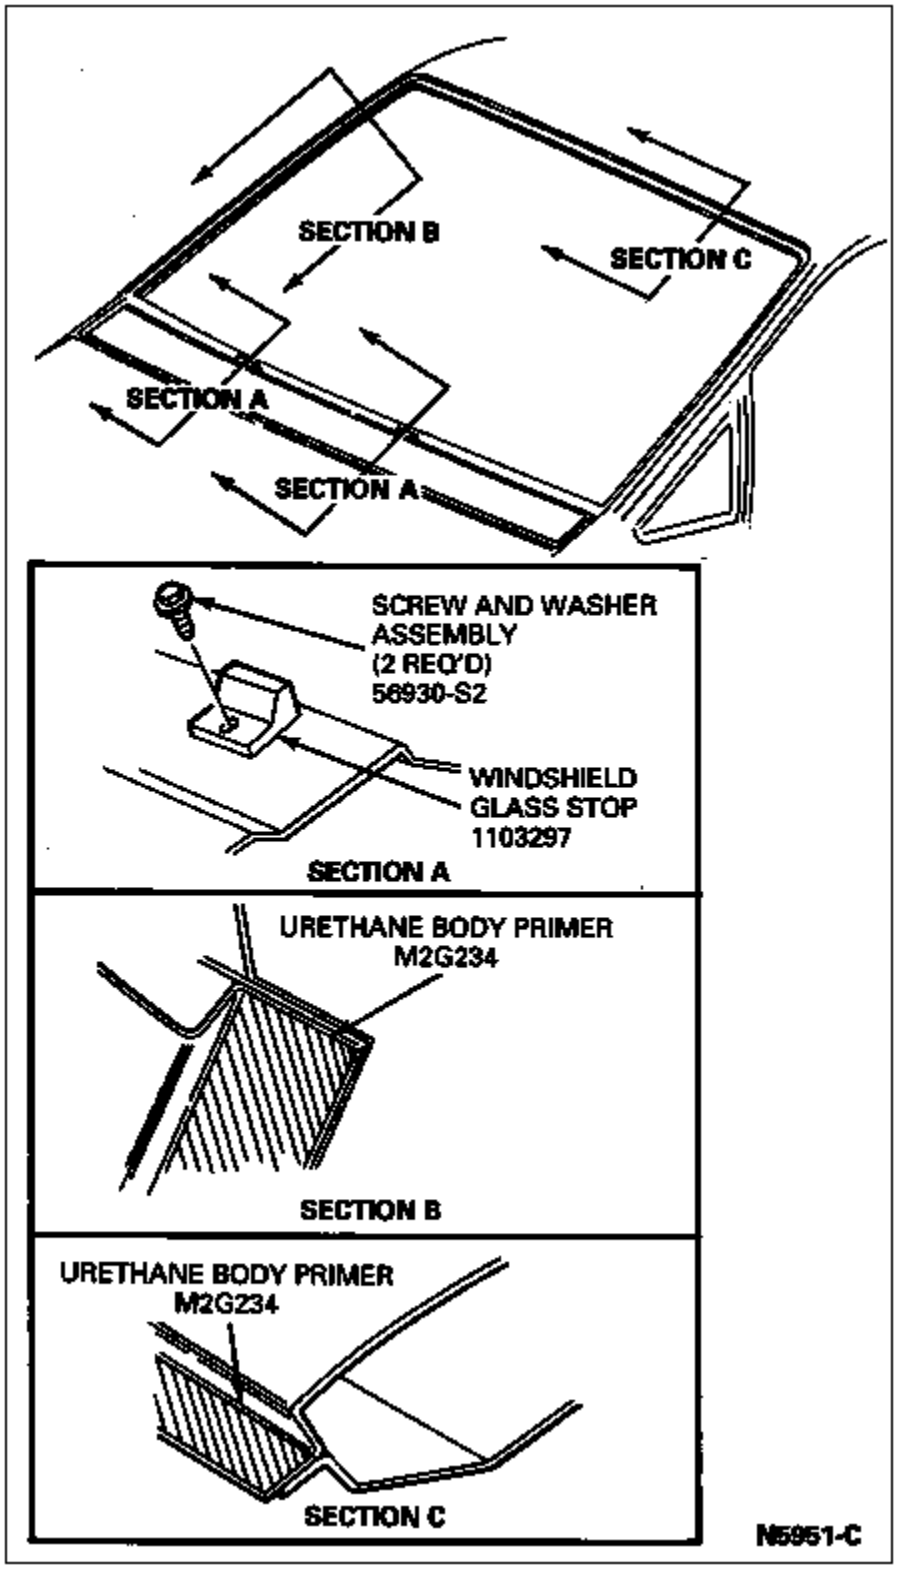
NOTE: Refer to manufacturer's directions for exact cure time of urethane.

1. Leave front door window glass open to prevent movement of the windshield glass from pressure when closing front door (20124).
2. Remove any remaining urethane from windshield glass.
3. Using a mask or template apply primer Essex No. 3 around windshield glass.
4. Install foam dam onto pinchweld.
5. **CAUTION: To ensure correct windshield molding fit, maintain a maximum of 1mm (.04-inch) difference between side margins.**

   Apply Essex No. 4 urethane and position windshield glass on vehicle.
6. Install roof trim panel, inside visors (04104), trim, windshield moulding, glass stops and retainers.
7. Install windshield wiper pivot arms.

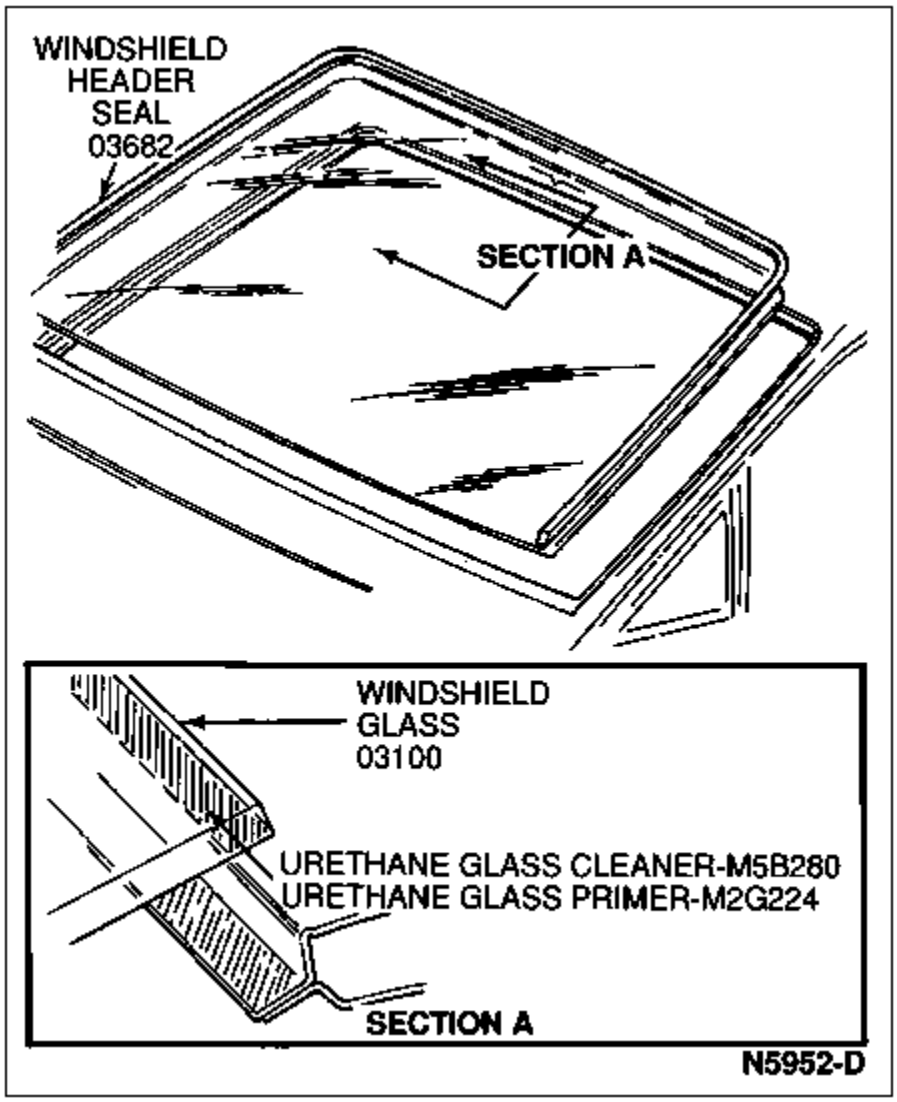
tomsn048@gmail.com

Urethane Primer Application, Aerostar



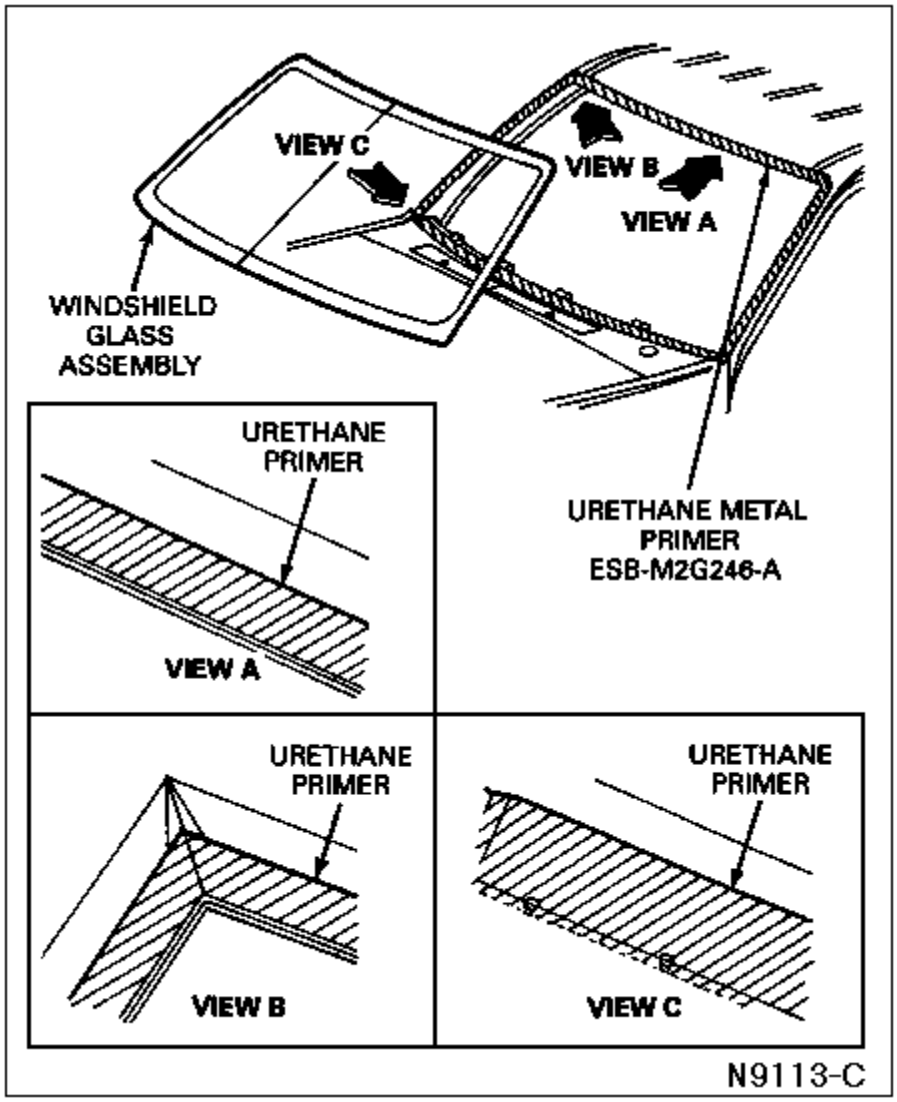
tomsn048@gmail.com

Windshield Glass Installation, Aerostar

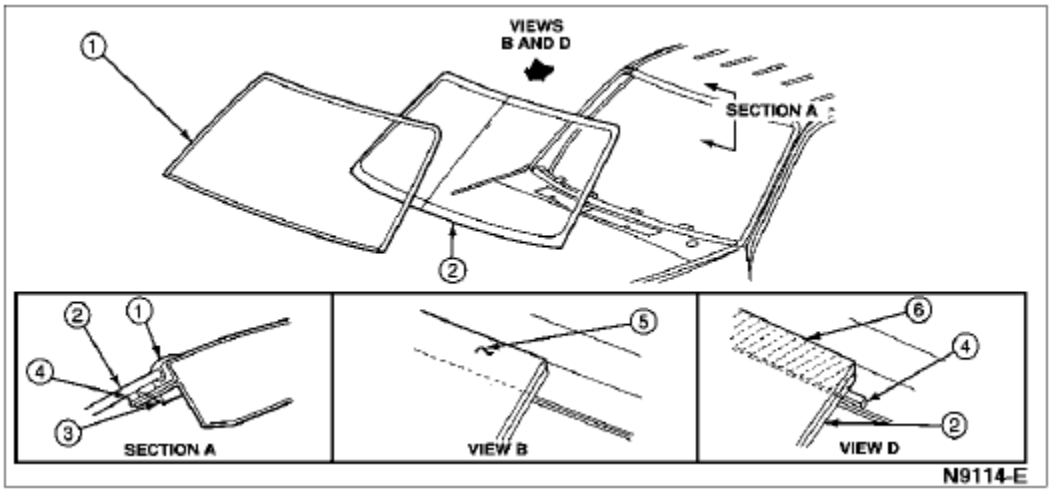


Urethane Primer Application, Ranger

tomsn048@gmail.com



Windshield Glass Installation, Ranger



tomsn048@gmail.com

Item	Part Number	Description
1	03045	Windshield Header Seal
2	03100	Windshield Glass
3	M2G316	Urethane High Viscosity Sealer
4	M3G137	Extruded Foam Dam
5	M5B280	Urethane Glass Cleaner
6	M2G314-B	Urethane Glass Primer

tomsn048@gmail.com

Mouldings, Aerostar

The windshield header seal (03045) is made of a PVC material and is retained in the windshield opening by the urethane sealant.

NOTE: On Ranger, the windshield header seal is removed and installed in the Windshield Glass removal and installation procedure in this section.

Removal

1. Remove the cowl top vent panel (022A68).
2. **CAUTION: To prevent damage, do not pry against the windshield glass (03100). Use care not to damage the paint.**

   Pry out and discard the windshield header seal from the windshield glass opening. The windshield header seal cannot be reused.
3. With a sharp knife, remove sufficient urethane sealant to allow room for new urethane sealant.

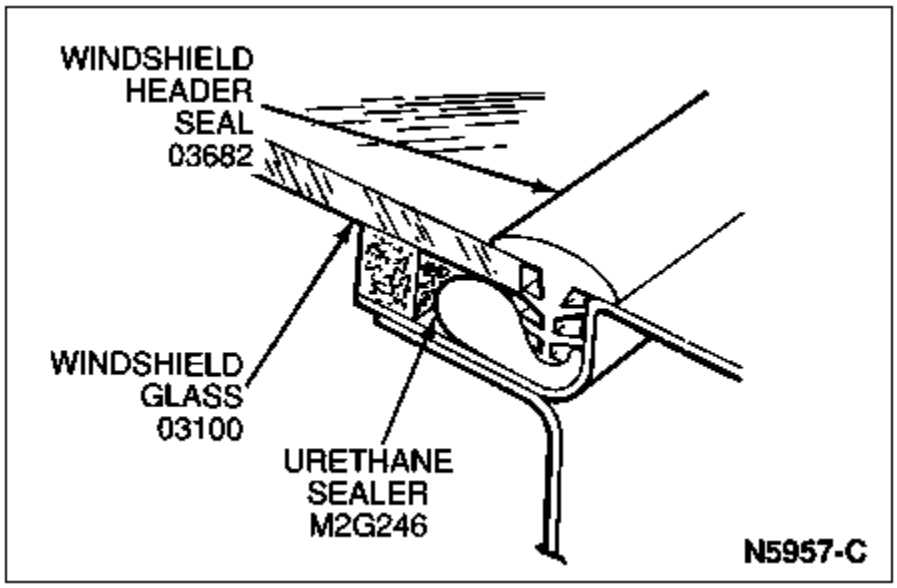
Installation

CAUTION: When replacing urethane installed glass parts, the vehicle should not be driven until the urethane has cured. This will prevent parts from being jarred out of position.

NOTE: Refer to manufacturer's directions for exact cure time of urethane.

1. Replace the PVC windshield header seal with a new service moulding.
2. Apply urethane glass cleaner meeting Ford specification WSB-M5B280-C to the entire periphery of the windshield glass and wipe off immediately.
3. Apply urethane glass primer meeting Ford specification WSB-M2G314-B to the entire periphery of the windshield glass.
4. Apply a sufficient amount of high viscosity urethane adhesive meeting Ford specification WSB-M2G316-B to the entire periphery of windshield glass opening to retain the PVC windshield header seal.

tomsn048@gmail.com



5. Align the centering notch of the PVC windshield header seal to the center mark in the ceramic paint at top and bottom of windshield glass.

6. Position the windshield header seal assembly into the windshield glass opening and press around entire periphery to seat.

7. Install the cowl top vent panel.

Door Window and Quarter Window, Front and Rear

Removal and Installation

The outside door window mouldings are attached with various fasteners, including nuts, rivets and clips. For removal, use a tool to suit the fastener and use care not to damage painted surfaces. Use care not to bend or otherwise damage the mouldings. For installation, use new fasteners as necessary and reverse the removal procedure.

tomsn048@gmail.com

tomsn048@gmail.com

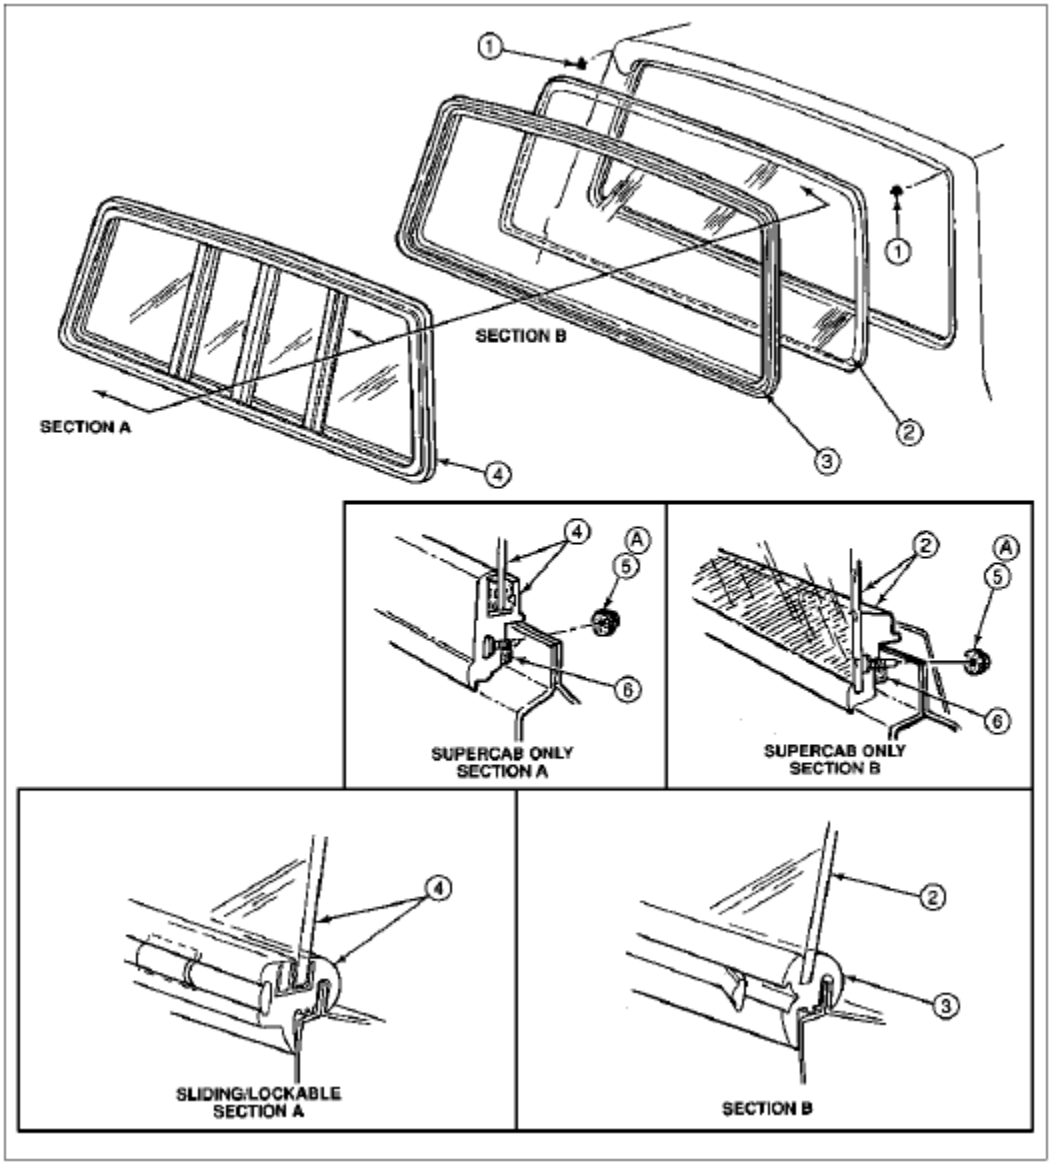
Back Window Glass, Fixed, Ranger

Removal

1. Remove the interior trim necessary to access the back window glass mounting area. Refer to Section 01-05A .
2. For Regular Cab, pull the back window glass weatherstrip away from the back window glass opening.
3. For SuperCab, remove the eight back window glass nuts.
4. With an assistant to prevent damage, push out the back window glass (42006) from the back window glass opening.
5. Clean all sealant from the back window glass weatherstrip and the back window glass opening.

Rear Window, Ranger

tomsn048@gmail.com



Item	Part Number	Description
1	ESB-M4G250-A	Sealer. Apply Before Glass Installation
2	42006	Back Window Glass, Fixed
3	42084	Weatherstrip, Back Window Glass
4	42006	Back Window Glass, Sliding
5	N621900-S2	Nut, Back Window Glass
6	—	Seal Tap (Part of 42006)
A	—	Tighten to 1-2 Nm (9-17 Lb-In)

Installation

tomsn048@gmail.com

1. **NOTE: Green Soap ESB-M1B9-A or equivalent, diluted 10 to 1 with water, may be used to facilitate installation of back window glass weatherstrips and mouldings.**

   Install a draw cord all around the back window glass weatherstrip in the flange crevice, allowing the cord to overlap at the bottom center of the back window glass.

2. Coat the back window glass weatherstrip mounting surface with a rubber lubricant meeting Ford specification ESR-M99B135-A or ESA-M1B6-A or equivalent.

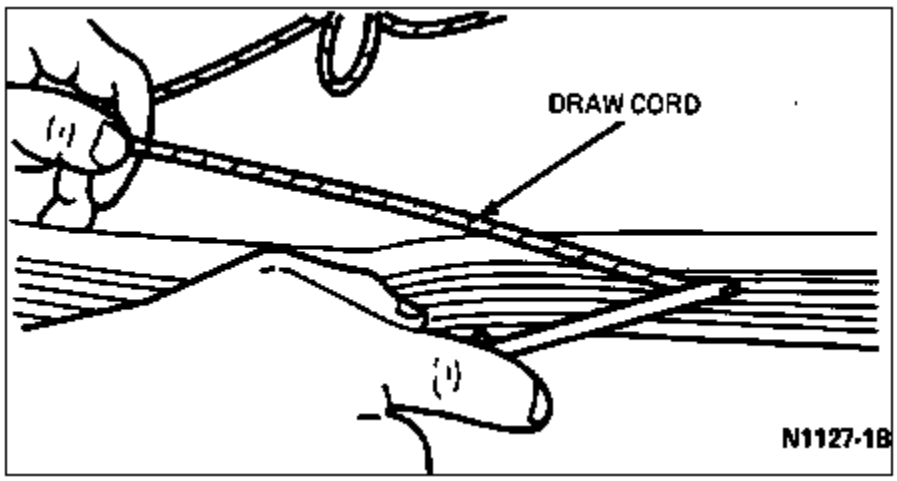
3. For SuperCab, position the back window glass in the back window glass opening and install the eight back window glass nuts. Tighten the nuts to 1-2 Nm (9-17 lb-in).

4. For Regular Cab, position the back window glass and back window glass weatherstrip to the window opening. With an assistant applying hand pressure from outside the cab, pull (from inside) the back window glass weatherstrip lip over the flange with the draw cord.

5. Pull back window glass weatherstrip over lower flange, pulling one end of the cord at a time. Then, pull the back window glass weatherstrip over the side flanges and upper flange.

6. Clean area aroundback window glass and remove all excess sealer.

7. Test for water leaks.



tomsn048@gmail.com

tomsn048@gmail.com

Back Window Glass, Opening, Ranger

Removal

1. From the interior of the vehicle, pull down the back window glass weatherstrip lip along the window opening and with an assistant, push the sliding back window glass and weatherstrip assembly out of the back window glass opening from inside the cab.

2. Remove the back window glass weatherstrip from the back window glass (42006). Place the movable back window glass in the open position.

3. At the top of the sliding back window glass frame, remove the screw retaining each division bar.

4. Remove the two screws retaining anchor plate in the window track. Remove the plate.

5. Spread the sliding back window glass frame and work the movable portion of the back window glass out of its track. Remove the movable back window glass frame.

6. If the stationary panes of the sliding back window glass are to be replaced, remove the division bar lower retaining screw and remove the division bar.

7. Spread the sliding back window glass frame just enough to permit the stationary panes of the back window glass to be worked out of the frame.

Installation

1. If the stationary portion of the sliding back window glass is to be replaced, apply Silicone Lubricant C0AZ-19553-AA or equivalent meeting Ford specification ESR-M13P4-A to the back window glass weatherstrip and track.

2. **NOTE: Do not allow the back window glass weatherstrip within the sliding back window glass frame to bunch.**

   Spread the sliding back window glass frame slightly and slide the pane or panes into place in the sliding back window glass frame.

3. Position division bar in sliding back window glass frame. Install the lower retaining screw.

4. Spread the sliding back window glass frame slightly and install the movable back window glass in its track.

5. Position the anchor plate in the window track. Install the two retaining screws.

6. Install the division bar upper retaining screws.

7. Install the back window glass and frame assembly into the back window glass weatherstrip.

8. Install a draw cord all around the back window glass weatherstrip in the flange crevice, allowing the

tomsn048@gmail.com

cord to overlap at the bottom center of the back window glass.

9. **NOTE: Green Soap ESB-M1B9-A or equivalent, diluted 10 to 1 with water, may be used to facilitate installation of back window glass and back window upper garnish moulding.**

   Position the back window glass to the window opening. With an assistant applying hand pressure from outside the cab, pull the back window glass weatherstrip lip over the window opening flange with the draw cord.

10. Pull the back window glass weatherstrip over the lower flange, pulling one end of the cord at a time. Then, pull the seal over the side flanges and upper flange.

---

tomsn048@gmail.com

Body Side Window/Sliding Side Door Glass, Aerostar

CAUTION: Avoid damaging window assembly if it is to be reused.

Removal

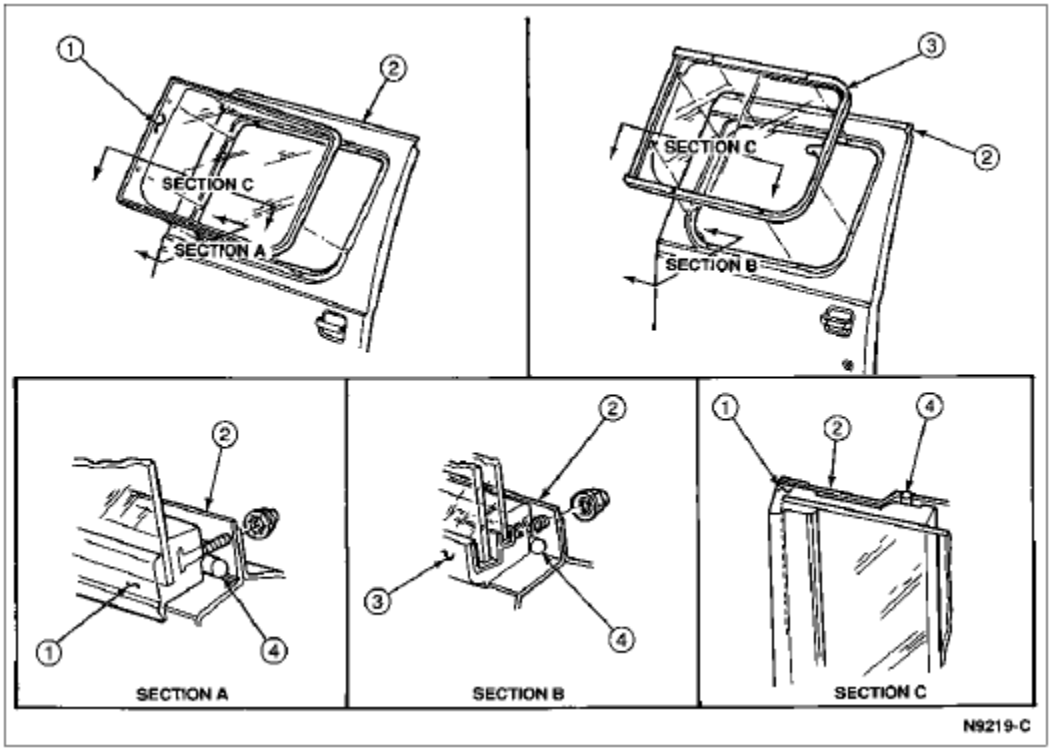
1. Remove the quarter trim panel (31012). Refer to Section 01-05B .
2. Remove the retaining nuts from window module.
3. With an assistant to prevent damage, push the window out carefully.

Installation

1. Clean the window opening surface of all sealer.
2. Clean existing sealer from window module, if reusing.
3. Apply a continuous strip of 8-9mm (11/32 in.) bead of Liquid Butyl Sealer C9AZ-19554-B or equivalent meeting Ford specification ESB-M4G162-A.
4. Install the window module into the opening.
5. Install the retaining nuts. Tighten to 1-2 Nm (9-17 lb-in).
6. Test for water leaks.
7. Install quarter trim panel. Refer to Section 01-05B .

Sliding Side Door Glass, Aerostar

tomsn048@gmail.com



Item	Part Number	Description
1	25700	Sliding Door Window, Fixed
2	24602	Sliding Side Door
3	25700	Sliding Door Window, Opening
4	26954	Sealer, 8-9mm (11/32 In.) Bead

tomsn048@gmail.com

Body Side Window Assembly, Movable Glass, Ranger SuperCab

Removal and Installation

1. Open quarter window latch. Remove two screws attaching quarter window latch.
2. Remove the quarter trim panel. Refer to Section 01-05A .
3. Drill out the four rivets attaching the quarter window hinges to the body panel.
4. Remove body side window assembly.

For installation, follow removal procedures in reverse order.

Body Side Window, Ranger SuperCab

tomsn048@gmail.com

Body Side Window Assembly

Fixed Glass, Ranger SuperCab; Fixed or Movable Glass, Aerostar

Removal

1. **CAUTION: Avoid damaging or distorting window assembly.**

   Remove quarter trim panel. Refer to Section 01-05A .

2. From inside the vehicle, remove the nuts from inside the quarter window or rear quarter window.

3. With an assistant to prevent the rear quarter window glass from falling, remove glass assembly by pushing with enough pressure to separate the butyl seal.

4. Clean old seal from body recess and from the rear quarter window glass. All traces of old sealing material must be removed.

5. Inspect for sheet metal deficiencies. Check sealing surface of flange for chipped or missing paint. Repair as necessary.

Installation

1. If the rear quarter window glass replacement is not complete with sealer tape, then apply a continuous strip of 8.0 x 8.0mm (5/16 x 5/16 inch) Foam Core Butyl Tape ESB-M3G143-A2 or equivalent to the back of the rear quarter window glass. The start/stop joint must be at the bottom of the rear quarter window glass, between studs and overlap 24-50mm (1-2 inches).

2. Press the rear quarter window glass into place. Use enough pressure to seat window firmly in sealing material.

3. Install retaining nuts. Tighten to 1-2 Nm (9-17 lb-in).

4. Install the quarter trim panel. Refer to Section 01-05A .

Weatherstrip, Door Glass Belt

Removal and Installation

1. Lower the door window glass to full down position.
2. Unsnap and remove belt weatherstrips from the door.

For installation, follow removal procedures in reverse order.

tomsn048@gmail.com

Weatherstrip, Body Side Glass

Removal and Installation

The Aerostar rear quarter glass weatherstrips are bonded to the rear quarter window glass and are not separately serviceable. For removal and installation of the Ranger quarter window glass weatherstrips, use the following procedure.

1. Remove the body side window glass as described in this section.
2. Pull and remove the quarter window glass weatherstrip from the window opening.

For installation, follow removal procedure in reverse order. Use care not to bunch or stretch the weatherstrip.

tomsn048@gmail.com

Window Regulator Control Switch, Aerostar

NOTE: The window regulator control switches are located on the front door trim panel.

Removal and Installation

1. Remove window regulator switch plate by carefully prying up with a flat-bladed tool.
2. Remove retaining nuts holding front window regulator wiring to the back of the window regulator switch plate. Using a thin-bladed screwdriver, carefully pry the window regulator control switch from the connector.

For installation, follow removal procedures in reverse order.

tomsn048@gmail.com

Circuit Breaker

Removal and Installation

1. Remove the cover from the power distribution box next to the battery tray.
2. Remove the power window circuit breaker from position number five.

For installation, follow removal procedures in reverse order.

tomsn048@gmail.com

Window Regulator Electric Drive, Aerostar

Front Door

Removal

1. **NOTE: When the battery is disconnected and reconnected, some abnormal drive symptoms may occur while the powertrain control module (PCM) (12A650) relearns its adaptive strategy. The vehicle may need to be driven 16 km (10 miles) or more to relearn the strategy.**

   Disconnect the battery ground cable (14301).

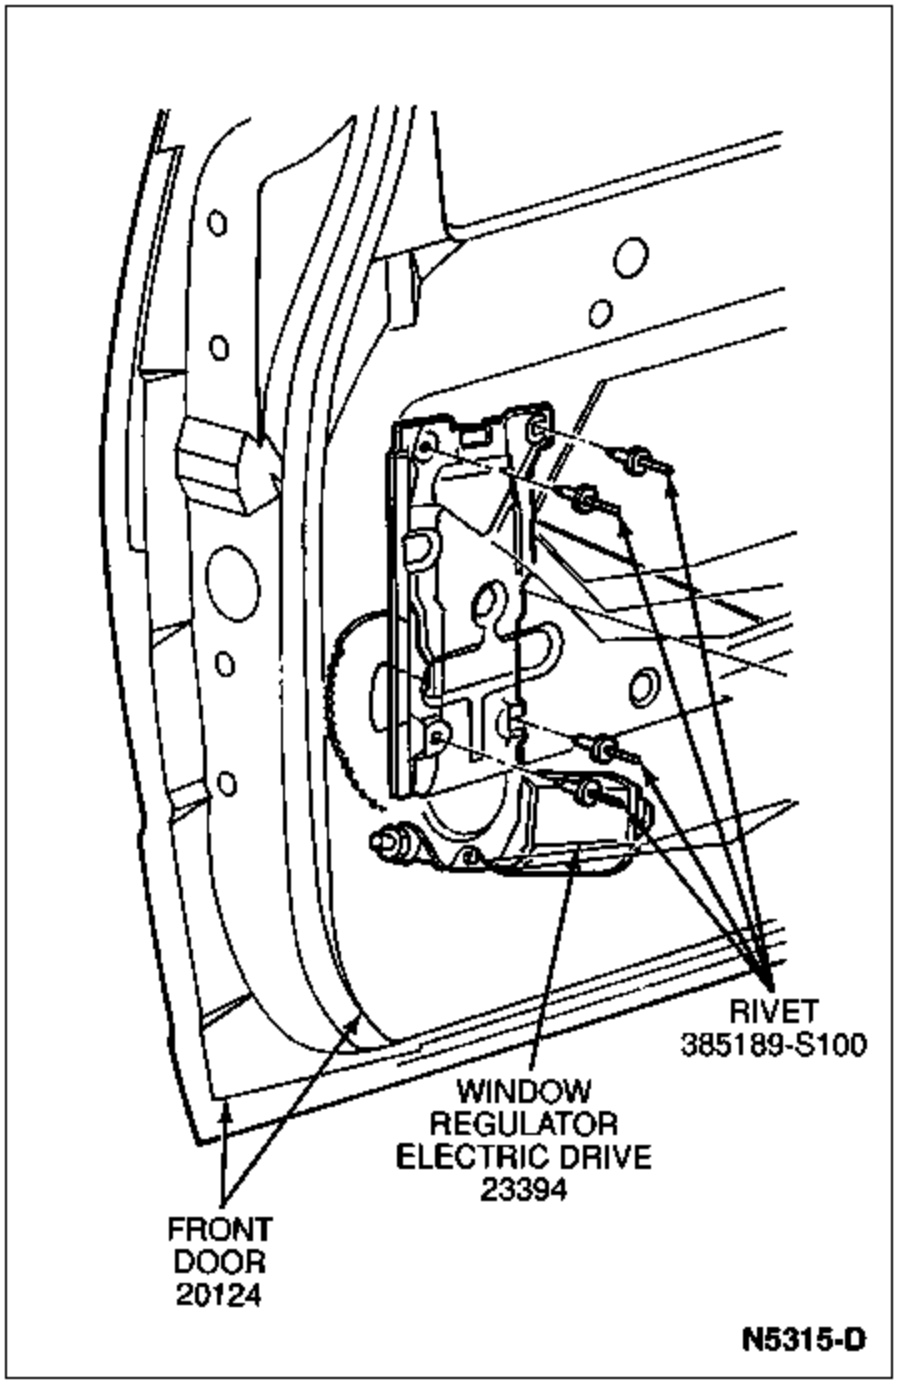
2. Remove the front door trim panel. Refer to Section 01-05B .

3. **NOTE: Check inside the front door (20124) to make sure front window regulator wiring is not in line with holes to be drilled in the door inner panel.**

   Disconnect front window regulator wiring connector.

4. Using a 12.7mm (1/2-inch) diameter drill bit, drill two holes in the front door trim shield at the drill dimples located opposite the two unexposed motor drive retainer screws.

tomsn048@gmail.com



5. Remove three motor mount retainer screws, using two drilled holes and existing larger hole access to screw heads.

6. Push window regulator electric drive toward outside sheet metal to disengage window regulator electric drive and drive from the window regulator gear.

7. After the window regulator electric drive and drive are disengaged, prop the front door window glass (21410) in full up position.

8. **WARNING: AEROSTAR HAS A COUNTERBALANCED SPRING. WINDOW MUST BE IN UP**

tomsn048@gmail.com

POSITION TO REMOVE POWER MOTOR OR BLOCKED TO PREVENT WINDOW FROM SUDDENLY RAISING, CAUSING POSSIBLE INJURY.

Remove window regulator electric drive and drive from inside front door.

Installation

1. Install a new window regulator electric drive. Tighten retaining screws to 6-9 Nm (50-84 lb-in).
2. Install two pieces for Pressure Sensitive Waterproof Tape D6AZ-19627-A or equivalent body tape 25.4mm (1 inch) square over drilled holes.
3. Connect front window regulator wiring and battery ground cable.
4. Remove front door window glass prop. Check front door window glass operation.
5. Make sure drain holes are open.
6. Install front door trim panel. Refer to Section 01-05B .

tomsn048@gmail.com

Window Regulator Electric Drive, Ranger

Front Door

Removal

1. **NOTE: When the battery is disconnected and reconnected, some abnormal drive symptoms may occur while the powertrain control module (PCM) (12A650) relearns its adaptive strategy. The vehicle may need to be driven 16 km (10 miles) or more to relearn the strategy.**

   Disconnect battery ground cable (14301).

2. Remove front door trim panel (23942) and front door trim shield (237A04). Refer to Section 01-05A .

3. Disconnect front window regulator wiring from wire harness connector.

4. Locate two of the three window regulator electric drive mounting screws, visible through existing holes.

5. Locate dimple in inner door panel, covering the third mounting screw. Drill a 1/2-inch hole to access third screw. Use care not to drill into door wiring.

6. Remove three screws retaining front door window regulator to window regulator electric drive.

7. Remove the window regulator electric drive through the access hole.

Installation

1. Install new window regulator electric drive to front door window regulator. Tighten motor retaining screws to 6-9 Nm (50-84 lb-in).

2. Connect front window regulator wiring and battery ground cable.

3. Check front door window regulator wiring operation.

4. Make sure door drain holes are open.

5. Cover drilled hole with pressure sensitive tape.

6. Install front door trim shield and front door trim panel. Refer to Section 01-05A .

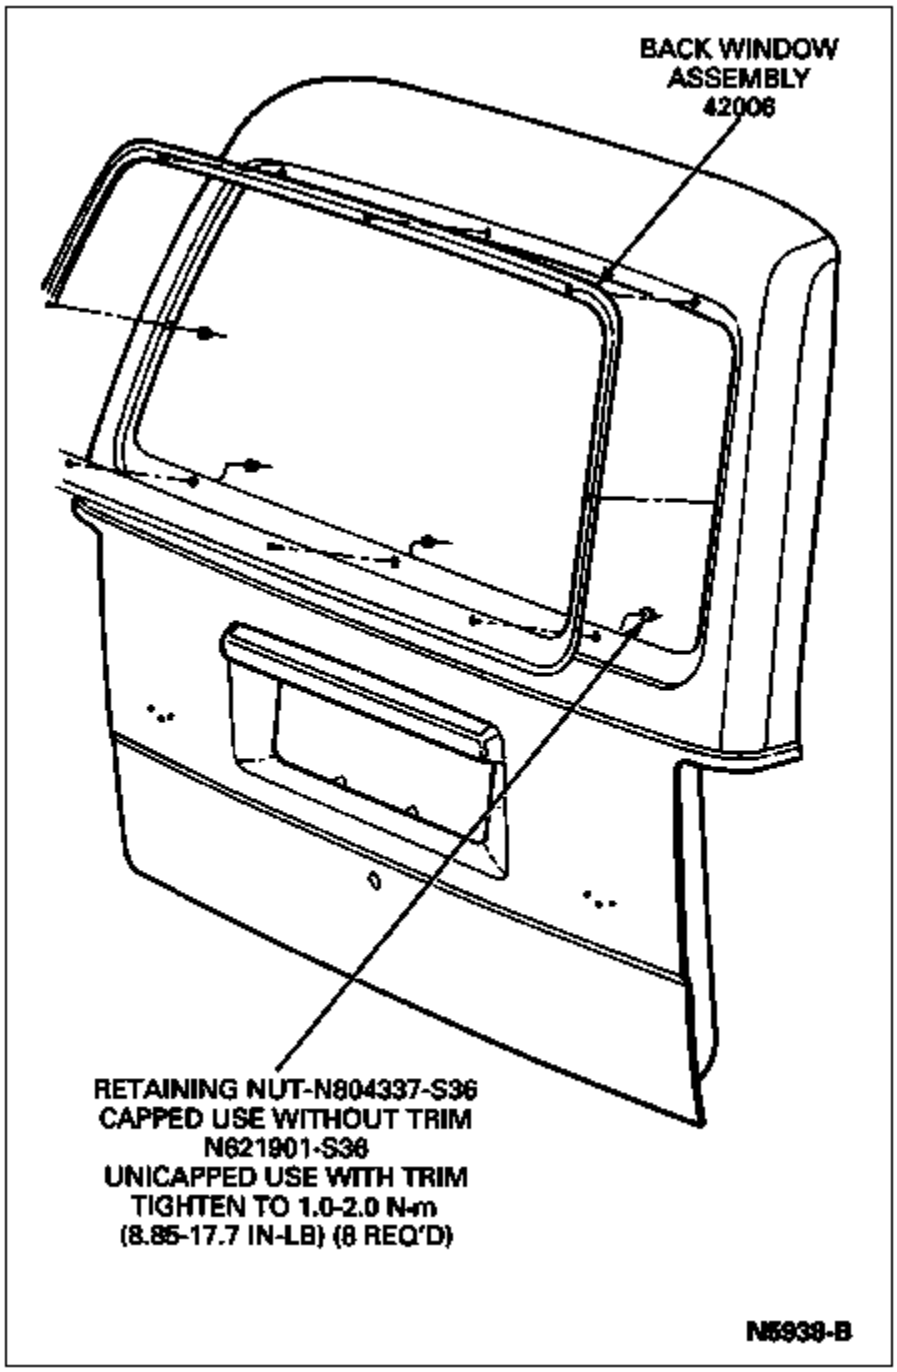
Glass, Stationary, Rear Door, Aerostar

Removal

1. Remove the door trim panel. Refer to Section 01-05B .
2. On liftgate, disconnect rear window defroster wire leads at each end of window glass.
3. Remove the eight retaining nuts on dual rear door or liftgate back window glass, eight nuts per back window glass.
4. With an assistant to prevent damage, push the back window glass out.

tomsn048@gmail.com



Installation

1. **CAUTION: Do not use a razor blade to clean sealer from heated rear window. Use of razor blades, steel wool or abrasive powders will damage the grid wires.**

   Clean the existing sealer from the back window glass if it is to be reused.

2. Clean the window opening surface of all sealer.

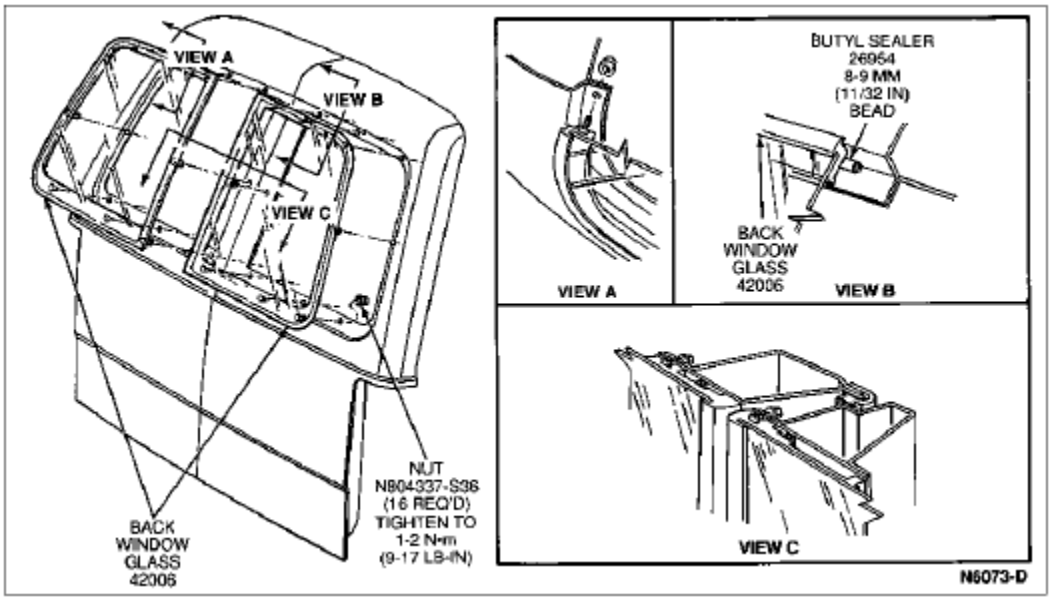
3. Apply a continuous 8-9mm (11/32 in.) bead of Liquid Butyl Sealer C9AZ-19554-B or equivalent

tomsn048@gmail.com

meeting Ford specification ESB-M4G162-A.

4. Install the back window glass into the opening.
5. Install the retaining nuts. Tighten to 1-2 Nm (9-17 lb-in).
6. Test for water leaks.
7. Install door trim panel. Refer to Section 01-05B .
8. Connect rear window defroster wire leads.

Rear Window, Aerostar



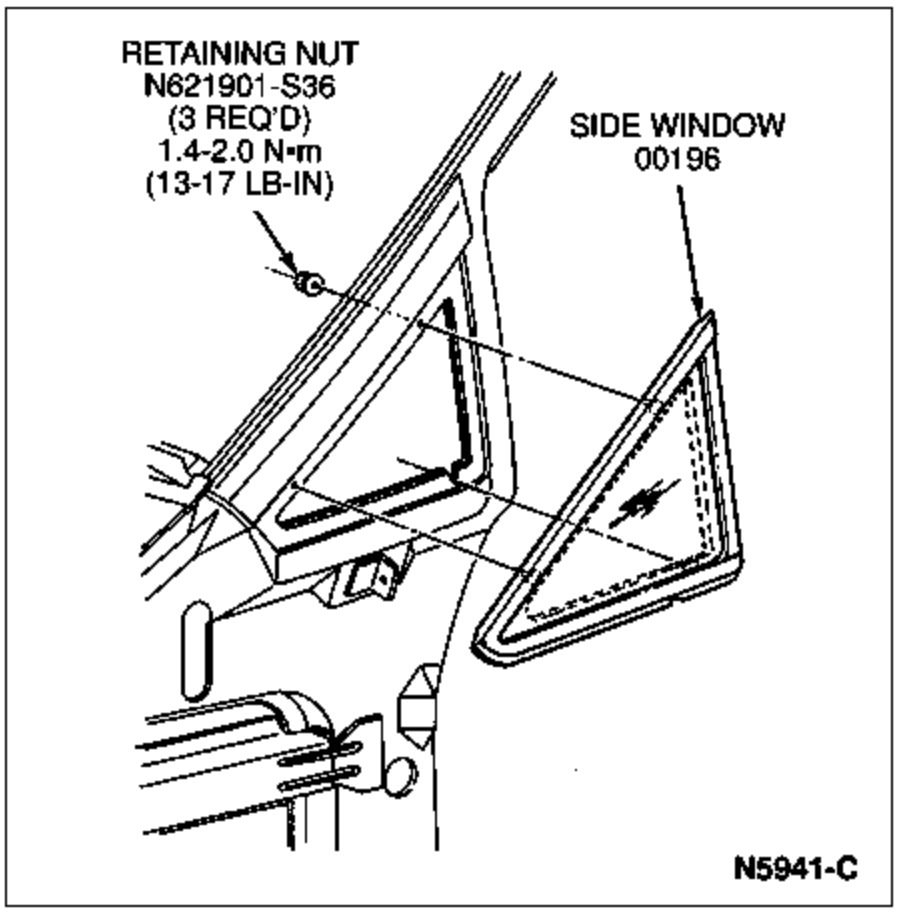
tomsn048@gmail.com

tomsn048@gmail.com

Side Window, Aerostar

Removal

1. Remove the interior trim. Refer to Section 01-05B .
2. Remove the three retaining nuts.
3. Push the side window module out.

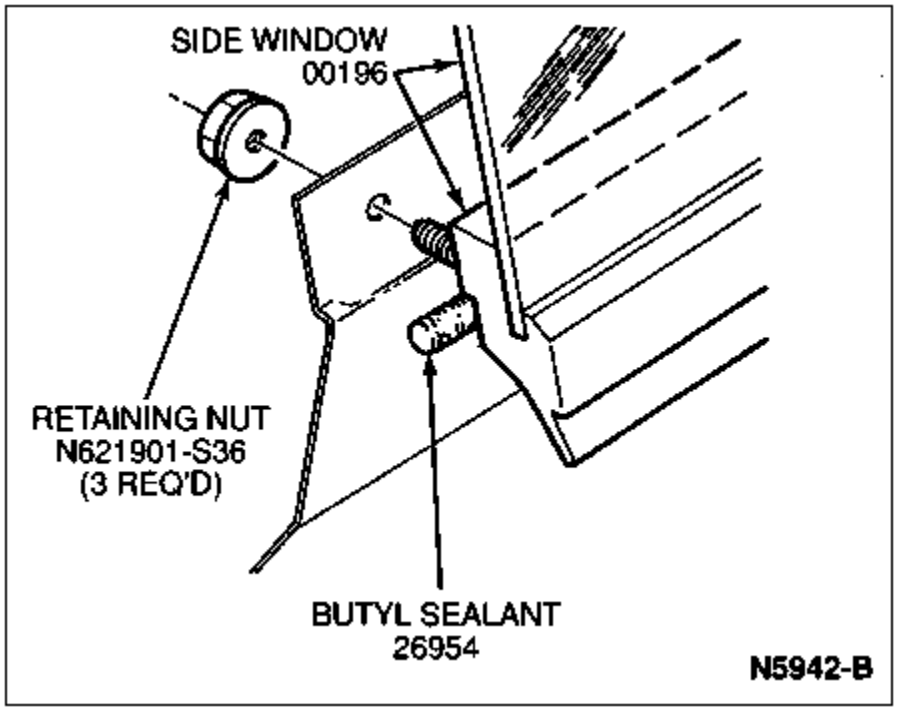


Installation

1. Clean the window opening surface of all sealer.
2. Clean the existing sealer from the window module if it is to be reused.
3. Apply a continuous 8-9mm (11/32 in.) bead of Liquid Butyl Sealer C9AZ-19554-B or equivalent meeting Ford specification ESB-M4G162-A.

tomsn048@gmail.com

4. Install the side window module into the opening.
5. Install the three retaining nuts. Tighten to 1-2 Nm (9-17 lb-in).
6. Clean the area around the window to remove all the excess sealer.
7. Test for water leaks.
8. Install the interior trim. Refer to Section 01-05B .



tomsn048@gmail.com

tomsn048@gmail.com

Latch, Rear Quarter Window, Ranger

Removal and Installation

1. Open the quarter window to relieve latch tension.
2. Remove the latch pin from the clamp and window pin.
3. Unscrew the window pin from the quarter window. Observe the part orientation.
4. Remove the two screws attaching the latch clamp to the inside body panel.
5. Remove the quarter window latch from the inside body panel.

For installation, follow removal procedures in reverse order. Tighten the latch-to-body screws to 7-11 Nm (62-97 lb-in).

tomsn048@gmail.com

Latch, Sliding Body Side Window

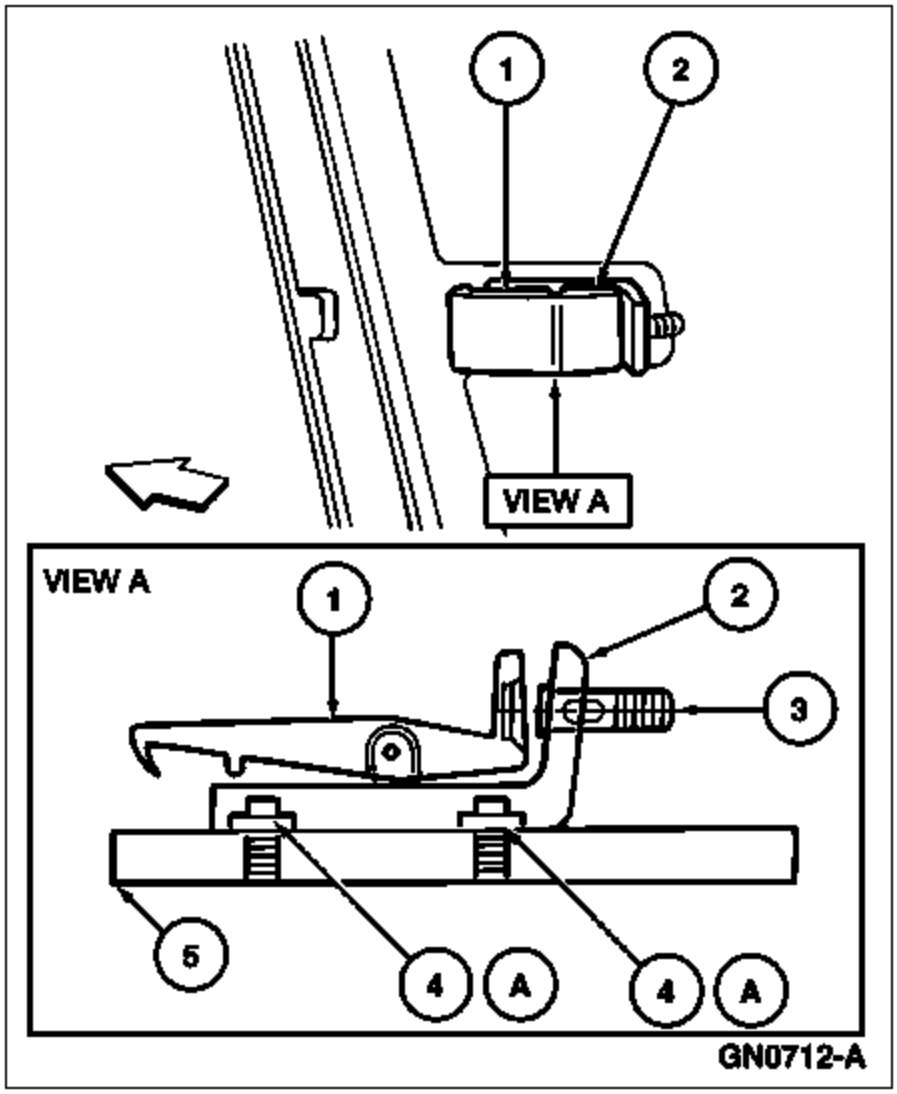
Removal

1. Open the sliding body side window to relieve tension.
2. Remove the roll pin from the latch handle and latch base.
3. Remove the latch handle and spring.
4. Remove the two screws attaching the latch base to sliding body side window.
5. Remove the latch base from sliding window.
6. Clean adhesive from sliding body side window.

Installation

1. To install, reverse the removal procedure. Tighten latch base to sliding body sie window attaching screws to 2-3 Nm (18-27 lb/in).

tomsn048@gmail.com



Item	Part Number	Description
1	—	Latch Handle
2	—	Latch Base
3	—	Latch Lock
4	—	Screws
5	29701	Body Side Window, Sliding
6	—	Roll Pin
7	—	Tighten to 2-3 Nm (18-27 Lb/In)

tomsn048@gmail.com

Heated Back Window Switch and Light, Aerostar

Removal

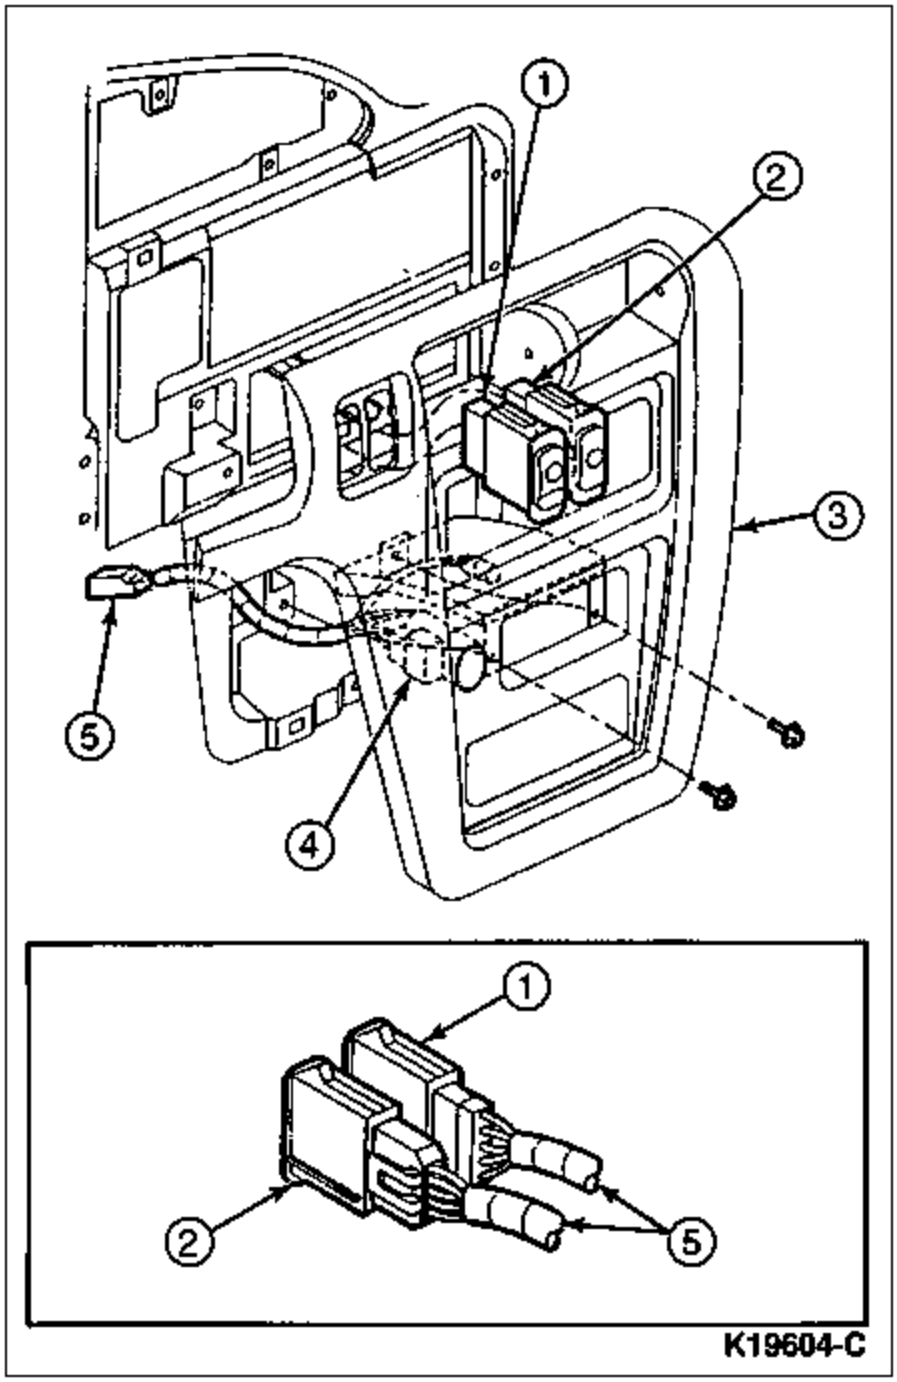
1. Disconnect the battery ground cable (14301).
2. Remove instrument panel finish panel (044D70). Refer to Section 01-12 .
3. Remove connector from the heated back window switch and light.
4. Remove the heated back window switch and light from the instrument panel finish panel by pushing from the connector side until the snap-in mounting clips release.

Installation

1. Feed the electrical connector through the switch mounting hole on the instrument panel finish panel.
2. Install the electrical connector to the heated back window switch and light.
3. Install the switch in the instrument panel finish panel (snap-in).
4. Install instrument panel finish panel.
5. **NOTE: When the battery is disconnected and reconnected, some abnormal drive symptoms may occur while the powertrain control module (PCM) (12A650) relearns its adaptive strategy. The vehicle may need to be driven 10 miles or more to relearn the strategy.**

   Connect battery ground cable.
6. Check system operation.

tomsn048@gmail.com



Item	Part Number	Description
1	17A406	Rear Window Wiper/Washer Switch
2	18C621	Heated Back Window Switch and Light
3	044D70	Instrument Panel Finish Panel
4	13776	Interior Lamp
5	14401	Main Wiring

tomsn048@gmail.com

tomsn048@gmail.com

Grid Wire, Back Window

CAUTION: Any break in the grid longer than 25mm (1 inch) can not be serviced. The back window glass must be replaced. For breaks less than 25mm (1 inch) long, use the following procedure:

NOTE: If the first layer of the rear window grid (brown color) is damaged or missing it will be necessary to apply Brown Lacquer Touch-Up Paint AL81-5477-B or equivalent on the glass prior to applying the Rear Window Defroster Repair D8AZ-19562-AA or equivalent meeting Ford specification ESB-M4J58-A.

Inoperative grid wires on heated rear windows should be serviced by using Rear Window Defroster Repair D8AZ-19562-AA or equivalent meeting Ford specification ESB-M4J58-A.

NOTE: There are two methods for repairing terminal separation from back window glass and/or grid breaks. Method one involves soldering the terminal to the glass and method two uses an epoxy adhesive.

Method One

Surface Preparation

1. The vehicle should be brought inside and permitted to come to room temperature 16℃ (60℉) or above.

2. **CAUTION: Do not use scrapers, sharp instruments, or abrasive cleaners on the interior surface of the rear window as this may cause damage to the grid lines.**

   Clean the entire grid line service area with Ford Ultra Clear Spray Glass Cleaner E4AZ-19C507-AA or equivalent meeting Ford specification ESR-M14P5-A cleaning solvent to remove all dirt, wax, grease, oil or other foreign matter. It is important that the service area be clean and dry.

Mixing

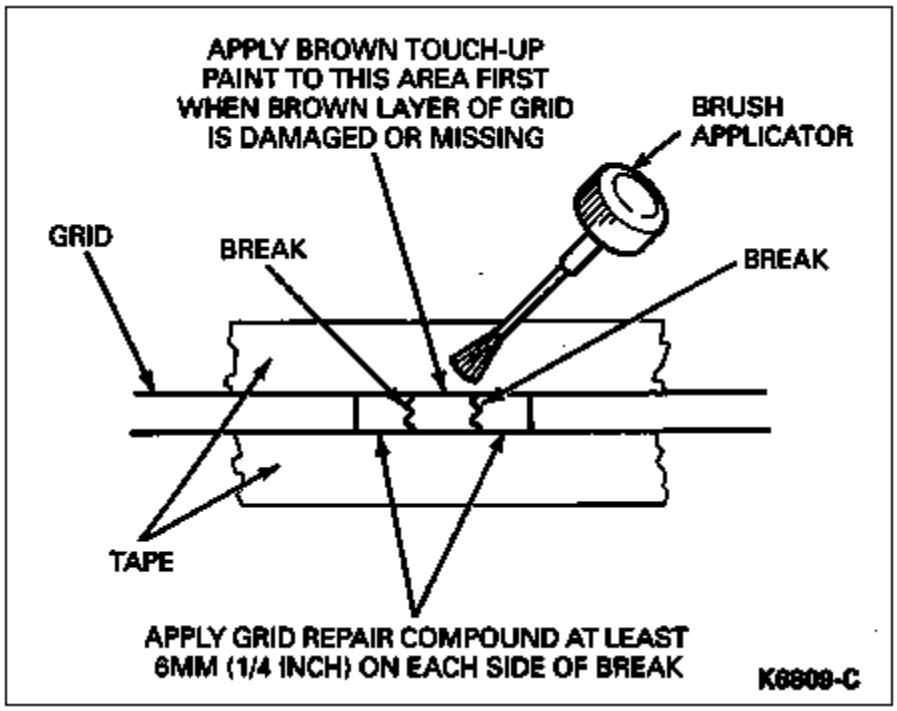
Rear Window Defroster Repair D8AZ-19562-AA or equivalent meeting Ford specification ESB-M4J58-A and touch-up paint, if needed, must be at room temperature. Shake bottle for at least one minute for thorough mixing. Shake frequently during use.

Application

1. Mark the location of the break on the outside of the window.

2. Using cellulose tape, mask off the area directly above and below the grid break. The break area should be at the center of the mask and the tape gap must be no wider than the existing grid line.

tomsn048@gmail.com



3. **NOTE: If both brown and silver layers of the grid are broken or missing, apply a coat of the brown touch-up paint across the break area first. Two coats may be necessary to obtain the proper color. Allow the touch-up paint to dry, then apply three coats of silver grid repair compound, allowing three to five minutes drying time between coats. The coating of the silver grid repair compound should extend at least 6mm (1/4 inch) on each side of the break area.**

   Apply the service coating in several smooth continuous strokes (allowing 3 to 5 minutes drying time between coats) across the break areas using the brush applicator in the cap. Extend the service coating at least 6mm (1/4 inch) on both sides of the break area.

4. Allow to dry for five minutes, then remove the mask.

5. **CAUTION: In the following procedure, be careful not to damage the grid line with the razor blade.**

   After removing the mask, check the outside appearance of the grid repair. If compound is visible above or below the grid, this excess should be removed. This can be done by placing a single-edge razor blade on the glass parallel to the grid and scraping gently toward the grid.

Curing

The service coating will air dry in approximately one minute and can be energized within three minutes. Optimum hardness and adhesion occurs after approximately 24 hours. At that time, the serviced area may be cleaned with a mild window cleaner.

Method Two

NOTE: This method requires a repair kit number 50-25-0584-0029 available from:

Marketing East Company

tomsn048@gmail.com

No. 10 Liberty Street

North Andover, MA 01845

Attn: Sales

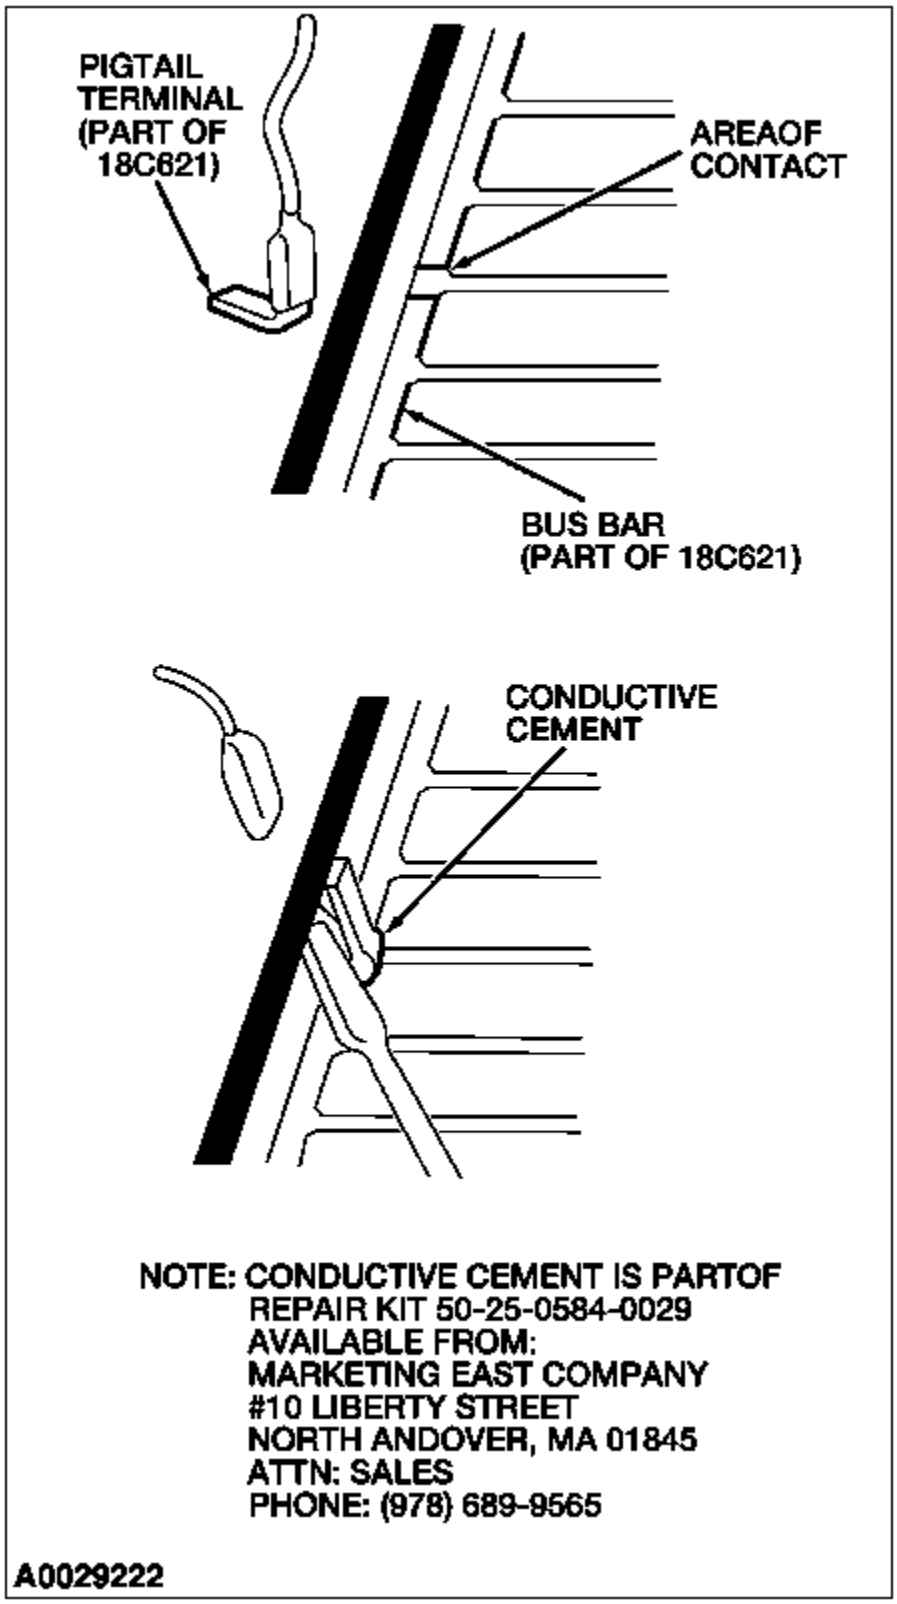
Phone: (978) 689-9565

Contact the manufacturer for the latest ordering information.

Terminal Repair

1. Following the manufacturer's instructions, apply conductive cement to the repair area.
2. Following the manufacturer's instructions, apply conductive cement to the repair area.

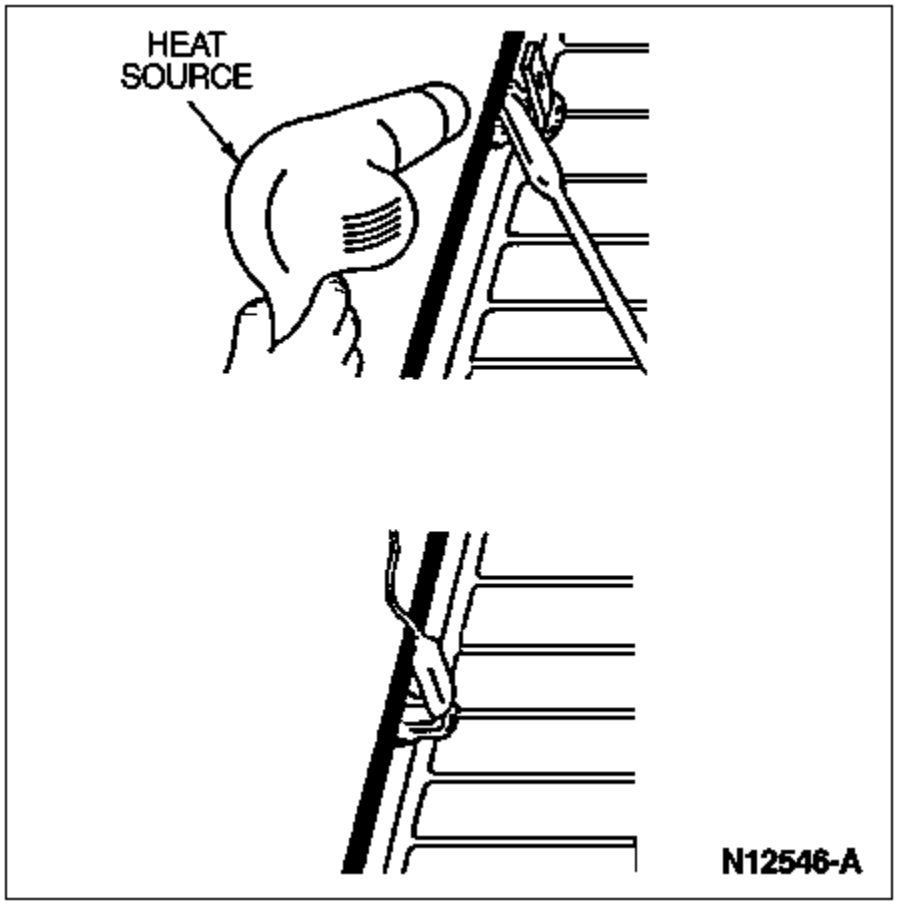
tomsn048@gmail.com



3. Following the manufacturer's instructions, position and hold the pigtail terminal on the conductive cement.

4. Following the manufacturer's instructions, apply heat to the repair area.

tomsn048@gmail.com



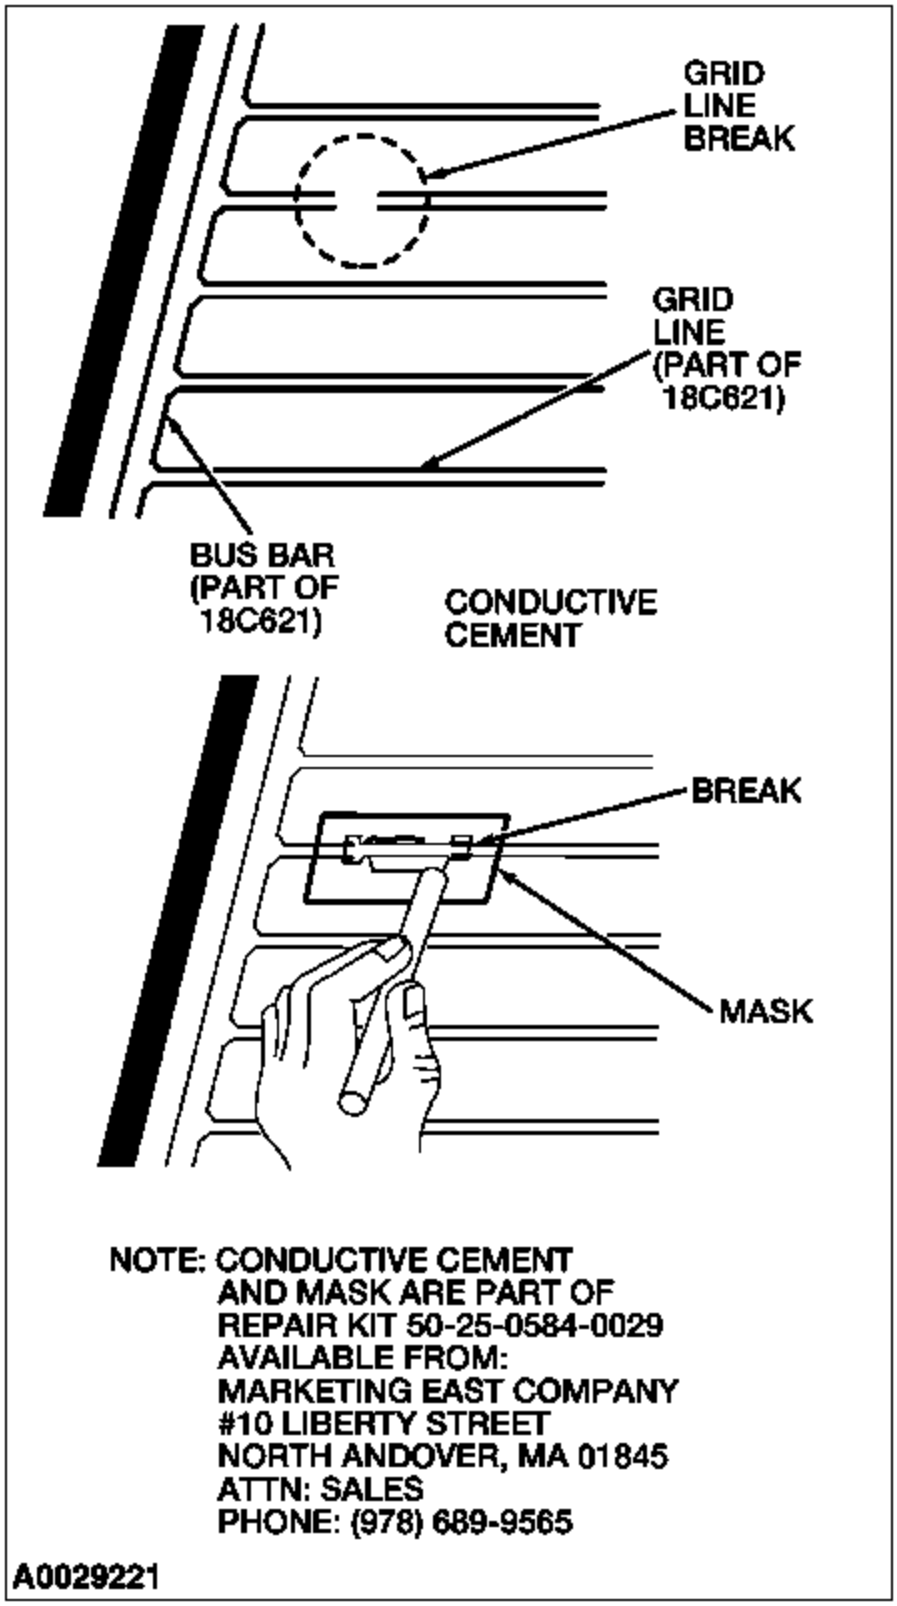
5. After allowing sufficient cure time, according to manufacturer's instructions, reconnect the heated back window switch and light connector to the pigtail terminal and retest the system.

Grid Line Repair

1. Following the manufacturer's instructions, clean and mask the repair area.

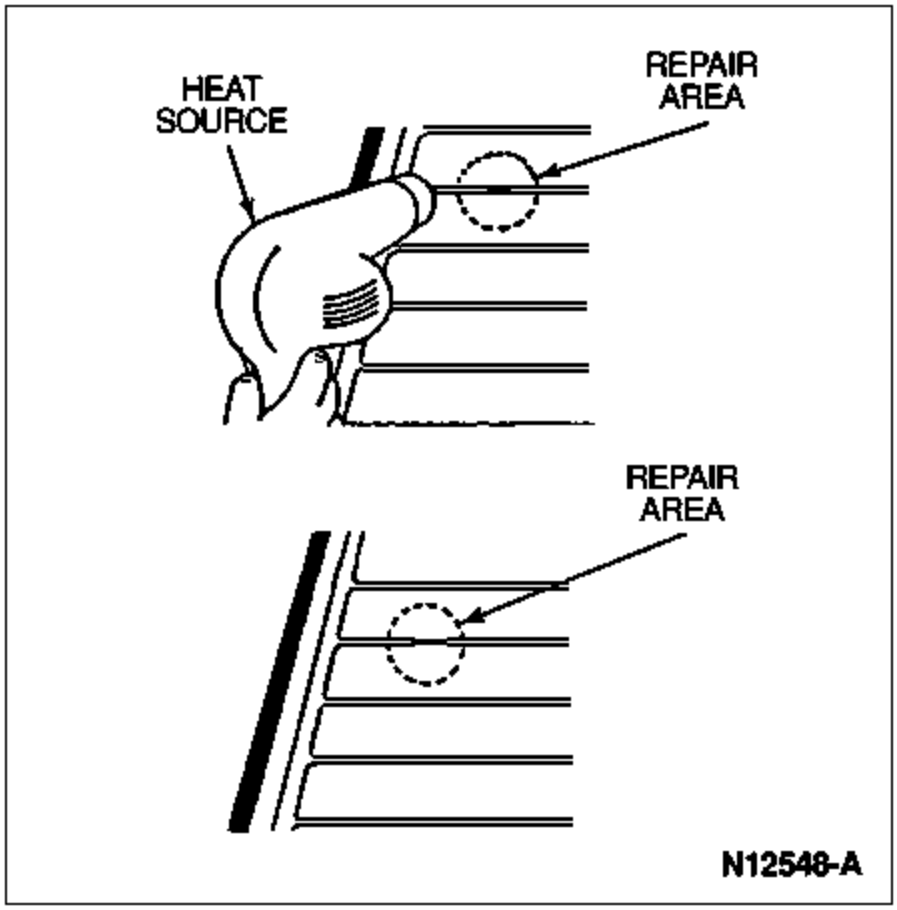
2. Following the manufacturer's instructions, apply conductive cement to the repair area.

tomsn048@gmail.com



3. Following the manufacturer's instructions, apply heat to the repair area.

tomsn048@gmail.com

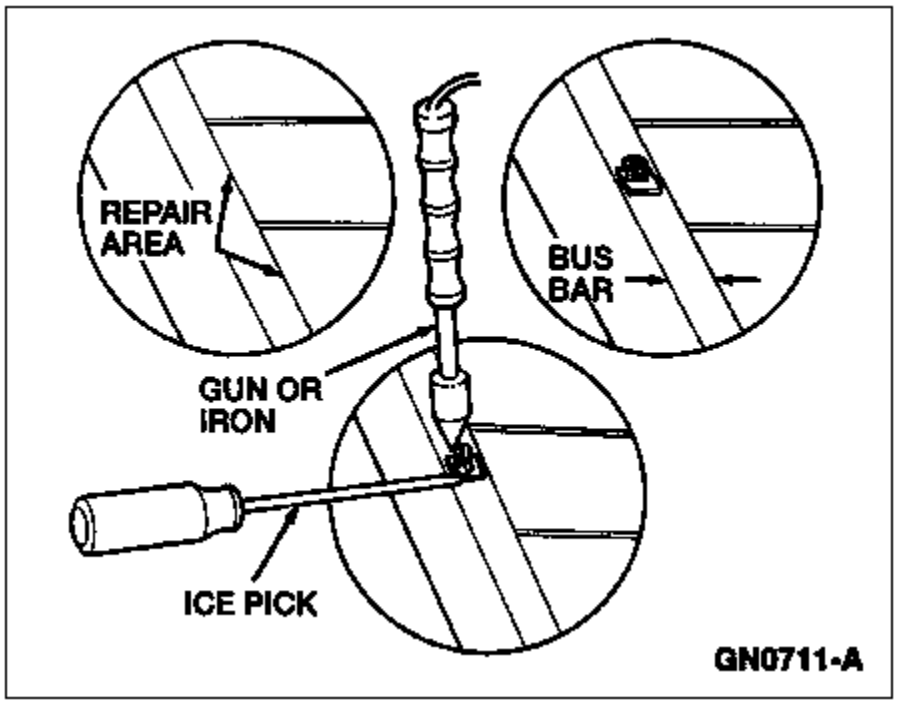


4. After allowing sufficient cure time, according to manufacturer's instructions, retest the system.

tomsn048@gmail.com

Lead Window Terminal Service

1. Allow the rear window to warm up to room temperature for one-half hour to one hour.
2. Clean the bus bar in the area to be serviced using fine steel wool (3/0 to 4/0 grade).
3. Restore the area where the bus bar terminal was originally attached by applying three coats of Rear Window Defroster Repair D8AZ-19562-AA or equivalent meeting Ford specification ESB-M4J58-A. Allow approximately ten minutes drying time between coats.
4. Working as quickly as possible to avoid overheating the glass, tin the bus bar with solder in the area where the terminal will be attached. To avoid damaging the bus bar, remove the soldering gun or iron as soon as the solder flows.
5. Using a heat lamp, preheat the glass in the solder area to 50°-60°C (120°-140°F) just prior to soldering the terminal on.
6. Position the terminal on the bus bar in the area that was tinned and hold it in place with an ice pick or screwdriver.
7. Apply soldering heat to the pad of the terminal unit until the solder flows.
8. Start the vehicle, turn the heated rear window on and leave it on for five minutes. Inspect the terminal and apply Rear Window Defroster Repair D8AZ-19562-AA or equivalent meeting Ford specification ESB-M4J58-A to the required area.

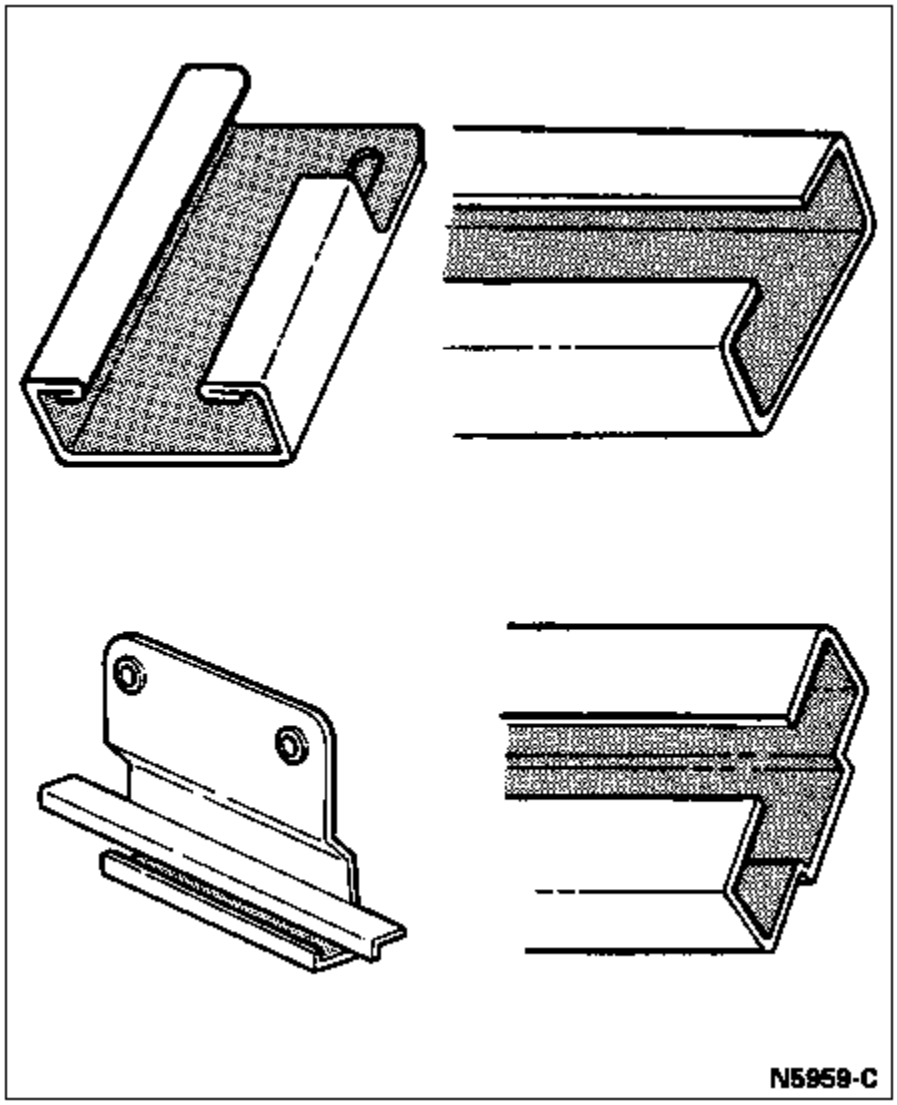


tomsn048@gmail.com

tomsn048@gmail.com

Window Regulator, Front Door, Power

The door window mechanism should be properly lubricated to provide ease of operation. The window glass mechanism should be lubricated whenever the glass channel or window regulators are removed or excessive effort is required to operate the windows. To lubricate a door window mechanism, apply an even coating of Premium Long-Life Grease XG-1-C or -K or equivalent meeting Ford specification ESA-M1C75-B to the window regulator rollers, shafts and the entire length of the roller guides as illustrated by the shaded areas.



tomsn048@gmail.com

tomsn048@gmail.com

Counterbalance Spring

WARNING: IMPROPERLY REMOVED COUNTERBALANCE SPRINGS CAN CAUSE INJURY. BE SURE TO USE THE FOLLOWING PROCEDURE TO MINIMIZE RISK.

WARNING: THE COUNTERBALANCE SPRING IS PRETORQUED. CAREFUL HANDLING IS REQUIRED TO MINIMIZE RISK OF PERSONAL INJURY.

Removal

1. Remove the window regulator from the front door (20124) as described in this section.
2. Place the window regulator in the full-up position, if possible, to partially relieve the spring load.
3. Clamp the window regulator so that no rotational movement is possible.
4. **NOTE: Position spring center bar relative to slotted pivot pin for reassembly later.**

   Using locking pliers proceed as follows:

   a. Grip counterbalance spring hook at retaining pin.
   b. Carefully lift high enough to clear the pin.
   c. Allow the spring to unwind to a free position, about 1/3 to 1/2 turn.

5. Remove the window regulator electric drive from the mounting plate. The counterbalance spring can now be discarded.

Installation

1. Place the window regulator in the full-up position to ease assembly.
2. Reattach the window regulator electric drive to the mounting plate and clamp the window regulator so that no rotational movement is allowed.
3. Place the spring center bar on the slotted pivot pin.
4. **WARNING: THE SPRING MAY CAUSE INJURY IF NOT PROPERLY SEATED BELOW THE SHOULDER ON THE RETAINING PIN BECAUSE THE SPRING COULD SLIP OFF THE PIN.**

   NOTE: Make sure spring is properly seated below the pin shoulder.

   With locking pliers on the spring hook, carefully wind the spring to retainer pin.

5. Cycle the window regulator making sure the spring coils constrict as the window glass travels down. This ensures that the coil is in the proper position.
6. Replace the window regulator in the front door as described in this section.

Symptom Chart — Instrument Panel And Console

INSTRUMENT PANEL AND CONSOLE

Condition	Possible Source	Action
• Ash Receptacle Lamp Inoperative	• Short to ground. • Open to ground. • Open supply. • Open fuse.	• GO to Pinpoint Test A .

tomsn048@gmail.com

Pinpoint Tests

NOTE: Use Rotunda Digital Volt-Ohmmeter 014-00407 or equivalent to perform electrical pinpoint tests.

PINPOINT TEST A: ASH RECEPTACLE LAMP (AEROSTAR ONLY)

A1 CHECK FUSE CIRCUIT NO. 7

- Ignition switch OFF.
- Check the 10A fuse No. 7 located in the instrument panel.

Is fuse No. 7 blown?

Yes	No
REPLACE fuse No. 7 and RETEST.	GO to **A2** .

A2 CHECK ASH RECEPTACLE LAMP ILLUMINATION

- Rotate pulse width module (PWM) rheostat until ash receptacle lamp illuminates.

Does ash receptacle lamp illuminate?

Yes	No
Not a circuit problem. System OK.	GO to **A3** .

A3 CHECK FOR SHORT TO GROUND

- Remove the 10A fuse No. 7.
- Disconnect the pulse width module connector.
- Measure the resistance of Circuit 1011 (T/O) between the RH terminal of fuse No. 7 and ground.

Is resistance less than 5 ohms?

Yes	No
SERVICE Circuit 1011 (T/O) between instrument panel, fuse junction panel and the pulse width module connector. RETEST.	GO to **A4** .

tomsn048@gmail.com

A4 CHECK POWER SUPPLY TO ASH RECEPTACLE LAMP

- Disconnect the pulse width module (PWM) connector.
- Ignition switch in RUN or ACC.
- Measure the voltage of the Circuit 1011 (T/O) at the PWM connector.

Is voltage greater than 10 volts?

Yes	No
GO to **A5** .	SERVICE Circuit 1011 (T/O) between instrument panel, fuse junction panel and the PWM connector. RETEST.

A5 CHECK ASH RECEPTACLE LAMP

- Rotate PWM rheostat fully ON.
- Back probe PWM connector Circuit 235 (R/BR).

Does voltage read 10 or more volts?

Yes	No
REPLACE bulb in ash receptacle lamp. RETEST.	GO to **A6** .

A6 CHECK ASH RECEPTACLE LAMP GROUND

- Disconnect PWM connector.
- Measure the resistance of the Circuit 57 (BR) between the ash receptacle lamp connector and ground.

Is resistance less than 5 ohms?

Yes	No
REPLACE ash receptacle lamp element.	SERVICE Circuit 57 (BK) between ash receptacle lamp element and ground. RETEST.

tomsn048@gmail.com

Instrument Panel and Console

CAUTION: Before performing any removal or installation on the Aerostar instrument panel, the battery to starter relay cable must be disconnected for a minimum of 60 seconds to discharge the air bag backup power supply.

NOTE: When the battery has been disconnected and reconnected, some abnormal drive symptoms may occur while the powertrain control module (PCM) (12A650) relearns its adaptive strategy. The vehicle may need to be driven 16 km (10 miles) or more to relearn the strategy.

tomsn048@gmail.com

Ash Receptacle, Aerostar

Instrument Panel Mounted

Removal and Installation

1. Pull the instrument panel ash receptacle (04810) out to the stop.
2. Depress and hold the spring-loaded flap. Continue to pull the instrument panel ash receptacle from the instrument panel.
3. To install, depress the flap and slide the instrument panel ash receptacle into the instrument panel to full closed position.

tomsn048@gmail.com

Ash Receptacle and Retainer, Ranger

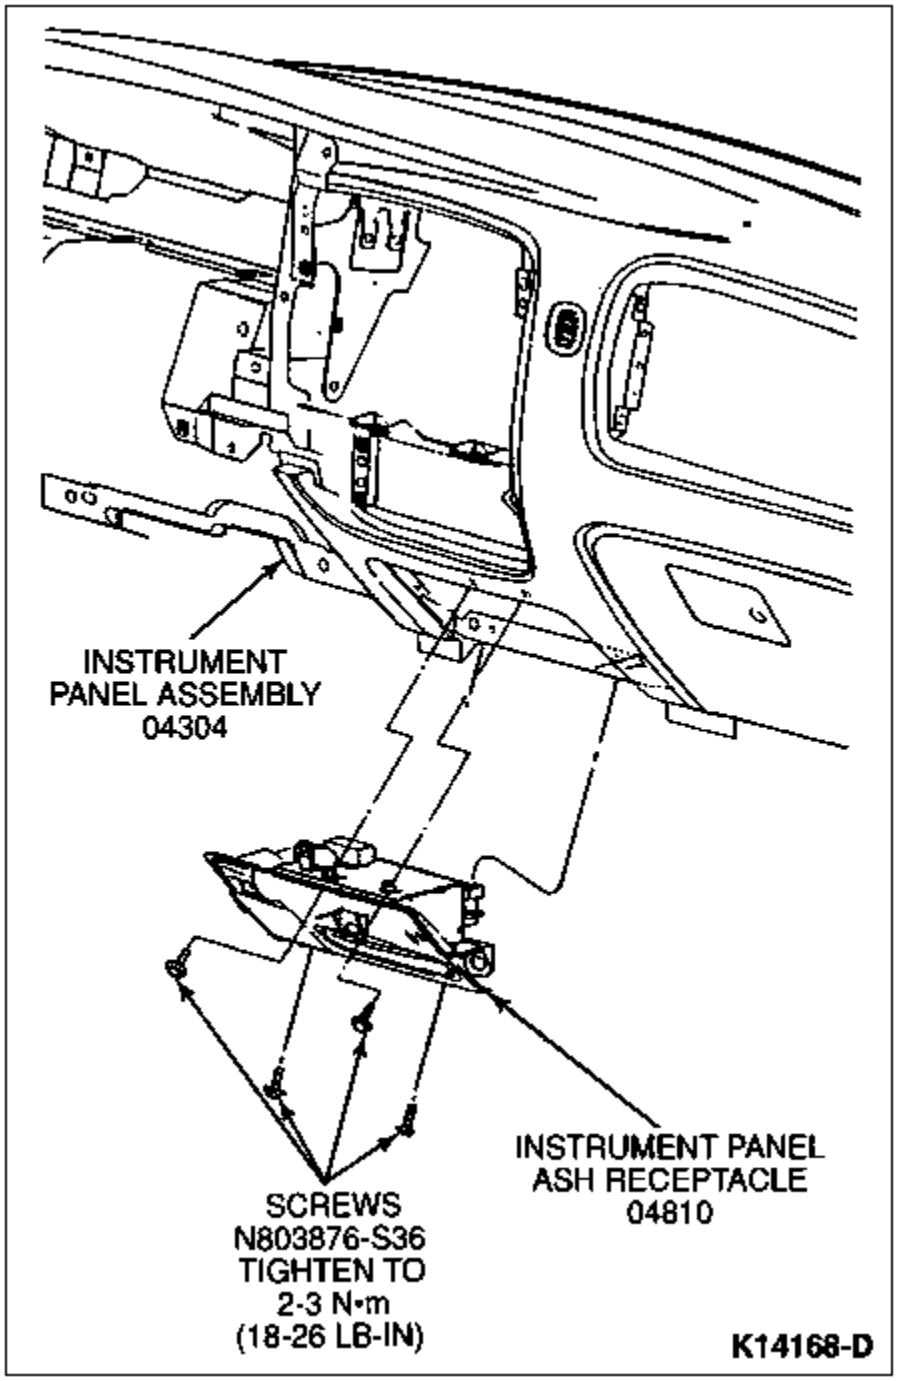
Instrument Panel Mounted

Removal and Installation

1. Remove instrument panel ash receptacle (04810).
2. Remove the four (4) screws attaching instrument panel ash receptacle to instrument panel.
3. Apply pressure to sides of instrument panel ash receptacle to release clips.
4. Disconnect power point electrical connection (three electrical connections).

For installation, follow removal procedures in reverse order.

tomsn048@gmail.com



tomsn048@gmail.com

tomsn048@gmail.com

Cigar Lighter, Aerostar

Instrument Panel Mounted

Removal and Installation

1. Disconnect battery to starter relay cable.
2. Remove cigar lighter knob and element (15052).
3. Remove instrument panel finish panel (044D70) as described in Removal and Installation, Instrument Cluster Finish Panel, Aerostar in this section.
4. Unscrew the cigar lighter socket and retainer (15055) and remove from the finish panel.

For installation, follow removal procedures in reverse order.

tomsn048@gmail.com

Cigar Lighter, Ranger

Instrument Panel Mounted

Removal and Installation

1. Disconnect battery ground cable (14301).
2. Remove center finish panel. Refer to procedure in this section.
3. Disconnect cigar lighter wire from base.
4. Unscrew cigar lighter socket and retainer (15055).

For installation, follow removal procedures in reverse order.

When the battery has been disconnected and reconnected, some abnormal drive symptoms may occur while the powertrain control module (PCM) (12A650) relearns its adaptive strategy. The vehicle may need to be driven 16 km (10 miles) or more to relearn the strategy.

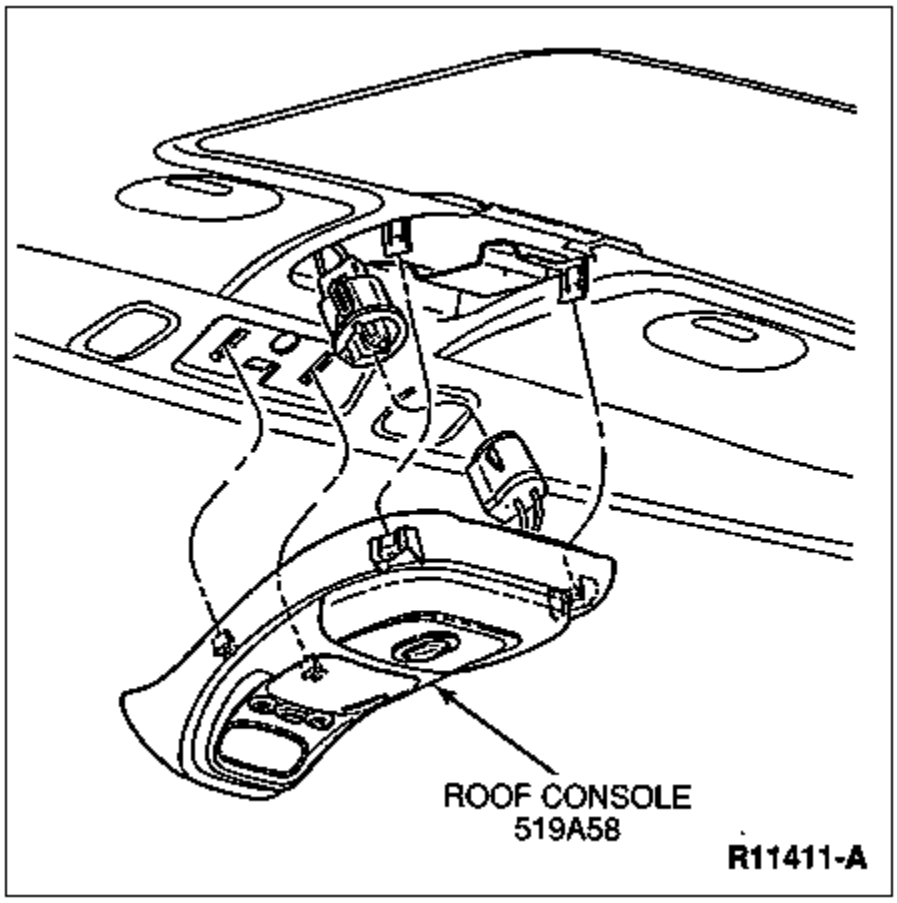
tomsn048@gmail.com

Console, Roof (with Power Moon Roof)

Removal and Installation

1. Push moon roof trim moulding back for clearance.
2. Using hand pressure, release snapping clips attaching console to mounting bracket.
3. Disconnect electrical connector.
4. Remove roof console (519A58).

For installation, follow removal procedures in reverse order.



tomsn048@gmail.com

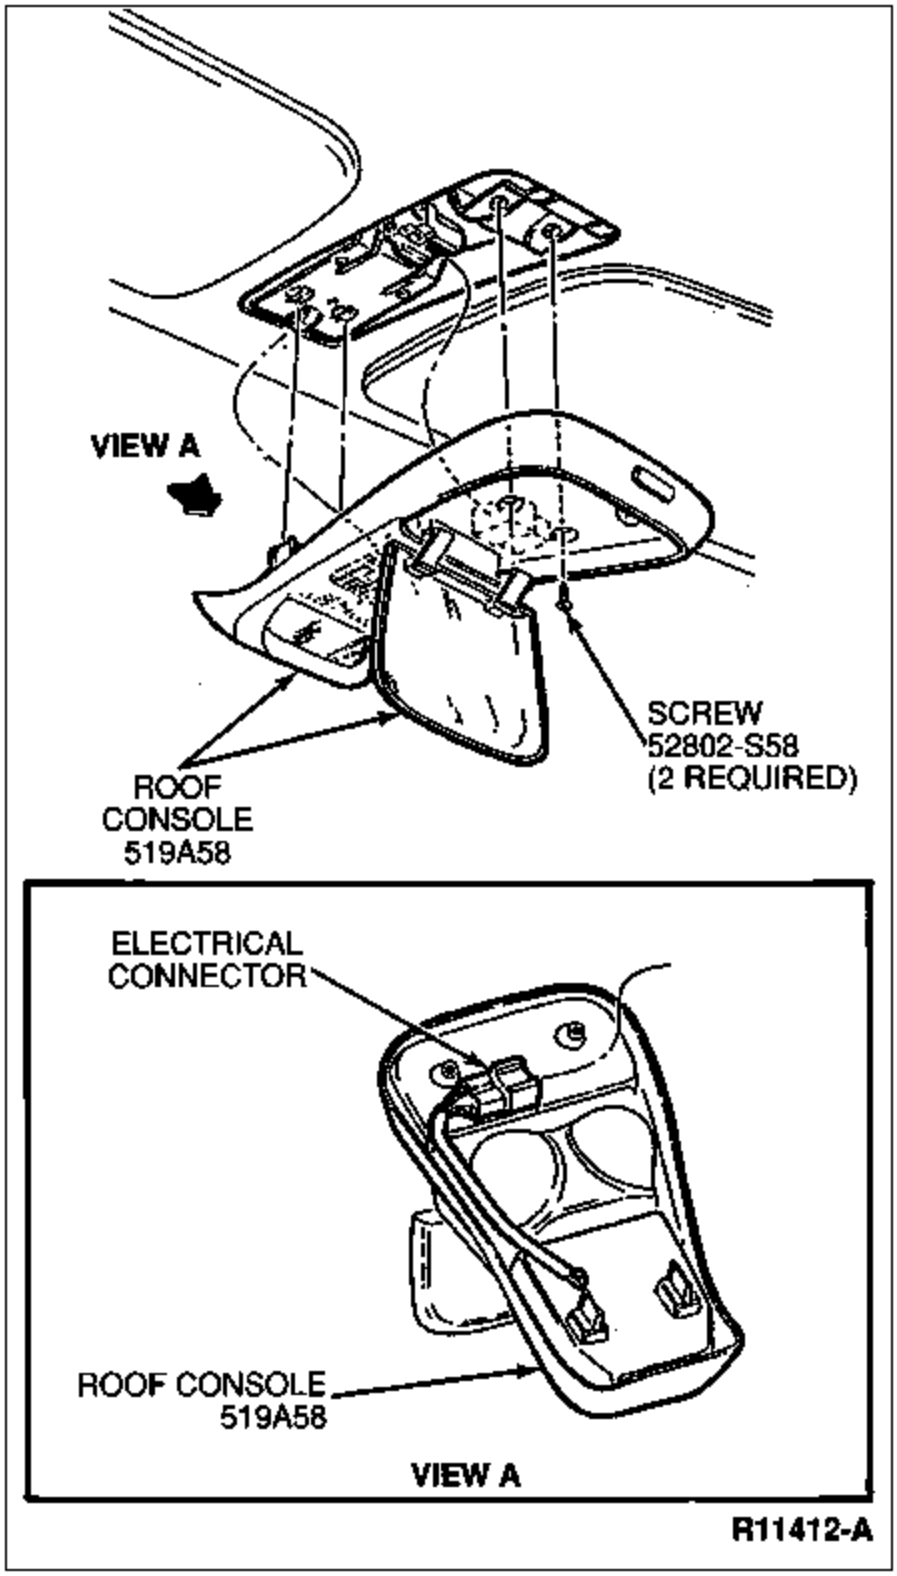
tomsn048@gmail.com

Console, Roof (Without Power Moon Roof)

Removal and Installation

1. Open door on roof console (519A58) and remove two (2) screws attaching console to mounting bracket.
2. Release two (2) tabs in front (closest to windshield) using hand pressure.
3. Disconnect electrical connector.
4. Remove roof console.

tomsn048@gmail.com



tomsn048@gmail.com

tomsn048@gmail.com

Mounting Bracket, Floor Console, Aerostar

Removal and Installation

1. Remove floor console as described in Removal and Installation, Console, Floor, Aerostar in this section.
2. Remove two nut and washer assemblies retaining console panel rear mounting bracket to floor.
3. Remove the console panel rear mounting bracket.

To install, reverse the removal procedure.

tomsn048@gmail.com

Mounting Bracket, Floor Console, Ranger

Removal and Installation

1. Remove console assembly as described in Removal and Installation, Base Console, Floor, Ranger in this section.
2. Remove two nuts retaining console panel front mounting bracket to floor.
3. Lift the console panel front mounting bracket from the weld studs.

To install, reverse the removal procedure. Tighten nuts to 7-11 Nm (62-97 lb-in).

tomsn048@gmail.com

Mounting Bracket, Console Armrest, Ranger

Base Model

Removal and Installation

1. Remove the console armrest mounting access covers (047A62) from the right and left sides of the console panel (045A36).
2. Remove two bolts from each side of the console panel which are located behind the console armrest mounting access covers.
3. Remove the front seat center armrest.
4. To install, follow removal steps in reverse order. Tighten bolts to 9-14 Nm (80-124 lb-in).

Upper Series

Removal and Installation

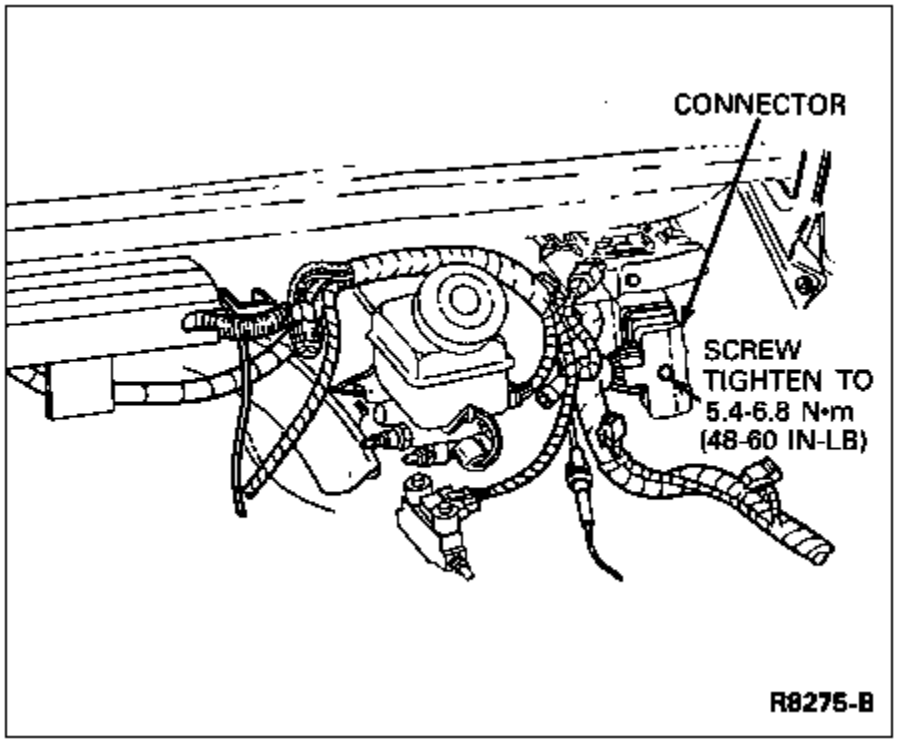
1. Raise console armrest to full open position.
2. Remove four screws retaining the digital audio compartment (if equipped).
3. Remove one screw from the armrest bracket and remove armrest.
4. To install, follow removal steps in reverse order.

tomsn048@gmail.com

Instrument Panel, Aerostar

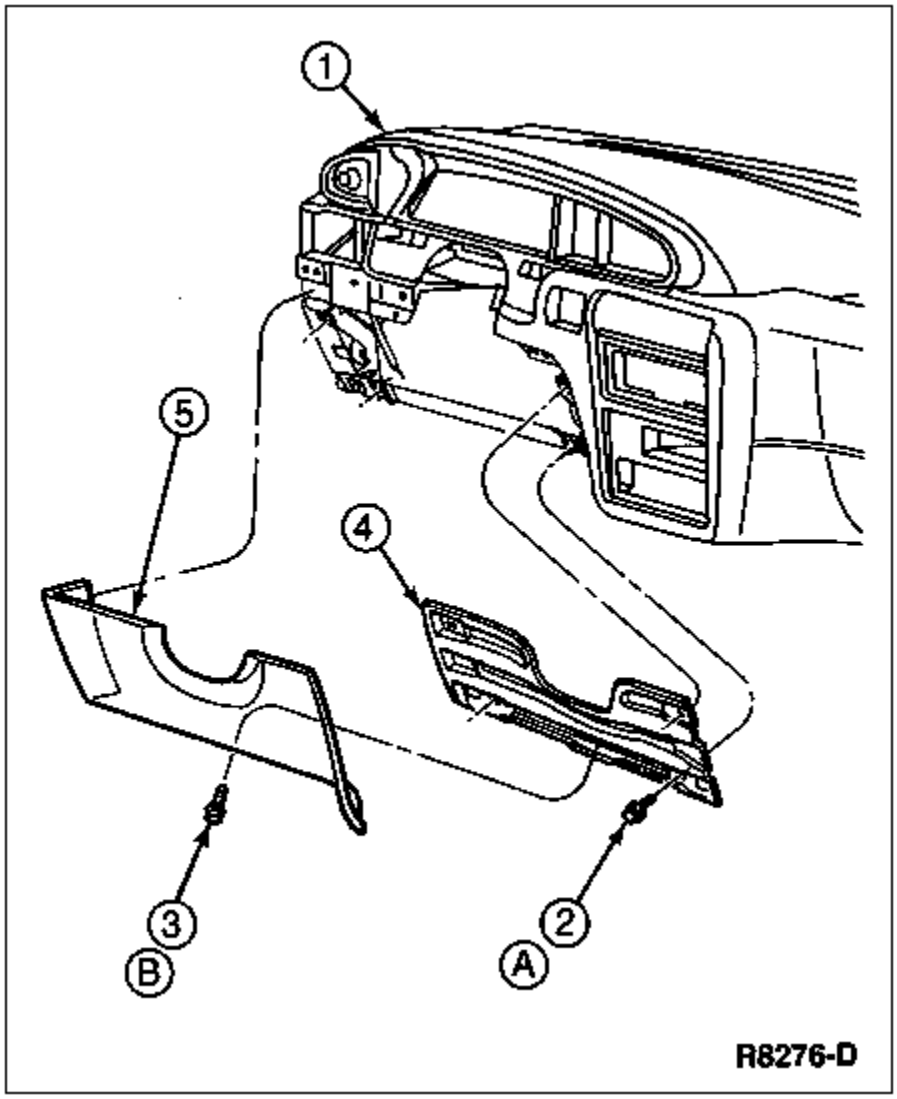
Removal and Installation

1. Disconnect battery positive cable.
2. Disconnect wiring connector on instrument panel located in the engine compartment, by loosening bolt and separating connectors.



3. Remove left and right windshield inside mouldings.
4. Remove defroster grille.
5. Remove glove compartment door finish panel (06036).
6. Remove instrument panel steering column cover (04459).
7. Remove four screws attaching the steering column lower reinforcement. Remove reinforcement.

tomsn048@gmail.com

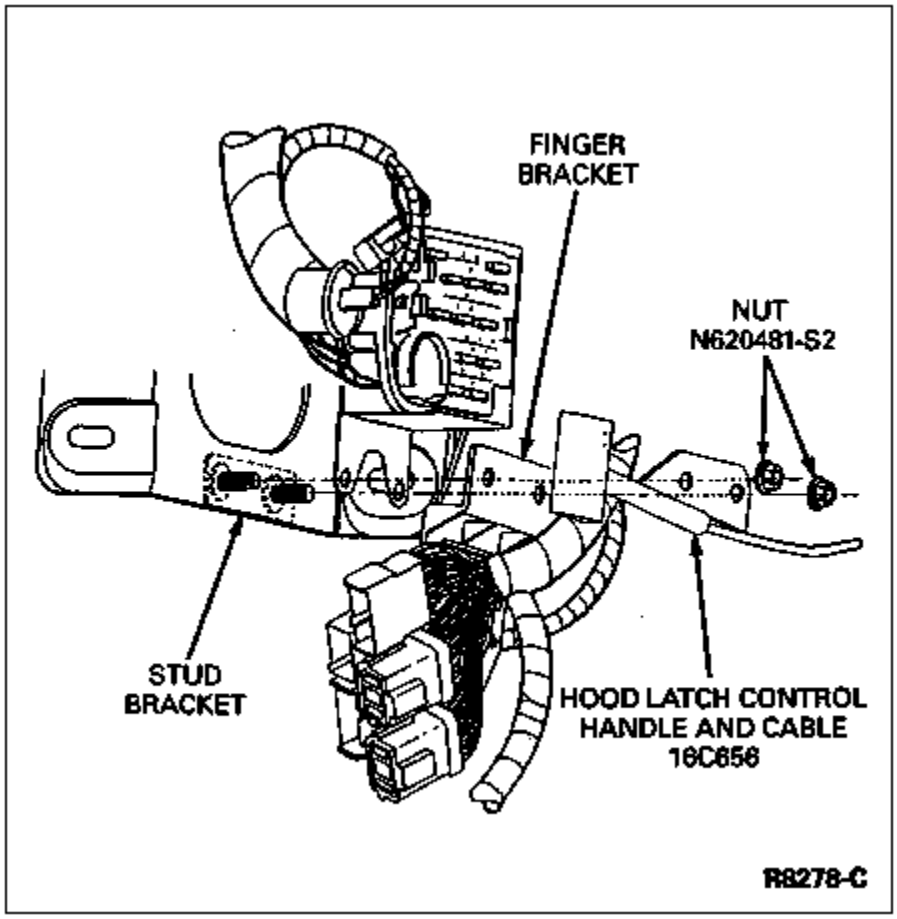


Item	Part Number	Description
1	04320	Instrument Panel
2	N803876-S36B	Screw (4 Req'd)
3	N803877-S36B	Screw (4 Req'd)
4	043C00	Steering Column Opening Reinforcement
5	04459	Instrument Panel Steering Column Cover
A	—	Tighten to 10-14 Nm (7-10 Lb-Ft)
B	—	Tighten to 2-3 Nm (18-26 Lb-In)

8. Remove right and left cowl side panels (02039).

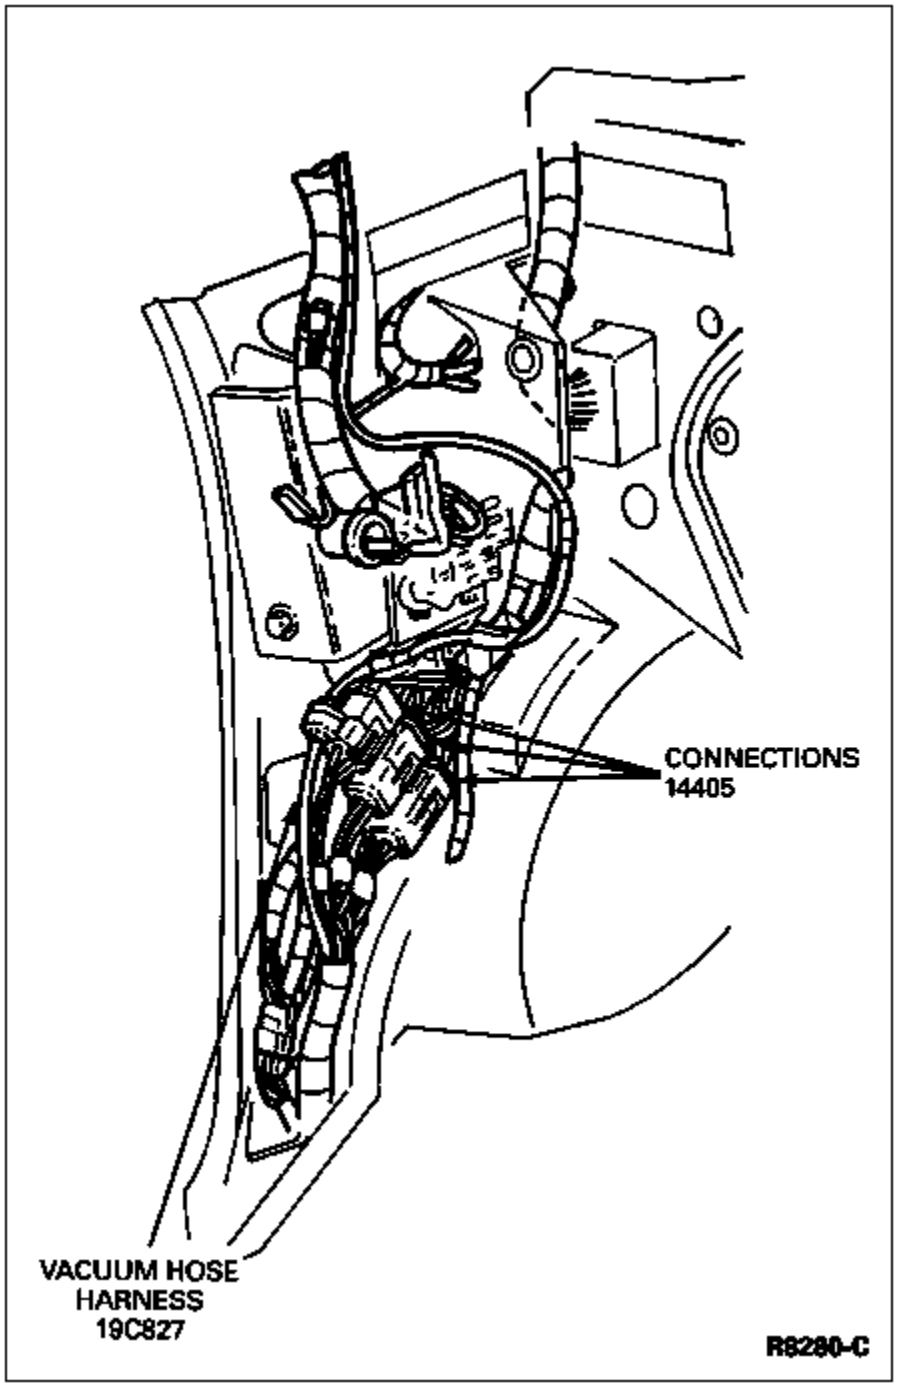
9. Remove two nuts and hood latch control handle and cable (16916) assembly from left cowl side and reinstall the nuts to hold the bracket and relay (14A323).

tomsn048@gmail.com



10. Disconnect the wiring on the left cowl side panel and, if equipped, the vacuum hose harness (19C827) connector. Number and location of connectors may vary depending on optional equipment.

tomsn048@gmail.com



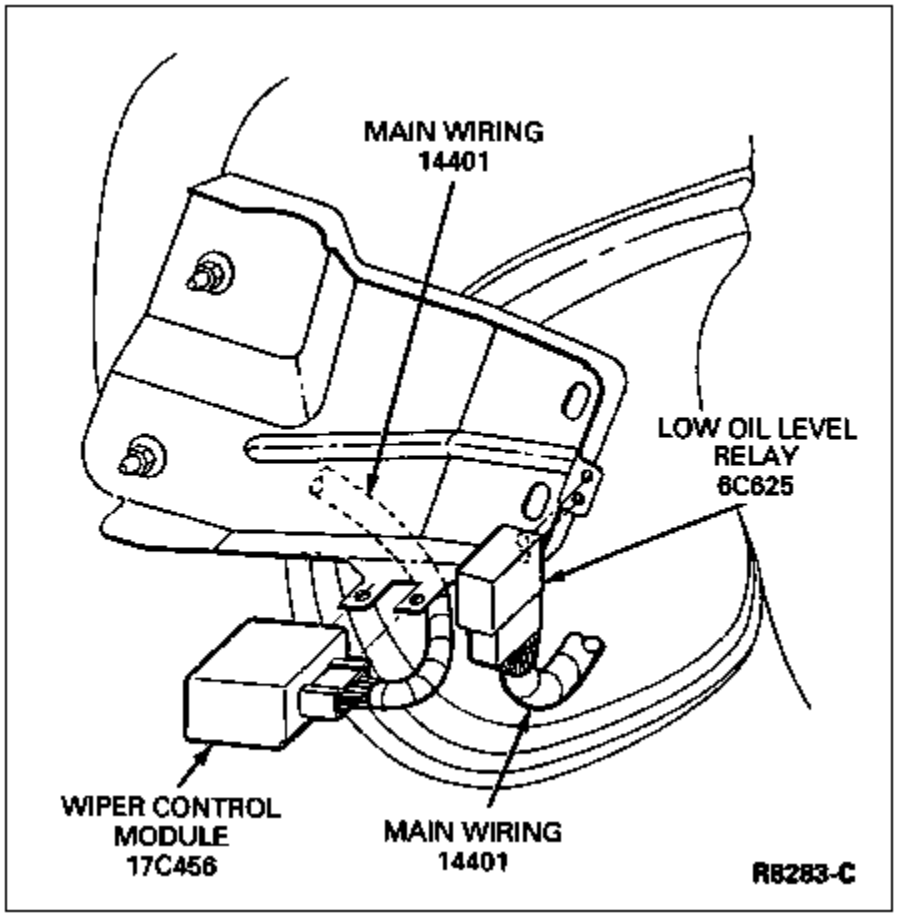
11. Disconnect the brake light switch wiring connector.

12. Remove steering column-to-extension shaft pinch bolt. Compress extension shaft toward engine and separate from the column U-joint.

13. Disconnect the transmission range indicator (7A110) from steering column.

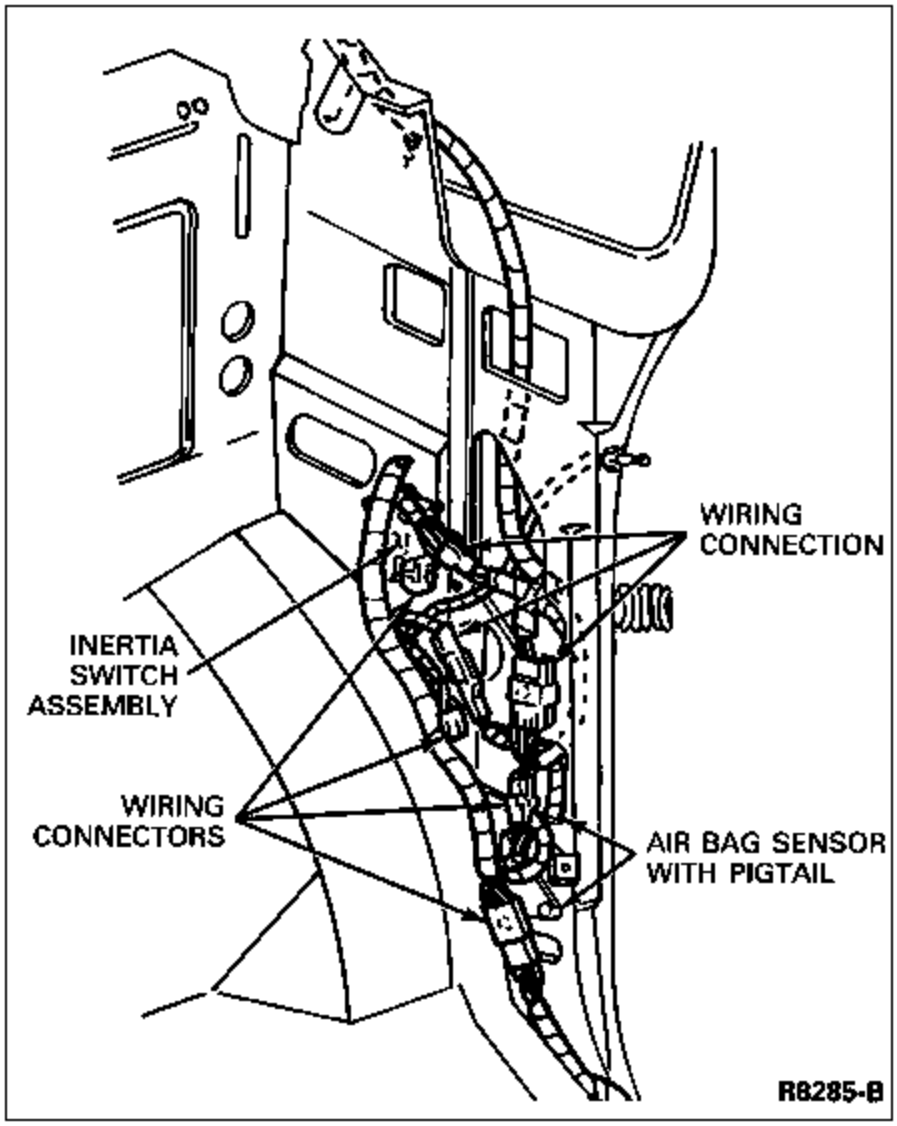
14. Disconnect wiring to windshield wiper intermittent control module The module is located to the right of steering column.

tomsn048@gmail.com



15. Disconnect radio antenna lead in cable (18812) at the right cowl side panel.

tomsn048@gmail.com



16. Disconnect heater temperature cable (18518). If equipped, disconnect vacuum hose harness connector.

17. Remove the five screws attaching the top of the instrument panel to the cowl side panel top.

18. Remove the one nut attaching the lower right side of the instrument panel to the cowl side panel.

19. Remove the two rearward nuts and loosen the two forward nuts located to the right of the steering column attaching the instrument panel to the center mounting bracket.

20. **NOTE: The following Steps (20, 21, 22) require two technicians.**

    Support the instrument panel. Remove three bolts and one nut attaching the instrument panel to left cowl side panel.

21. Carefully pull the instrument panel rearward and disconnect any remaining wires or other components.

22. Carefully remove instrument panel through the left front door (20124).

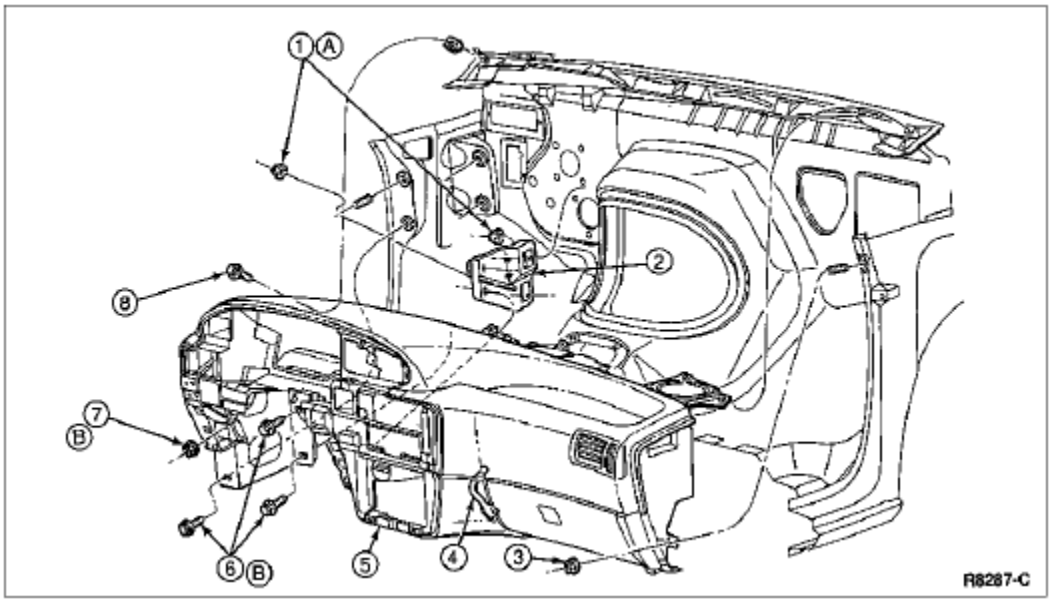
tomsn048@gmail.com

23. If replacing the instrument panel, transfer all the components to the replacement instrument panel.

For installation, follow removal procedures in reverse order.

When the battery has been disconnected and reconnected, some abnormal drive symptoms may occur while the powertrain control module (PCM) (12A650) relearns its adaptive strategy. The vehicle may need to be driven 16 km (10 miles) or more to relearn the strategy.

Instrument Panel, Aerostar



Item	Part Number	Description
1	N620481-S2	Nut (2 Req'd)

B	—	Tighten to 40-54 Nm (30-39 Lb-Ft)

tomsn048@gmail.com

tomsn048@gmail.com

Instrument Panel, Ranger

Removal and Installation

1. Disconnect battery ground cable (14301).
2. Disconnect wiring connectors in engine compartment.
3. Remove two bolts retaining hood latch control handle and cable (16916) and lower cable and two bolts attaching parking brake release.
4. Move transfer case control to far forward position.
5. Remove instrument panel steering column cover (04459) by removing two (2) screws and pulling on cover to release grasshopper clips.
6. Remove bolt to bracket at right of accelerator pedal.
7. Remove instrument panel steering column reinforcement by removing six (6) screws.
8. Remove TK yoke by removing two (2) nuts from cross vehicle beam.
9. Open fuse panel door, and remove two (2) bolts attaching instrument panel to cowl (A pillar beam).
10. On right side of instrument panel lower, remove one (1) bolt.
11. Remove one (1) threadless fastener and two (2) pushpins attaching insulator to lower right-hand instrument panel .
12. Lift edge of defroster grille, using a flat wooden dowel, then pull up on defroster grille to release clips and tension tabs. Remove defroster grille.
13. Remove four (4) bolts at top of instrument panel.
14. Disconnect all electrical connections at rear of instrument panel.
15. Remove instrument panel.

tomsn048@gmail.com

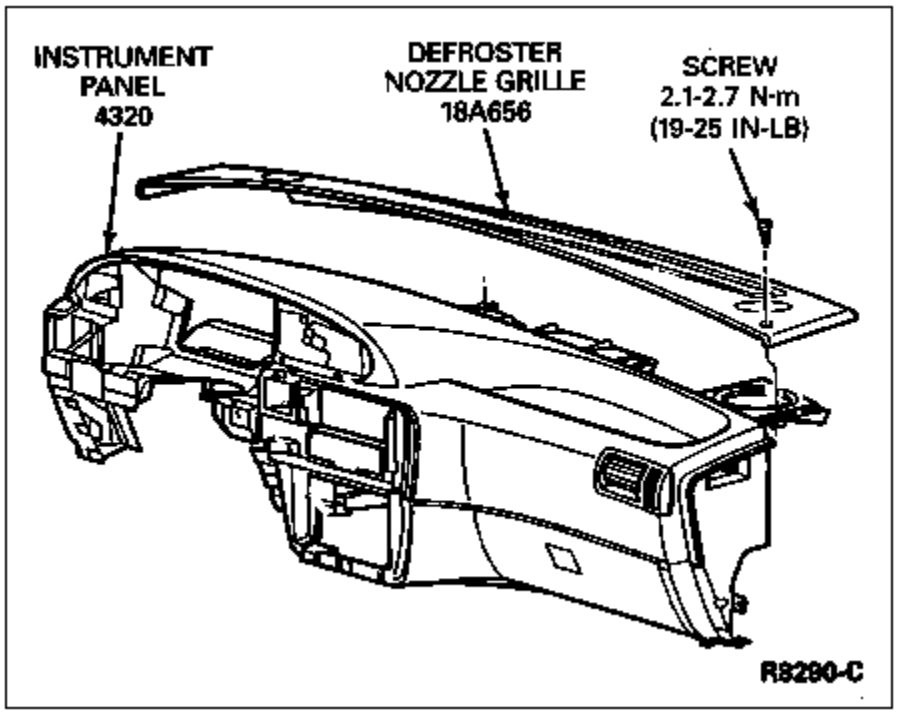
Defroster Grille, Aerostar

Removal and Installation

1. Remove the nine screws attaching the grille to the instrument panel.
2. Carefully lift up and pull the grille rearward. Remove from vehicle.

For installation, follow removal procedures in reverse order.



tomsn048@gmail.com

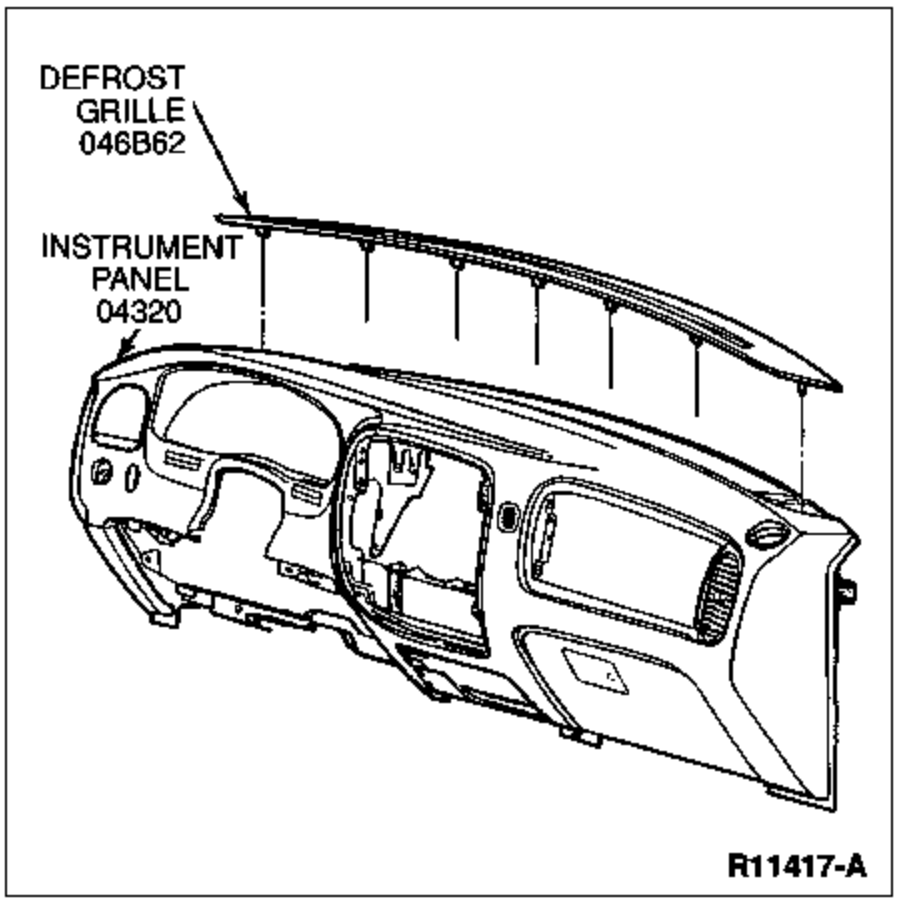
tomsn048@gmail.com

Defroster Grille, Ranger

Removal and Installation

1. Lift edge of defroster grille using a flat edge dowel.
2. Grab defroster grille edge and lift up to release clips and tension tabs.

For installation, follow removal procedure in reverse order.



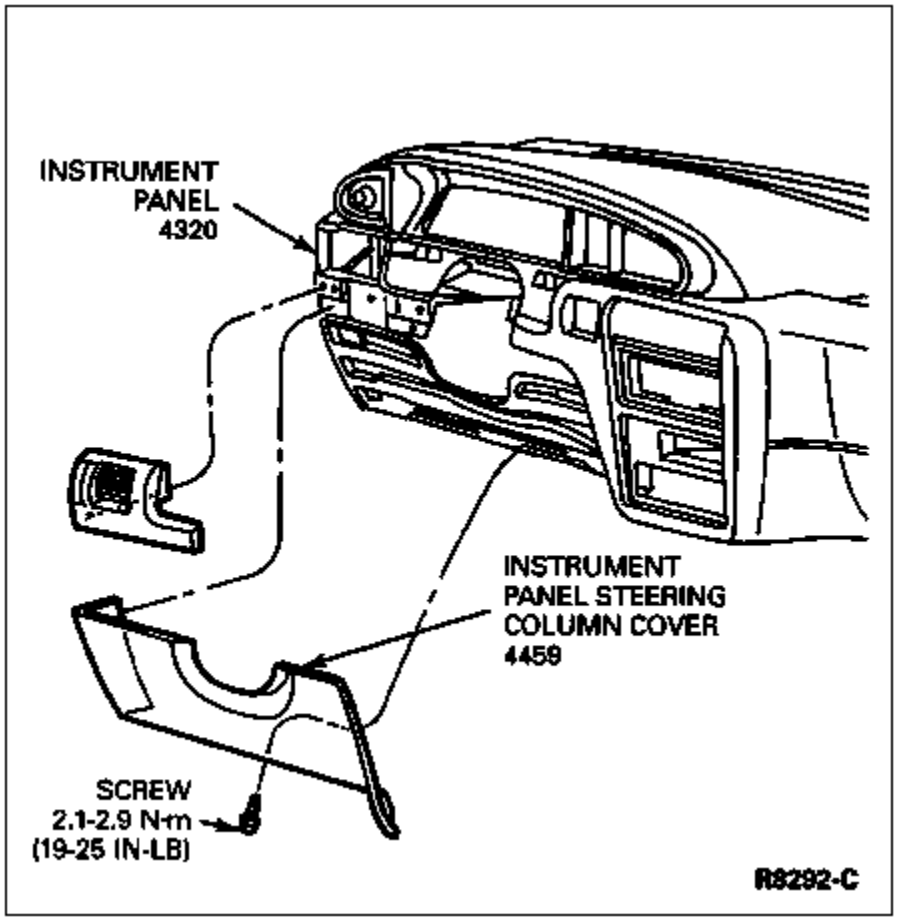
tomsn048@gmail.com

tomsn048@gmail.com

Instrument Cluster Finish Panel, Aerostar

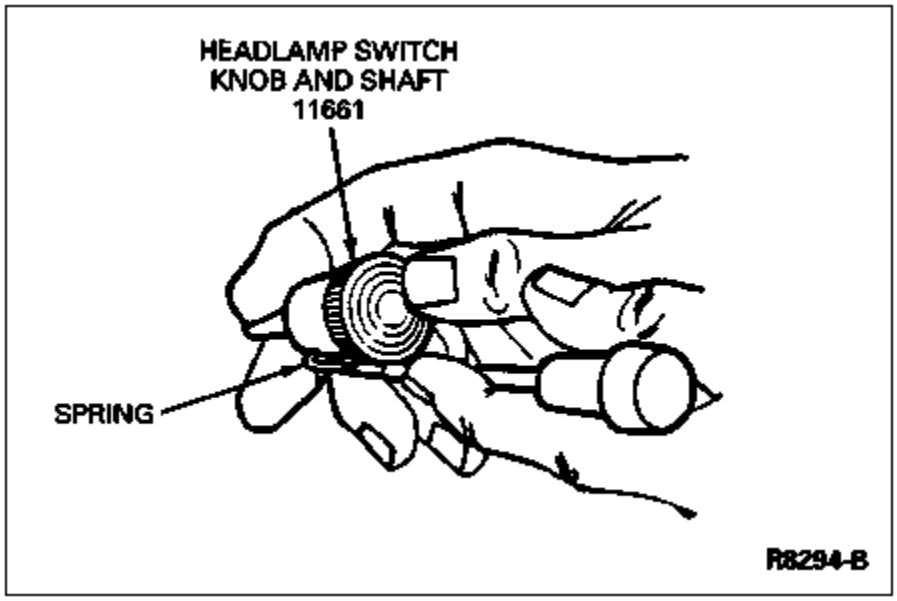
Removal and Installation

1. Disconnect battery positive cable.
2. Remove three screws attaching the instrument panel steering column cover (04459).
3. Pull instrument panel steering column cover from instrument panel and unsnap the three upper and one right-hand side retainers.
4. Remove center instrument panel finish panel (044D70) as described in Removal and Installation, Center Finish Panel, Aerostar in this section.
5. Remove the left side instrument panel finish panel as described in Removal and Installation, Finish Panel, Left, Aerostar in this section.



tomsn048@gmail.com

6. Remove headlamp switch knob and shaft (11661) by inserting hooked tool into knob slot to depress spring, then pull off shaft.



7. Remove three screws retaining bottom of the cluster finish panel.

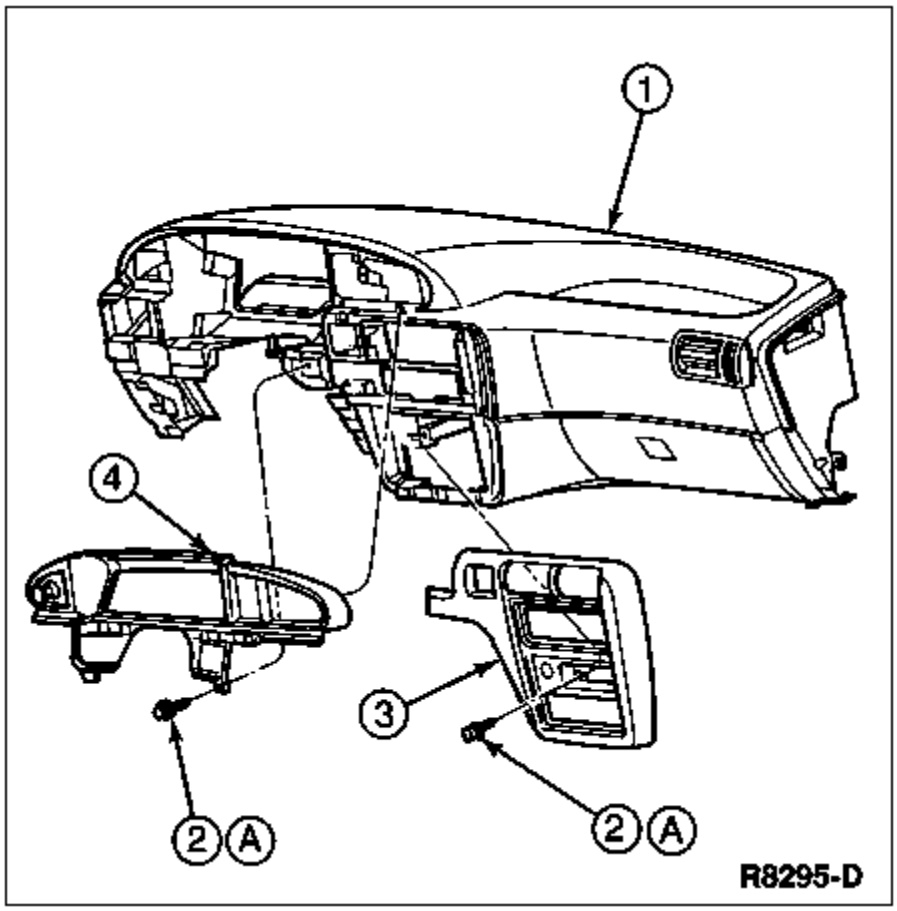
8. Remove two screws retaining top of the cluster finish panel.

9. Pull the cluster finish panel rearward and unsnap the two retainers, one at each end.

For installation, follow the removal procedures in reverse order.

When the battery has been disconnected and reconnected, some abnormal drive symptoms may occur while the powertrain control module (PCM) (12A650) relearns its adaptive strategy. The vehicle may need to be driven 16 km (10 miles) or more to relearn the strategy.

tomsn048@gmail.com



Item	Part Number	Description
1	04320	Instrument Panel
2	N803876-S36B	Screw
3	044D70	Instrument Panel Finish Panel
4	10K961	Instrument Panel Cluster Finish Panel
A	—	Tighten to 2-3 Nm (19-25 Lb-In)

tomsn048@gmail.com

tomsn048@gmail.com

Instrument Cluster Finish Panel, Ranger

Removal and Installation

1. Remove center finish panel, refer to removal procedure in this section.
2. Remove two (2) screws attaching instrument panel steering column cover (04459) and pull cover to collapse grasshopper clips two (2).
3. Remove metal knee bolster retaining screws (7) and remove knee bolster.
4. Remove five (5) screws attaching instrument cluster finish panel.
5. Remove six (6) screws attaching instrument panel steering column opening cover reinforcement.
6. Disconnect electrical connector to headlamp switch and thumbwheel rotary dimmer switch.
7. Remove instrument cluster finish panel.

For installation, follow removal procedure in reverse order.

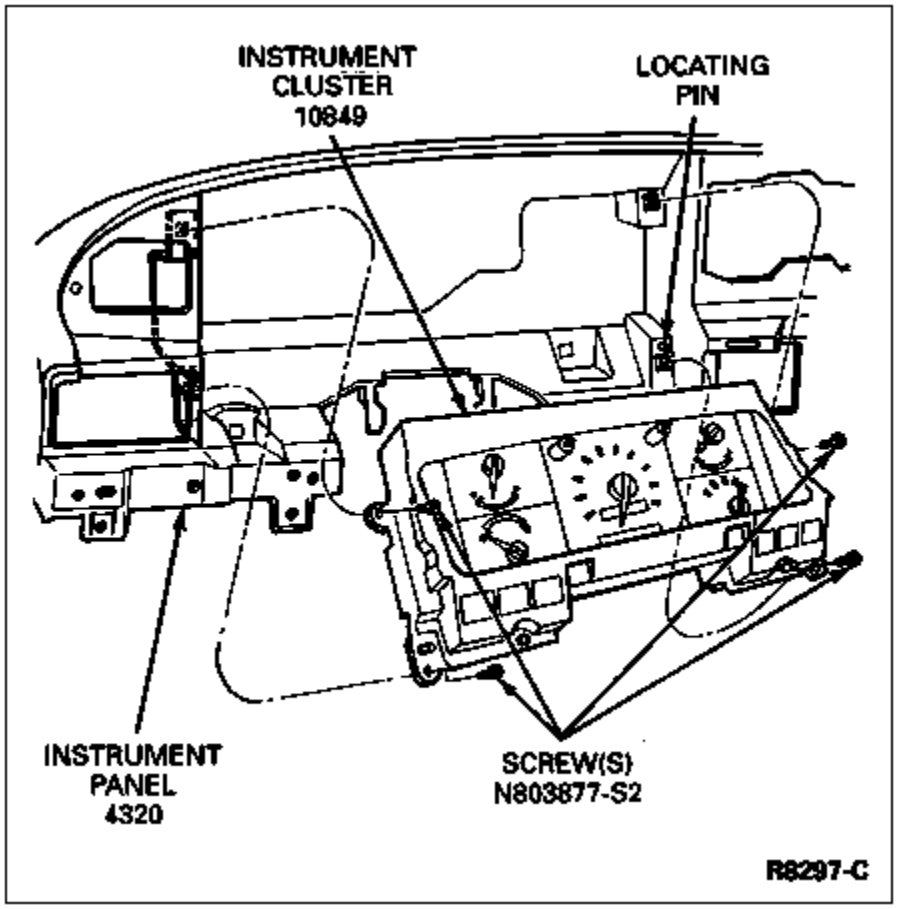
tomsn048@gmail.com

Instrument Cluster, Aerostar

Removal and Installation

1. Remove the instrument cluster finish panel as described in Removal and Installation, Instrument Cluster Finish Panel, Aerostar in this section.

2. Remove four screws attaching instrument cluster to instrument panel.



3. Disconnect PRND21 cable from instrument panel.

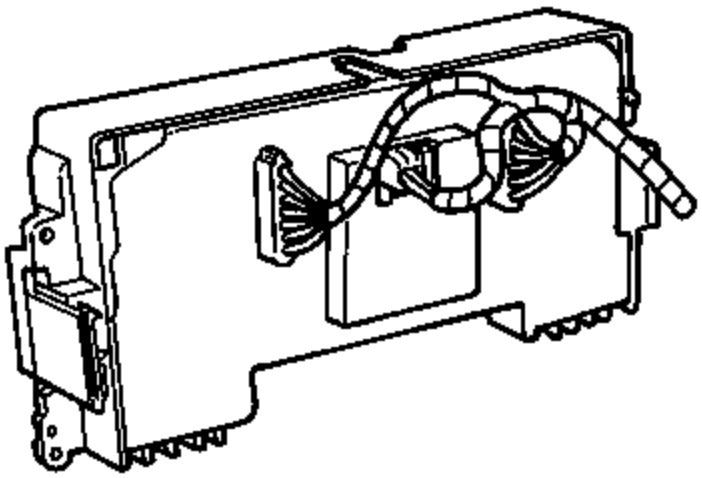
4. Pull instrument cluster (10849) rearward and disconnect wiring.

    - Mechanical instrument cluster — three connectors

5. Remove instrument cluster from instrument panel.

For installation, follow removal procedures in reverse order.

tomsn048@gmail.com



MECHANICAL CLUSTER — REAR VIEW

R8299-B

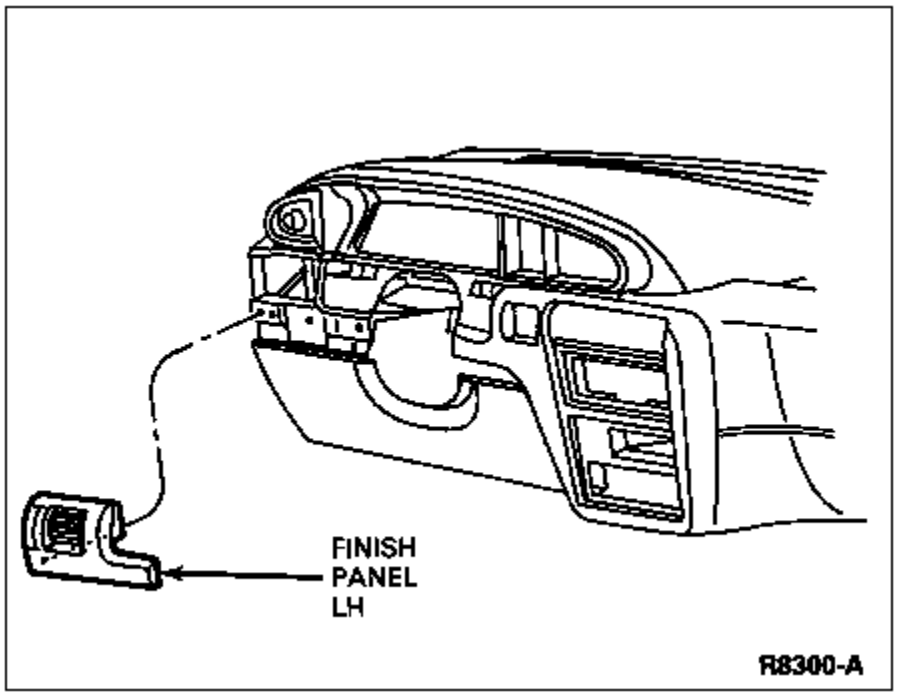
tomsn048@gmail.com

Finish Panel, Left, Aerostar

Removal and Installation

1. Pull instrument panel finish panel (044D70) rearward to disengage the five snap-in retainers (two on top, three on bottom).

2. To install, push finish panel into retainer holes.



tomsn048@gmail.com

tomsn048@gmail.com

Finish Panel, Instrument Panel, Aerostar

Removal and Installation

1. Disconnect battery positive cable.
2. Remove three screws attaching instrument panel steering column cover (04459).
3. Pull lower cover from instrument panel. Unsnap one right side and three upper retainers.
4. Remove instrument panel ash receptacle (04810) and two exposed screws after instrument panel ash receptacle is removed.
5. Carefully pull instrument panel finish panel (044D70) rearward to unsnap the retainers and far enough to disconnect the wiring from the back.
6. Remove instrument panel finish panel from instrument panel.

For installation, follow removal procedures in reverse order.

tomsn048@gmail.com

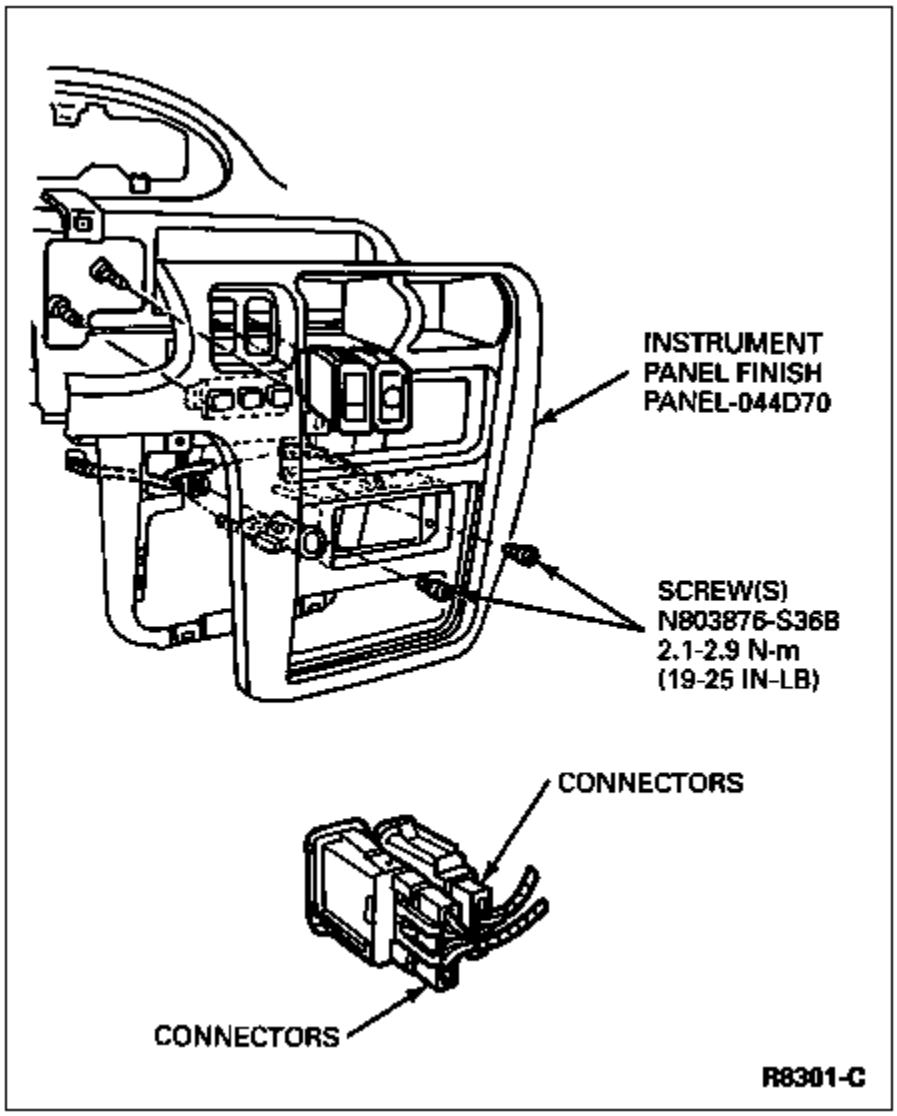
Center Finish Panel, Aerostar

Removal and Installation

1. Remove radio. Refer to Section 15-01 for radio removal and installation.
2. If equipped with radio opening cover, release tabs and remove.
3. Remove rear wipe/wash switch, rear defrost switches and fog lamp switch, if equipped.
4. Remove two (2) screws.
5. Remove four (4) grasshopper clips.
6. Remove center finish panel.
7. Disconnect electrical connector.

For installation, follow removal procedures in reverse order.

tomsn048@gmail.com



tomsn048@gmail.com

tomsn048@gmail.com

Air Bag Delete Panel

Removal and Installation

1. Use blunt tool to release tabs attaching air bag delete cover to instrument panel. (Air bag delete has an electrical sensor that indicates to the air bag module that there is no passenger air bag.)

2. From back of air bag delete panel, disconnect electrical connection.

For installation, follow removal procedures in reverse order.

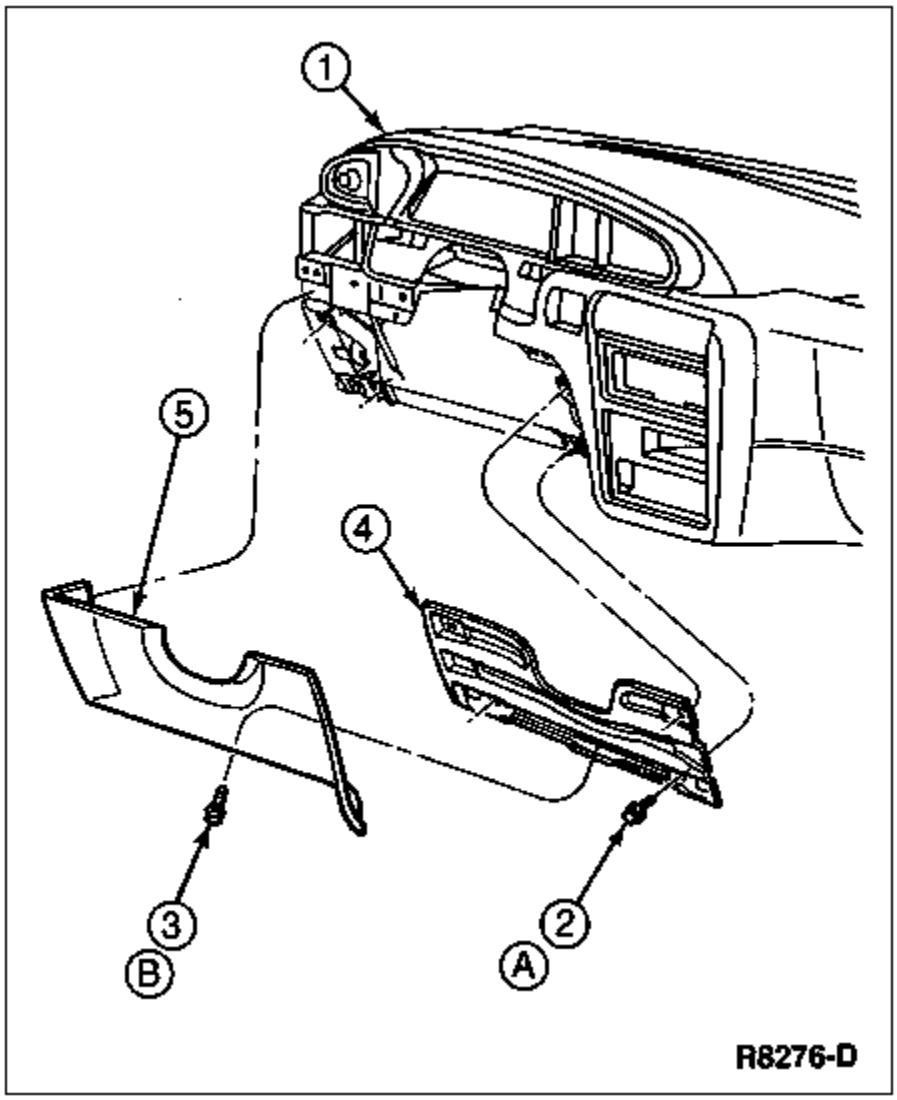
tomsn048@gmail.com

Steering Column Opening Cover Assembly and Reinforcement, Aerostar

Removal and Installation

1. Remove three screws attaching the instrument panel steering column cover (04459).
2. Pull instrument panel steering column cover from instrument panel and unsnap one right side and three upper retainers.
3. Remove four screws attaching the steering column lower reinforcement and remove reinforcement.

For installation, follow removal procedures in reverse order.



Item	Part Number	Description

tomsn048@gmail.com

1	04320	Instrument Panel
2	N803876-S36B	Screw (4 Req'd)
3	N803877-S36B	Screw (4 Req'd)
4	043C00	Steering Column Opening Reinforcement
5	04459	Instrument Panel Steering Column Cover
A	—	Tighten to 10-14 Nm (7-10 Lb-Ft)
B	—	Tighten to 2-3 Nm (18-26 Lb-In)

tomsn048@gmail.com

Instrument Panel Assembly, Lower, Aerostar

Removal and Installation

1. Remove instrument panel steering column cover (04459).
2. Remove instrument panel finish panel (044D70).
3. Remove glove box door assembly.
4. Disconnect glove box light wiring connector.
5. If equipped, disconnect the graphic equalizer wiring connectors.
6. Remove two bolts attaching the left end of the instrument panel steering column cover to the instrument panel.
7. Remove one screw attaching equalizer or reinforcement bracket to instrument panel steering column cover.
8. Remove five screws attaching the instrument panel steering column cover to the instrument panel.
9. If replacing the instrument panel steering column cover, transfer the components to the replacement instrument panel.

For installation, follow removal procedures in reverse order.

tomsn048@gmail.com

Glove Compartment Door, Aerostar

Removal and Installation

1. Depress the two side stops inward, pull the glove compartment door finish panel (06036) open. Release the hinge pivots.
2. To install, line up the hinge pivots with the glove compartment door (06024). Position stop in instrument panel.
3. Close door to latched position.

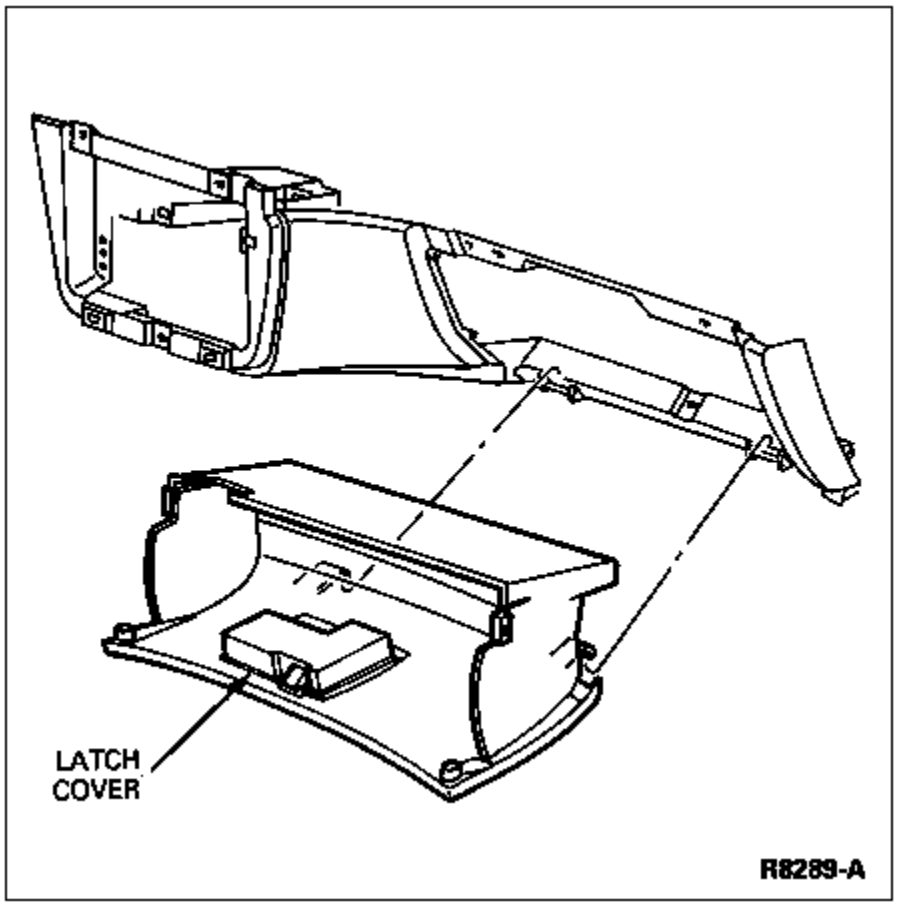
tomsn048@gmail.com

Latch Assembly, Glove Compartment, Aerostar

Removal and Installation

1. Remove latch cover from inside of glove compartment by unsnapping the four tabs.
2. Remove the two screws attaching the latch.

For installation, follow removal procedures in reverse order.



tomsn048@gmail.com

Inspection and Verification

1. Verify the vehicle owner's original concern by operating the power door locks to duplicate the concern.

2. Inspect to determine if one of the following mechanical or electrical concerns apply.

VISUAL INSPECTION CHART

Mechanical	Electrical
• Binding latch mechanism	• Open fuse:
• Binding linkage	■ Engine compartment
• Misaligned door	power distribution box
• Loose connectors	
• Corroded connectors	

3. If the concern(s) remains after the inspection, determine the symptom(s) and proceed to the following Symptom Chart.

tomsn048@gmail.com

Symptom Chart — Handles, Locks, Latches And Mechanisms

NOTE: Use Rotunda 73 Digital Multimeter 105-R0051 or equivalent to perform electrical pinpoint tests.

HANDLES, LOCKS, LATCHES AND MECHANISMS

Condition	Possible Source	Action
• One Door Lock Inoperative	• Circuitry. • Power door lock actuator.	• GO to Pinpoint Test A.
• All Door Locks Inoperative (Aerostar)	• Locks fuse open. • Battery/power circuit. • Poor ground. • Circuitry. • Door lock switch. • Door lock/unlock control relay.	• GO to Pinpoint Test B.
• All Door Locks Inoperative (Ranger)	• Locks fuse open in power distribution box. • Battery/power circuit. • Poor ground. • Circuitry. • Door lock switch. • All lock relay and all unlock relay.	• GO to Pinpoint Test C.
• All Locks Operate from One Switch Only	• Power to switch. • Door lock switch. • Circuitry.	• GO to Pinpoint Test D.
• Door Locks Operate One Way Only (Aerostar)	• Circuitry. • Poor ground. • Door lock/unlock control relay door lock switches.	• GO to Pinpoint Test E.
• Door Locks Operate One Way Only (Ranger)	• Circuitry. • Poor ground.	

tomsn048@gmail.com

	• Door lock switches. • All lock relay or all unlock relay.	• GO to Pinpoint Test F.
• Sliding Door Lock Inoperative (Aerostar)	• Circuitry. • Sliding door lock actuator. • Power door lock module. • Sliding door contacts.	• GO to Pinpoint Test G.
• Liftgate Door Lock Inoperative	• Circuitry. • Power door lock actuator.	• GO to Pinpoint Test H.
• Door Locks Work with Engine Running Only	• Battery discharged.	• GO to Pinpoint Test J.
• Door Locks Work Intermittently	• Battery partially charged. • Connections loose, opening or shorting. • Intermittent door lock switch or power door lock actuator.	• GO to Pinpoint Test K.

tomsn048@gmail.com

Pinpoint Tests

PINPOINT TEST A: ONE DOOR LOCK INOPERATIVE

A1 CHECK OPERATION OF SUSPECT DOOR LOCK

- Manually operate inoperative door lock.
- Check for binding or stuck condition.

Is lock stuck or binding?

Yes	No
REFER to Lubrication in this section. SERVICE as required. RETEST system.	GO to **A2**.

A2 CHECK SUSPECT POWER DOOR LOCK ACTUATOR LOCK OPERATION

- Gain access to suspect power door lock actuators as outlined.
- Disconnect power door lock actuator.
- Using a test lamp connected to a known good ground, check Circuit 117 (PK/BK) at harness connector while actuating door locks in the lock position.

Did test lamp illuminate?

Yes	No
GO to **A3**.	SERVICE Circuit 117 (PK/BK) for open circuit. RETEST system.

A3 CHECK POWER DOOR LOCK ACTUATOR FOR UNLOCK OPERATION

- Remove test lamp from Circuit 117 (PK/BK) and connect it to Circuit 118 (PK/O).
- Actuate switch in the unlock position.

Did test lamp illuminate?

Yes	No
GO to **A4**.	SERVICE Circuit 118 (PK/O) for open circuit. RETEST system.

tomsn048@gmail.com

A4 CHECK POWER DOOR LOCK ACTUATOR

- Using two 10 gauge jumper wires connected to battery positive (+) and negative (-), attach jumpers to actuator connector; reverse polarity for opposite direction.

Did actuator operate correctly?

Yes	No
GO to **A5** .	REPLACE power door lock actuator. RETEST system.

A5 CHECK POWER DOOR LOCK ACTUATOR CURRENT DRAW

- Using Rotunda 73 Digital Multimeter 105-R0051 or equivalent, check actuator current draw.

Is current draw 6 amps or less?

Yes	No
RECONNECT power door lock actuator. REFER to Lubrication . RETEST system.	REPLACE power door lock actuator. RETEST system.

PINPOINT TEST B: ALL DOOR LOCKS INOPERATIVE (AEROSTAR)

B1 CHECK SUPPLY TO DOOR LOCK/UNLOCK CONTROL RELAY

- Disconnect door lock/unlock control relay.
- Connect voltmeter between Circuit 171 (BK/W) Pin 4 on relay connector and a known good ground.
- Measure voltage.

Is battery voltage present?

Yes	No
GO to **B4** .	GO to **B2** .

B2 CHECK CIRCUIT 171 (BK/W) FOR OPEN

- Disconnect Fuselink C, Circuit 171 (BK/W) from starter relay.
- Connect ohmmeter between Fuseline C eyelet and door lock/unlock control relay connector, Circuit 171, Pin 4.
- Measure resistance.

Is resistance 5 ohms or less?

tomsn048@gmail.com

Yes	No
GO to **B3** .	SERVICE Circuit 171 (BK/W) for open. RETEST system.

B3 CHECK CIRCUIT 171 (BK/W) FOR SHORT TO GROUND

- Connect ohmmeter between door lock/unlock control relay connector Circuit 171 (BK/W) Pin 4 and a known good ground.
- Measure resistance.

Is resistance 5 ohms or less?

Yes	No
SERVICE Circuit 171 (BK/W) for short to ground. RETEST system.	GO to **B4** .

B4 CHECK GROUND CIRCUIT FOR DOOR LOCK/UNLOCK RELAY

- Connect ohmmeter between door lock/unlock relay connector Circuit 57 (BK) Pin 3 and a known good ground.
- Measure resistance.

Is resistance 5 ohms or less?

Yes	No
GO to **B5** .	SERVICE Circuit 57 (BK) for open. RETEST system.

B5 CHECK SUPPLY TO DOOR LOCK SWITCHES

- Remove door lock switches as outlined in this section.
- Connect a voltmeter between Circuit 171 (BK/W) Pin 2 on LH switch (Pin 8 on RH switch) and known good ground.
- Measure voltage.

Is battery voltage present?

Yes	No
GO to **B6** .	GO to **B2** .

B6 CHECK LOCK SIGNAL TO RELAY

- Connect voltmeter between door lock/unlock control relay connector Pin 6 Circuit 119 (PK/Y) and known good ground.

tomsn048@gmail.com

- Actuate a switch to lock position.

Is battery voltage present?

Yes	No
GO to **B7** .	GO to **B8** .

B7 CHECK UNLOCK SIGNAL TO RELAY

- Connect voltmeter between door lock/unlock control relay connector Pin 1 Circuit 120 (PK/LG) and known good ground.
- Actuate a switch to unlock position.

Is battery voltage present?

Yes	No
GO to **B14** .	GO to **B9** .

B8 CHECK CIRCUIT 119 (PK/Y)

- Using a jumper, connect Circuit 171 (BK/W) Pin 2 and Circuit 119 (PK/Y) Pin 1 of the door lock switch connector.
- Connect voltmeter between door lock/unlock control relay connector Pin 6 Circuit 119 (PK/Y) and known good ground.
- Measure voltage.

Is battery voltage present?

Yes	No
REFER to Switch Test in Component Test. SERVICE as required. RETEST system.	GO to **B10** .

B9 CHECK CIRCUIT 120 (PK/LG)

- Using a jumper, connect Circuit 171 (BK/W) Pin 2 and Circuit 120 (PK/LG) Pin 3 of the door lock switch connector.
- Connect voltmeter between door lock/unlock control relay connector Circuit 120 (PK/LG) Pin 1 and known good ground.
- Measure voltage.

Is battery voltage present?

Yes	No
REFER to Switch Test in Component Test. SERVICE as required. RETEST system.	SERVICE Circuit 120 (PK/LG). RETEST system.

tomsn048@gmail.com

B10 CHECK LOCK SIGNAL TO RELAY FOR OPEN

- Connect ohmmeter between LH door lock switch connector Circuit 119 (PK/Y) Pin 1 and the door lock/unlock control relay connector Circuit 119 (PK/Y) Pin 6.
- Measure resistance.

Is resistance 5 ohms or less?

Yes	No
GO to **B11** .	SERVICE Circuit 119 (PK/Y) for open. RETEST system.

B11 CHECK LOCK SIGNAL TO RELAY FOR SHORT TO GROUND

- Connect ohmmeter between LH door lock switch connector Circuit 119 (PK/Y) Pin 1 and known good ground.
- Measure resistance.

Is resistance 5 ohms or less?

Yes	No
SERVICE Circuit 119 (PK/Y) for short to ground. RETEST system.	GO to **B12** .

B12 CHECK UNLOCK SIGNAL TO RELAY FOR OPEN

- Connect ohmmeter between LH door lock switch connector Circuit 120 (PK/LG) Pin 3 and door lock/unlock control relay connector Circuit 120 (PK/LG) Pin 1.
- Measure resistance.

Is resistance 5 ohms or less?

Yes	No
GO to **B13** .	SERVICE Circuit 120 (PK/LG) for open. RETEST system.

B13 CHECK UNLOCK SIGNAL TO RELAY FOR SHORT TO GROUND

- Connect ohmmeter between LH door lock switch connector Circuit 120 (PK/LG) Pin 3 and known good ground.
- Measure resistance.

Is resistance 5 ohms or less?

Yes	No

tomsn048@gmail.com

SERVICE circuit 120 (PK/LG) for short to ground. RETEST system.	RETEST system.

B14 CHECK CIRCUIT 118 (PK/O) FOR OPEN

- Connect ohmmeter between RF door lock actuator connector, Circuit 118 (PK/O) and the door lock/unlock control relay connector, Circuit 118 (PK/O), Pin 2.
- Measure resistance.

Is resistance 5 ohms or less?

Yes	No
GO to **B15** .	SERVICE Circuit 118 (PK/O) for open. RETEST system.

B15 CHECK CIRCUIT 118 (PK/O) FOR SHORT

- Connect ohmmeter between RF door lock actuator connector, Circuit 118 (PK/O) and known good ground.
- Measure resistance.

Is resistance 10,000 ohms or greater?

Yes	No
GO to **B16** .	SERVICE Circuit 118 (PK/O) for short to ground. RETEST system.

B16 CHECK CIRCUIT 117 (PK/BK) FOR OPEN

- Connect ohmmeter between RF door lock actuator connector, Circuit 117 (PK/BK), and the door lock/unlock control relay connector, Circuit 117 (PK/BK), Pin 5.
- Measure resistance.

Is resistance 5 ohms or less?

Yes	No
GO to **B17** .	SERVICE Circuit 117 (PK/BK) for open. RETEST system.

B17 CHECK CIRCUIT 117 (PK/BK) FOR SHORT

- Connect ohmmeter between RF door lock actuator connector, Circuit 117 (PK/BK), and known good ground.
- Measure resistance.

tomsn048@gmail.com

Is resistance 10,000 ohms or greater?

Yes	No
REFER to Relay Test in Component Test. SERVICE as required. If relay is OK, REPLACE power door lock module. RETEST system.	SERVICE Circuit 117 (PK/BK) for short to ground. RETEST system.

PINPOINT TEST C: ALL DOOR LOCKS INOPERATIVE (RANGER)

C1 CHECK FUSE E (20A) IN POWER DISTRIBUTION BOX

Is the fuse open?

Yes	No
GO to **C5** .	GO to **C2** .

C2 CHECK SUPPLY TO ALL LOCK RELAY AND ALL UNLOCK RELAY

- Gain access to relay module No. 3.
- Remove all lock and all unlock relays located in instrument panel relay module No. 3. Refer to Section 18-01 for location illustrations.
- Connect voltmeter negative lead to known good ground, then test module Pins 25, 26, 31 and 34 individually with positive lead of voltmeter.
- Measure voltage on each pin.

Is battery voltage present on each pin?

Yes	No
GO to **C3** .	GO to **C4** .

C3 CHECK GROUND CIRCUIT FOR ALL LOCK AND ALL UNLOCK RELAYS

- Connect ohmmeter test lead to known good ground, then with other test lead, test module Pins 30 and 33 on instrument panel relay module No. 3.
- Measure resistance of each pin.

Is resistance 5 ohms or less on each pin?

Yes	No
GO to **C6** .	SERVICE Circuit 57 (BK) for open on any pin over 5 ohms. RETEST system.

tomsn048@gmail.com

C4 CHECK CIRCUIT 171 (BK/W) FOR OPEN

- Connect ohmmeter between fuse E Circuit 171 (BK/W) of power distribution box and instrument panel relay module No. 3, Pins 25, 26, 31 and 34, test each individually.
- Measure resistance of each pin.

Is resistance 5 ohms or less on each pin?

Yes	No
GO to **C5** .	SERVICE Circuit 171 (BK/W) for open. RETEST system.

C5 CHECK CIRCUIT 171 (BK/W) FOR SHORT

- Connector ohmmeter between known good ground and instrument panel relay module No. 3 Pin 25.
- Measure resistance.

Is resistance 5 ohms or less on any pin?

Yes	No
SERVICE Circuit 171 (BK/W) for short to ground. RETEST system.	GO to **C6** .

C6 CHECK LOCK SIGNAL TO ALL LOCK RELAY FOR OPEN

- Connect ohmmeter between Circuit 119 (PK/Y) instrument panel relay module No. 3 and known good ground.
- Actuate any door lock switch to lock position.
- Measure resistance.

Is resistance 5 ohms or less?

Yes	No
REFER to Relay Test in component test. SERVICE as required. RETEST system.	GO to **C7** .

C7 CHECK CIRCUIT 119 (PK/Y) FOR OPEN

- Remove door lock switch as outlined in this section.
- Connect ohmmeter between Circuit 119 (PK/Y) of instrument panel module No. 3.
- Measure resistance.

Is resistance 5 ohms or less?

Yes	No

tomsn048@gmail.com

GO to **C8** .	SERVICE Circuit 119 (PK/Y) for open. RETEST system.

C8 CHECK CIRCUIT 118 (PK/O) FOR OPEN

- Connect ohmmeter between RF door lock actuator connector, Circuit 118 (PK/O) and the instrument panel relay module No. 31, Circuit 118 (PK/O).
- Measure resistance.

Is resistance 5 ohms or less?

Yes	No
GO to **C9** .	SERVICE Circuit 118 (PK/O) for open. RETEST system.

C9 CHECK CIRCUIT 118 (PK/O) FOR SHORT

- Connect ohmmeter between RF door lock actuator connector, Circuit 118 (PK/O), and known good ground.
- Measure resistance.

Is resistance 10,000 ohms or greater?

Yes	No
GO to **C10** .	SERVICE Circuit 118 (PK/O) for short to ground. RETEST system.

C10 CHECK CIRCUIT 117 (PK/BK) FOR OPEN

- Connect ohmmeter between RF door lock actuator connector, Circuit 117 (PK/BK), and the instrument panel relay module No. 3, Circuit 117 (PK/BK), Pin 5.
- Measure resistance.

Is resistance 5 ohms or less?

Yes	No
GO to **C11** .	SERVICE Circuit 117 (PK/BK) for open. RETEST system.

C11 CHECK CIRCUIT 117 (PK/BK) FOR SHORT

- Connect ohmmeter between RF door lock actuator connector, Circuit 117 (PK/BK), and known good ground.
- Measure resistance.

tomsn048@gmail.com

Is resistance 10,000 ohms or greater?

Yes	No
GO to **C12** .	SERVICE Circuit 117 (PK/BK) for short to ground. RETEST system.

C12 CHECK INSTRUMENT PANEL RELAY MODULE NO. 3

- Check the instrument panel relay module No. 3. Refer to Relay Test in component test.

Is the relay OK?

Yes	No
GO to **C13** .	REPLACE the instrument panel relay module No. 3. RETEST system.

C13 CHECK SWITCH GROUND CIRCUIT 57 (BK) FOR OPEN

- With switch removed, connect ohmmeter between Circuit 57 (BK) on switch connector and known good ground.
- Measure resistance.

Is resistance 5 ohms or less?

Yes	No
REFER to Switch Test in component test. SERVICE as required. RETEST system.	SERVICE Circuit 57 (BK) for open. RETEST system.

PINPOINT TEST D: ALL LOCKS WORK FROM ONE SWITCH ONLY

D1 CHECK SUSPECT SWITCH

- Remove suspect switch.
- Perform Switch Test . Refer to Component Tests in this section.

Did switch test OK?

Yes	No
GO to **D2** .	REPLACE door lock switch. RETEST system.

D2 CHECK CIRCUIT 57 (BK)

tomsn048@gmail.com

- Check Circuit 57 (BK) for LH switch or for RH switch for continuity to ground.

Is there continuity?

Yes	No
GO to **D3** .	SERVICE Circuit 57 (BK) for open. RETEST system.

D3 CHECK CIRCUIT 119 (PK/Y)

- Remove opposite door lock switch.
- Using an ohmmeter, check Circuit 119 (PK/Y) from LH door lock switch connector to Circuit 119 (PK/Y) at RH door lock switch connector for continuity.

Is there continuity?

Yes	No
GO to **D4** .	SERVICE Circuit 119 (PK/Y) for open. RETEST system.

D4 CHECK CIRCUIT 120 (PK/LG)

- Using ohmmeter, check Circuit 120 (PK/LG) from LH door lock switch connector to Circuit 120 (PK/LG) at RH door lock switch connector for continuity.

Is there continuity?

Yes	No
REPLACE opposite door lock switch. RETEST system.	SERVICE Circuit 120 (PK/LG) for open. RETEST system.

PINPOINT TEST E: DOOR LOCKS OPERATE ONE WAY ONLY (AEROSTAR)

E1 CHECK LOCK OPERATION

- Actuate door lock switch to the lock position.

Did doors lock?

Yes	No
GO to **E6** .	GO to **E2** .

tomsn048@gmail.com

E2 CHECK CIRCUIT 119 (PK/Y) TO DOOR LOCK/UNLOCK CONTROL RELAY FOR OPEN

- Remove door lock/unlock control relay.
- Using a test lamp, check for voltage at Circuit 119 (PK/Y) Pin 6 when door lock switch is actuated to the lock position.

Did test lamp illuminate?

Yes	No
REFER to Relay Test in component test. SERVICE as required. RETEST system.	GO to **E3** .

E3 CHECK CIRCUIT 119 (PK/Y) FOR OPEN

- Remove LH door lock switch as outlined in this section.
- Connect ohmmeter between Circuit 119 (PK/Y) Pin 1 on door lock switch connector and Circuit 119 (PK/Y) Pin 6 on door lock/unlock control relay connector.
- Measure resistance.

Is resistance 5 ohms or less?

Yes	No
GO to **E4** .	SERVICE Circuit 119 (PK/Y) for open. RETEST system.

E4 CHECK CIRCUIT 119 (PK/Y) FOR SHORT TO GROUND

- Connect ohmmeter between Circuit 119 (PK/Y) Pin 1 on door lock switch connector and known good ground.
- Measure resistance.

Is resistance 5 ohms or less?

Yes	No
SERVICE Circuit 119 (PK/Y) for short to ground. RETEST system.	GO to **E5** .

E5 CHECK DOOR LOCK/UNLOCK CONTROL RELAY OPERATION

- Reinstall door lock/unlock control relay.
- Using a jumper, connect Circuit 171 (BK/W) Pin 2 and Circuit 119 (PK/Y) Pin 1 on door lock switch connector.

Did door locks actuate?

tomsn048@gmail.com

Yes	No
REFER to Switch Test in component test. SERVICE as required. RETEST system.	REFER to Relay Test in component test. SERVICE as required. RETESt system.

E6 CHECK CIRCUIT 120 (PK/LG) TO DOOR LOCK/UNLOCK CONTROL RELAY FOR OPEN

- Remove door lock/unlock control relay.
- Using a test lamp, check for voltage at Circuit 120 (PK/LG) Pin 1 when door lock switch is activated to the unlock position.

Did test lamp illuminate?

Yes	No
REFER to Relay Test in component test. SERVICE as required. RETEST system.	GO to **E7** .

E7 CHECK CIRCUIT 120 (PK/LG) FOR OPEN

- Remove LH door lock switch as outlined in this section.
- Connect ohmmeter between Circuit 120 (PK/LG) Pin 3 on door lock switch connector and Circuit 120 (PK/LG) Pin 1 on door lock/unlock control relay connector.
- Measure resistance.

Is resistance 5 ohms or less?

Yes	No
GO to **E8** .	SERVICE Circuit 120 (PK/LG) for open. RETEST system.

E8 CHECK CIRCUIT 120 (PK/LG) FOR SHORT TO GROUND

- Connect ohmmeter between Circuit 120 (PK/LG) Pin 3 on door lock switch connector and known good ground.
- Measure resistance.

Is resistance 5 ohms or less?

Yes	No
SERVICE Circuit 120 (PK/LG) for short to ground. RETEST system.	GO to **E9** .

E9 CHECK DOOR LOCK/UNLOCK CONTROL RELAY OPERATION

tomsn048@gmail.com

- Reinstall door lock/unlock control relay.
- Using a jumper, connect Circuit 171 (BK/W) Pin 2 and Circuit 120 (PK/LG) Pin 3 on door lock switch connector.

Did door locks actuate?

Yes	No
REFER to Switch Test in component test. SERVICE as required. RETEST system.	REFER to Relay Test in component test. SERVICE as required. RETEST system.

PINPOINT TEST F: DOOR LOCKS OPERATE ONE WAY ONLY (RANGER)

F1 CHECK LOCK OPERATION

- Actuate door lock switch to the lock position.

Did doors lock?

Yes	No
GO to **F6** .	GO to **F2** .

F2 CHECK SUPPLY TO ALL LOCK RELAY

- Remove all lock relay from instrument panel relay module No. 3. Refer to Section 18-01 for location illustrations.
- Using a test lamp, check for voltage at Circuit 171 (BK/W) Pins 26 and 34.

Did test lamp illuminate at each pin?

Yes	No
GO to **F3** .	SERVICE Circuit 171 (BK/W) for open. RETEST system.

F3 CHECK GROUND TO ALL LOCK RELAY

- Connect ohmmeter between Circuit 57 (BK) of all lock relay connector and known good ground.
- Measure resistance.

Is resistance 5 ohms or less?

Yes	No
GO to **F4** .	SERVICE Circuit 57 (BK) for open. RETEST system.

tomsn048@gmail.com

F4 CHECK LOCK SIGNAL TO ALL LOCK RELAY

- Connect ohmmeter between Circuit 119 (PK/Y) of all lock relay connector and known good ground.
- Actuate door lock switch to lock position.
- Measure resistance.

Is resistance 5 ohms or less?

Yes	No
REFER to Relay Test in component test. SERVICE as required. RETEST system.	GO to **F5** .

F5 CHECK RELAY COIL GROUND CIRCUIT

- Remove door lock switch as outlined in this section.
- Using a jumper, connect Circuit 119 (PK/Y) and Circuit 57 (BK) of door lock switch connector.
- Connect ohmmeter between Circuit 119 (PK/Y) of all lock relay connector and known good ground.
- Measure resistance.

Is resistance 5 ohms or less?

Yes	No
REFER to Switch Test in component test. SERVICE any door lock switch as required. RETEST system.	SERVICE Circuit 119 (PK/Y) or 57 (BK) of switch connector for open. RETEST system.

F6 CHECK SUPPLY TO ALL UNLOCK RELAY

- Remove all unlock relay from instrument panel relay module No. 3. Refer to Section 18-01 for location illustrations.
- Using a test lamp, check for voltage at Circuit 171 (BK/W) Pins 25 and 31.

Did test lamp illuminate at each pin?

Yes	No
GO to **F7** .	SERVICE Circuit 171 (BK/W) for open. RETEST system.

F7 CHECK GROUND TO ALL UNLOCK RELAY

- Connect ohmmeter between Circuit 57 (BK) of all unlock relay connector and known good ground.
- Measure resistance.

Is resistance 5 ohms or less?

tomsn048@gmail.com

Yes	No
GO to **F8** .	SERVICE Circuit 57 (BK) for open. RETEST system.

F8 CHECK UNLOCK SIGNAL TO ALL UNLOCK RELAY

- Connect ohmmeter between Circuit 120 (PK/LG) of all unlock relay connector and known good ground.
- Actuate door lock switch to lock position.
- Measure resistance.

Is resistance 5 ohms or less?

Yes	No
REFER to Relay Test in component test. SERVICE as required. RETEST system.	GO to **F9** .

F9 CHECK RELAY COIL GROUND CIRCUIT

- Remove door lock switch as outlined in this section.
- Using a jumper, connect Circuit 120 (PK/LG) and Circuit 57 (BK) of door lock switch connector.
- Connect ohmmeter between Circuit 120 (PK/LG) of all unlock relay connector and known good ground.
- Measure resistance.

Is resistance 5 ohms or less?

Yes	No
REFER to Switch Test in component test. SERVICE any door lock switch as required. RETEST system.	SERVICE Circuit 120 (PK/LG) or 57 (BK) of switch connector for open. RETEST system.

PINPOINT TEST G: SLIDING DOOR LOCK INOPERATIVE (AEROSTAR)

G1 CHECK OPERATION OF SUSPECT DOOR LOCK

- Manually operate inoperative door lock.
- Check for binding or stuck condition.

Is lock stuck or binding?

Yes	No
REFER to Lubrication in this section. SERVICE	GO to **G2** .

tomsn048@gmail.com

as required. RETEST system.	

G2 CHECK SUPPLY TO POWER DOOR LOCK MODULE

- Gain access to power door lock module as outlined in this section.
- Remove connector from power door lock module.
- Using a test lamp, check for voltage at Circuit 171 (BK/W) Pin 8 of power door lock module connector.

Did test lamp illuminate?

Yes	No
GO to **G3** .	SERVICE Circuit 171 (BK/W) for open. RETEST system.

G3 CHECK GROUND TO POWER DOOR LOCK MODULE

- Connect ohmmeter between Circuit 57 (BK) Pin 4 of power door lock module connector and known good ground.
- Measure resistance.

Is resistance 5 ohms or less?

Yes	No
GO to **G4** .	SERVICE Circuit 57 (BK) for open. RETEST system.

G4 CHECK LOCK SIGNAL TO POWER DOOR LOCK MODULE

- Using a test lamp, check for voltage at Circuit 117 (PK/BK) Pin 2 of power door lock module connector while door lock switch is actuated to the lock position.

Did test lamp illuminate?

Yes	No
GO to **G6** .	GO to **G5** .

G5 CHECK CIRCUIT 117 (PK/BK) FOR SHORT

- Remove door lock/unlock control relay as outlined in this section.
- Connect ohmmeter between Circuit 117 (PK/BK) Pin 2 of power door lock module connector and known good ground.
- Measure resistance.

tomsn048@gmail.com

Is resistance 5 ohms or less?

Yes	No
SERVICE Circuit 117 (PK/BK) for short to ground. RETEST system.	SERVICE Circuit 117 (PK/BK) for open. RETEST system.

G6 CHECK UNLOCK SIGNAL TO POWER DOOR LOCK MODULE

- Using a test lamp, check for voltage at Circuit 118 (PK/O) Pin 1 of power door lock module connector while door lock switch is actuated to the unlock position.

Did test lamp illuminate?

Yes	No
GO to **G8** .	GO to **G7** .

G7 CHECK CIRCUIT 118 (PK/O) TO POWER DOOR LOCK MODULE FOR SHORT TO GROUND

- Remove door lock/unlock control relay as outlined in this section.
- Connect ohmmeter between Circuit 118 (PK/O) Pin 1 of power door lock module connector and known good ground.
- Measure resistance.

Is resistance 5 ohms or less?

Yes	No
SERVICE Circuit 118 (PK/O) for short to ground. RETEST system.	SERVICE Circuit 118 (PK/O) for open. RETEST system.

G8 CHECK CIRCUIT 121 (PK/BK) FOR OPEN

- Gain access to sliding door lock actuator as outlined in this section.
- Disconnect sliding door lock actuator.
- With sliding door closed, connect ohmmeter between Circuit 121 (PK/BK) on actuator connector and Circuit 121 (PK/BK) Pin 7 of power door lock module connector.
- Measure resistance.

Is resistance 5 ohms or less?

Yes	No
GO to **G9** .	SERVICE Circuit 121 (PK/BK) for open. RETEST system.

tomsn048@gmail.com

G9 CHECK CIRCUIT 121 (PK/BK) FOR SHORT

- Connect ohmmeter between Circuit 121 (PK/BK) Pin 7 on power door lock module connector and known good ground.
- Measure resistance.

Is resistance 5 ohms or less?

Yes	No
SERVICE Circuit 121 (PK/BK) for short to ground. RETEST system.	GO to **G10** .

G10 CHECK CIRCUIT 118 (PK/O) TO DOOR LOCK/UNLOCK CONTROL RELAY FOR OPEN

- Connect ohmmeter between Circuit 118 (PK/O) at sliding door lock actuator connector and Circuit 118 (PK/O) at door lock/unlock control relay connector.
- Measure resistance.

Is resistance 5 ohms or less?

Yes	No
GO to **G11** .	SERVICE Circuit 118 (PK/O) for open. RETEST system.

G11 CHECK CIRCUIT 118 (PK/O) TO DOOR LOCK/UNLOCK CONTROL RELAY FOR SHORT TO GROUND

- Connect ohmmeter between sliding door lock actuator connector Circuit 118 (PK/O) and known good ground.
- Measure resistance.

Is resistance 5 ohms or less?

Yes	No
SERVICE Circuit 118 (PK/O) for short to ground. RETEST system.	GO to **G12** .

G12 CHECK THE POWER DOOR LOCK MODULE

- Perform the Component Test for the power door lock module. Refer to Power Door Lock Module Test in Component Test.

Is the power door lock module OK?

tomsn048@gmail.com

Yes	No
REFER to Door Lock Actuator Test in Component Test. SERVICE as required. RETEST system.	REPLACE the power door lock module. RETEST the system.

PINPOINT TEST H: LIFTGATE DOOR LOCK INOPERATIVE

H1 CHECK OPERATION OF SUSPECT DOOR LOCK

- Manually operate liftgate door lock.
- Check for binding or stuck condition.

Is lock stuck or binding?

Yes	No
REFER to Lubrication in this section. SERVICE as required. RETEST system.	GO to **H2** .

H2 CHECK LIFTGATE POWER DOOR LOCK ACTUATOR LOCK OPERATION

- Gain access to liftgate power door lock actuator as outlined.
- Disconnect power door lock actuator.
- Using a test lamp connected to a known good ground, check Circuit 117 (PK/BK) at harness connector while actuating door locks in the lock position.

Did test lamp illuminate?

Yes	No
GO to **H3** .	SERVICE Circuit 117 (PK/BK) for open circuit. RETEST system.

H3 CHECK POWER DOOR LOCK ACTUATOR FOR UNLOCK POSITION

- Remove test lamp from Circuit 117 (PK/BK) and connect it to Circuit 118 (PK/O).
- Actuate switch in the unlock position.

Did test lamp illuminate?

Yes	No
GO to **H4** .	SERVICE Circuit 118 (PK/O) for open circuit. RETEST system.

tomsn048@gmail.com

H4 CHECK POWER DOOR LOCK ACTUATOR

- Using two 10 gauge jumper wires connected to battery positive (+) and negative (-), attach jumpers to actuator connector; reverse polarity for opposite direction.

Did actuator operate properly?

Yes	No
GO to **H5** .	REPLACE power door lock actuator. RETEST system.

H5 CHECK POWER DOOR LOCK ACTUATOR CURRENT DRAW

- Using Rotunda 73 Digital Multimeter 105-R0051 or equivalent, check actuator current draw.

Is current draw 6 amps or less?

Yes	No
RECONNECT power door lock actuator. REFER to Lubrication . RETEST system.	REPLACE power door lock actuator. RETEST system.

PINPOINT TEST J: DOOR LOCKS WORK WITH ENGINE RUNNING ONLY

J1 CHECK SUPPLY CIRCUIT

- Using a voltmeter, check vehicle battery voltage.

Is voltage 10 volts or more?

Yes	No
GO to **J2** .	REFER to Section 14-00 for proper service. RETEST system.

J2 CHECK LATCH/LINKAGE

- Manually lock/unlock door.

Does latch operate easily?

Yes	No
GO to **J3** .	REFER to Lubrication and service as necessary.

tomsn048@gmail.com

J3 CHECK DOOR LOCK SWITCH CONNECTOR

- Partially remove left door lock switch as outlined.
- Inspect connector for corrosion or damaged/loose connection.

Is connector OK?

Yes	No
REFER to Lubrication in this section and service as necessary. RETEST system.	SERVICE as required. RETEST system.

PINPOINT TEST K: DOOR LOCKS WORK INTERMITTENTLY

K1 CHECK CONNECTIONS

- Access all related components.
- Check connectors for corrosion and tightness.

Are connectors OK?

Yes	No
GO to **K2** .	SERVICE as required. RETEST system.

K2 CHECK GROUND CIRCUIT AT RH OR LH SWITCH

- Using an ohmmeter connected to a known good ground, connect second lead to Circuit 57 (BK) at Pin 3.
- Measure resistance of each circuit.

Is resistance 5 ohms or less?

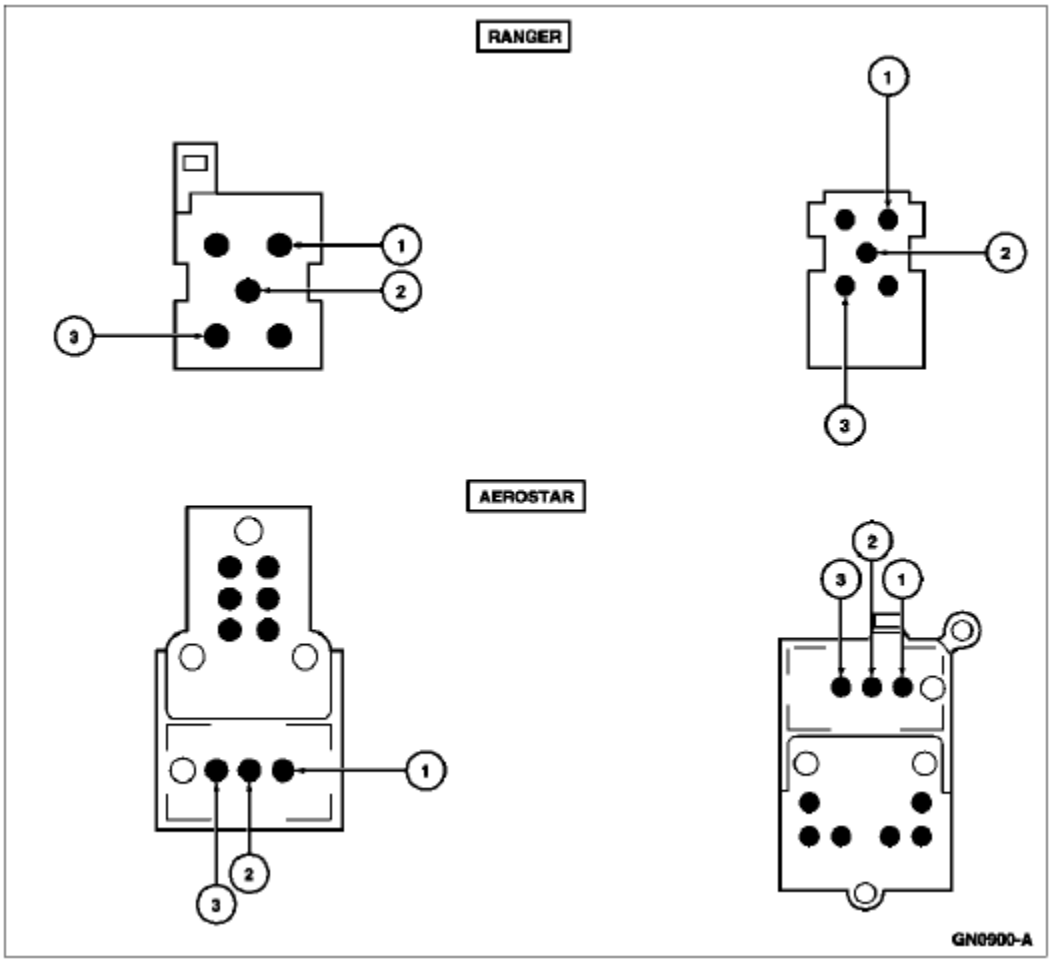
Yes	No
REFER to Switch Test in Component test. SERVICE as required. RETEST systems.	SERVICE Circuit 57 (BK) for open circuit. RETEST system.

tomsn048@gmail.com

tomsn048@gmail.com

Component Tests

Door Lock Switch



1. Measure the resistance of the door lock switch in question, between terminals 1 and 2, while pressing the switch in the unlock position. The resistance should be less than 5 ohms; if not less than 5 ohms, REPLACE the door lock switch.

2. Measure the resistance of the door lock switch in question, between terminals 2 and 3, while pressing the switch in the lock position. The resistance should be less than 5 ohms; if not less than 5 ohms, REPLACE the door lock switch.

3. Measure the resistance of the door lock switch in question, between terminals 1 and 2. The resistance should be greater than 10,000 ohms; if not greater than 10,000 ohms, REPLACE the door lock switch.

tomsn048@gmail.com

4. Measure the resistance of the door lock switch in question, between terminals 2 and 3. The resistance should be greater than 10,000 ohms; if not greater than 10,000 ohms, REPLACE the door lock switch.

Door Lock Actuator

NOTE: Do not hold power and ground to the power door lock actuator for more than five seconds at a time.

Apply 12 volts to one of the wire terminals and ground to the other wire terminal of the door lock actuator. Reverse the connections. The actuator should produce a clicking noise when power and ground is applied in both directions. If the actuator does not click, replace the power door lock actuator. Otherwise, return to the Pinpoint Test.

Power Door Lock Module, Aerostar

NOTE: Do not hold power and ground to the power door lock module for more than five seconds at a time.

Apply 12 volts to Pin 8 of the power door lock module and ground to Pin 4. Applying 12 volts to Pins 1 and 2 alternately will cycle Pin 7 to 12 volts, when Pin 1 is powered and ground, when Pin 2 is powered.

If it fails to respond in this manner, replace the power door lock module. Otherwise return to the Pinpoint Test.

Door Lock Relay

NOTE: Some relays are double relays and both sections of this type relay must prove good.

Remove the relay as outlined in this section. Connect an ohmmeter between the terminal that connects to Circuit 57 (B) and the terminal that connects to Circuit 118 (PK/O), for the unlock relay, or Circuit 117 (PK/BK), for the lock relay. The resistance should be 5 ohms or less.

Next, with the ohmmeter still connected to Circuit 118 (PK/O) terminal, for unlock relays, or Circuit 117 (PK/BK) terminal, for lock relays, connect the other test lead to the terminal that connects to Circuit 171 (BK/W). Energize the relay by applying 12 volts to the relay coil terminal, Circuit 120 (PK/LG) for runlock relays or Circuit 119 (PK/Y), for lock relays, and ground to the terminal that connects to Circuit 57 (BK) on the Aerostar or Circuit 171 (BK/W) on Ranger. The relay should click audibly and the ohmmeter should show resistance at 5 ohms or less.

If the resistance is over 5 ohms for either portion described above, replace the relay. Otherwise return to Pinpoint Test.

tomsn048@gmail.com

tomsn048@gmail.com

Latch, Door

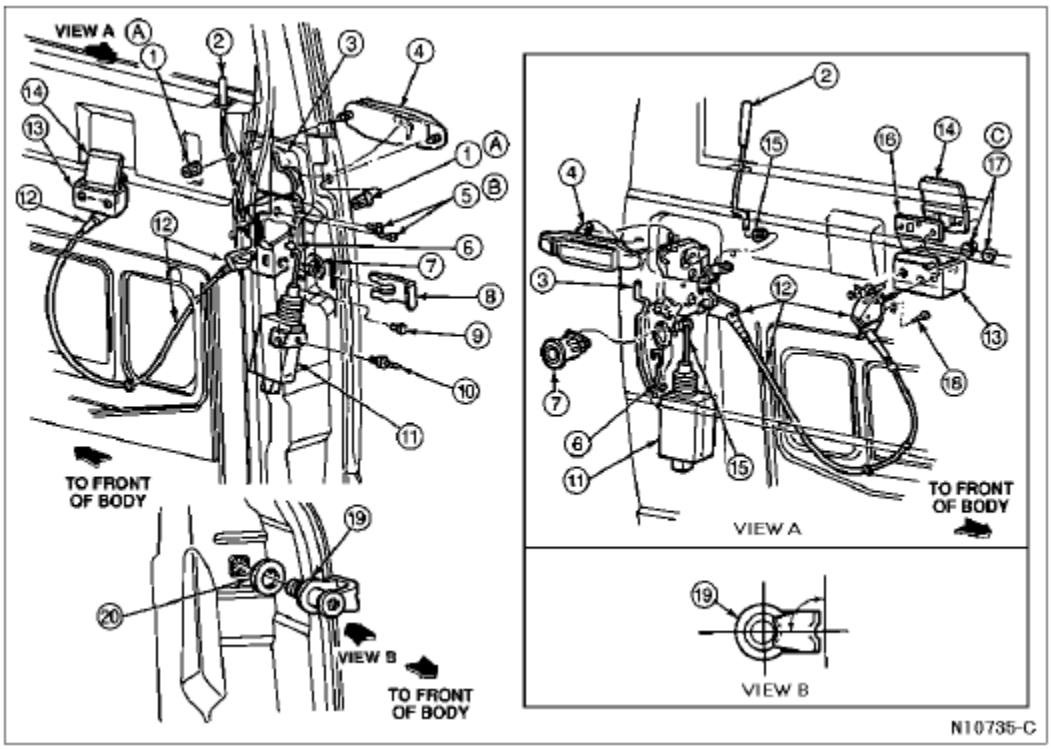
Front, Aerostar and Ranger

Removal and Installation

1. Remove the front door trim panel and watershield from the front door. Refer to Section 01-05A or Section 01-05B .
2. Disconnect front door latch actuating rod (22152) from lock cylinder.
3. Remove attaching screws from front door latch remote control and link (21818). Remove front door latch remote control and link from front door.
4. Disconnect front door latch control cylinder rod (22134) from front door latch remote control and link.
5. Disconnect front door latch remote control link.

For installation, follow removal procedures in reverse order.

Front Door Latch Installation, Aerostar



tomsn048@gmail.com

Item	Part Number	Description

Liftgate, Aerostar

Removal and Installation

1. Open liftgate and remove liftgate door trim panel and liftgate handle, if so equipped.
2. Disconnect liftgate latch release rod from control assembly.

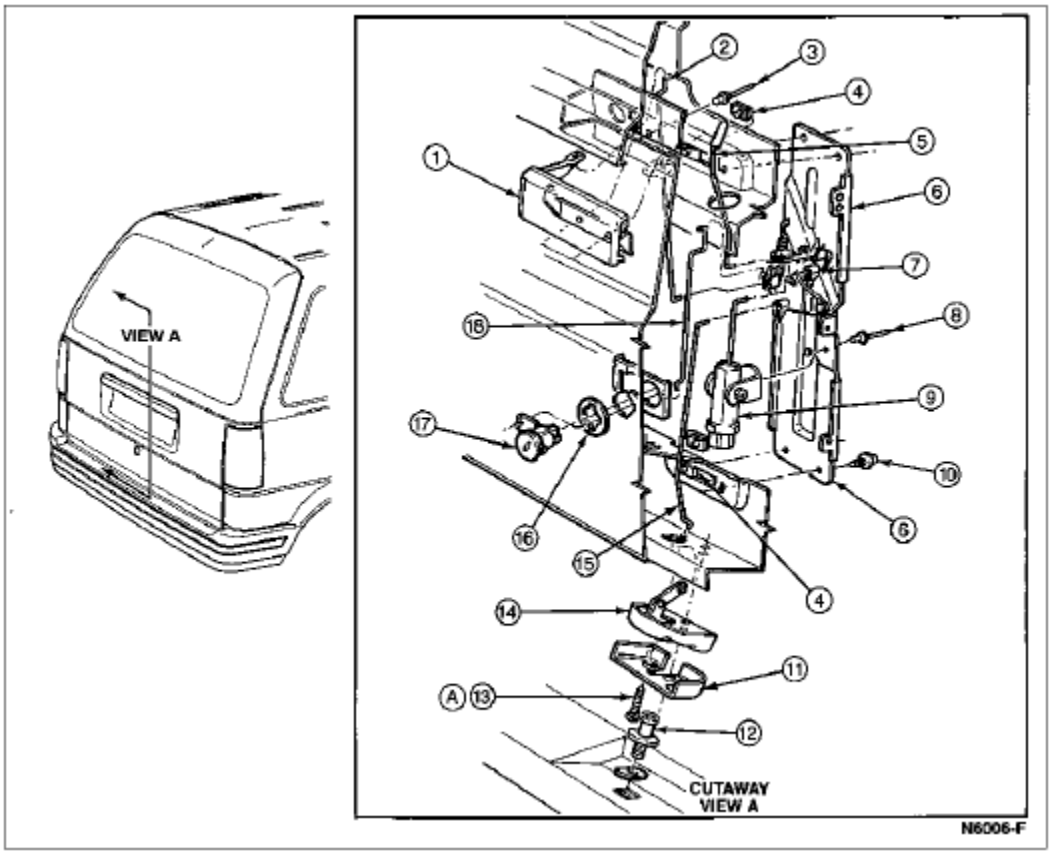
tomsn048@gmail.com

3. Remove three latch retaining screws and remove luggage compartment door lock mechanism cover (43243) and latch from liftgate.

4. On vehicles equipped with liftgate ajar warning switch, pull latch slightly away from liftgate and disconnect electrical wire harness from the latch.

To install, reverse Steps 1 through 4. Tighten liftgate handle retaining screws to 4-8 Nm (36-70 lb-in).

Liftgate Latch, Aerostar



Item	Part Number	Description
1	43400	Liftgate Handle
2	43329	Liftgate Latch Release Rod

A	—	Tighten to 9-14 Nm (7-10 Lb-Ft)

Body Side, Sliding, Aerostar

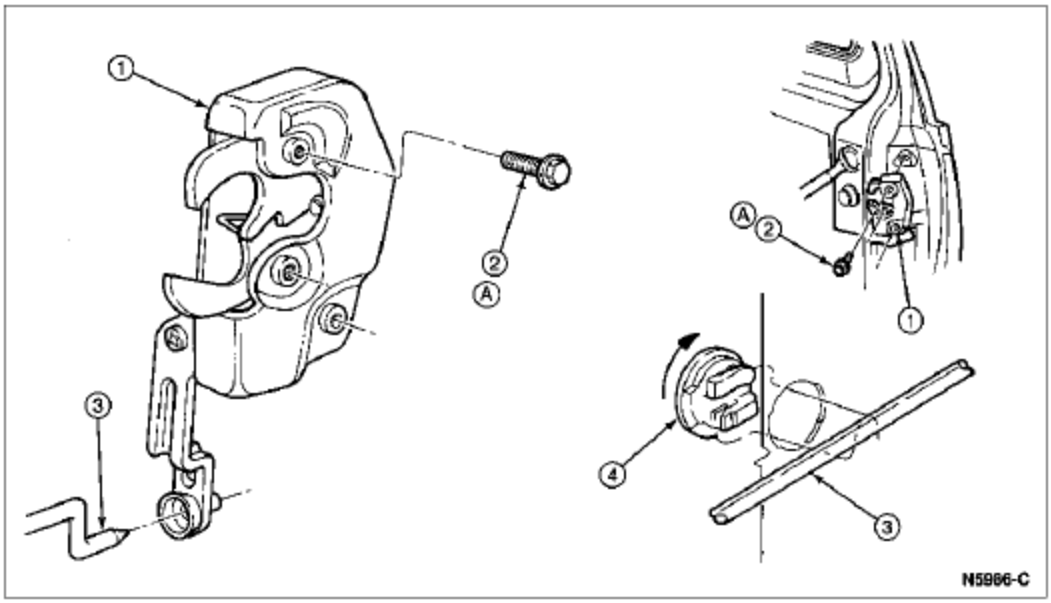
Removal and Installation

1. Remove sliding door trim panel, watershield and access hole cover plates.
2. Unlatch the sliding door.
3. Remove latch actuator rod retainer from center door retainer hole.
4. Disconnect the rear door latch actuator rod from the remote control assembly by opening the clip.
5. Open the door sufficiently to gain access to the three bolts attaching the rear latch to the sliding door. Remove bolts.
6. Remove the sliding door rear latch with the remote control actuator rod attached to the latch, from the sliding door.

For installation, follow removal procedures in reverse order. The three latch retainer bolts must not be tightened more than 9-14 Nm (6-10 lb-ft) when installed.

Latch, Sliding Door, Aerostar

tomsn048@gmail.com



Item	Part Number	Description
1	264A32	Body Side Door Rear Latch Assembly
2	N804353-S100	Bolt (3 Req'd)
3	264A64	Body Side Door Rear Latch Actuator Rod
4	220A48	Actuator Rod Retainer
A	—	Tighten to 9-14 Nm (6-10 Lb-Ft)

Doors, Dual Rear, Aerostar

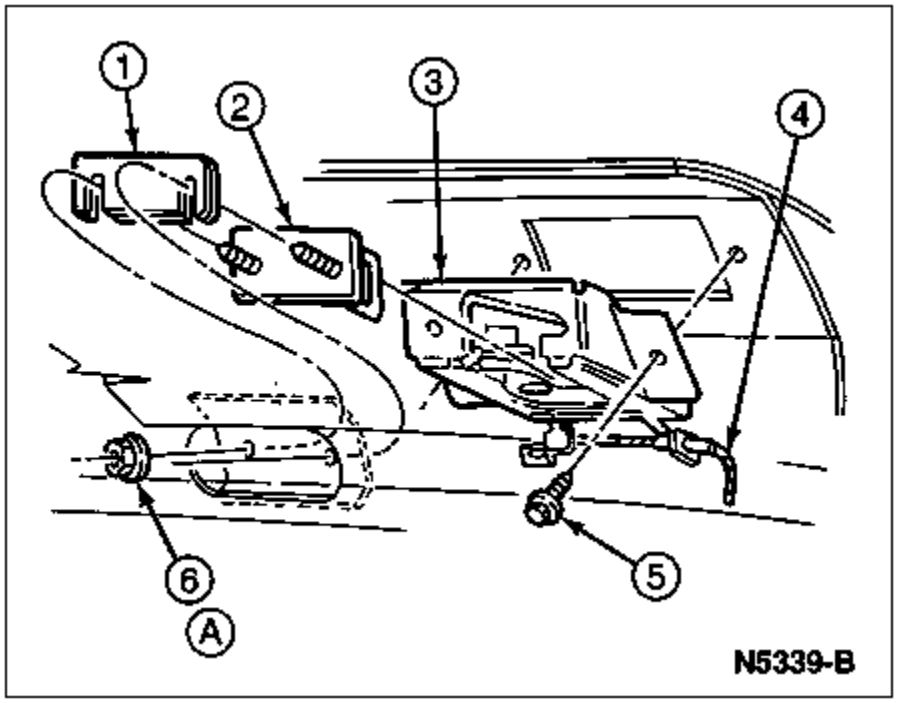
Removal and Installation

1. Remove trim panel and watershield. Refer to Section 01-05B .
2. Release threaded fitting of back door upper latch release cable assembly from door lock rod retainer on remote control assembly.
3. Disengage cable bushing from tab on remote control assembly.
4. Remove two back door upper latch attaching screws.
5. Remove latch assembly with cable assembly attached. Separate by removing cable bushing from retaining tab on latch. Replace either or both parts as required.
6. Reconnect latch and cable. Install retaining screws as shown in illustration following Lock Cylinder removal.
7. **NOTE: Cable must be routed down through door pillar.**

   Connect cable bushing and threaded fitting.

tomsn048@gmail.com

8. Install watershield and trim panel. Refer to Section 01-05B .



Item	Part Number	Description
1	44096	Door Striker Shim
2	43118	Rear Door Latch Upper Striker (Left Side)
3	43287	Back Door Upper Latch
4	431B42	Back Door Upper Latch Release Cable Assembly
5	N602728-S55	Screw (2 Req'd)
6	N621927-S36M	Nut and Washer

tomsn048@gmail.com

tomsn048@gmail.com

Latch and Rod, Lower

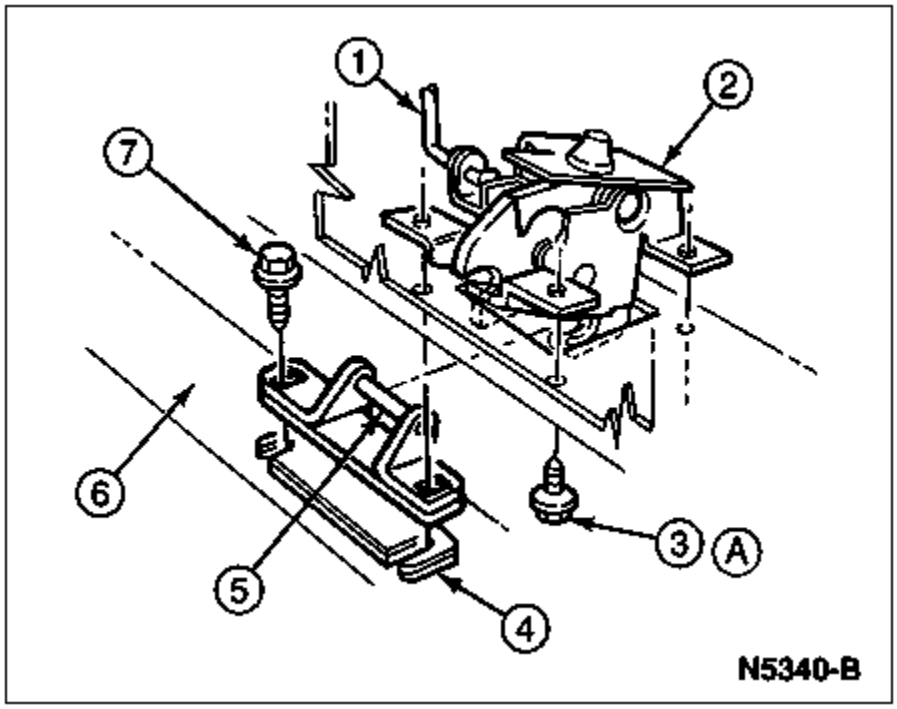
Aerostar

Removal and Installation

1. Remove trim panel and watershield. Refer to Section 01-05B .
2. Disconnect rod from remote control assembly.
3. **NOTE: If vehicle is equipped with courtesy lamp or door ajar lamp, the switch for these must be removed from right latch (one screw attachment) and installed with latch.**

   Remove four attaching screws, and remove latch.

For installation, follow removal procedures in reverse order.



Item	Part Number	Description
1	43298	Rear Door Latch Rod
2	43288	Back Door Lower Latch Assembly
3	N606676-S55	Bolt (4 Req'd)
4	44096	Door Striker Shim

tomsn048@gmail.com

Remote Control Assembly, Door Latch

Front Doors, All Vehicles

Refer to Door Latch Removal and Installation.

Removal

1. Remove the door trim and watershield.
2. Remove the screws attaching the remote control to the door inner panel, and remove the remote control.
3. Disconnect the latch remote control link or cable from the remote control.

Installation

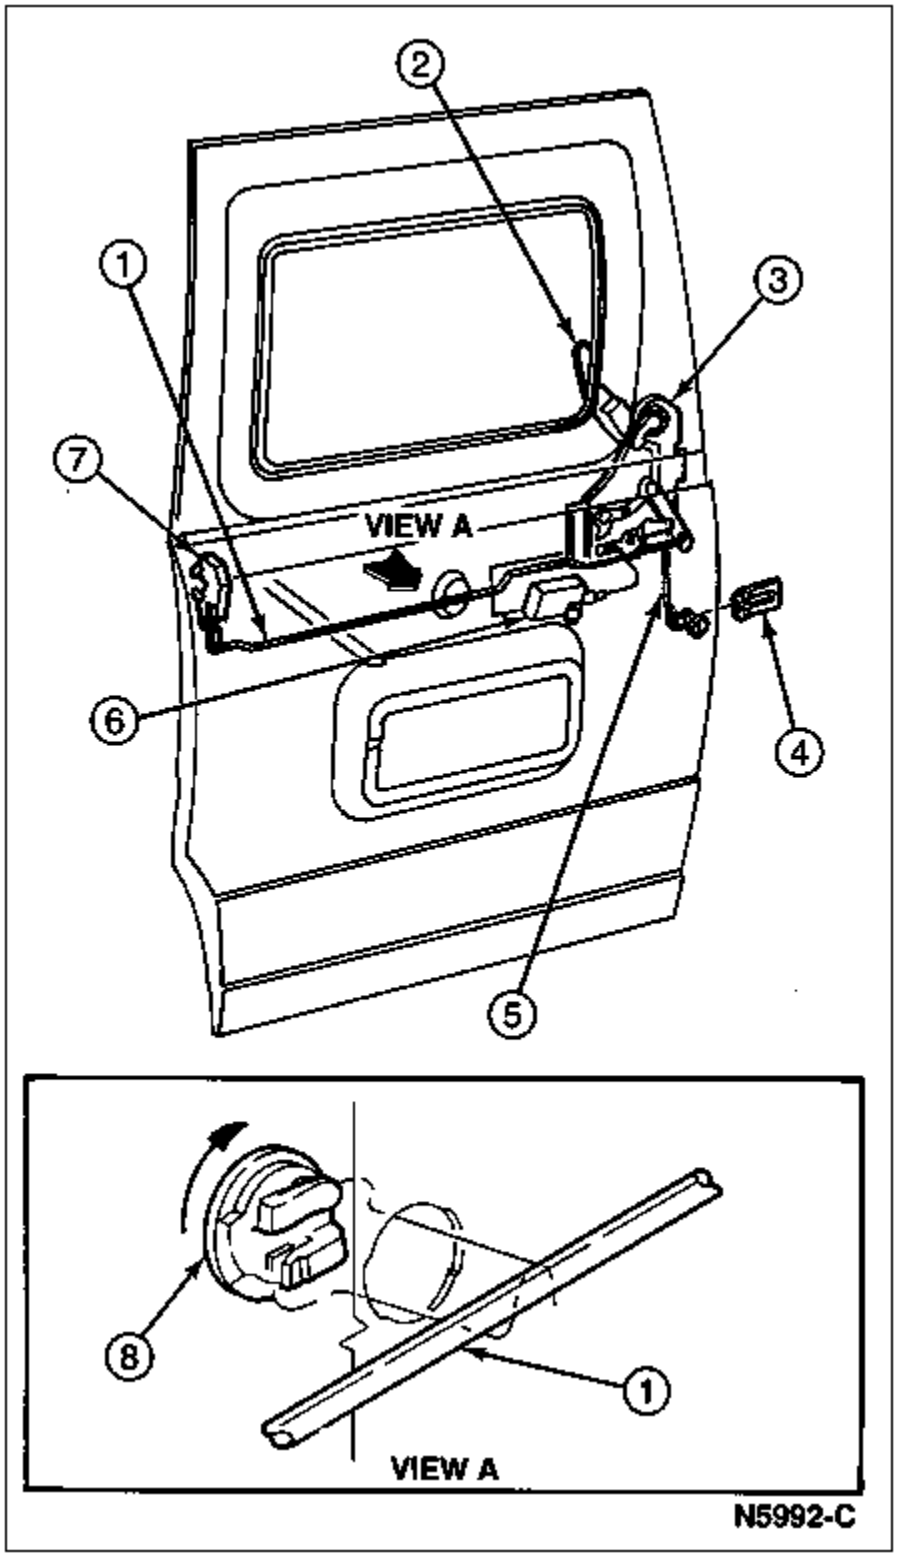
1. Position the remote control to the door inner panel and connect the link or cable to the remote control.
2. Install the remote control attaching screw.
3. Check the remote control and latch operation.
4. Install the watershield and door trim panel.

Sliding Door, Aerostar

Removal and Installation

1. Remove the inside door handle screw.

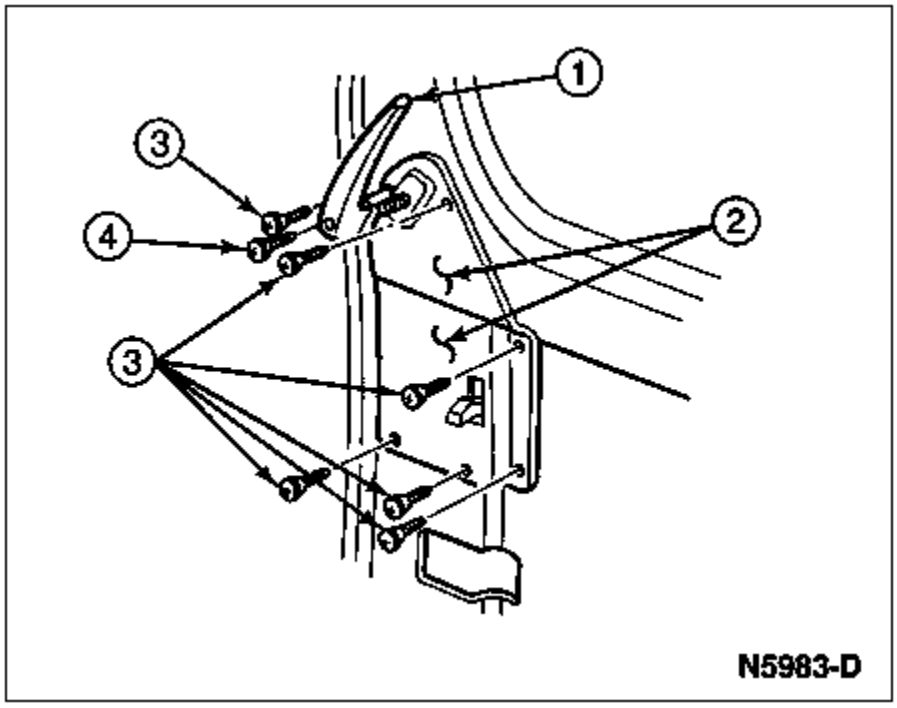
tomsn048@gmail.com



Item	Part Number	Description
1	264A64	Body Side Door Latch Actuator Rod
2	26680	Body Side Door Inside Handle

tomsn048@gmail.com

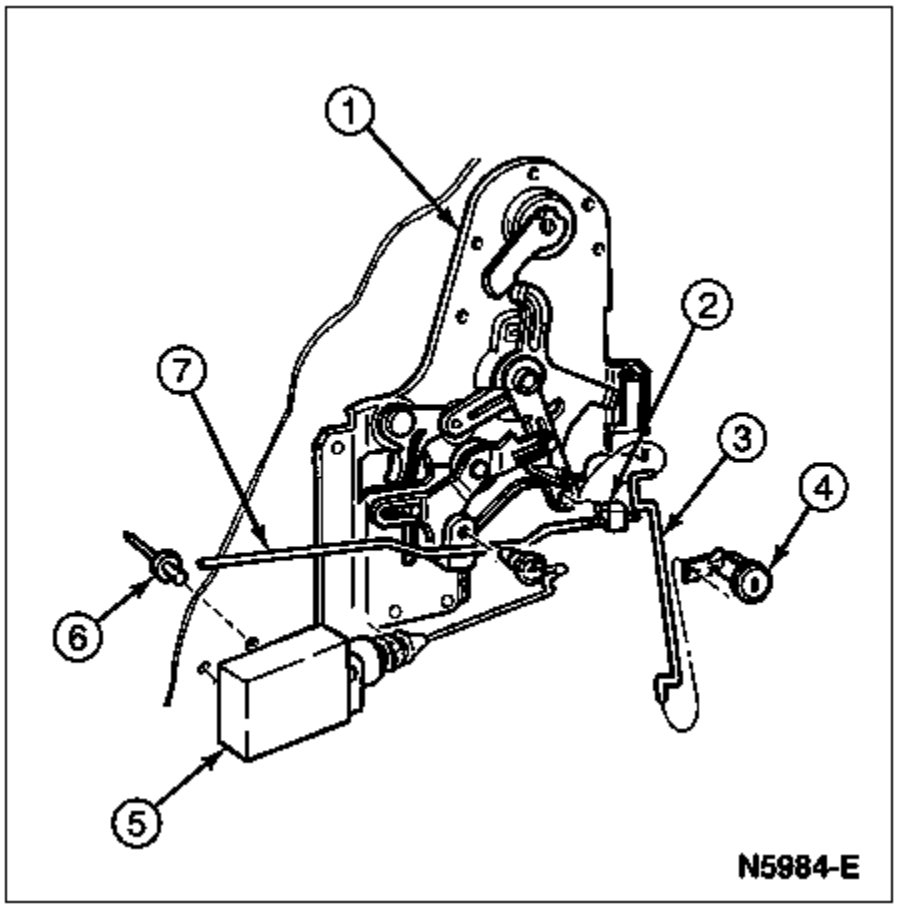
3	26404	Body Side Door Latch Remote Control Assembly
4	22023	Front Door Lock Cylinder Retainer
5	26642	Rear Door Latch Remote Control Rod
6	26594	Door Latch Actuator Assembly
7	264A32	Body Side Door Latch Assembly
8	265A99	Actuator Rod Retainer



Item	Part Number	Description
1	26680	Body Side Door Inside Handle
2	24766	Body Side Door Inner Panel Access Hole Cover Plate
3	56902-S55	Screw (6 Req'd)
4	390334-S2	Screw

2. On Hi Series-trimmed vehicles, remove the moulded upper body side door trim panels, and watershield. On Lo Series-trimmed vehicles, the remote control patch cover plate and access hole cover plates must be removed prior to proceeding to Step 3.

tomsn048@gmail.com



Item	Part Number	Description
1	26404	Rear Door Latch Remote Control Assembly
2	219A38	Retainer Assembly
3	26642	Rear Door Latch Remote Control Rod
4	22050	Door Lock Cylinder
5	26594	Door Latch Actuator Assembly
6	N806772-S100	Rivet (2 Req'd)
7	264A64	Rear Door Latch Actuator Rod

3. Using the lower access hole, disconnect the door lock cylinder rod and the remote actuator rod rear door latch from the remote control assembly latch levers.

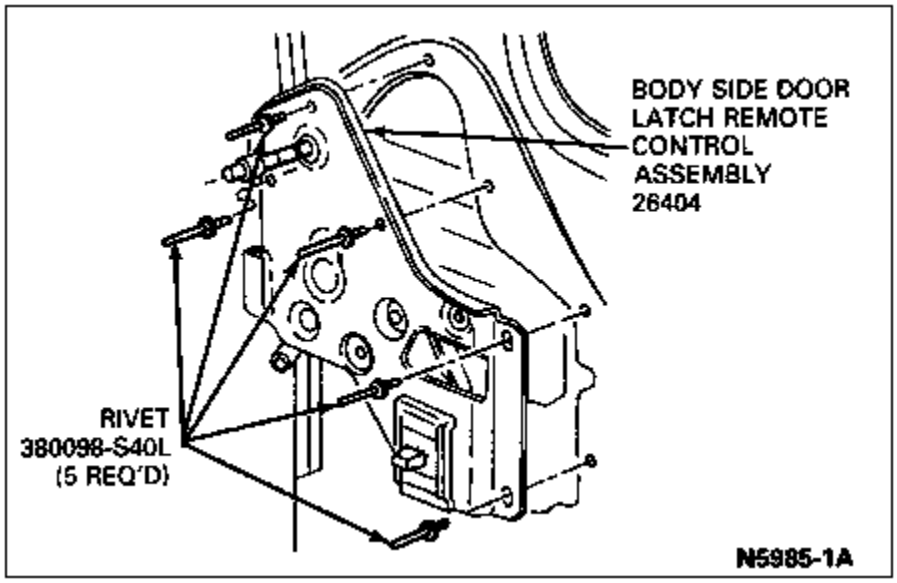
   If the vehicle is equipped with power locks, drill out actuator bracket rivet, disconnect electrical connector to actuator, and remove remote control assembly with actuator.

4. **CAUTION: Use care not to enlarge inner panel retainer holes while drilling.**

   Using a 1/4-inch diameter drill, drill out the five rivets attaching the remote control assembly to the door inner panel. Remove the remote control assembly.

For installation, follow removal procedures in reverse order. Install new rivets with Heavy Duty Riveter.

tomsn048@gmail.com



Dual Rear Door, Right Side, Aerostar

Removal

1. Remove rear door trim panel and watershield.
2. Disconnect cable and rod.
3. Disconnect bottom of rod from lock cylinder.
4. Disconnect outboard end of rod from inside handle remote. Remove by sliding through grommet in remote lever.
5. Disconnect power lock actuator rod if equipped with power locks.
6. Remove locating pin and attaching nuts. Remove outside handle.
7. Raise remote control enough to pull lock cylinder rod out of hole in inner panel. Remove rod from remote by sliding through grommet.
8. Remove push button rod from remote control by tipping remote control back and forth to thread rod out of grommet.

Installation

1. Install clips and grommets onto remote control assembly. Do not install power lock clip unless vehicle has power locks.
2. Slide push button rod through grommet in inner panel and thread end through lock lever grommet in remote control assembly. Maneuvering of remote control assembly is required.
3. With remote control still loose, thread lock cylinder rod through grommet on other end of lock lever and through hole in inner panel.

tomsn048@gmail.com

4. Place remote control assembly to inner panel and install locating pin.

5. Install outside handle with two studs through door outer panel and remote control base. Secure with retaining nuts.

6. Slide rod through release lever grommet with end that has larger 90-degree bend portion toward inside handle assembly. Slide rod through hole in inner panel and connect to clip on remote control assembly.

7. Connect bottom of lock cylinder rod to lock cylinder lever. Connect power lock actuator rod, if so equipped.

8. Install cable grommet into slot in remote control frame. Lightly pull cable end fitting to remove free play (approximately 3mm [1/8 inch]). Insert fitting into retainer.

9. Lift up lightly on lower latch rod to remove free play (approximately 3mm [1/8 inch]). Insert threaded end into retainer.

10. Rotate upper and lower latch bolts into latched position. Check function of handles, lock rod, lock cylinder, etc.

11. **NOTE: If latches will not latch, cable or rod may have been pulled too far.**

    If all latches and switches operate properly, install watershield and trim panel.

B	—	Tighten to 1.7-2.3 Nm (11-20 Lb-In)

Dual Rear Door, Left Side, Aerostar

Removal

1. Remove trim panel and watershield. Refer to Section 01-05B .
2. Unclip lower latch rod and cable fitting from remote control assembly.
3. Remove three screws attaching remote control.
4. Partially remove remote control assembly from access hole to gain access to release rod assembly. Disengage and remove release rod.
5. Disengage cable grommet from forked flange in remote control assembly. Remove remote control assembly.

Installation

tomsn048@gmail.com

1. Install retainer in remote control assembly.
2. Install cable grommet into slot in remote control base.
3. Position remote control assembly so release rod assembly can be installed into clip at end of lever.
4. Install three attaching screws.
5. Install lower latch rod into clip in remote control assembly.
6. Lightly pull slack out of cable (approximately 3mm [1/8 inch]) and install into retainer.
7. Check function of latches using release rod.
8. Install watershield and trim panel. Refer to Section 01-05B .

tomsn048@gmail.com

Remote Control Assembly, Inside Handle

Dual Rear Doors, Aerostar

Removal and Installation

1. Remove two nuts and remove handle assembly.
2. Disengage rod from clip on inside remote control assembly by reaching through access hole below this area.
3. Remove pushnuts from studs to remote control, remove remote control.

For installation, follow removal procedures in reverse order.

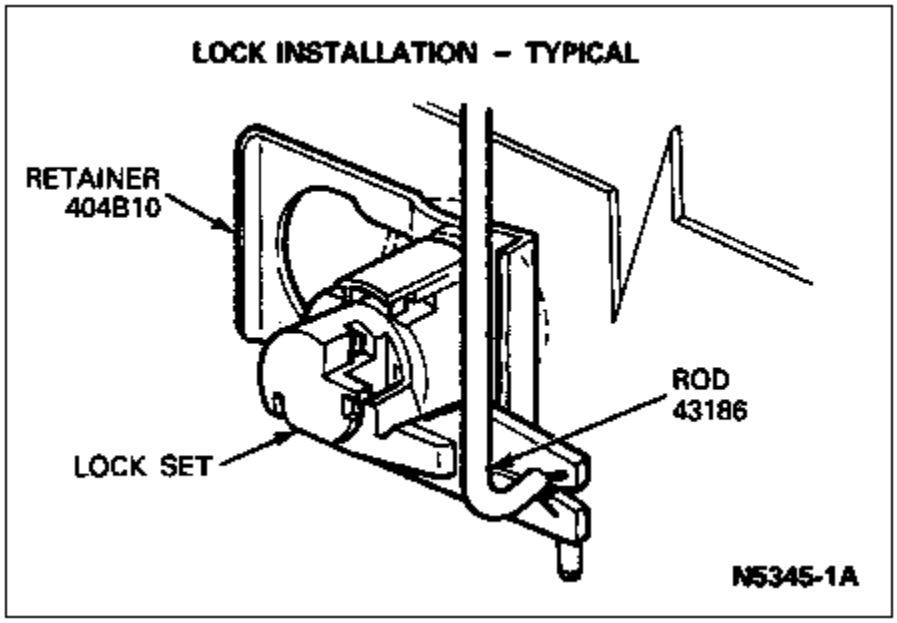
Lock Cylinder, Door

NOTE: When a lock cylinder is replaced, both door lock cylinders should be replaced in a set. This will eliminate carrying an extra key which will fit only one lock. If a key is to be replaced, the new key code number is stamped on a metal tag attached to the key.

NOTE: Individual lock cylinders are repaired by discarding the inoperative cylinder and building a new lock cylinder using the appropriate lock repair package. The lock repair package includes a detailed instruction sheet to build the new lock cylinder to the current key code to the vehicle.

Removal

1. Close window.
2. Remove the access hole cover and/or front door trim panel (23942) and pull away the watershield if so equipped. Refer to Section 01-05A or Section 01-05B .
3. Disconnect the front door latch control cylinder rod from the door lock cylinder retainer clip.



4. Slide the door lock cylinder retainer away from the lock cylinder.
5. If equipped with remote anti-theft personality (RAP) module, disconnect the RAP switch electrical connector.
6. Remove the lock cylinder.

tomsn048@gmail.com

Installation

1. Insert the lock cylinder in the door and connect the lock cylinder retainer.
2. Connect the front door latch control cylinder rod to the door lock cylinder retainer.
3. Install the watershield. Using Gasket and Trim Adhesive D7AZ-19B508-B or equivalent adhesive meeting Ford specifications ESR-M11P17 or ESE-M2G52-A, cement the top and/or side edges of the watershield to the inner surface of the inner panel.
4. Install the access hole cover and/or front door trim panel.

---

tomsn048@gmail.com

Lock Cylinder, Liftgate

Aerostar

Removal and Installation

NOTE: Individual lock cylinders are repaired by discarding the inoperative cylinder and building a new lock cylinder using the appropriate lock repair package. The lock repair package includes a detailed instruction sheet to build the new lock cylinder to the current key code to the vehicle.

Refer to the illustrations in this section following Liftgate, Aerostar in Removal and Installation.

1. Remove the liftgate latch as outlined.
2. Remove the liftgate lock cylinder retainer (with the lock-to-latch rod still attached) from the liftgate.

To install, reverse removal procedure.

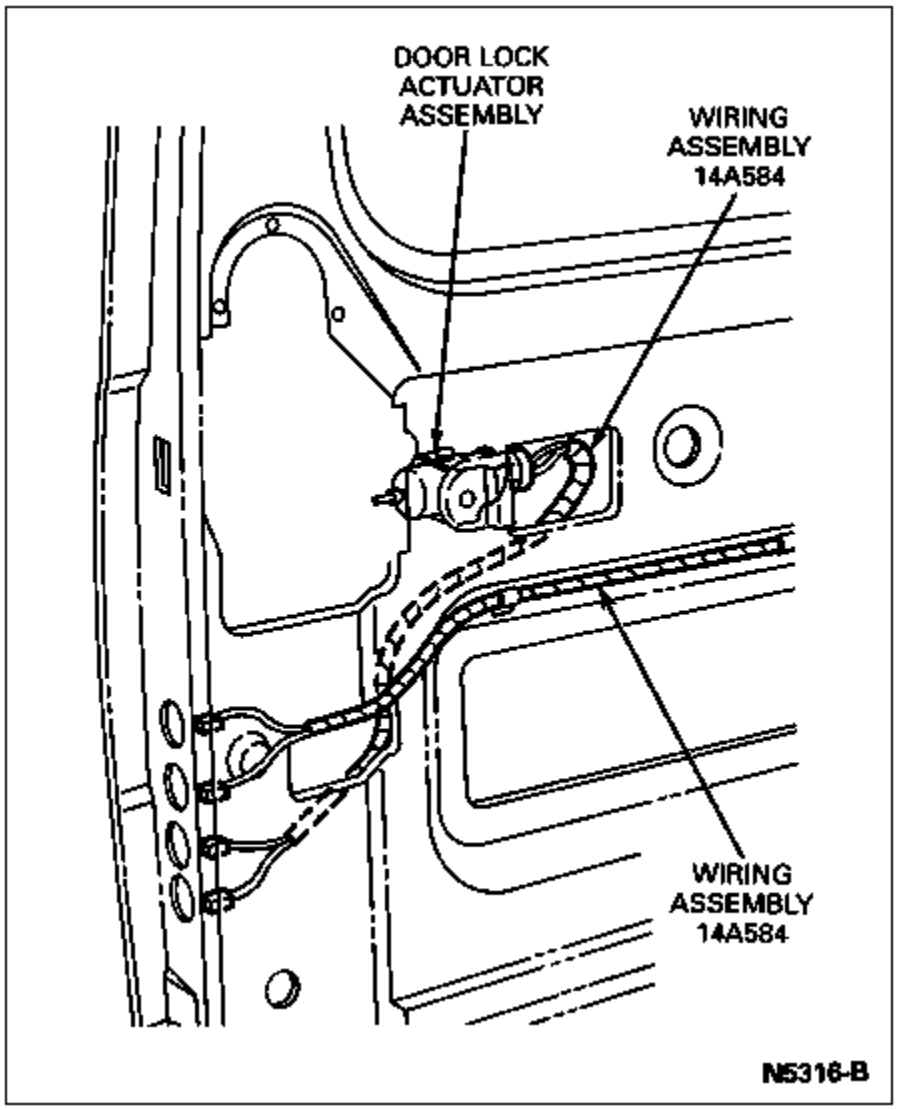
tomsn048@gmail.com

Actuator, Power Door Lock, Aerostar

Removal and Installation

1. Remove front door trim panel (23942). Refer to Section 01-05B .
2. Remove actuator motor and swivel bracket assembly from the door by drilling out the retaining pop rivet. Remove remote control.
3. Disconnect the door latch remote control link from the door latch.
4. Disconnect the wire harness plug at the motor connector.

For installation, follow removal procedures in reverse order. Old motor bracket must be replaced with new bracket which is supplied with replacement actuator motor assembly.



tomsn048@gmail.com

tomsn048@gmail.com

Control Switch, Door Lock, Aerostar

Removal and Installation

1. Using a flat-bladed tool, carefully pry window regulator switch plate from switch housing.
2. Remove retaining nuts from front window regulator window at back of window regulator switch plate.
3. Using a thin-bladed screwdriver carefully pry door lock switch from front window regulator wiring.

For installation, follow the removal procedures in reverse order.

tomsn048@gmail.com

Handle, Inside Door

Front and Rear

Removal

1. Remove front door trim panel and watershield. Refer to Section 01-05A or Section 01-05B .
2. Remove the inside door handle screws, nut and washer assemblies or rivet from the inside door handle and the front door frame.
3. Disconnect the door latch remote control link from the door latch assembly. Remove the inside door handle and the inside door latch remote control link.

For installation, follow removal procedures in reverse order. Install new rivets with Heavy Duty Riveter. Tighten Aerostar nut and washer assemblies to 1.7-2.3 Nm (1.2-1.7 lb-ft).

Body Side, Sliding, Aerostar

Removal and Installation

1. Remove screw from the sliding door handle.
2. Remove handle from latch assembly shaft.

For installation, follow removal procedures in reverse order. Tighten screw to 3.7-5.4 Nm (2.7-4 lb-ft).

Right Dual Rear, Aerostar

Removal and Installation

1. Remove rear door trim panel and watershield. Refer to Section 01-05B .
2. Disconnect the rear door latch remote control link from the inside door handle.
3. Remove two nut and washer assemblies from the handle and remote control assemblies. Remove the handle and remote control assemblies.

For installation, follow removal procedures in reverse order. Tighten nut and washer assemblies to 1.7-2.3 Nm (1.2-1.7 lb-ft).

tomsn048@gmail.com

tomsn048@gmail.com

Handle, Outside Door

Front Doors, Aerostar

Removal and Installation

1. Remove the front door trim panel and watershield.
2. Disconnect the front door latch actuating rod from the front door latch.
3. Remove the two nuts retaining door handle.

For installation, follow removal procedures in reverse order.

Door Latch and Handle Installation, Aerostar

B	—	Tighten to 4-8 Nm (36-70 Lb-In)
C	—	Tighten to 1.7-2.3 Nm (11-20 Lb-In)

Front Doors, Ranger

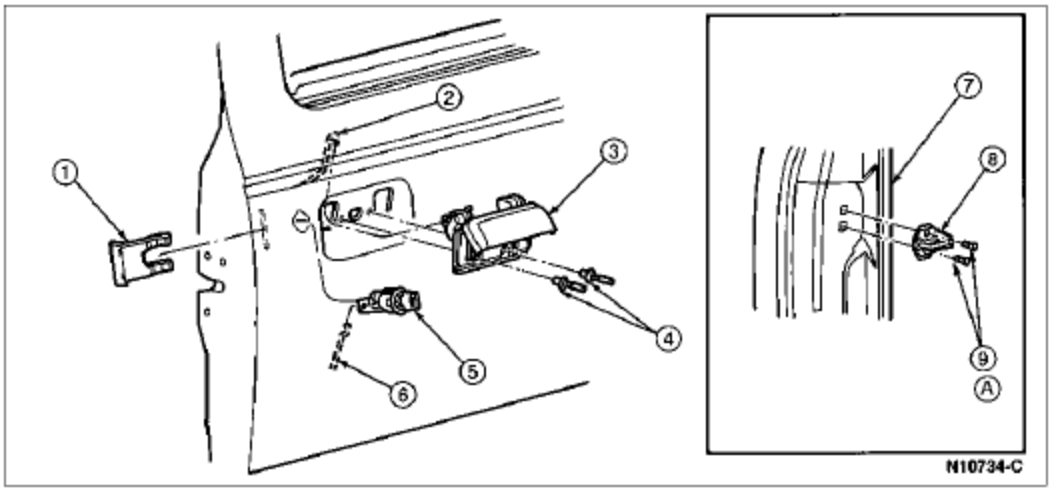
Removal and Installation

1. Remove the access hole cover and/or trim panel and pull away the watershield, if equipped. Refer to Section 01-05A .
2. Disconnect door latch actuator rod from latch.
3. Block handle open.
4. Drill out the two rivets securing outside door handle to door.

For installation, follow removal procedures in reverse order.

Outside Handle

tomsn048@gmail.com



Item	Part Number	Description
1	22023	Door Lock Cylinder Retainer
2	22152	Door Latch Control Rod Knob
3	22404	Door Handle
4	388047-S	Rivet (2 Req'd Each Side)

A	—	Tighten to 22-28 Nm (17-28 Lb-Ft)

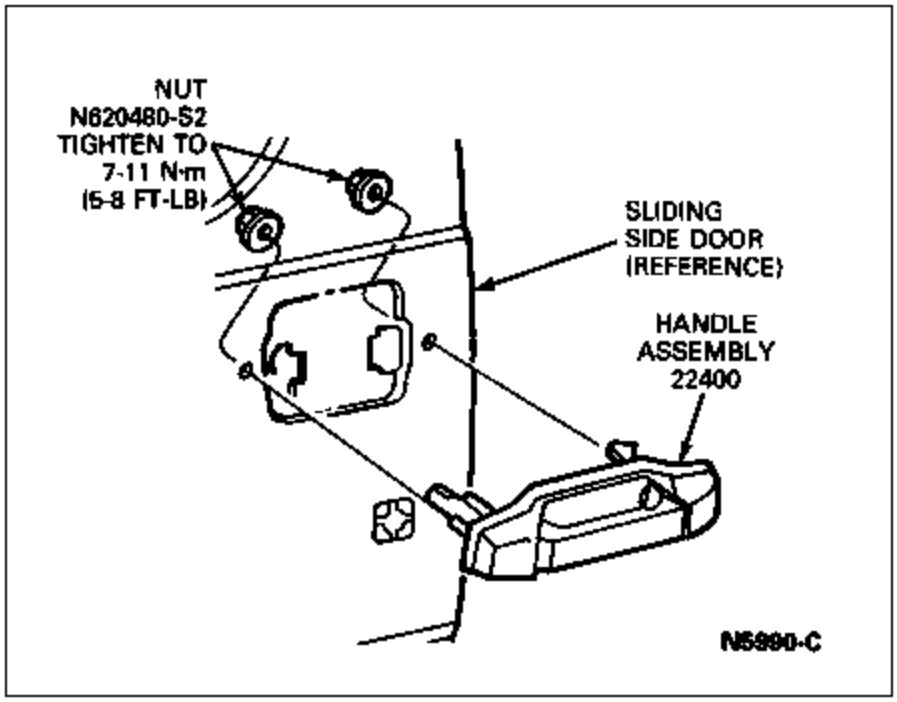
Body Side, Sliding, Aerostar

Removal and Installation

1. Remove the access hole cover and/or trim panel and pull away the watershield, if so equipped. Refer to Section 01-05B .
2. Disconnect door latch actuator rod from latch.
3. Remove two nuts retaining handle.

For installation, follow removal procedures in reverse order.

tomsn048@gmail.com



Dual Rear, Aerostar

Removal and Installation

1. Remove trim panel and watershield. Refer to Section 01-05B .
2. Remove retaining nuts.
3. Remove and replace outside handle.
4. Install retaining nuts.
5. Install watershield and trim panel. Refer to Section 01-05B .

Liftgate, Aerostar

Removal

1. Remove liftgate door trim panel and liftgate handle, if equipped.
2. Disconnect liftgate latch release rod from latch control assembly and remove from liftgate handle.
3. Tape or otherwise protect area of liftgate around liftgate handle to prevent paint damage.
4. Prop open liftgate handle (use wood props).
5. Remove two rivets attaching liftgate handle to liftgate. Use a drift punch to knock out center pin. Drill

tomsn048@gmail.com

out remainder of rivet.

6. Remove prop and pull liftgate handle out of hole in liftgate.

Installation

1. Install liftgate handle, without control rod, into liftgate.
2. Prop open liftgate handle and install two rivets to attach liftgate handle.
3. Install control rod to liftgate handle, then install bottom of rod to latch control assembly.
4. Open and close liftgate to check operation.

Liftgate Outside Handle, Aerostar

Latch and Release Cable, Fuel Filler Door, Aerostar

Removal and Installation

1. **NOTE: In the event the remote release handle, fuel filler door latch handle, or latch assembly cable breaks, the fuel filler door can be released with the manual override fuel filler door latch handle located in the left rear floor stowage area on the floor for the extended model and in the left rear pillar area for the standard models.**

   To service the fuel filler door latch handle located on the lower B-pillar area adjacent to the driver side seat, remove the 4mm screw holding the handle in place. Refer to Section 01-05B .

2. Remove the screw holding the fuel filler door latch handle in place. After the fuel filler door latch handle is removed from the panel, remove the cable end fitting from the fuel filler door latch handle housing and disengage the wire strand ferrule from the fuel filler door latch handle.

3. If the latch assembly cable has to be serviced, remove the left interior trim panels as required, refer to Section 01-05B , the associated seat belt hardware (refer to Section 01-20A) and the rear seats (refer to Section 01-10).

4. Open the fuel filler door and disconnect the U-shaped fuel filler door assist spring by loosening the two nuts. Slide the spring out and disengage the ferrule ball from the keyway slot in the spring.

5. Remove the nut holding the fuel filler door latch to the housing.

6. From inside the vehicle pull the fuel filler door latch end away from the housing and remove the rest of the cable from the routed position.

7. Disconnect the clips holding the override fuel filler door latch handle in place and remove the latch assembly cable from the vehicle.

For installation, follow removal procedures in reverse order. Tighten all fasteners to specifications.

tomsn048@gmail.com

Actuator, Liftgate Lock, Power, Aerostar

Removal and Installation

1. Remove the liftgate door trim panel and watershield. Refer to Section 01-05A .
2. Disconnect the liftgate power lock actuator electrical connector.
3. Disconnect power actuator rod from the tailgate latch remote control (43170).
4. Drill out the rivet attaching the liftgate power lock actuator to the liftgate. Remove the liftgate power lock actuator.

For installation, follow removal procedures in reverse order. Install new rivets with Heavy Duty Riveter.

tomsn048@gmail.com

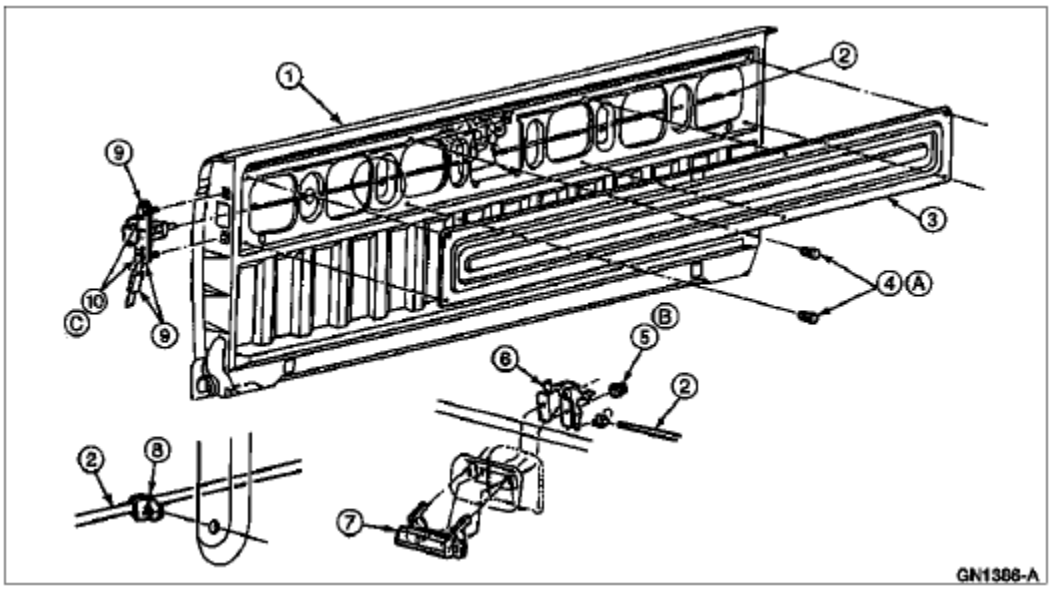
Handle and Control Assembly, Tailgate, Ranger

Removal and Installation

1. Open the tailgate and disconnect from upper support pin.
2. Remove screws from access cover. Remove cover.
3. Remove nuts and disconnect tailgate latch release links from tailgate latch remote control to remove tailgate latch release handle and tailgate latch remote control.
4. Remove clips from each side.
5. Remove two screws attaching tailgate latch. Remove tailgate latch from tailgate.

For installation, follow removal procedures in reverse order. Tighten nuts to remote control assembly and tailgate handle assembly to 10.2-13.8 Nm (91-122 lb-in). Tighten screws for access cover to 4.5-6.3 Nm (40-55 lb-in). Tighten screws for tailgate latch to 25.5-34.5 Nm (19-25 lb-ft). Adjust striker if necessary as described in this section.

Handle and Control Assembly, Tailgate, Ranger



Item	Part Number	Description
1	40700	Tailgate Assembly
2	431A78	Latch Release Link
3	43121	Cover

tomsn048@gmail.com

7	43400	Tailgate Latch Release Handle
8	382929-S	Clip
9	43150	Tailgate Latch
10	N806910-S100	Screw (2 Req'd Each Side)
A	—	Tighten to 4.5-6.3 Nm (40-55 Lb-In)
B	—	Tighten to 10.2-13.8 Nm (91-122 Lb-In)
C	—	Tighten to 25.5-34.5 Nm (19-25 Lb-Ft)

tomsn048@gmail.com

Release Control Assembly, Tailgate

Removal

1. Remove tailgate inside panel cover retaining screws. Remove panel.
2. Disconnect two tailgate latch release links from tailgate latch remote control (43170).
3. If removing handle and tailgate latch remote control, remove two nut and washer assemblies from tailgate assembly.
4. Remove screws attaching tailgate latch.
5. Remove by sliding out link of tailgate.

Installation

1. **NOTE: Prior to installation, take out the slack in links and latches by pulling link to center of tailgate. Close plastic clip over closet thread of link.**

   Remove link from tailgate latch assembly.

   For installation, follow removal procedures in reverse order.

tomsn048@gmail.com

Striker, Door Latch

Front Doors, All Vehicles

CAUTION: Do not cover up a poor door alignment with a latch striker adjustment.

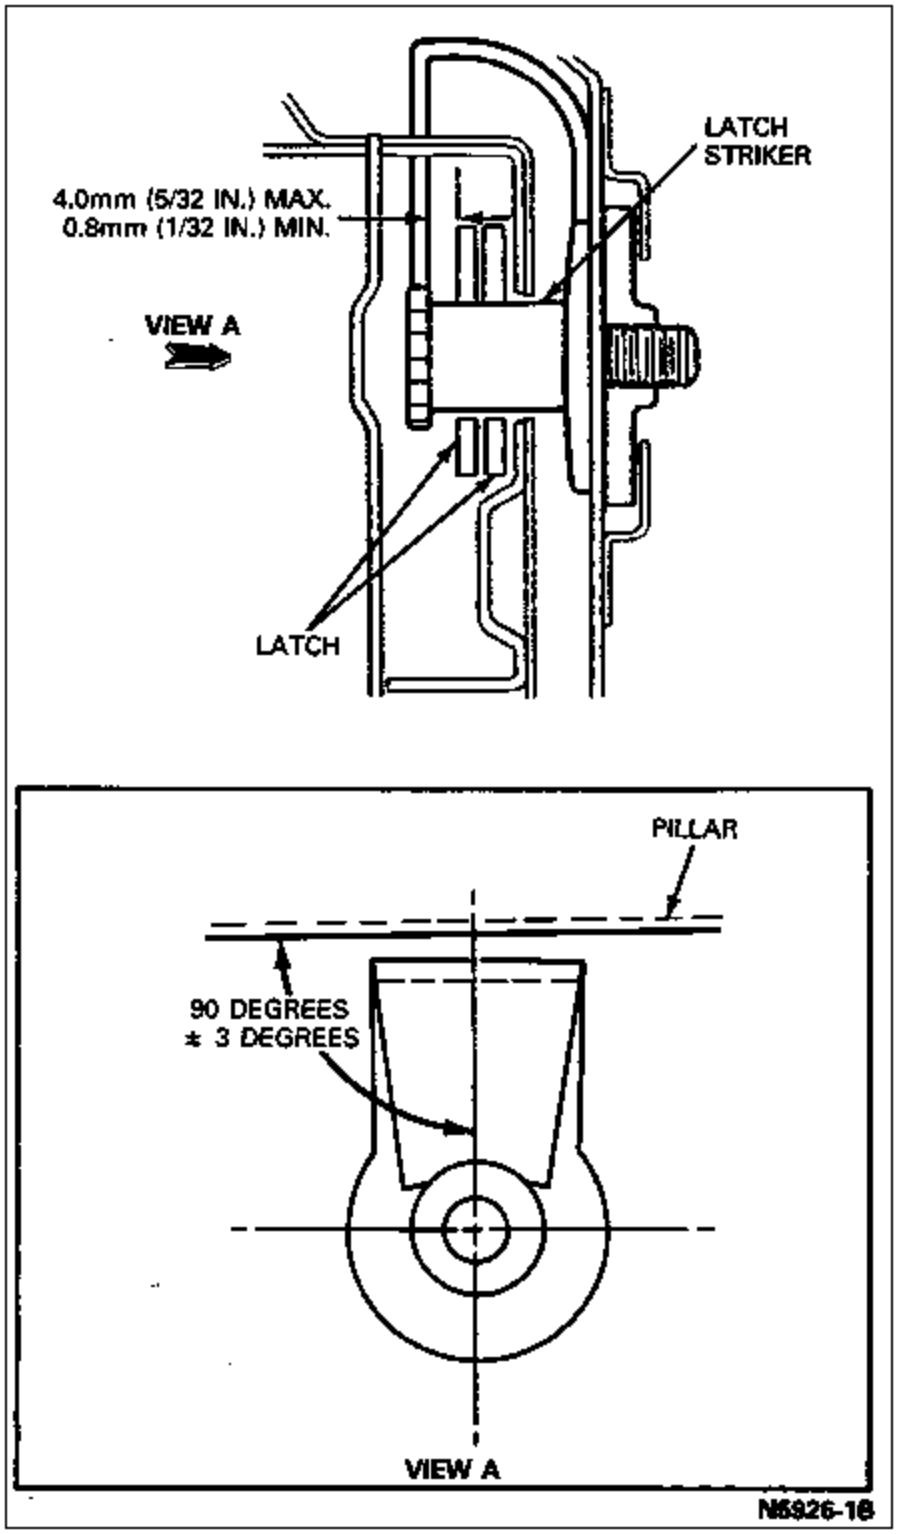
NOTE: Use Torx® Drive Bit Set where required to loosen or tighten striker.

The striker pin can be adjusted laterally and vertically as well as fore and aft. The latch striker should be shimmed to obtain clearance between the latch striker and the latch. To check this clearance, perform the following steps:

1. Clean the latch jaws and the striker area.
2. Apply a thin layer of dark grease such as Premium Long-Life Grease XG-1-C or -K or equivalent meeting Ford specification ESA-M1C75-B to the latch striker.
3. As the door is closed and opened, a measurable, visual pattern will result.
4. **CAUTION: Do not use more than one shim per door.**

   Move the striker assembly laterally to provide a flush fit with the door and body.
5. Tighten the striker to 33-45 Nm (24-33 lb-ft).

tomsn048@gmail.com



Body Side, Sliding, Aerostar

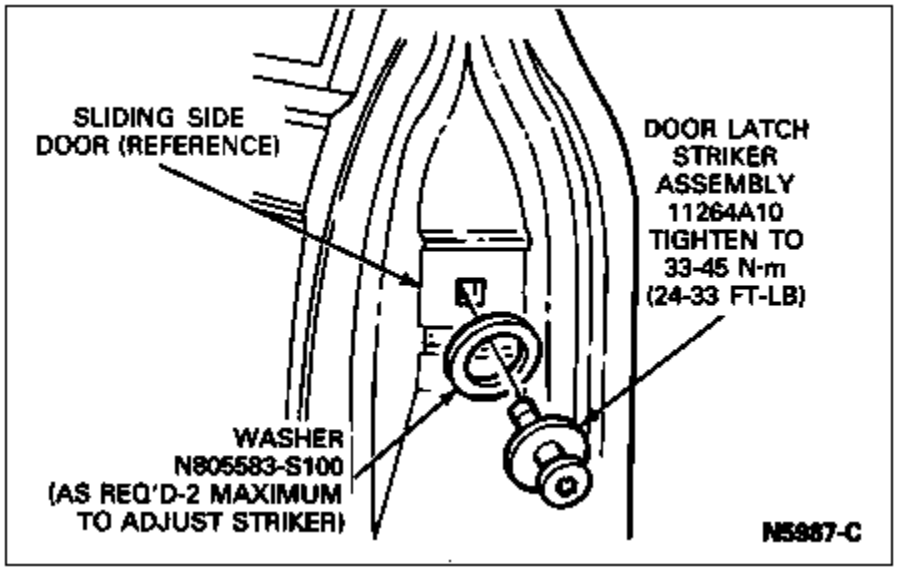
CAUTION: Striker adjusts in or out only. Up and down adjustment is obtained only with rear

tomsn048@gmail.com

hinge, providing the rear hinge does not bind striker latch setting.

The sliding door latch is located at the rear of the door. When the door is closed, the latch engages the striker which positions the rear of the door to the body. Adjusting the striker in or out will position the rear edge of the sliding door as required to obtain the proper fit to the body.

Positioning the front edge of the door to the body, adjust the lower front guide and wedge striker.



Dual Rear Doors, Aerostar

Upper Striker

NOTE: Use an M-11 socket to loosen or tighten the nut and washer assemblies that attach the upper striker assemblies.

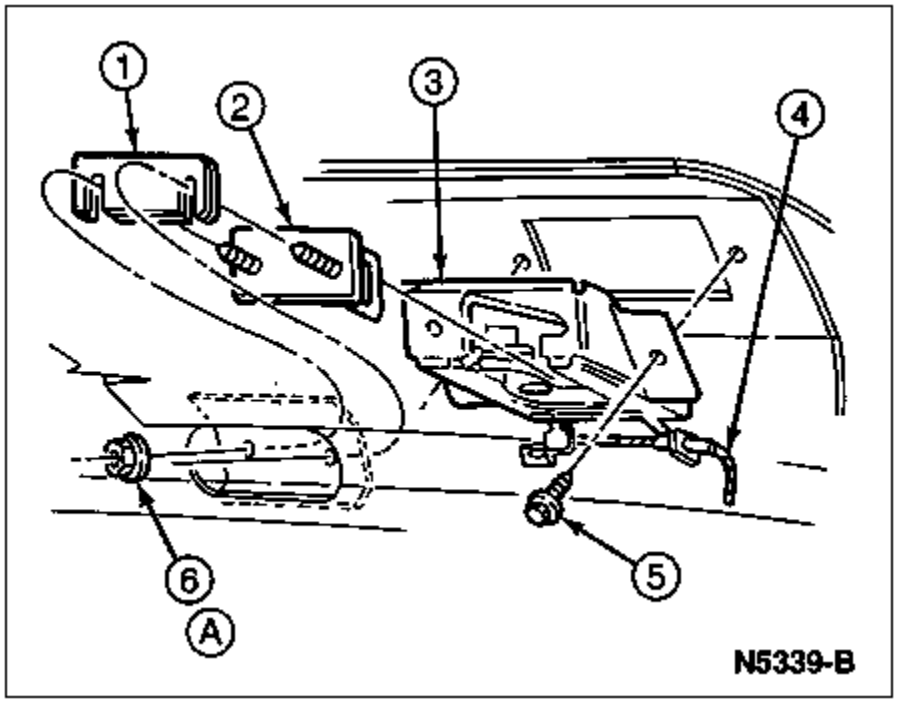
The strikers can be adjusted laterally and vertically, and shimmed fore and aft. Do not use more than four shims. To adjust striker, loosen attaching nuts so that striker can be moved around by hand. Close door firmly (thereby moving striker into proper position) and tighten retaining nuts.

NOTE: After adjusting either upper door striker, both the right and left wedge, and plate assemblies must be adjusted.

1. Open doors and remove both wedge assemblies.
2. Push wedge fully forward in plate.
3. Loosely assemble to door bottom.
4. Shut left door firmly to set wedge.
5. Open door and tighten retaining screws.

tomsn048@gmail.com

6. Repeat for right door.



Item	Part Number	Description
1	44096	Door Striker Shim
2	43118	Rear Door Latch Upper Striker (Left Side)
3	43287	Back Door Upper Latch
4	431B42	Back Door Upper Latch Release Cable Assembly
5	N602728-S55	Screw (2 Req'd)
6	N621927-S36M	Nut and Washer
A	—	Tighten to 7-11 Nm (5-8 Lb-Ft)

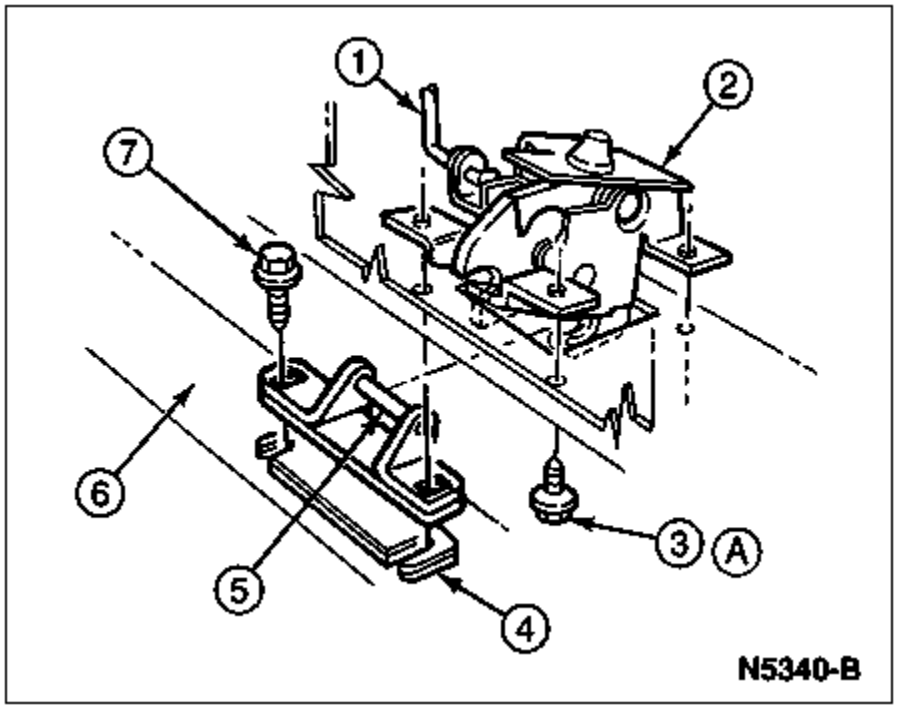
Lower Striker

NOTE: Use M-8 socket to loosen or tighten striker bolts.

NOTE: After adjusting either lower striker, both the right and left wedge and plate assemblies must be adjusted. Follow same procedure as above for upper door striker.

The strikers can be adjusted fore and aft, and shimmed vertically. The latch striker should not be adjusted to correct door sag. The latch striker should be shimmed to achieve correct clearance between latch striker and latch. To check this clearance, close one door at a time and observe the alignment as the latch engages the striker. Move the striker assembly fore and aft to provide a flush fit at the door and the body. **Do not use more than four shims.**

tomsn048@gmail.com



Item	Part Number	Description
1	43298	Rear Door Latch Rod
2	43288	Back Door Lower Latch Assembly
3	N606676-S55	Bolt (4 Req'd)
4	44096	Door Striker Shim
5	43118	Back Door Lower Latch
6	—	Body Panel
7	N605892-S36	Bolt (2 Req'd)
A	—	Tighten to 7-11 Nm (5-8 Lb-Ft)

tomsn048@gmail.com

tomsn048@gmail.com

Striker, Liftgate, Aerostar

1. Loosen striker screws.
2. The liftgate striker assembly can be moved 4.0mm (1/6 inch). Adjust the striker radially, up, down, fore and aft so that the liftgate is flush.
3. Tighten the striker screws to 33-44 Nm (24-32 lb-ft).

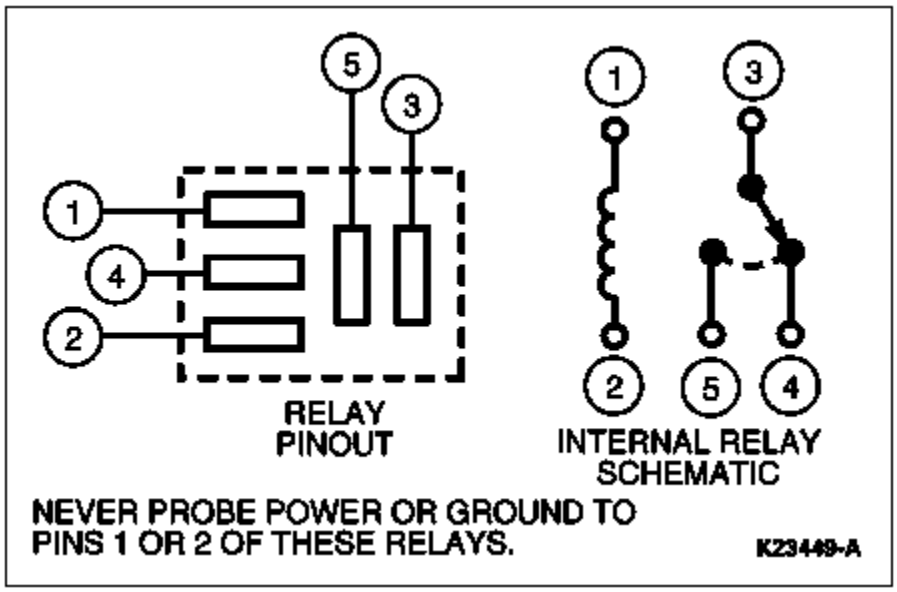
22	119 (PK/Y)	All Lock Relay

All Relay Connectors

The harness connectors to each system relay (horn, parklamp, starter interrupt) have the same pinout. Check the Electrical Schematics for circuit number, wire gauge and color.



Item	Part Number	Description
1	—	Battery Feed to Coil
2	—	Coil Ground
3	—	Battery Feed to Contacts
4	—	Normally Closed Connector
5	—	Coil Energized Contact

NOTE: NEVER probe power or ground to Pins 1 or 2 of these relays.

Inspection and Verification

NOTE: Doors may automatically unlock as a result of shorts in the door unlock circuits. Refer to Section 18-04A .

The electronic door lock control system is diagnosed as part of the overall remote control alarm and door lock system. Refer to Section 18-04B to initiate system self test, New Generation Star (NGS) Tester use and diagnostic test codes.

1. Verify the vehicle owner's original concern by duplicating the concern.

2. Inspect to determine if one of the following mechanical or electrical concerns apply:

VISUAL INSPECTION CHART

Mechanical	Electrical
• Damaged driver/passenger door lock cylinder	• Open fuses • Loose connections • Corroded connections

3. If the concern(s) remains after the inspection, determine the symptom(s) and proceed to the following Symptom Chart.

NOTE: For system inspection and verification using Rotunda New Generation Star (NGS) Tester 001-00500 or equivalent, refer to Section 18-04B .

To test and service door lock system:

- Check that battery is fully charged (if not, it may be causing the concern).

NOTE: When the battery has been disconnected and reconnected, some abnormal symptoms may occur while the powertrain control module (PCM) (12A650) relearns its adaptive strategy. The vehicle may need to be driven 16 km (10 miles) or more to relearn the strategy.

- Disconnect and reconnect battery to make sure system is reset.
- Perform the self test. If necessary, refer to Section 18-04B .
- Service only as specified in the tests.
- Repeat the self test to make sure the system is operational.

Symptom Chart — Electronic Door Lock Control System

NOTE: Use Rotunda New Generation Star (NGS) Tester 007-00500 or equivalent and Rotunda 73 Digital Multimeter 105-R0051 or equivalent to perform electrical pinpoint tests.

ELECTRONIC DOOR LOCK CONTROL SYSTEM

Condition	Possible Source	Action
• Door Lock Motors/Switches Inoperative or Door Locks Continuously Cycling	• Mechanical condition. • Switch. • Circuit. • GEM module.	• GO to Pinpoint Test A . **NOTE: Before proceeding with pinpoint test, go to Section 18-04B for system self test and diagnostic test codes.**
• Transmitter/Remote Entry Inoperative	• Transmitter. • Antenna. • Transmitter battery.	• GO to Pinpoint Test B . **NOTE: Before proceeding with pinpoint test, go to Section 18-04B for system self test and diagnostic test codes.**
• Illuminated Entry Request Inoperative	• GEM module. • Circuit.	• GO to Pinpoint Test C . **NOTE: Before proceeding with pinpoint test, go to Section 18-04B for system self test and diagnostic test codes.**

Pinpoint Tests

PINPOINT TEST A: DOOR LOCK MOTORS/SWITCHES INOPERATIVE

The door locks are wired so that the lock and unlock switches on the doors can operate the door locks with or without a receiver assembly installed in the system. The door lock switches are wired directly to the relays that control the door locks.

When the receiver assembly operates the door locks, it provides a ground just like the door lock switches.

If the receiver assembly is disconnected and the door locks still don't work, there is a switch, motor, lock mechanism, fuse or wiring issue.

The receiver assembly uses the LOCK ALL and UNLOCK ALL Circuits 119 and 120 as outputs, but also monitors these circuits as inputs to see when the door lock switches are pressed.

Pressing the UNLOCK switch on the door can unlock all doors. It unlocks the driver's door by supplying power to the driver's door lock motor through the normally closed contacts of the driver's door unlock relay.

NOTE: If state is SHORT, check and service Circuits 120 (PK/LG) and 119 (PK/Y) for short to ground or each other.

A1 CHECK MECHANICAL OPERATION OF LOCKS

- Manually (not electrically) cycle the lock by turning the key in the door.

Do the door lock mechanisms move freely?

Yes	No
GO to **A2** .	GO to Section 01-14A and SERVICE the door lock mechanisms (LUBRICATE linkage, CLEAR interferences, etc.).

A2 DOOR LOCKS DON'T WORK WITH LOCK SWITCHES ON THE DOORS

- Check the fuses for the door lock motors.

Are the fuses OK?

Yes	No

GO to **A3** .	LOCATE the wiring short in the door lock power circuits. REPLACE fuse.

A3 CHECK STATUS OF DOOR LOCK SWITCHES

- Enter in NGS: RAP, PID/DATA and select DD_LOCK to monitor the door lock and unlock switches.

  NOTE: Some vehicles may have power door locks, but may not have a receiver assembly system. If there is no receiver assembly, tests are limited to voltage and resistance measuring.

Is NGS DD_LOCK state OFF?

Yes	No
GO to **A4** .	If the display says UNLOCK, CHECK and SERVICE the all unlock Circuit 120 (PK/LG) or door unlock switches for a short to ground. If the display says LOCK, CHECK and SERVICE the all lock Circuit 119 (PK/Y) or door lock switches for a short to ground.

A4 CHECK OPERATION OF DOOR LOCK SWITCHES

- Press LOCK button on each door lock switch and confirm that NGS, RAP DD_ LOCK state changes to LOCK when switches are pressed.
- Press UNLOCK button on each door lock switch and confirm that NGS, RAP DD_ LOCK state changes to UNLOCK when switches are pressed.

Does LOCK and UNLOCK state for each door lock switch occur?

Yes	No
GO to **A5** .	If UNLOCK state doesn't occur, CHECK and SERVICE the all unlock Circuit 120 (PK/LG) or door unlock switches for an open, or SERVICE the grounding circuit for the door lock switch. If LOCK state doesn't occur, CHECK and SERVICE the all lock Circuit 119 (PK/Y) or door lock switches for an open. If always UNLOCK, CHECK and SERVICE the all unlock Circuit 120 (PK/LG) or door unlock switches for a short to ground. If always LOCK, CHECK and SERVICE the all lock Circuit 119 (PK/Y) or door lock switches for a short to ground.

A5 CHECK RECEIVER ASSEMBLY ALL LOCK OUTPUT

- Enter in NGS_RAP ACTIVE COMMANDS and select DOOR LOCK CONTROL.
- Toggle LOCK to ON.

Do all doors lock?

Yes	No
GO to **A6** .	CHECK and SERVICE Circuit 119 (PK/Y) from receiver assembly to relay.

A6 CHECK RECEIVER ASSEMBLY UNLOCK DRIVER'S DOOR OUTPUT

- Toggle DD LOCK to OFF.
- Toggle DD UNLOCK to ON.

Does the driver side door unlock?

Yes	No
GO to **A7** .	CHECK and SERVICE driver's door unlock Circuit 129 (LG) from receiver assembly to relay.

A7 CHECK RECEIVER ASSEMBLY ALL UNLOCK OUTPUT

- Toggle UNLOCK to ON.

Do all doors unlock?

Yes	No
GO to **A8** .	CHECK and SERVICE Circuit 120 (PK/LG) from receiver assembly to relay.

A8 CHECK DOOR LOCK SWITCH CIRCUIT

- Check Circuit 119 (PK/Y) for continuity between all lock relay and door lock switch.
- Check Circuit 119 (PK/Y) for continuity to ground.

Is there continuity and is resistance less than 100 ohms?

Yes	No
GO to **A9** .	SERVICE open or ground in Circuit 119.

A9 CHECK DOOR UNLOCK SWITCH CIRCUIT

- Check Circuit 120 (PK/LG) for continuity between unlock relay and door lock switch.

- Check Circuit 120 (PK/Y) for continuity to ground.

Is there continuity and is resistance less than 100 ohms?

Yes	No
GO to **A10** .	SERVICE open or ground in Circuit 120.

A10 CHECK DOOR UNLOCK POWER CIRCUITS

- Disconnect receiver assembly and GEM module.
- Remove all doors lock relay, all doors unlock relay and driver's door unlock relay.
- Jumper battery voltage to the common contact (Pin 3) of all doors unlock relay connector and jumper ground (Pin 4) to common contact (Pin 3) of all doors lock relay connector.

Do door lock motors unlock?

Yes	No
GO to **A11** .	SERVICE all circuits connecting to door lock relays for shorts or opens. REPLACE door lock relays only if required following wiring repairs. DISCONNECT door lock motors and power separately to confirm operation.

A11 CHECK DOOR LOCK POWER CIRCUITS

- Confirm receiver assembly and GEM module as well as the all doors lock relay, all doors unlock relay and driver's door unlock relay are disconnected.
- Jumper battery voltage to common contact (Pin 3) of all doors lock relay connector and jumper ground (Pin 4) to common contact (Pin 3) of the all doors unlock relay connector.

Do door lock motors lock?

Yes	No
CHECK and REPLACE relays by placing known good relays in place of door lock and unlock relays.	SERVICE all circuits jumpered in Pinpoint Test A10 for shorts or opens. REPLACE door lock relays only if required following wiring repairs. If substitute relays do not correct condition, GO to **A7** .

PINPOINT TEST B: TRANSMITTER/REMOTE ENTRY INOPERATIVE

Remote Entry range may be affected when operated within a quarter mile of some radio or TV towers. Although the range is reduced at these locations, the owner should still be able to enter their vehicle using the remote transmitter.

B1 CHECK TRANSMITTER/REMOTE ENTRY OPERATION

- Turn ignition OFF.
- Perform the self test as Described in Section 18-04B , Pinpoint Test A to insure that the receiver assembly has power.
- Press each button on remote entry transmitter fob while standing 10 meters/yards away from vehicle and confirm that operation is as described in Description and Operation, Transmitter, Remote Entry .

Was there an appropriate response for each button press?

Yes	No
System OK.	GO to **B2** if there was no response to the transmitter. GO to the correct pinpoint test for the specific output which did not function correctly, if there was only a partial response. Some outputs are covered in Section 13-11 .

B2 CHECK FOR ANY RESPONSE FROM TRANSMITTER NO. 1

Does system respond to any button press from transmitter in question when standing closer or inside of vehicle?

Yes	No
GO to **B4** .	GO to **B3** .

B3 CHECK FOR ANY RESPONSE FROM TRANSMITTER NO. 2

Does the system respond to any button press from the other transmitter when standing closer or inside of the vehicle?

Yes	No
GO to **B6** .	GO to **B4** .

B4 ANTENNA CHECK

- Confirm that while testing for 10 meters/yards range of remote entry system that the vehicle is more than .8 km (1/2 mile) away from radio or TV towers. If closer than .8 km (1/2 mile) away from a TV or radio tower, a 5 meter/yard range is acceptable.
- Check to see if the antenna connecting to the receiver assembly module is fully seated or is missing.
- Connect antenna or press it fully into receiver assembly.
- Test range with transmitter.

Has range improved?

Yes	No
REPEAT **B1** .	GO to **B5** .

B5 ANTENNA DAMAGE CHECK

- Disconnect antenna from RAP module.
- Check for less than 10 ohms of resistance from antenna signal pin to opposite end of antenna coax center conductor.
- Reconnect antenna to receiver assembly.

Is resistance less than 10 ohms?

Yes	No
Antenna is OK. GO to **B6** .	REPLACE the antenna and REPEAT **B1** .

B6 NGS TRANSMITTER TIC/DATA — STORED TICS

- Enter in NGS: RAP, FUNCTION TESTS, TRANSMITTER TIC/DATA in order to see which Transmitter Identification Codes (TICs) are stored in the RAP module.
- When TRANSMITTER TIC/DATA screen first comes up, different eight digit letter/number codes should appear next to the TIC 1: and TIC 2: symbols on right. TIC 1 is stored TIC for Transmitter 1, and TIC 2 is stored TIC for Transmitter 2.

  NOTE: Since receiver assembly can store up to 4 transmitter codes, there may be a second, third and/or fourth TIC programmed to system next to TIC 2, TIC 3 and TIC 4. These were extra transmitters programmed after vehicle was delivered.

Is there at least one transmitter stored and displayed next to TIC 1?

Yes	No
GO to **B7** .	TURN ignition OFF, PROGRAM all of the transmitters to be used with this system as described in Description and Operation, Transmitter, Remote Entry and REPEAT **B1** .

B7 NGS TRANSMITTER TIC/DATA — LAST TIC RECEIVED

- Turn ignition OFF.
- Press and release UNLOCK button many times for transmitter in question. Transmission received contains TIC for transmitter being operated and DATA for which button has been pressed.

  NOTE: Pressing CLEAR will clear last transmission received, but will not clear stored TICs in memory.

  NOTE: It is normal for LAST TIC RECEIVED and LAST DATA RECEIVED to flash different information momentarily when button is pressed. Information will lock in on correct values. Tester is catching computer updating its memory.

Does an eight digit letter/number code appear under LAST TIC RECEIVED: and word UNLOCK appear under LAST DATA RECEIVED:?

Yes	No
GO to **B10** . Transmitter and receiver assembly are OK.	GO to **B8** .

B8 NGS TRANSMITTER TIC/DATA — OTHER TRANSMITTER (IF EQUIPPED)

- Repeat Steps B6 and B7 , but press and release UNLOCK button many times for other transmitter after turning ignition OFF.

Does an eight digit letter/number code appear under LAST TIC RECEIVED: and word UNLOCK appear under LAST DATA RECEIVED:?

Yes	No
GO to **B9** .	GO to **B12** .

B9 TEST TRANSMITTER BATTERIES

- Switch batteries in good transmitter tested in Step B8 with poor transmitter tested in Step B7. (See Removal and Installation, Transmitter Battery .)
- Press and release the UNLOCK button many times for transmitter tested in B7.

Does an eight-digit letter/number code appear under LAST TIC RECEIVED: and word UNLOCK appear under LAST DATA RECEIVED:?

Yes	No
RETURN original batteries to both transmitters, REPLACE batteries in transmitter tested in **B7** , and REPEAT **B1** .	REPLACE transmitter. RETEST system.

B10 NGS TRANSMITTER TIC/DATA — TIC MATCH

NOTE: Ranger vehicles are factory equipped with one remote transmitter.

Does TIC under LAST TIC RECEIVED: match TIC 1 (or TIC 2 or TIC 3 or TIC 4)?

Yes	No
GO to **B11** .	TURN ignition OFF. PROGRAM all transmitters to be used with this system as described in Programming Transmitters , Description and Operation and REPEAT **B1** .

B11 NGS TRANSMITTER TIC/DATA — TIC MATCH

Do all buttons pressed for each transmitter create expected LAST DATA RECEIVED output?

Yes	No
System should be operating OK.	TURN ignition OFF. PROGRAM all transmitters to be used with this system as described in Description and Operation, Transmitter, Remote Entry and REPEAT **B1** .

B12 CHECK RECEIVER ASSEMBLY FOR EXPORT REMOTE SHORTING BAR

- Enter in NGS RAP PID/DATA and select NOREMOT.

Does NOREMOT PID display YES?

Yes	No
INSPECT wiring connector for no remote shorting Pin C1-22. If present, REMOVE and GO to **B1** . If not present, REPLACE receiver assembly. RETEST system.	REPLACE receiver assembly. RETEST system.

PINPOINT TEST C: ILLUMINATED ENTRY REQUEST INOPERATIVE

The GEM module (Section 18-04A) controls the interior lights with the illuminated entry function.

The receiver assembly sends pulses on the GEM illuminated entry circuit to request the illuminated entry begin or end. Circuit 1013 (BR/LG) is normally pulled up by the GEM module. The receiver assembly pulls the voltage low with pulses of different lengths.

- 200 mS pulse from receiver assembly requests illuminated entry on.
- 300 mS pulse from receiver assembly requests illuminated entry off.

C1 CHECK ILLUMINATED ENTRY OPERATION

- Press the UNLOCK button on a remote transmitter (for any keypad button) to unlock the doors and turn the illuminated entry on.
- Press the LOCK button on a remote transmitter (or lock with keypad) within 20 seconds of pressing the UNLOCK button to lock the doors and turn the illuminated entry off.

Does illuminated entry work as described?

Yes	No
Illuminated entry request function appears OK. CLARIFY with customer and REVIEW customer symptoms table.	If illuminated entry did not work as described, GO to **C2** . If driver's door either did not lock or did not unlock, REPEAT **C1** to make sure transmitter was pressed and GO to Pinpoint Test B .

C2 MEASURE GEM ILLUMINATED ENTRY VOLTAGES

- Measure the voltage on Circuit 1013 (BR/LG) at the receiver assembly (keep modules connected) using signal ground Circuit 570 (BK/W) as a voltage reference. Measure voltage with NGS, DIGITAL MEASUREMENT, VOLTMETER, setting RANGE at 40V.
- Continue to measure voltage and press the UNLOCK button on the transmitter (or any keypad button).

Was the MIN voltage captured when the pulse was transmitted less than 1.3V?

Yes	No
GO to **C3** .	CLEAR MIN voltage and REPEAT Test **C2** once to CONFIRM high voltage; if so, REPLACE receiver assembly. RETEST system.

C3 MEASURE GEM ILLUMINATED ENTRY PULSE WIDTHS

- Keep setup from C2.
- Select NGS, DIGITAL MEASUREMENT, PULSE WIDTH METER, and choose LEVEL setting LOW.
- Press the UNLOCK button on the transmitter (or any keypad button).

Was the PULSE WIDTH between 190 and 210 mS?

Yes	No
GO to **C4** .	REPLACE receiver assembly. RETEST system.

C4 CHECK GEM ILLUMINATED ENTRY REQUEST CIRCUIT

- Check Circuit 1013 (BR/LG) for shorts or an open between the RAP and GEM modules.

Is the wiring OK?

Yes	No
GO to Section 18-04A to diagnose the GEM module for illuminated entry operation.	SERVICE Circuit 1013 (BR/LG).

Antenna

Removal and Installation

NOTE: This vehicle uses an antenna that runs along the wiring harness. DO NOT REMOVE the damaged antenna from the wire harness.

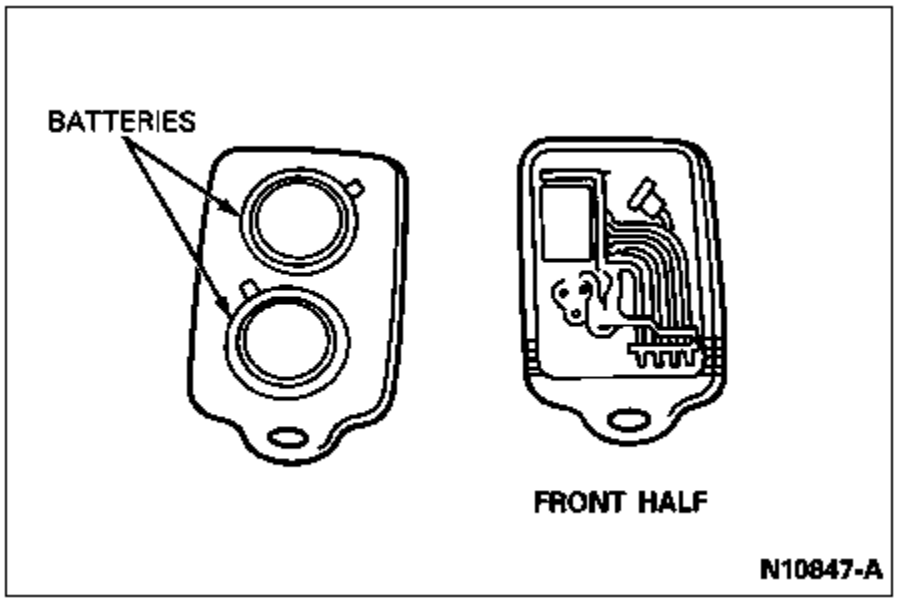
1. Locate the module by removing the proper trim.
2. Disconnect antenna from the module and tape securely out of the way.
3. Connect new antenna connector to the receiver assembly.
4. Install new antenna by securing along path followed by the unconnected damaged antenna. Secure using Ford-approved tie-wraps or tape.

Transmitter Battery

The door lock switch actuator transmitter is powered by two coin-type 3-volt lithium batteries. To replace the batteries, the transmitter comes apart by inserting a thin coin between the two halves of the transmitter, at the keyring end, and twist the halves apart.

CAUTION: Do not take the front half of the transmitter apart.

When installing the new batteries, be sure to place the positive side down as marked. Make sure batteries are fully seated to prevent dropping when transmitter halves are assembled. Snap the two halves back together.



SPECIAL SERVICE TOOLS/EQUIPMENT

ROTUNDA EQUIPMENT

Model	Description
007-00500	New Generation Star (NGS) Tester
105-R0051	Rotunda 73 Digital Multimeter

Wiper System, Windshield

The front windshield wiper system consists of a wiper control module, a windshield wiper motor (17508), a washer system, and multi-function switch (13K359).

The optional rear windshield wiper system consists of an electric motor mounted inside the liftgate, a washer system, a dash-mounted windshield wiper/washer switch, an in-line circuit breaker and a fuse block-mounted 15-amp fuse (14A094) in cavity 18.

Off/Low/High Speed

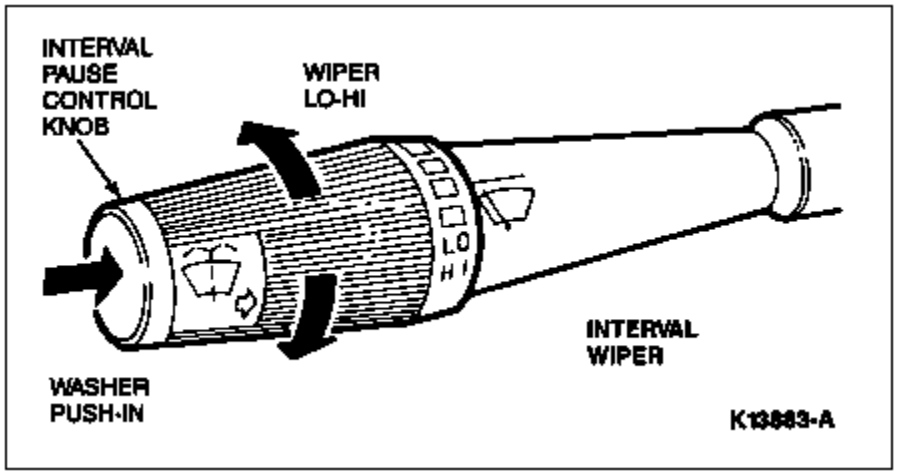
The permanent magnet three-brush electric wiper motor of the front wiper system allows selection of either low or high speed. When the multi-function switch is in the LOW position, the common brush Circuit 61 (Y/R) and low speed brush Circuit 58 (W) are used. When the switch is in the HIGH position, current bypasses part of the armature winding to the high speed brush Circuit 56 (DB/O), causing the motor to run faster. When the switch is moved to the OFF position, the motor will continue to run at low speed until the wipers park.

The rear wiper system motor runs at one speed only. When the dash-mounted switch is moved to OFF, the motor continues to run until the wiper parks.

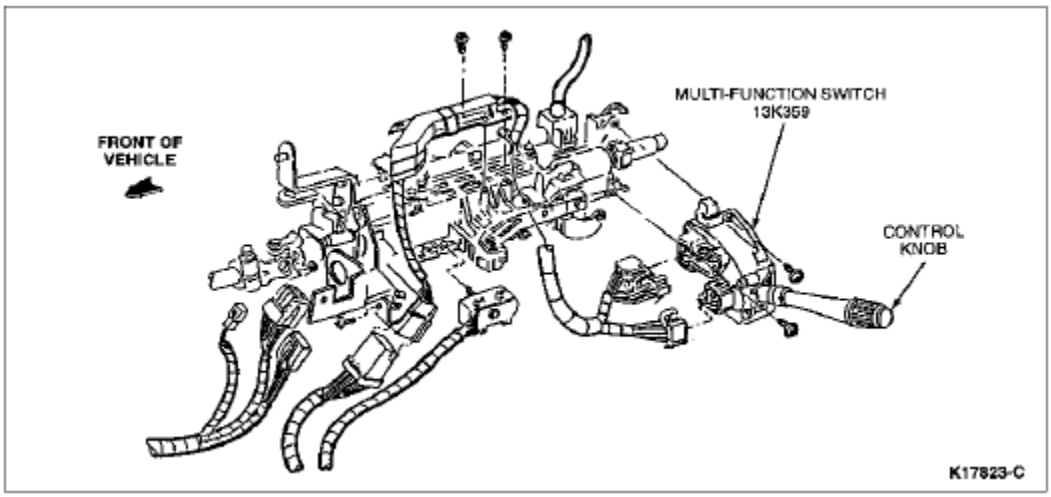
Interval (Front Wipers Only)

When the multi-function switch is in the interval (INT) position, the wipers will make single sweeps separated by a pause. The control knob on the end of the switch sets the length of the pause from approximately 1-12 seconds each.

When using interval wipe, the first wipe may not occur until after a pause of up to 12 seconds.



Interval Wipe/Wash System



FRONT OF VEHICLE
MULTI-FUNCTION SWITCH 13K359
CONTROL KNOB
K17823-C

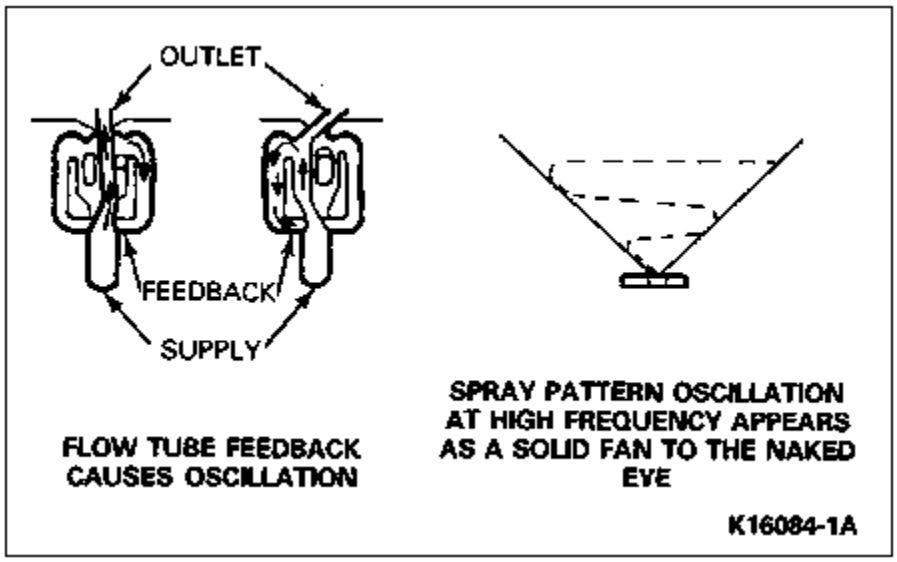
Washer System, Windshield

Front

The washer system for the front wipers consists of a control switch inside the multi-function switch (13K359), a windshield washer reservoir (17618), windshield washer pump, and necessary hoses/nozzle(s).

To engage the washer, push the knob of the multi-function switch toward the steering column. If the control switch is at the OFF or INT position, the wipers will run as long as the knob is depressed. When the knob is released, the washer will stop immediately, but the wipers will continue to run for one to four sweeps, then return to their previous set operation. Washer engagement does not affect wiper operation when the control switch is in the LO or HI position.

Each windshield washer nozzle jet and bracket (17603) expels what appears to be a wide fan-like spray pattern of large droplets of fluid on the windshield glass (03100). However, it is actually a single oscillating jet stream. This produces a more efficient cleansing action. Care should be taken to only actuate the system momentarily because of the greater volume of fluid used in this system. The windshield washer nozzle jet and brackets are not adjustable.



Rear Window

The washer system for the rear wipers consists of a dash-mounted switch, a windshield washer pump (17664), windshield washer reservoir, and a single hose/washer nozzle. The washer fluid reservoir is located behind the right quarter trim panel, and the fill cap is near the opening of the liftgate above the right rear lamp (13404). Fill the reservoir slowly to avoid spilling fluid. To engage the washer, push the dash-mounted switch. When the switch is released, the washer will stop immediately and the wipers will return to their previous set operation.

Inspection and Verification

1. Verify the vehicle owner's original concern by operating the wiper and washer system to duplicate the vehicle owner's concern.

2. Inspect to determine if one of the following mechanical or electrical concerns apply:

VISUAL INSPECTION CHART

Mechanical	Electrical
• Windshield wiper blade missing or damaged	• Open circuit breaker
• Binding windshield wiper pivot arm	• Damaged windshield wiper motor
• Binding windshield wiper mounting arm and pivot shaft	• Damaged windshield washer pump
• Empty windshield washer reservoir	• Open connectors
• Kinked or broken windshield washer hoses	• Corroded connectors • Inoperative windshield wiper switch

3. If the concern(s) remains after the inspection, determine the symptom(s) and proceed to the following symptom chart.

Symptom Chart — Windshield Wiper/Washer System Diagnosis

NOTE: Use 73 Digital Multimeter or equivalent, 105-R0051, Alternator, Regulator, Battery and Starter Tester (ARBST), 010-00725 or equivalent to perform electrical pinpoint tests.

WINDSHIELD WIPER/WASHER SYSTEM DIAGNOSIS

Condition	Possible Source	Action
• Windshield Washer Inoperative	• Low fluid level. • Plugged nozzles. • Bent or blocked hoses. • Blocked pump outlet. • Damaged circuit breaker. • Damaged multi-function switch. • Damaged wiper control module (WCM). • Damaged or worn washer pump. • Circuitry.	• GO to Pinpoint Test A.
• Windshield Wipers Inoperative at All Switch Positions	• Damaged circuit breaker. • Damaged multi-function switch. • Damaged wiper control module (WCM). • Damaged windshield wiper motor. • Circuitry.	• GO to Pinpoint Test B.
• Windshield Wipers Inoperative at Low Speed (High Speed OK)	• Damaged multi-function switch. • Damaged wiper control module (WCM). • Damaged windshield wiper motor. • Circuitry.	• GO to Pinpoint Test C.
• Windshield Wipers Inoperative at High Speed (Low Speed OK)	• Damaged multi-function switch. • Damaged wiper control module (WCM).	

	• Damaged windshield wiper motor. • Circuitry.	• GO to Pinpoint Test B.
• Windshield Wipers Inoperative at Interval (Low and High Only)	• Damaged multi-function switch. • Damaged wiper control module (WCM). • Circuitry.	• GO to Pinpoint Test D.
• No Wipe After Wash — Washer Pump Runs, Low Speed OK	• Damaged wiper control module (WCM).	• REPLACE Wiper Control Module (WCM).
• Windshield Wipers Will Not Park at Proper Position	• Damaged windshield wiper motor. • Damaged wiper control module (WCM). • Worn or damaged multi-function switch.	• GO to Pinpoint Test E.
• Windshield Wipers Continue to Run When Switch Is Turned Off	• Worn or damaged multi-function switch. • Damaged wiper control module (WCM). • Circuitry.	• GO to Pinpoint Test E.
• Rear Window Washer Inoperative	• Rear washer pump motor. • Liftgate wiper/washer switch. • Circuitry.	• GO to Pinpoint Test F.
• Rear Window Wiper Inoperative	• Fuses. • Circuit breaker. • Battery or charging system. • Liftgate wiper motor. • Liftgate wiper/washer switch. • Circuitry.	• GO to Pinpoint Test G.
• Rear Windshield Wiper Will Not Park	• Liftgate wiper motor. • Liftgate wiper/washer switch. • Circuitry.	• GO to Pinpoint Test H.
• Rear Windshield Wiper Will Not Turn Off	• Liftgate wiper motor. • Liftgate wiper/washer switch. • Circuitry.	• GO to Pinpoint Test J.

PINPOINT TEST A: WINDSHIELD WASHER INOPERATIVE

A1 WINDSHIELD WASHERS INOPERATIVE

- Check fluid level of windshield washer reservoir.

Is windshield washer reservoir empty?

Yes	No
FILL windshield washer reservoir. RETEST system.	GO to A2.

A2 TURN ON WASHER SWITCH

- Check operation of windshield washer pump.

Does windshield washer pump operate?

Yes	No
GO to A3.	GO to A6.

A3 INSPECT NOZZLE FOR BLOCKAGE

- Inspect windshield washer nozzle jet and bracket for blockage.

Is windshield washer nozzle jet and bracket blocked?

Yes	No
CLEAN or REPLACE windshield washer nozzle jet and bracket. RETEST system.	GO to A4.

A4 INSPECT HOSE, FILTER, CHECK VALVE, FOR BLOCKAGE OR KINKS

- Inspect hose, filter and check valve for blockage or kinks.

Are any blockages or kinks present?

Yes	No
CLEAN, REPAIR or REPLACE as necessary. RETEST system.	GO to A5.

A5 INSPECT PUMP OUTLET FOR BLOCKAGE

- Inspect washer pump outlet for blockage.

Is windshield washer pump outlet blocked or obstructed?

Yes	No
REMOVE windshield washer pump and CLEAN or REPLACE windshield washer pump. RETEST system.	CHECK washer pump feed in reservoir for blockage. SERVICE as required. RETEST system.

A6 CHECK FOR VOLTAGE AT WASHER PUMP

- Using a voltmeter, actuate the multi-function switch and check for voltage at windshield washer pump.

Is battery voltage present?

Yes	No
GO to **A7** .	GO to **A8** .

A7 CHECK PUMP GROUND

- Using a volt-ohmmeter, check resistance of ground Circuit 57 (BK) at pump connector to known good ground.

Is resistance five ohms or less?

Yes	No
REPLACE windshield washer pump. RETEST system.	REPAIR ground. RETEST system.

A8 TURN ON WINDSHIELD WIPERS

- Check operation of windshield wipers.

Do wipers operate?

Yes	No
GO to **A9** .	GO to Pinpoint Test B .

A9 CHECK MULTI-FUNCTION SWITCH RESISTANCE AT WIPER CONTROL MODULE

- Unplug connector from wiper control module.
- Depress windshield washer switch on end of multi-function switch.
- Check continuity between Circuits 993 (BR/W) and 590 (DB/W).

Is continuity present?

Yes	No
GO to **A11** .	GO to **A10** .

A10 CHECK MULTI-FUNCTION SWITCH

- Unplug wiper switch connector.
- Depress multi-function switch.
- Check for continuity between terminals 993 and 590.

Is continuity present?

Yes	No
SERVICE for open circuit between multi-function switch and wiper control module. RETEST system.	REPLACE multi-function switch. RETEST system.

A11 CHECK WASHER PUMP CIRCUIT

- Check continuity of Circuit 941 (BK/W) from wiper control module to windshield washer pump.

Is continuity present?

Yes	No
REPLACE wiper control module. RETEST system.	SERVICE for open circuit. RETEST system.

PINPOINT TEST B: WINDSHIELD WIPERS INOPERATIVE AT ALL SWITCH POSITIONS

B1 CHECK FOR SUPPLY VOLTAGE AT MOTOR

- Turn ignition switch on.
- Turn multi-function switch to high.
- Unplug windshield wiper motor.
- Check for battery voltage at Circuit 65 (DG).

Is battery voltage present?

Yes	No
GO to **B2** .	CHECK for : • Open circuit breaker in fuse panel.

	• Open wire Circuit 65 (DG). • SERVICE as required. RETEST system.

B2 CHECK FOR BATTERY VOLTAGE AT THE WIPER CONTROL MODULE (WCM)

- Disconnect wiper control module from wire harness.
- Check for battery voltage at Circuit 65 (DG) Pin 2 of connector.

Is battery voltage present?

Yes	No
GO to **B3** .	SERVICE open in power feed to module. RETEST system.

B3 CHECK FOR BATTERY VOLTAGE TO MOTOR WINDINGS

- Reconnect wiper control module.
- Turn ignition switch to run.
- Turn multi-function switch to high.
- Disconnect windshield wiper motor connector.
- Check for battery voltage between Circuits 61 (Y/R) and 56 (DB/O).

Is battery voltage present?

Yes	No
GO to **B7** .	GO to **B4** .

B4 CHECK FOR BATTERY VOLTAGE AT WIPER CONTROL MODULE CONNECTOR

- Check for battery voltage between Pins 10 and 14 (Circuits 61 (Y/R) and 56 (DB/O) of WCM connector at the wire harness side with multi-function switch in the HIGH position.

Is battery voltage present?

Yes	No
CHECK for: • Open wire Circuits 56 (DB/O) or 61 (Y/R). • Unseated terminal(s). • SERVICE as required. RETEST system.	GO to **B5** .

B5 CHECK WIRING BETWEEN WIPER CONTROL MODULE AND SWITCH

- Disconnect connector from wiper control module.

- Measure resistance between Circuits 993 (BR/W) and 589 (O) with wiper switch at high.

Is resistance less than five ohms?

Yes	No
REPLACE WCM. RETEST system.	GO to **B6** .

B6 CHECK MULTI-FUNCTION SWITCH CONTINUITY

- Disconnect harness from the multi-function switch.
- Check continuity between switch terminals for Circuits 993 (BR/W) and 589 (O) with SW in the HIGH position.

Is resistance less than one ohm?

Yes	No
CHECK for open wire between multi-function switch and Wiper Control Module. SERVICE as required. RETEST system.	CHECK for damaged multi-function switch. SERVICE as required. RETEST system.

B7 PREFORM WIPER MOTOR CURRENT DRAW TEST

Is current draw OK?

Yes	No
CHECK wiper linkage. SERVICE as required. RETEST system.	SERVICE windshield wiper motor as required. RETEST system.

PINPOINT TEST C: WINDSHIELD WIPERS INOPERATIVE AT LOW SPEED (HIGH SPEED OK)

C1 CHECK FOR BATTERY VOLTAGE TO MOTOR WINDINGS

- Turn ignition switch to run.
- Turn multi-function switch to low.
- Disconnect windshield wiper motor connector.
- Check for battery voltage between Circuits 61 (Y/R) and 58 (W).

Is voltage present?

Yes	No
GO to **C5** .	GO to **C2** .

C2 CHECK FOR BATTERY VOLTAGE AT WIPER CONTROL MODULE CONNECTOR

- Check for battery voltage between Pins 10 and 8 (Circuits 61 (Y/R) and 58 (W) of WCM connector at the wire harness side.

Is voltage present?

Yes	No
CHECK for: • Open wire Circuits 58 (W) or 61 (Y/R). • Unseated terminal(s). RETEST system.	GO to **C3** .

C3 CHECK WIRING BETWEEN WIPER CONTROL MODULE AND MULTI-FUNCTION SWITCH

- Disconnect connector from wiper control module.
- Measure resistance between Circuit 993 (BR/W) and 589 (O) with multi-function switch in the LOW position.

Is resistance between 3.5k and 4.5k Ohms?

Yes	No
REPLACE WCM. RETEST system.	GO to **C4** .

C4 CHECK CONTROL LINE SIGNAL AT MULTI-FUNCTION SWITCH

- Disconnect harness from the multi-function switch.
- Check continuity between switch terminals for Circuits 993 (BR/W) and 589 (O) with multi-function switch in the LOW position.

Is resistance between 3.5k and 4.5k Ohms?

Yes	No
SERVICE open wire between multi-function switch and wiper control module. RETEST system.	SERVICE damaged multi-function switch. RETEST system.

C5 PERFORM WIPER MOTOR CURRENT DRAW TEST

Is current draw OK?

Yes	No
CHECK wiper linkage. SERVICE windshield wiper motor as required. RETEST system.	SERVICE windshield wiper motor. RETEST system.

PINPOINT TEST D: WINDSHIELD WIPERS INOPERATIVE AT INTERVAL (LOW AND HIGH ONLY)

D1 CHECK MODE SELECT INPUT SIGNAL

- Disconnect wiper control module connector.
- Measure resistance between Circuits 993 (BR/W) and 589 (O) with multi-function switch in the INTERVAL position.

Is resistance between 10.5k and 12.0k Ohms?

Yes	No
GO to **D3** .	GO to **D2** .

D2 CHECK MODE SELECT SIGNAL AT WIPER SWITCH

- Disconnect harness from the multi-function switch.
- Measure resistance between terminals for Circuits 993 (BR/W) and 589 (O) with multi-function switch in the INTERVAL position.

Is resistance between 10.5k and 12.0k Ohms?

Yes	No
CHECK for open wire between multi-function switch and wiper control module. SERVICE as required. RETEST system.	CHECK for damaged multi-function switch. SERVICE as required. RETEST system.

D3 CHECK INTERVAL SELECT INPUT SIGNAL

- Rotate interval control on the multi-function switch from min. to max.
- Measure resistance between Circuits 590 (DB/W) and 993 (BR/W).

Is resistance 3.3k-103.3k Ohms?

Yes	No
REPLACE WCM. RETEST system.	GO to **D4** .

D4 CHECK INTERVAL SELECT INPUT SIGNAL AT WIPER SWITCH

- Disconnect harness from multi-function switch.
- Rotate interval control on the multi-function switch from min. to max.
- Measure resistance between terminals of wiper switch for Circuits 590 (DB/W) and 993 (BR/W).

Is resistance 3.3k-103.3k Ohms?

Yes	No
CHECk for open wires between the multi-function switch and the wiper control module. SERVICE as required. RETEST system.	CHECK for damaged multi-function switch. SERVICE as required. RETEST system.

PINPOINT TEST E: WINDSHIELD WIPERS WILL NOT PARK AT PROPER POSITION/CONTINUE TO RUN WHEN SWITCH IS TURNED OFF

E1 CHECK MOTOR GROUND

- Unplug wiper motor connector.
- Check for ground at Circuit 57 (BK).

Is ground present?

Yes	No
GO to **E2** .	SERVICE for open circuit. RETEST system.

E2 CHECK FOR BATTERY VOLTAGE AT WIPER MOTOR

- Key on.
- Multi-function switch off.
- Using a volt-ohmmeter, check for voltage between Circuit 65 (DG) and Circuit 57 (BK) at the windshield wiper motor connector.

Is battery voltage present?

Yes	No
GO to **E3** .	SERVICE open circuits. RETEST system.

E3 CHECK WIPER MOTOR CIRCUIT CONTINUITY THRU WIPER CONTROL MODULE

- With ignition in run and multi-function switch at off, check continuity between Circuits 28 (BK/PK) and 58 (W) and between 61 (Y/R) and known good ground at the windshield wiper motor connectors.

Is continuity present?

Yes	No
GO to **E5** .	GO to **E4** .

E4 CHECK CIRCUITS TO WIPER CONTROL MODULE

- Disconnect WCM connector.
- Check continuity of Circuits 28, 58, and 61 between windshield wiper motor and wiper control module.

Is continuity present?

Yes	No
GO to **E5** .	SERVICE for open circuit. RETEST system.

E5 CHECK WIPER LINKAGE

- Check linkage for being bent, cracked, or mispositioned from windshield wiper motor.

Is linkage OK?

Yes	No
REPLACE windshield wiper motor module. RETEST system.	SERVICE linkage as required. RETEST system.

PINPOINT TEST F: REAR WINDOW WASHER INOPERATIVE

F1 PRELIMINARY CHECK

- Check battery and charging system for proper operation.
- Check related fuses and circuit breaker.

Are they functioning properly?

Yes	No
GO to **F2** .	SERVICE circuit or component before processing. RETEST system.

F2 CHECK POWER SUPPLY TO WASHER PUMP MOTOR

- Gain access to liftgate washer pump motor.
- Disconnect washer pump motor connector.
- Key on.
- Using a test lamp volt-ohmmeter, check for voltage at connector Circuit 941 (BK/W) while depressing the rear washer switch.

Is voltage present?

Yes	No
GO to F3 .	GO to F4 .

F3 CHECK GROUND CIRCUIT TO WASHER PUMP MOTOR

- Key off.
- Using a self-powered test lamp or volt-ohmmeter, check for continuity between washer connector Circuit 57 (BK) and known good ground.

Is continuity present?

Yes	No
REPLACE liftgate washer pump motor. RETEST system.	SERVICE Circuit 57 (BK) for open. RETEST system.

F4 CHECK CIRCUIT 941 (BK/W) FOR OPEN

- Gain access to liftgate wiper/washer switch.
- Key on, leave switch connected to harness.
- Using a test lamp or volt-ohmmeter, check for voltage at switch connector Pin 5 Circuit 941 (BK/W) while depressing the washer switch.

Is voltage present?

Yes	No
SERVICE Circuit 941 (BK/W) for open. RETEST system.	REPLACE liftgate wiper/washer switch. RETEST system.

PINPOINT TEST G: REAR WINDOW WIPER INOPERATIVE

G1 PRELIMINARY CHECK

- Check battery and charging system for proper operation.
- Check related fuses and circuit breaker.

Are they functioning properly?

Yes	No
GO to G2 .	SERVICE circuit or component before proceeding. RETEST system.

G2 CHECK SWITCH SIGNAL TO WIPER MOTOR

- Gain access to liftgate wiper motor.
- Disconnect wiper motor connector.
- Key on, wiper switch to run.
- Using a test lamp or volt-ohmmeter, check for voltage at wiper motor connector Circuit 58 (W).

Is voltage present?

Yes	No
GO to **G3** .	GO to **G5** .

G3 CHECK RUN POWER SUPPLY TO WIPER MOTOR

- Key on.
- Using a test lamp or volt-ohmmeter, check for voltage at wiper motor connector Circuit 63 (R).

Is voltage present?

Yes	No
GO to **G4** .	SERVICE Circuit 63 (R) for open. RETEST system.

G4 CHECK GROUND TO WIPER MOTOR

- Using a self-powered test lamp or volt-ohmmeter, check for continuity between wiper motor connector Circuit 57 (BK) and known good ground.

Is continuity present?

Yes	No
REPLACE liftgate wiper motor. RETEST system.	SERVICE Circuit 57 (BK) for open. RETEST system.

G5 CHECK POWER SUPPLY TO WIPER SWITCH

- Gain access to liftgate wiper/washer switch.
- Key on, switch connected to harness and on.
- Using a test lamp or volt-ohmmeter, check for voltage at Pin 3 Circuit 63 (R) and Pin 4 Circuit 58 (W).

Is voltage present on both?

Yes	No
SERVICE Circuit 58 (W) for open. RETEST	If voltage is present on Pin 3 Circuit 63 (R) only, REPLACE liftgate wiper switch. If voltage is not

system.	present on either Pin, SERVICE Circuit 63 (R) for open. RETEST system.

PINPOINT TEST H: REAR WINDSHIELD WIPER WILL NOT PARK

H1 CHECK GROUND FOR PARK SWITCH

- Gain access to liftgate wiper motor.
- Disconnect wiper motor connector.
- Turn liftgate wiper switch off.
- Using a self-powered test lamp or volt-ohmmeter, check for continuity between wiper motor connector Circuit 58 (W) and known good ground.

Is continuity present?

Yes	No
REPLACE liftgate wiper motor. RETEST system.	GO to **H2** .

H2 CHECK CIRCUIT 58 (W) FOR OPEN

- Gain access to liftgate wiper/washer switch.
- Leave switch connected to harness.
- Using a self-powered test lamp or volt-ohmmeter, check for continuity between Pin 4, Circuit 58 (W) and known good ground.

Is continuity present?

Yes	No
SERVICE Circuit 58 (W) for open. RETEST system.	GO to **H3** .

H3 CHECK SWITCH GROUND FOR OPEN

- Using a self-powered test lamp or volt-ohmmeter, check for continuity between switch connector Pin 2 Circuit 57 (BK) and known good ground.

Is continuity present?

Yes	No
REPLACE liftgate wiper/washer switch. RETEST system.	SERVICE Circuit 57 (BK) for open. RETEST system.

PINPOINT TEST J: REAR WINDSHIELD WIPER WILL NOT TURN OFF

J1 CHECK LIFTGATE WIPER MOTOR OFF SIGNAL

- Gain access to liftgate wiper motor.
- Disconnect wiper motor connector.
- Turn wiper/washer switch to off.
- Using a self-powered test lamp or volt-ohmmeter, check for continuity between wiper motor connector Circuit 58 (W) and known good ground.

Is continuity present?

Yes	No
REPLACE liftgate wiper motor. RETEST system.	GO to **J2** .

J2 CHECK CIRCUIT 58 (W) FOR OPEN

- Gain access to liftgate wiper/washer switch.
- Disconnect switch connector.
- Using a self-powered test lamp or volt-ohmmeter, check for continuity between switch connector Pin 4 Circuit 58 (W) and liftgate wiper motor connector Circuit 58 (W).

Is continuity present?

Yes	No
GO to **J3** .	SERVICE Circuit 58 (W) for open. RETEST system.

J3 CHECK LIFTGATE WIPER/WASHER SWITCH GROUND

- Using a self-powered test lamp or volt-ohmmeter, check for continuity between wiper/washer switch Pin 2 Circuit 57 (BK) and known good ground.

Is continuity present?

Yes	No
REPLACE liftgate wiper/washer switch. RETEST system.	SERVICE Circuit 57 (BK) for open. RETEST system.

Component Tests

Circuit Breaker

NOTE: Front wiper motor and washer motor use the same circuit breaker.

The six-amp circuit breaker is located in the fuse panel.

Two separate tests are necessary to check for correct circuit breaker operation. Remove the circuit breaker from the fuse junction panel and connect the tester leads to the circuit breaker.

Test 1

1. Before connecting the circuit breaker to the Alternator, Regulator, Battery, and Starter Tester (ARBST) 010-00725 or equivalent, short the tester leads together and adjust the current draw until it equals the circuit breaker rating.

2. Connect the breaker to the tester. Leave the breaker connected to the tester for ten minutes. Hold the current reading on the ammeter at the rated current. If the circuit breaker opens during the ten minutes, replace the circuit breaker.

Test 2

1. Short the tester leads together and adjust the current draw until it is twice the rated current.

2. Connect the breaker. Hold the current reading on the ammeter at twice the rated current.

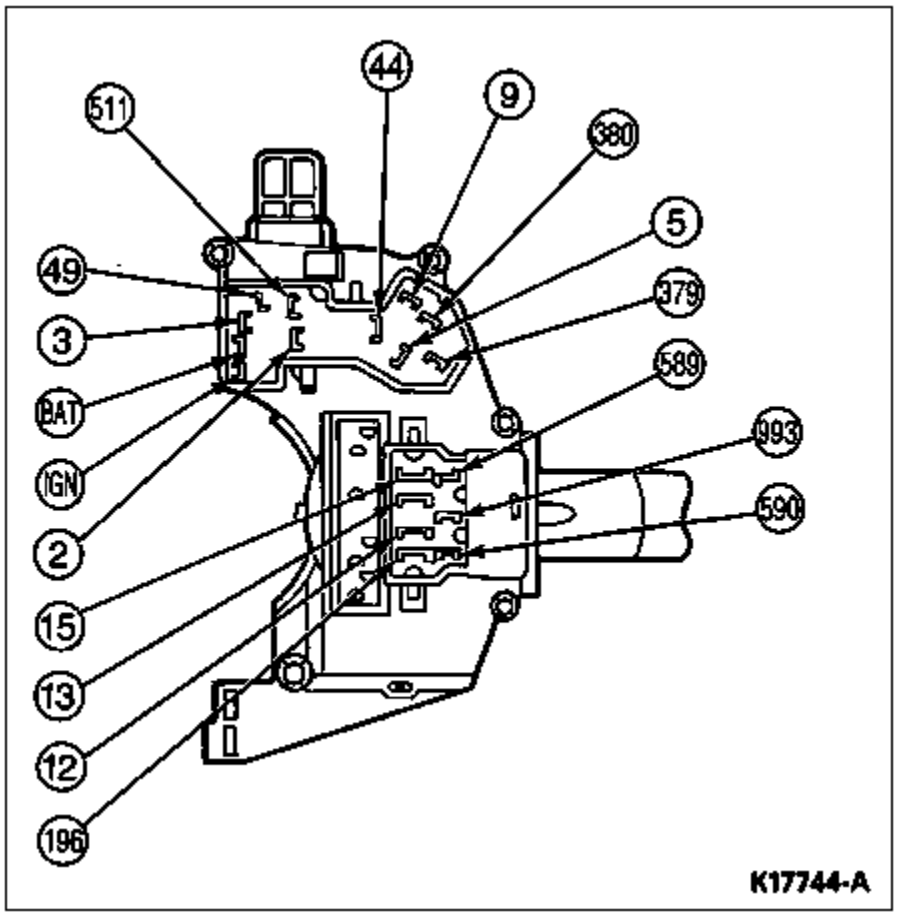
The current reading on the ammeter should drop to zero within 30 seconds. If it takes longer than 30 seconds for the circuit breaker to open (current reading drops to zero), replace the circuit breaker.

Multi-Function Switch Continuity Test

Check the continuity between the switch terminals. Either a self-powered test light or an ohmmeter can be used to test a standard two-speed switch. An ohmmeter must be used to test a switch used with the interval wiper system.

To detect marginal operation of the multi-function switch (13K359), move the lever while each reading is being taken.

If the multi-function switch does not exhibit continuity or if poor continuity exists in any switch position, replace the multi-function switch.



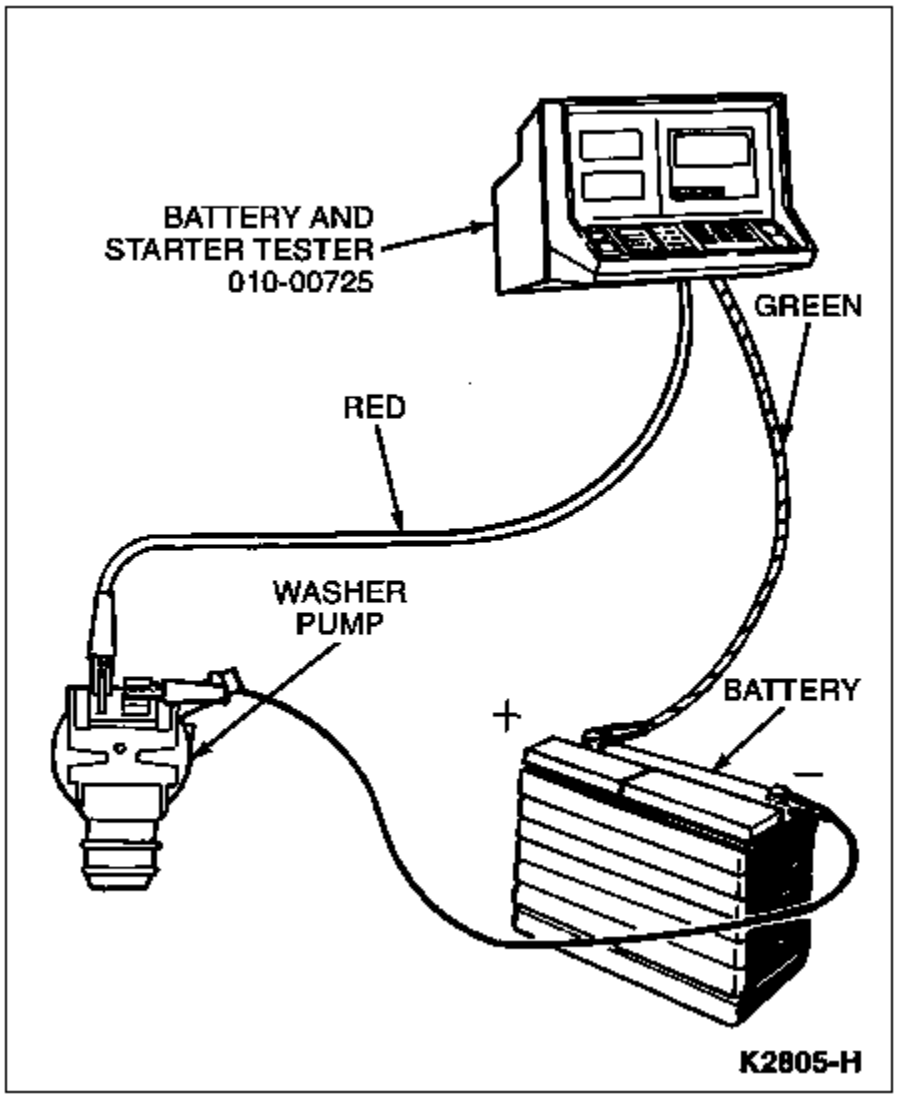
MULTI-FUNCTION SWITCH — BENCH CHECK CONTINUITY

Switch Actuator Position	Continuity by Circuit Number
Turn Signal Lever in Neutral — Hazard OFF	**Turn Signal:** Closed 511 to 5 and 9; 298 to 383. Open 511 to 2, 3, 44 and BAT: 44 to 2, 3, 5, 9; BAT to 383. **Cornering Lamp:** Open 15 to 379 and 380; 379 to 380.
Turn Signal Lever in Left Turn — Hazard OFF	**Turn Signal:** Closed 511 to 5; 44 to 3 and 9; IGN to 383. Open 511 to 3, 9, 44; 44 to 2, 5; BAT to 383. **Cornering Lamp:** Closed 15 to 380. Open 15 to 379; 379 to 380.
Turn Signal Lever in Right Turn — Hazard OFF	**Turn Signal:** Closed 511 to 9; 44 to 2 and 5; 298 to 383. Open 511 to 2, 5, 44; 44 to 3, 9 and BAT to 383. **Cornering Lamp:** Closed 15 to 380. Open 15 to 379; 379 to 380.
Hazard ON	Closed 44 to 2, 3, 5 and 9; BAT to 383. Open 511 to 5, 9, 44, 2 and 3; IGN to 383.
Hazard OFF Turn Signal Lever, Right	Closed 511 to 9; 44 to 2 and 5; 15 to 379. Open 511 to 2, 5, 44; 44 to 3 and 9.

Turn	
Headlamp Beam Switching:	
• Lever at **High Beam**	Closed 15 to 12. Open 15 to 13 and 196; 196 to 12.
• Lever at **Low Beam**	Closed 15 to 13. Open 15 to 12 and 196; 196 to 13.
• Lever at **FLASH-TO-PASS**	Closed 15 to 13; 196 to 12. Open 15 to 12; 196 to 13.
Wiper/Washer Switching:	
• Wash ON and Wiper OFF	Closed 993 to 590; Resistance 993 to 589, 47.6k Ohms ± 10%.
• Wiper OFF and Wash OFF	Resistance 993 to 590, 103.3k Ohms ± 10%. Resistance 993 to 589, 47.6k Ohms ± 10%.
• Wiper LO and Wash OFF	Resistance 993 to 590, 3.3k Ohms ± 10%. Resistance 993 to 589, 4.08k Ohms ± 10%.
• Wiper HI and Wash OFF	Resistance 993 to 590, 3.3k Ohms ± 10%. Closed 993 to 589.
• Wiper Interval and Wash OFF	Resistance 993 to 589, 11.33k Ohms ± 10%. Resistance 993 to 590. Gradually decreasing from 103.3k Ohms to 3.3k Ohms from Maximum Delay to Minimum Delay.

Current Draw, Windshield Washer Pump

Attach the leads of the 73 Digital Multimeter 105-R0051 or equivalent, or Alternator, Regulator, Battery and Starter Tester (ARBST) 010-00725 or equivalent as shown. The current draw should not exceed four amps nor be less than 1.7 amps while the windshield washer pump is pumping fluid.



Current Draw, Windshield Wiper Motor

1. Disconnect battery to starter relay cable (14300) from battery.
2. Disconnect windshield wiper pivot arm (17526) from windshield wiper motor (17504).
3. Disconnect the electrical plug to test the windshield wiper motor on the vehicle.
4. Connect the (green) lead from Rotunda Alternator, Regulator, Battery and Starter Tester 010-00725 (ARBST) or equivalent to the positive post of the battery.
5. Connect the positive (red) lead from the tester to low speed connection and high speed connection at connector plug as shown. In either case, the current draw should not exceed three amperes.

Windshield Wiper

Mounting Arm and Pivot Shaft

Removal and Installation

1. Turn multi-function switch (13K359) on. When windshield wiper pivot arms (17526) are in mid-position, turn ignition switch (11572) to OFF.
2. Disconnect windshield wiper motor (17504) electrical connector.
3. Remove both windshield wiper pivot arms. Refer to Windshield Wiper Pivot Arm Removal and Installation.
4. Remove cowl top vent panel (022A68).
5. Remove windshield wiper adapter and connecting arm clip (17531) retaining windshield wiper mounting arm and pivot shaft (17566) to wiper motor. Refer to the illustration under Wiper Motor Removal and Installation.
6. Remove four retaining screws.
7. Remove windshield wiper mounting arm and pivot shaft from vehicle.

For installation follow removal procedures in reverse order.

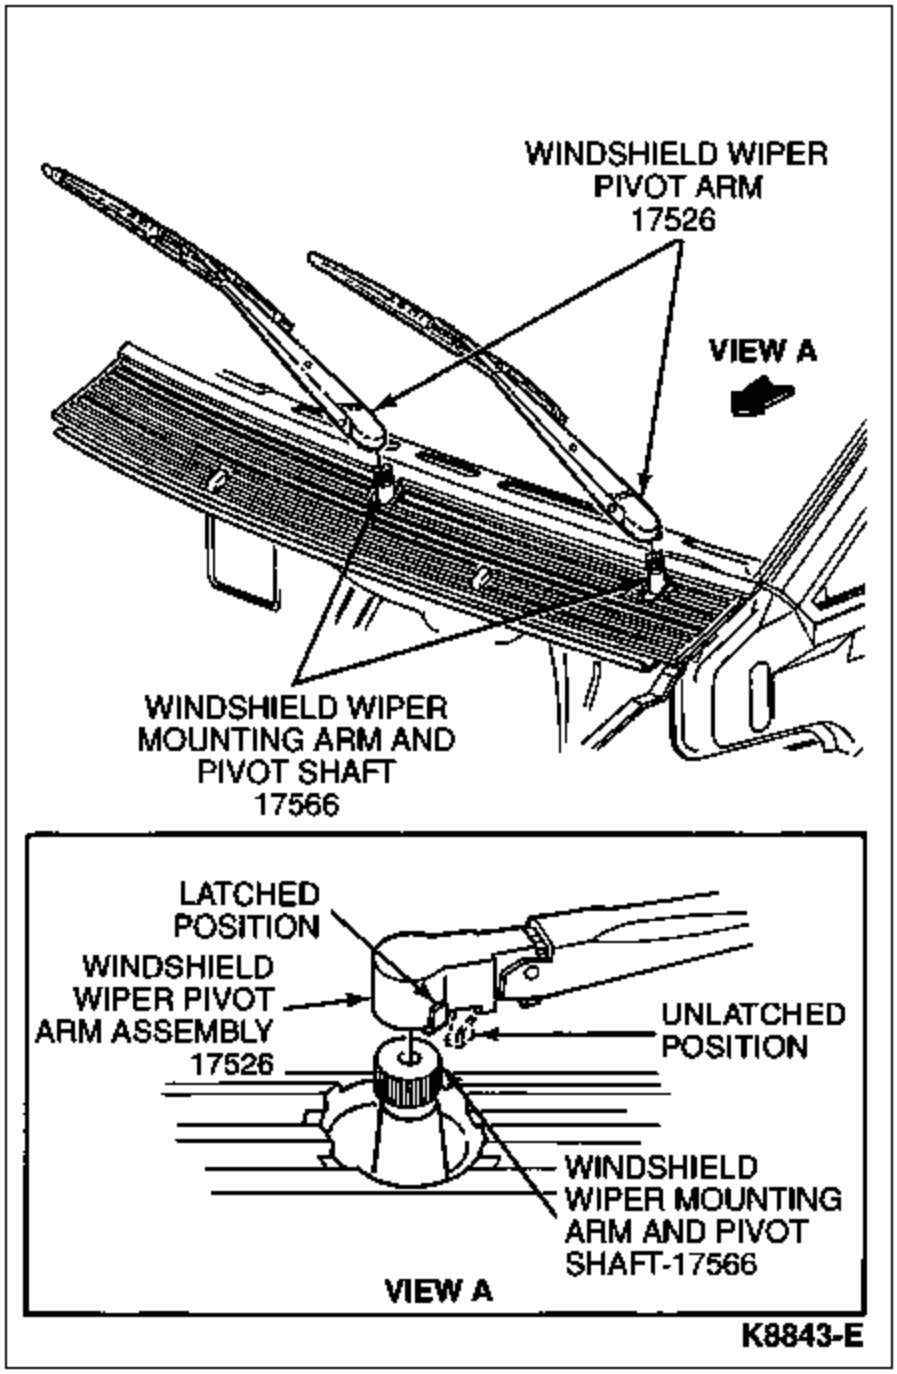
Pivot Arm

NOTE: No tools are required.

Removal and Installation

1. Raise windshield wiper pivot arm off windshield glass (03100) to specified dimension. Refer to Dimension X Chart in Specifications. Move slide latch away from windshield wiper mounting arm and pivot shaft.
2. Remove windshield wiper pivot arm assembly.

For installation, follow removal procedures in reverse order.



Wiper Blade

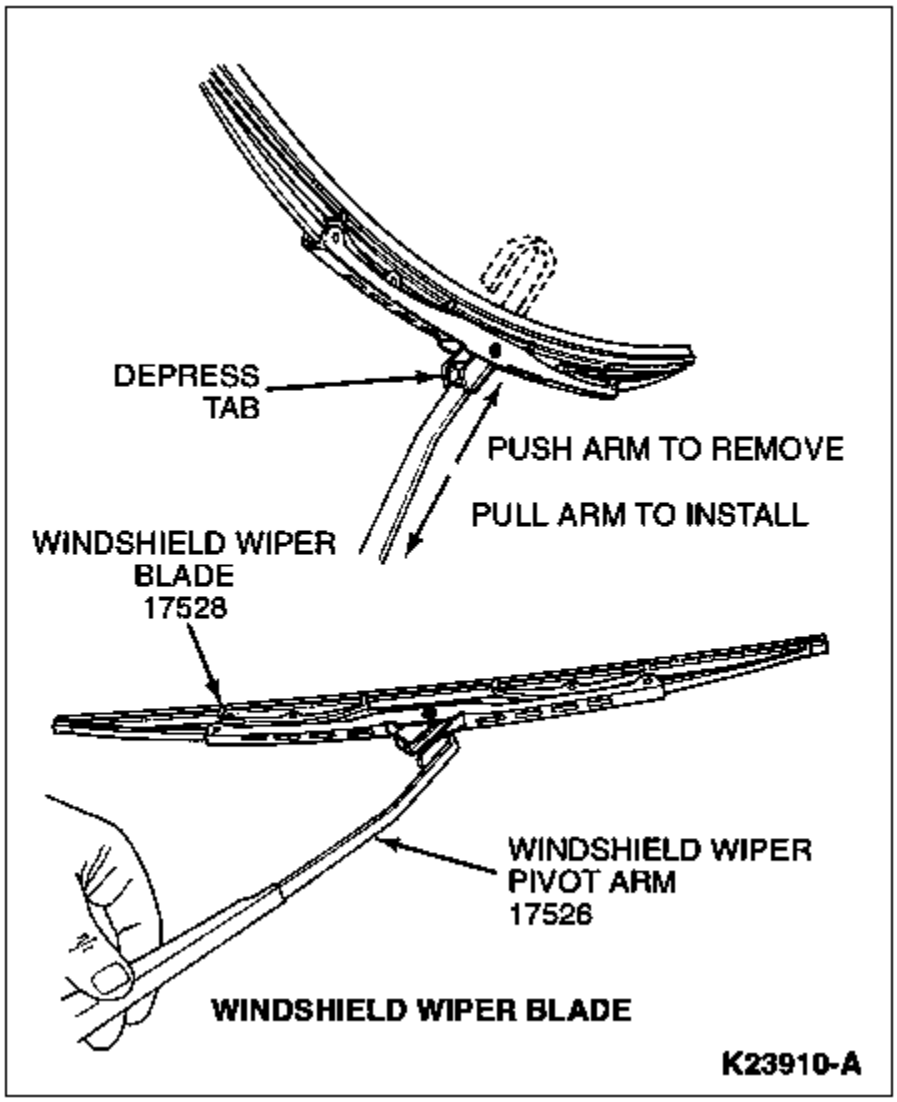
Removal and Installation

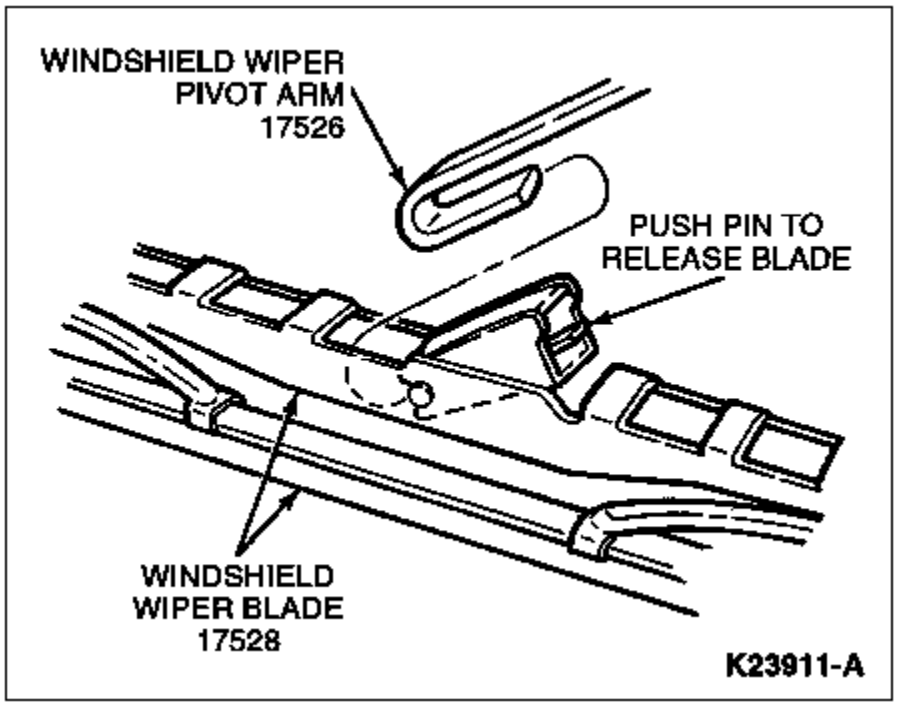
1. Cycle windshield wiper pivot arm assembly to where removal of windshield wiper blade (17528) can be performed without difficulty. Turn ignition switch off when wiper is in desired position.

2. To remove windshield wiper blade assembly from windshield wiper mounting arm and pivot shaft, depress lock tab and push windshield wiper mounting arm and pivot shaft away from windshield wiper

blade.

3. To install windshield wiper blade, pull windshield wiper mounting arm and pivot shaft down on windshield wiper blade until lock tab is engaged.

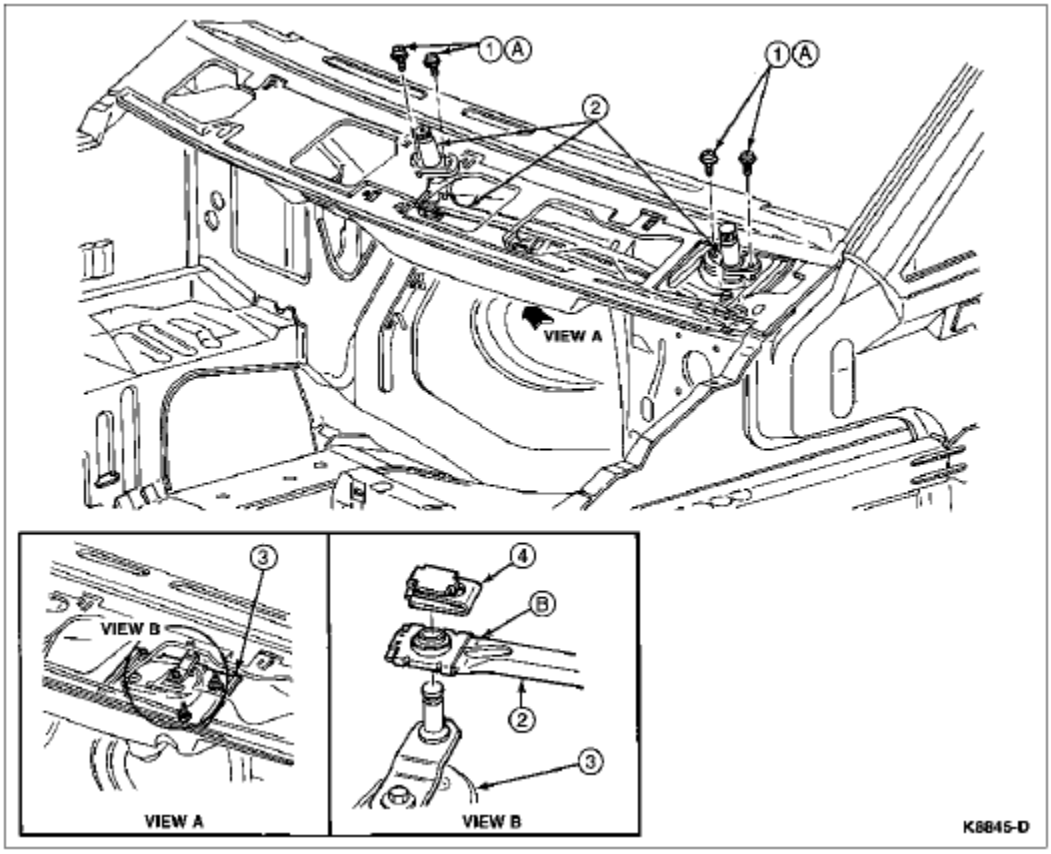




Motor

NOTE: The windshield wiper motor is not serviceable. It must be replaced as a complete assembly.

Front Windshield Wiper Motor

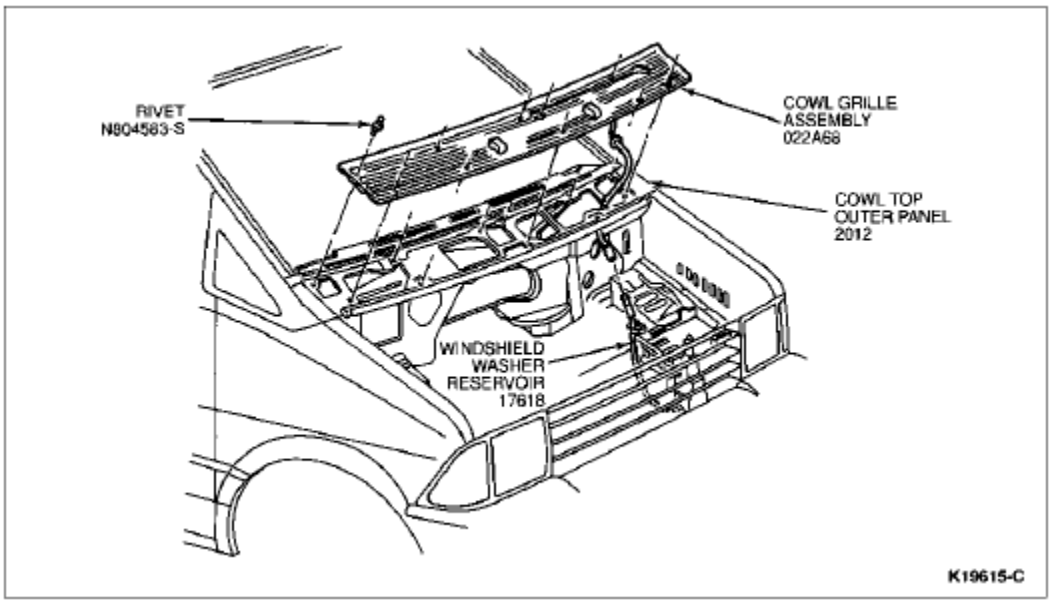


Item	Part Number	Description
1	N805837	Screw (2 Req'd Each Pivot)
2	17566	Windshield Wiper Mounting Arm and Pivot Shaft
3	17504	Windshield Wiper Motor
4	17531	Windshield Wiper Adapter and Connecting Arm Clip
A	—	Tighten to 7-10 Nm (62-89 Lb-In)
B	—	Press Here to Install

Removal and Installation

1. Turn the multi-function switch on. Turn ignition switch to RUN until the windshield wiper blades are in midpattern. Then turn ignition switch to OFF.
2. Disconnect battery.
3. Disconnect the wiring connector of windshield wiper motor.
4. Remove both windshield wiper mounting arm and pivot shafts.
5. Remove cowl top vent panel.

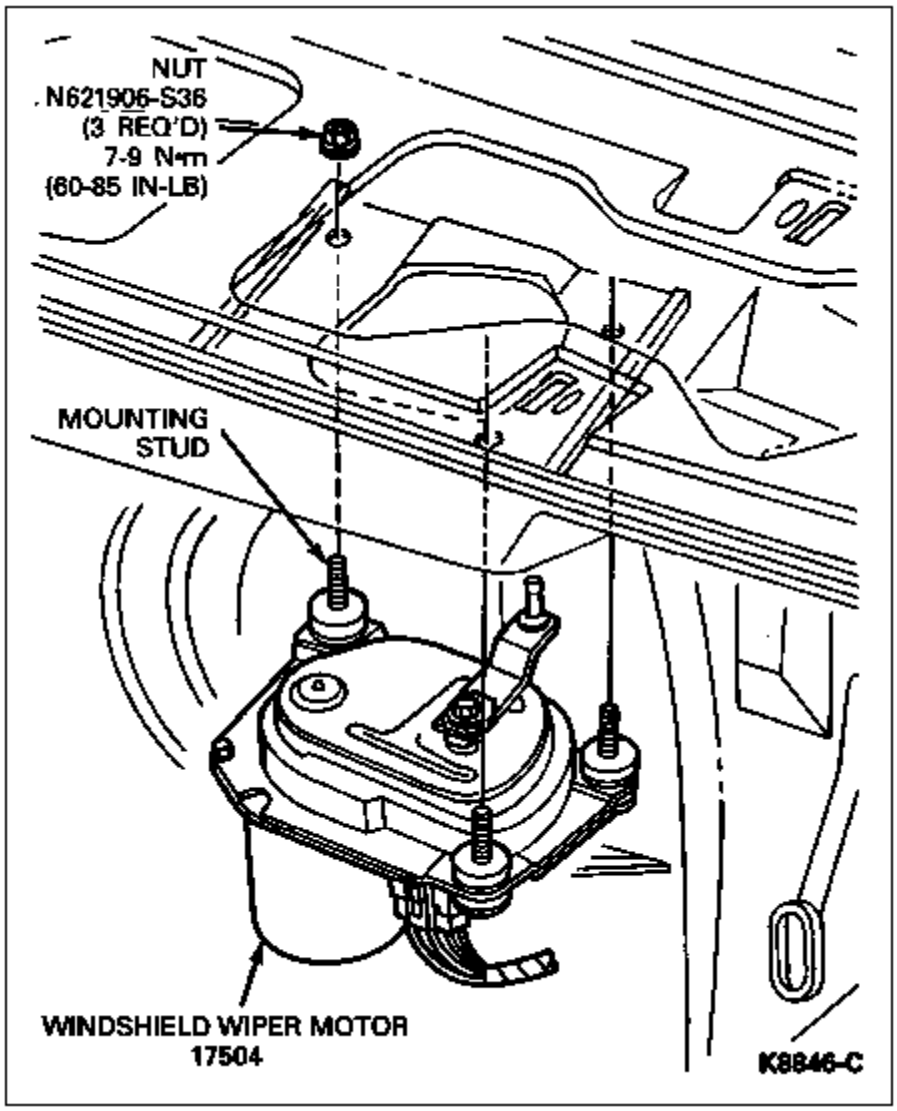
Cowl Top Vent Grille Removal



6. Remove windshield wiper adapter and connecting arm clip and disassemble linkage from crank arm.

7. **CAUTION: Support windshield wiper motor from underside to prevent it from falling and possible damage.**

   Remove retaining nuts.



NOTE: When the battery has been disconnected and reconnected, some abnormal drive symptoms may occur while the powertrain control module (PCM) (12A650), relearns its adaptive strategy. The vehicle may need to be driven 16 km (10 mi) or more to relearn the strategy.

For installation, follow removal procedures in reverse order.

Install the windshield wiper pivot arm and windshield wiper blade assemblies on the pivot shafts to dimension X. Dimension X is the distance between the centerline of the blade saddle and the top edge of the cowl top vent panel. The value of Dimension X for each vehicle is given in the Dimension X Chart in the Specifications portion of this section.

Windshield Wiper Control Module

Removal and Installation

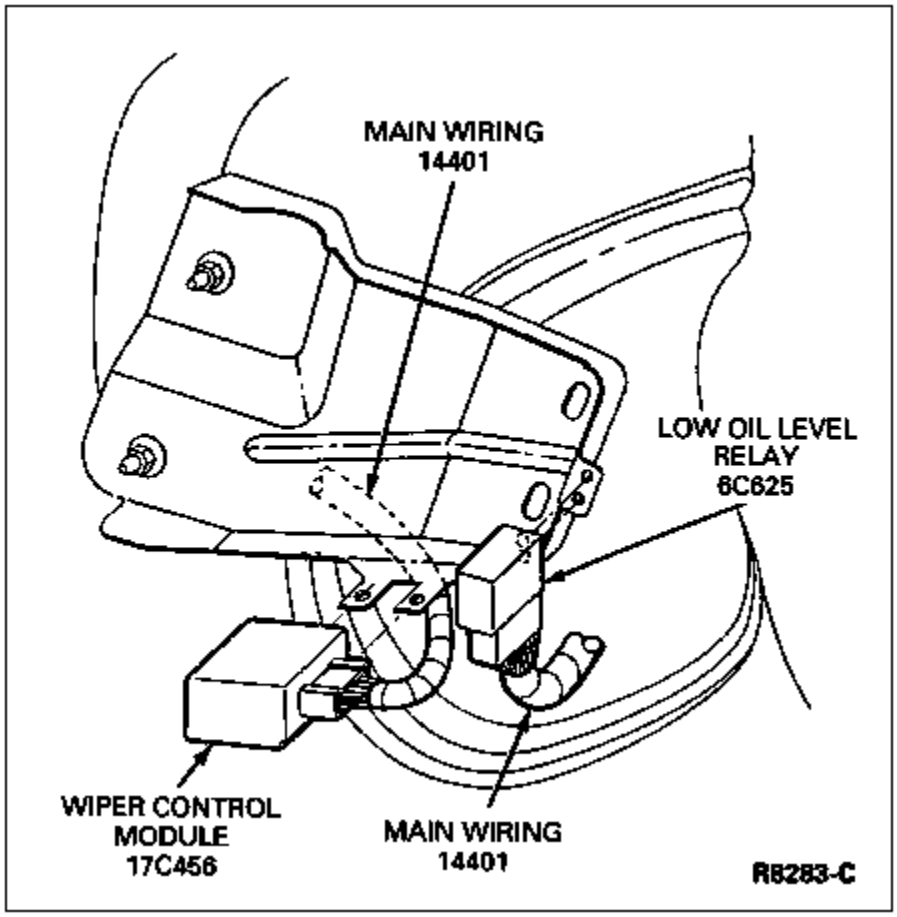
1. Disconnect battery.
2. Remove steering column lower trim panel. Refer to Section 11-04B .

3. Remove wiper control module from bracket.

4. Disconnect main wiring (14401) connector.

NOTE: When the battery has been disconnected and reconnected, some abnormal drive symptoms may occur while the powertrain control module relearns its adaptive strategy. The vehicle may need to be driven 16 km (10 mi) or more to relearn the strategy.

For installation, follow removal procedures in reverse order.



Washer Pump and Seal Assembly, Windshield

Removal

1. Remove windshield washer reservoir (17618) from vehicle. Disconnect main wiring (14401) and hose (17543).
2. Using a small-blade screwdriver, pry out windshield washer pump, being careful not to damage plastic housing.
3. Remove one-piece seal/filter and inspect for damage or debris.

Installation

1. Insert seal.
2. Lubricate inside diameter of seal with soapy solution.
3. Insert windshield washer pump into cavity until it is firmly seated in the seal.
4. Connect main wiring plugs and hose and replace windshield washer reservoir in vehicle.
5. Fill windshield washer reservoir slowly, otherwise air will be trapped in windshield washer reservoir causing it to overflow.
6. **CAUTION: Do not operate windshield washer pump until fluid is added to windshield washer reservoir.**

   Operate washer system.
7. Check for leaks.

Multi-Function Switch

NOTE: The handle is an integral part of the multi-function switch (13K359) and cannot be removed separately.

For removal and installation procedures refer to Section 11-05 .

Wiper System, Rear Window

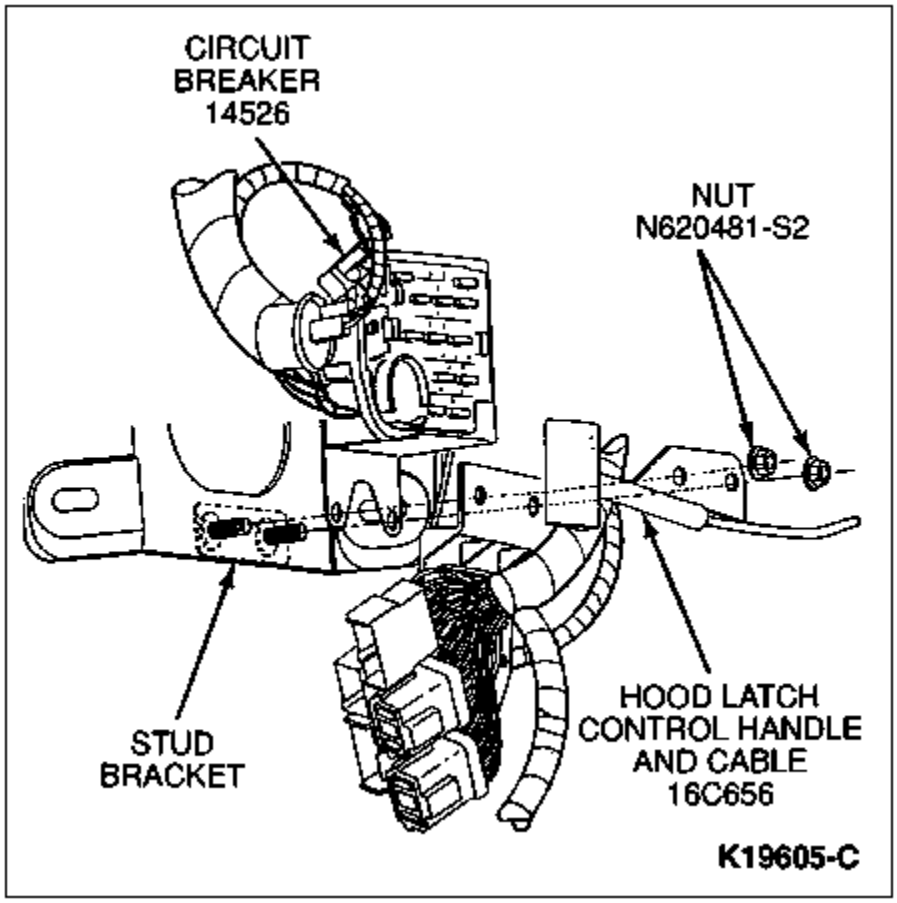
Circuit Breaker

Removal and Installation

1. Disconnect battery.
2. Remove screw from circuit breaker to instrument panel.
3. Remove wires from circuit breaker.

NOTE: When the battery has been disconnected and reconnected, some abnormal drive symptoms may occur while the powertrain control module (PCM) (12A650) relearns its adaptive strategy. The vehicle may need to be driven 16 km (10 mi) or more to relearn the strategy.

For installation, follow removal procedure in reverse order.



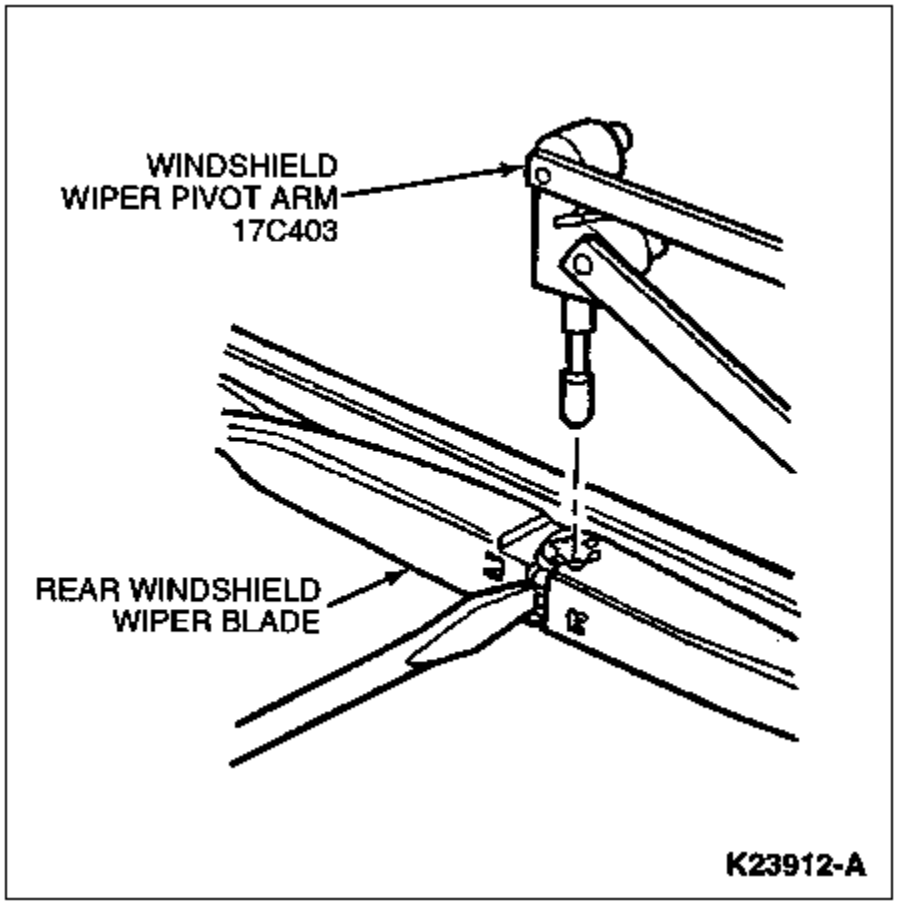
Wiper Blade, Rear

Removal and Installation

1. Cycle windshield wiper pivot arm (17526) and windshield wiper blade (17528) assembly to where removal of windshield wiper blade can be performed without difficulty. Turn ignition switch (11572) off at desired position.

2. To remove windshield wiper blade assembly, insert screwdriver in slot, push down on spring lock and pull windshield wiper blade assembly from pin.

3. To install, push the windshield wiper blade assembly on the pin so the spring lock engages the pin. Make sure the windshield wiper blade assembly is securely attached to pin.

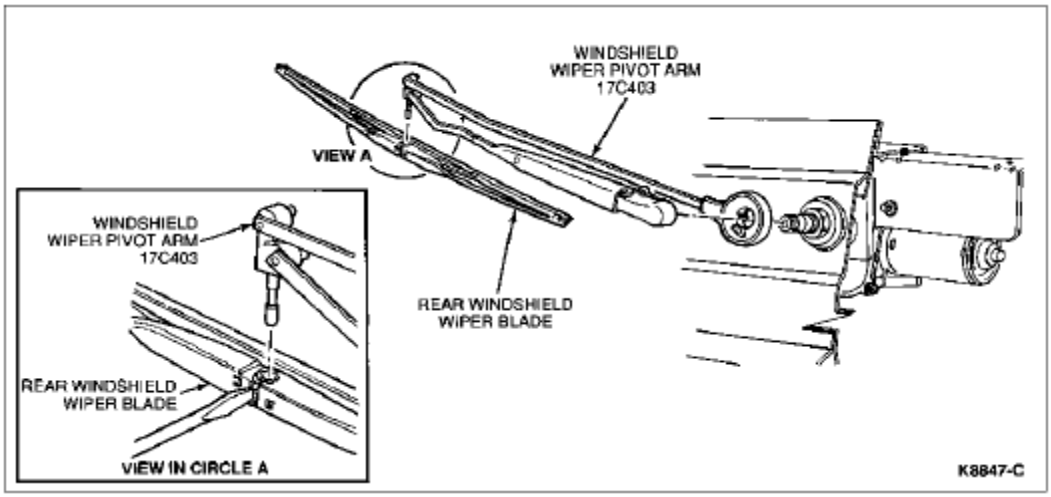


Arm, Wiper Pivot

NOTE: Windshield wiper pivot arm can be removed and installed without the aid of any tools.

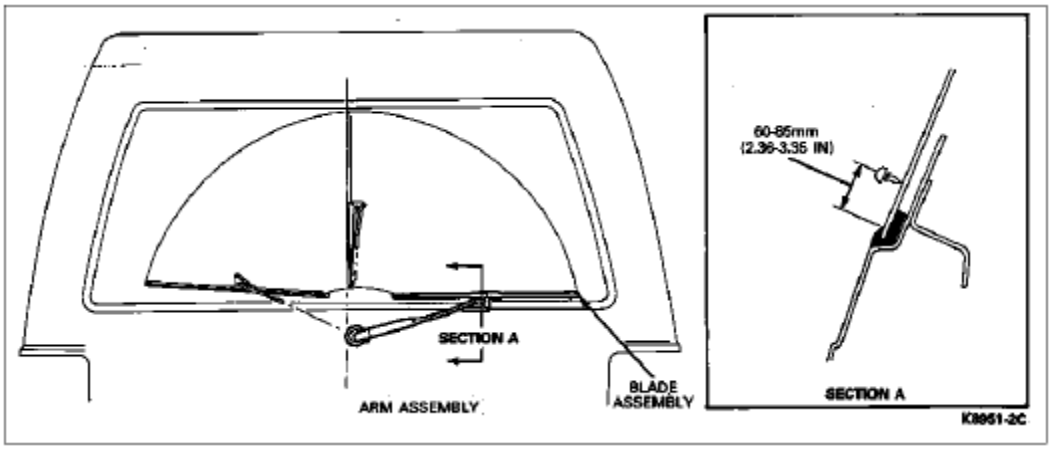
Removal and Installation

Arm and Blade Removal



1. Raise windshield wiper blade off back window glass, move latch from pivot shaft and release windshield wiper blade.

Rear Wiper Arm Assembly



2. **NOTE: Make sure pivot shaft is in park position and windshield wiper blade is positioned to the correct dimension.**

   Push main head over pivot shaft.

3. Hold the main arm head onto the pivot shaft, while raising the blade end of the windshield wiper pivot arm.

4. **NOTE: If windshield wiper pivot arm does not firmly contact back window glass, the latch is not fully seated.**

   Slide latch toward windshield wiper pivot arm until fully seated under pivot.

5. Lower windshield wiper pivot arm to back window glass.

Wiper/Washer Switch, Rear Window

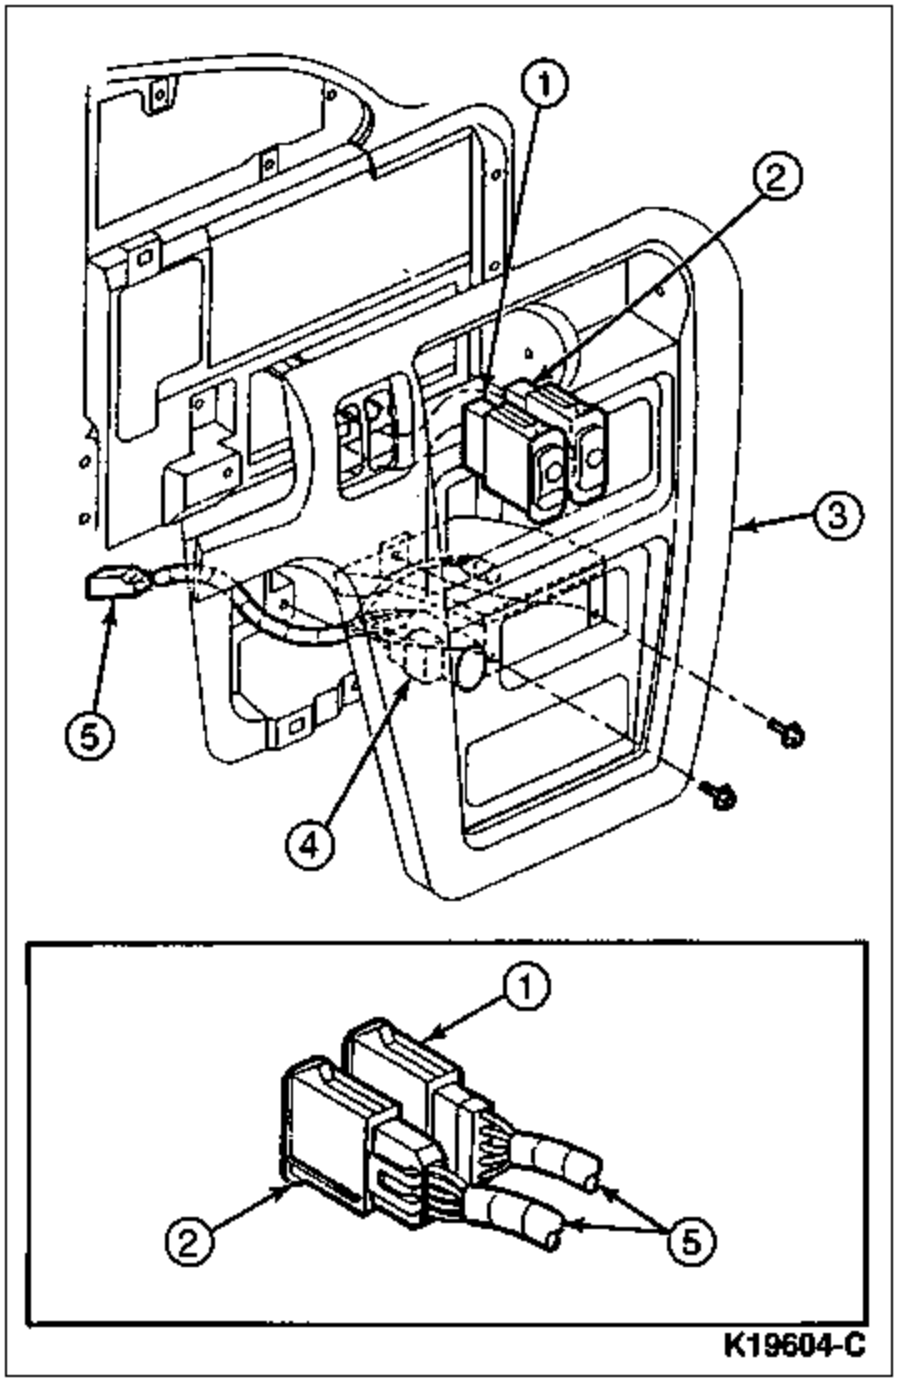
Removal

1. Disconnect the battery ground cable (14301).
2. Remove the center trim panel. Refer to Section 01-05A .
3. Remove the main wiring (14401) connector from rear windshield wiper/washer switch (17A553).
4. Remove windshield wiper/washer switch from the center trim panel by pushing on windshield wiper/washer switch from main wiring connector side until the snap-in mounting clips release.

Installation

1. Feed the main wiring connector through the windshield wiper/washer switch mounting hole on center trim panel.
2. Install main wiring connector to windshield wiper/washer switch.
3. Snap switch into center trim panel.
4. Install center trim panel.
5. **NOTE: When the battery ground cable has been disconnected and reconnected, some abnormal drive symptoms may occur while the powertrain control module (PCM) (12A650) relearns its adaptive strategy. The vehicle may need to be driven 16 km (10 mi) or more to relearn the strategy.**

   Connect battery ground cable.
6. Check system operation.



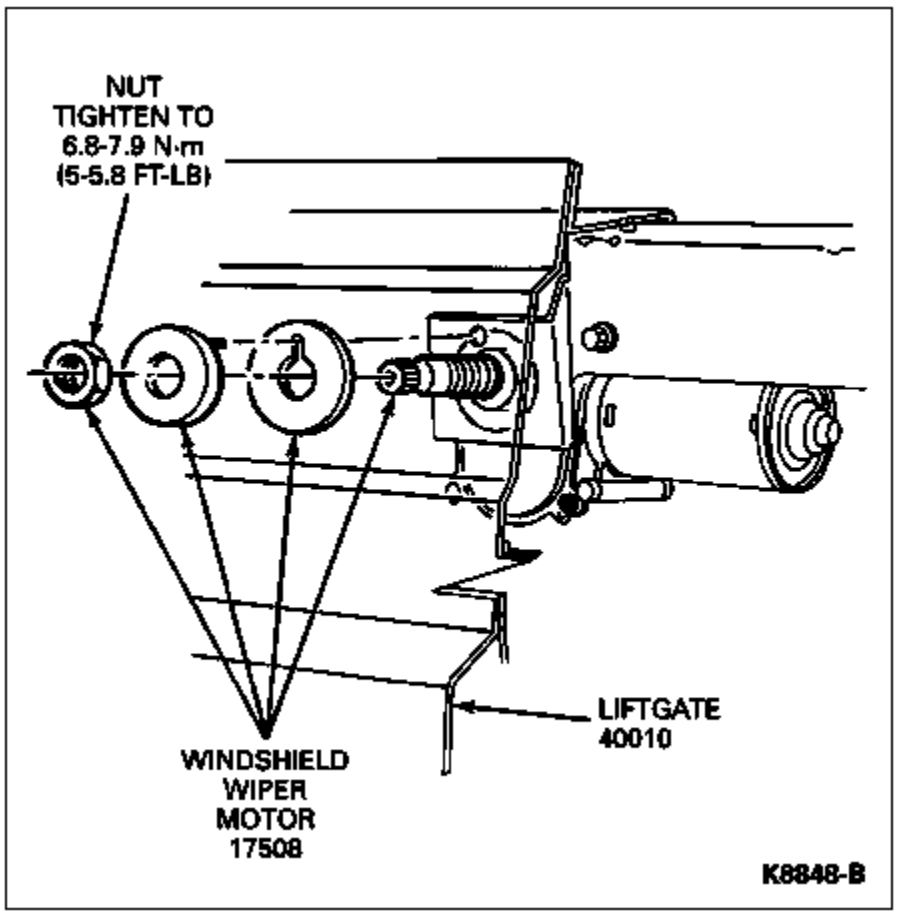
Item	Part Number	Description
1	17A406	Rear Window Wiper/Washer Switch
2	18C621	Heated Back Window Switch and Light
3	044D70	Instrument Panel Finish Panel
4	13776	Interior Lamp
5	14401	Main Wiring

Wiper Motor, Rear Window

Removal

NOTE: The windshield wiper motor is not serviceable. It must be replaced as a complete assembly.

1. Remove windshield wiper pivot arm (17526) and windshield wiper blade.
2. Remove motor shaft attaching nut and wedge block.
3. Remove liftgate door trim panel. Refer to Section 01-05B .
4. Disconnect electrical connector.
5. Remove motor wiring pins from inner panel.
6. Remove the windshield wiper motor.



Installation

1. Place windshield wiper motor into liftgate so windshield wiper motor output arm (17A436) protrudes through hole in outer panel.

2. Attach windshield wiper motor to liftgate door trim panel with bracket attaching screws. Do not tighten.

3. Install rubber seal and wedge block over windshield wiper motor output arm. Install pivot attaching nut. Tighten nut to 6.8-7.9 Nm (5-5.8 lb-ft).

4. Tighten motor bracket attaching screws. Tighten to 6.8-7.9 Nm (5-5.8 lb-ft).

5. Attach rear license lamp feed wiring (13B440) to liftgate door trim panel by installing wiring pushpins in holes provided.

6. **NOTE: Wiper system must be cycled and parked by operating the windshield wiper/washer switch (17A553). This will make sure system linkage is in PARK position before windshield wiper pivot arm and blade is installed.**

   Locate blade to specified installation position.

7. **NOTE: Use finger pressure only to slide latch, then release windshield wiper pivot arm and windshield wiper blade (17528) against back window glass.**

   While applying a downward pressure on windshield wiper pivot arm head, to obtain full seating, raise other end of windshield wiper pivot arm sufficiently to allow the latch to slide under windshield wiper pivot arm to locked position.

Washer Nozzle Jet and Bracket

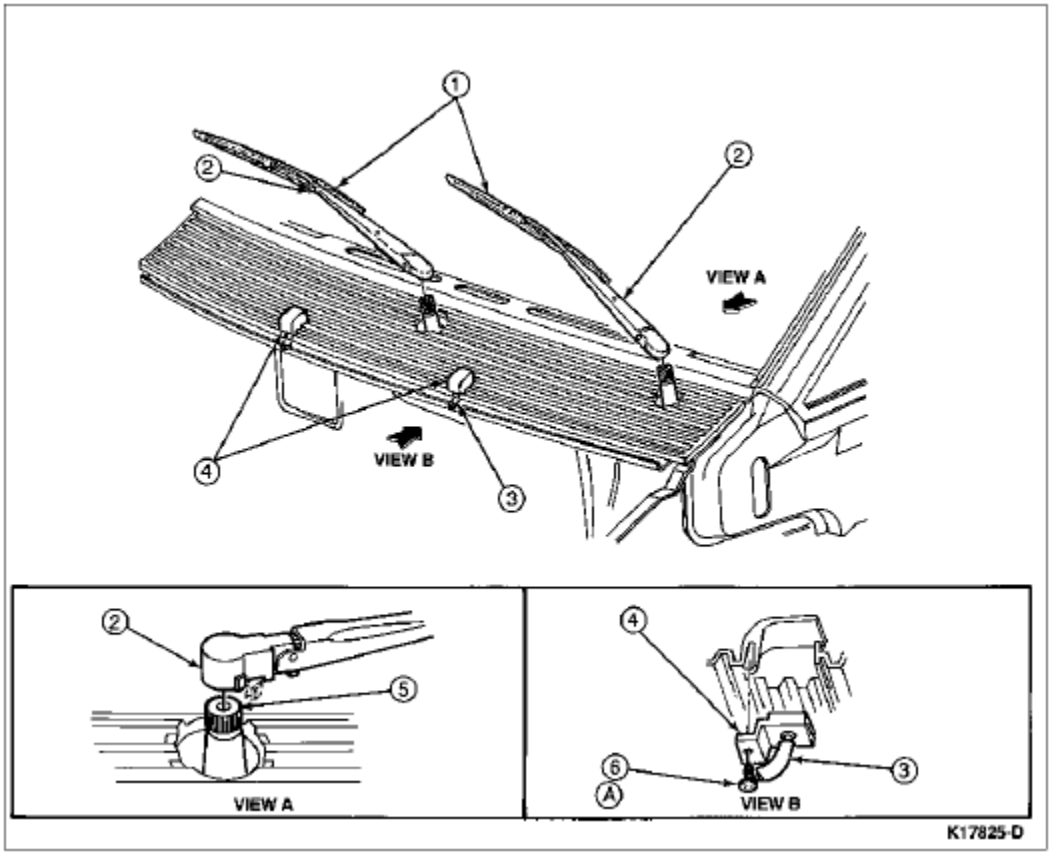
Removal

1. Remove right and left wiper windshield wiper pivot arms (17526).
2. Remove cowl top vent panel (022A68).
3. Disconnect hoses (17543).
4. Remove screw retaining windshield washer nozzle jet and bracket (17603) to cowl top vent panel.

Installation

1. Position windshield washer nozzle jet and bracket on cowl top vent panel.
2. Install screw. Tighten to 1-2 Nm (9-18 lb-in).
3. Connect hoses.
4. Install cowl top vent panel and windshield wiper pivot arm.
5. Operate front washer system to verify windshield washer nozzle jet and bracket aim and position.

Front Windshield Washer Nozzles



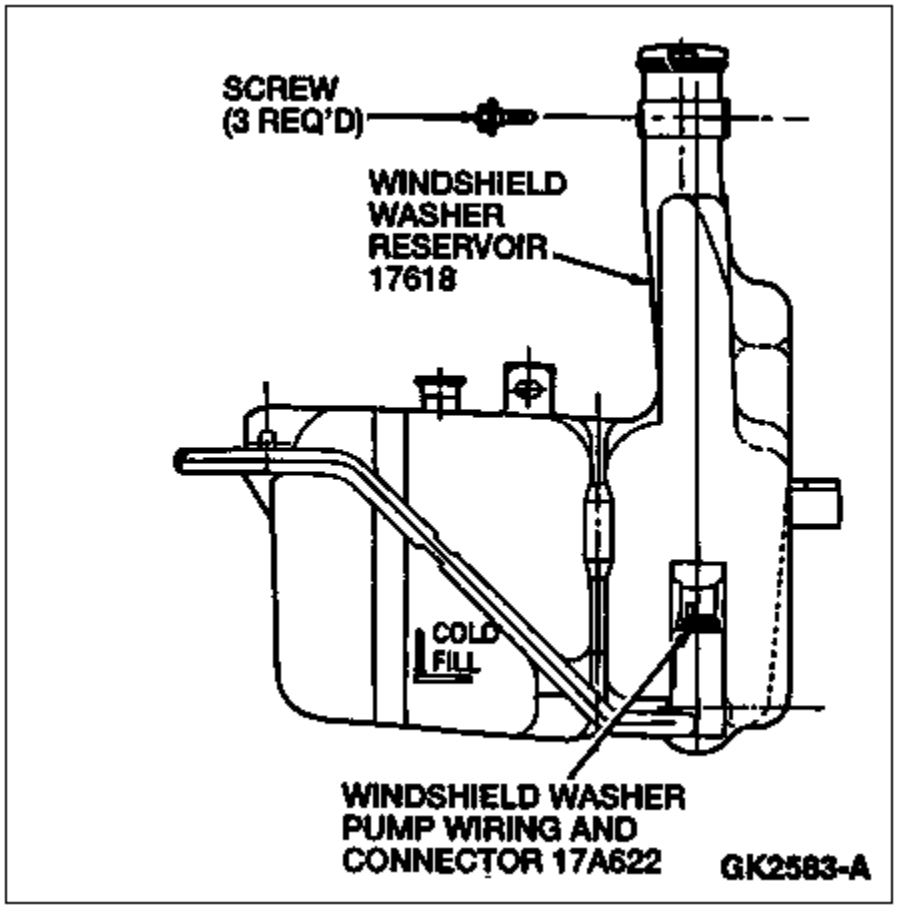
Item	Part Number	Description
1	17528	Windshield Wiper Blade
2	17526	Windshield Wiper Pivot Arm
3	17A605	Hose, Washer Nozzle Jet
4	17666	Windshield Washer Nozzle Jet and Bracket
5	17566	Windshield Wiper Mounting Arm and Pivot Shaft
6	56919	Screw
A	—	Tighten to 1-2 Nm (9-18 Lb-In)

Washer Pump and Reservoir

NOTE: The windshield washer reservoir (17618) assembly is serviced separately. The windshield washer pump and grommet are also serviced separately from the windshield washer reservoir.

Removal

1. Disconnect headlamp dash panel junction wire (14290) from windshield washer pump.
2. Remove retaining screws and lift assembly.
3. Disconnect hoses (17543).
4. Drain and discard contents of windshield washer reservoir.



Installation

CAUTION: Do not make electrical connection prior to filling reservoir. Do not operate

windshield washer pump prior to filling windshield washer reservoir.

1. Connect hoses.

2. Position assembly to front fender apron (16054) or front fender radiator support reinforcement (16B072). Install retaining screws.

3. Install hose and headlamp dash panel junction wire to windshield washer pump.

Washer System, Rear Window

Nozzle Jet and Bracket

Removal

1. Disconnect hose (17543) at windshield washer nozzle jet and bracket (17603).

2. Remove windshield washer nozzle jet and bracket attaching nut to liftgate. Remove windshield washer nozzle jet and bracket.

Installation

1. Position windshield washer nozzle jet and bracket to liftgate and install nut. Tighten nut to 1.0-1.5 Nm (8-13 lb-in).

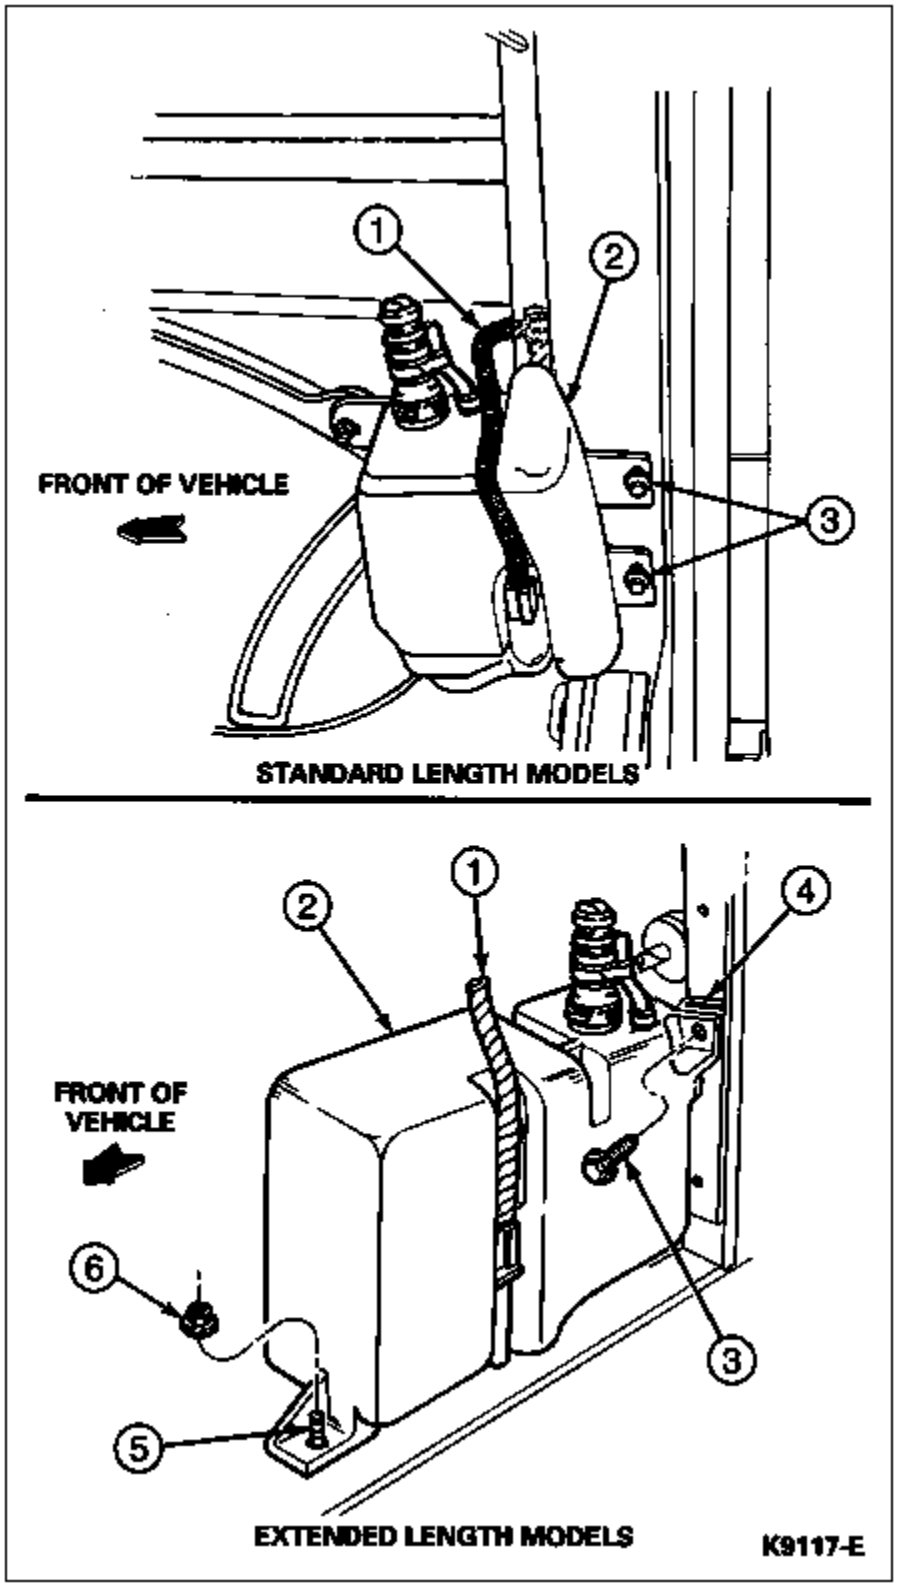
2. Connect hose to windshield washer nozzle jet and bracket and check washer operation.

Pump and Reservoir

Removal

1. Remove RH quarter trim panel. Refer to Section 01-05B .
2. **NOTE: Drain washer reservoir mounting bracket (17651) prior to removing windshield washer pump window washer hose (17408) to prevent spilling fluid on the floor of the van.**

   Disconnect windshield washer reservoir hose.
3. Disconnect windshield washer pump rear lamp wiring (14405).
4. Remove washer reservoir mounting bracket attaching screws to quarter trim panel and floor panel.
5. Remove washer reservoir mounting bracket.



Item	Part Number	Description
1	14401	Main Wiring
2	17618	Windshield Washer Reservoir

3	380924	Screw
4	N623342	J-Nut
5	N803448	Weld Stud
6	N621905	Nut

Installation

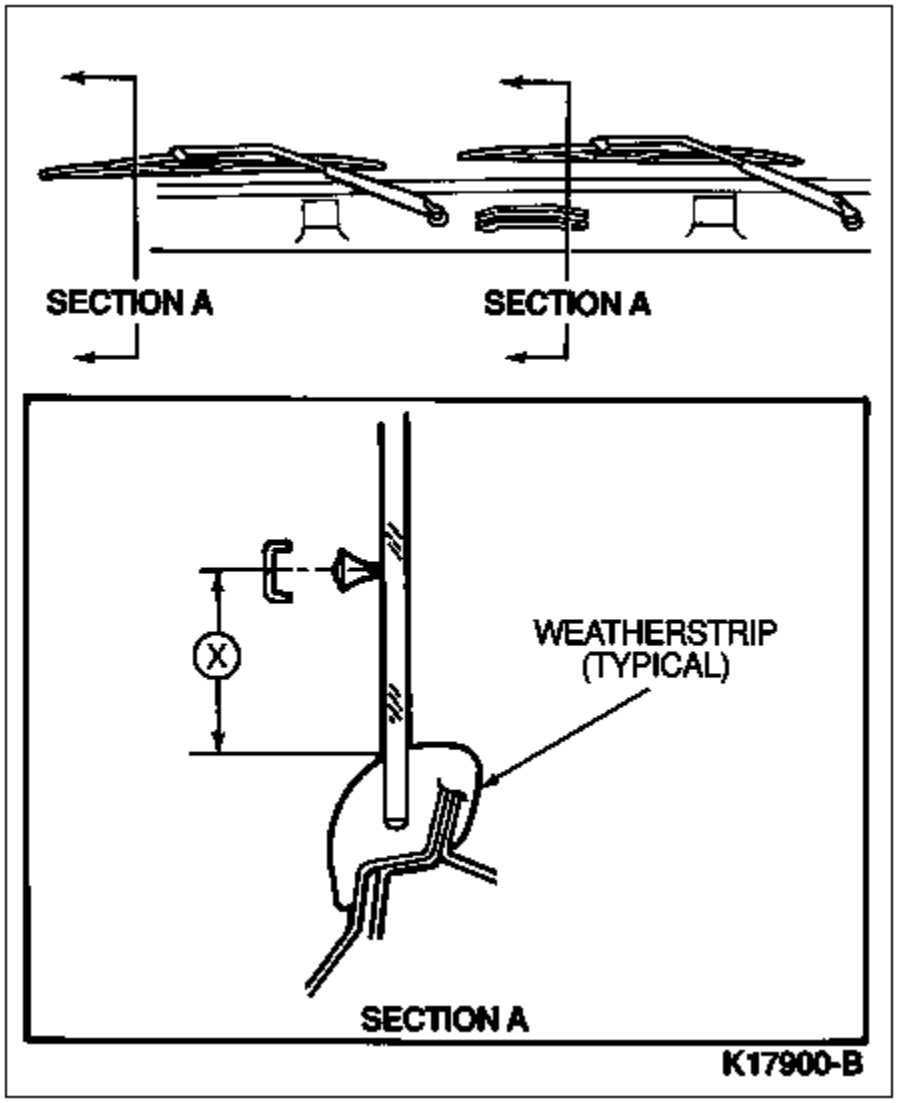
1. Install window washer hose to windshield washer pump discharge nipple.
2. Position washer reservoir mounting bracket on quarter trim panel and install attaching screws.
3. Connect rear lamp wiring to windshield washer pump.
4. Connect window washer hose.
5. Fill reservoir with washer fluid.
6. Check rear windshield washer operation.
7. Install quarter trim panel. Refer to Section 01-05B .

Park Position

Remove the arm and blade assemblies from the pivot shafts. Turn on the wiper switch, allow the motor to move the pivot shafts three or four cycles, and then turn off the wiper switch. This will place the pivot shafts in PARK position.

Install the arm and blade assemblies on the pivot shafts to Dimension X (69-96mm [2.7-3.8 inches] on driver's side; 77-104mm [3.0-4.1 inches] on passenger's side). Dimension X is the distance between the centerline of the blade saddle and the windshield lower moulding or weatherstrip. Dimension X distance must be maintained regardless of level of arm fastening.

Wiper Arm and Blade Adjustment



SPECIFICATIONS

9	N805070-S100	Screw, Shoulder

A	—	Tighten to 9-14 Nm (7-10 Lb-Ft)

Bumper Cover, Front, Aerostar

Removal and Installation

1. Remove five pushpins retaining air deflector to front bumper cover.
2. Remove air deflector.
3. Remove four bolts retaining bottom of front bumper cover to bumper.
4. Remove the three screws attaching front bumper cover to frame.
5. Pull front bumper cover away from vehicle to disengage retainers at both ends.
6. If required, remove front license plate mounting bracket (17A385) by drilling out four rivets.

For installation, follow removal procedures in reverse order. Tighten retaining screws and bolts to 9-14 Nm (7-10 lb-ft).

Bumper, Rear, Aerostar

Removal and Installation

1. Support the rear bumper (17906) and remove all bolts and nuts.
2. Pull the rear bumper from the vehicle to disengage retainers at both ends of the rear bumper.

   For extended-length vehicles, remove bolts at both ends of bumper retaining reinforcement.

For installation, follow removal procedures in reverse order. Tighten upper reinforcement screw to 3.5-4.7 Nm (31-41 lb-in) and lower reinforcement bolt to 7-11 Nm (6-8 lb-ft). Tighten nuts attaching rear bumper to 17-27 Nm (13-19 lb-ft) and bolts to 22-34 Nm (17-25 lb-ft).

Bumper, Rear, Aerostar

Occupant Restraint System

WARNING: ALL OUTBOARD SAFETY BELT ASSEMBLIES INCLUDING RETRACTORS, BUCKLES, FRONT SEAT BELT BUCKLE SUPPORT ASSEMBLIES (SLIDE BAR), IF SO EQUIPPED, CHILD SAFETY SEAT TETHER ATTACHMENTS, AND ATTACHING HARDWARE SHOULD BE INSPECTED AFTER ANY COLLISION. ALL BELT ASSEMBLIES SHOULD BE REPLACED UNLESS A QUALIFIED TECHNICIAN FINDS THAT THE BELTS SHOW NO DAMAGE AND OPERATE PROPERLY. BELT ASSEMBLIES NOT IN USE DURING A COLLISION SHOULD ALSO BE INSPECTED AND REPLACED IF EITHER DAMAGE OR IMPROPER OPERATION IS NOTED.

The occupant restraint system consists of a dual locking mode retractor on the shoulder belt portion of the combination lap/shoulder safety belt for front seat passenger and rear seat outboard passengers.

The safety seat belts and shoulder belts are factory-installed in their proper locations. If the safety belts or shoulder belts are removed for any reason, they should be installed as described in this section.

When replacing safety belts and/or retractor assemblies, use only the replacement parts specified in the Ford Parts and Service Division Master Parts and Accessories Catalogs for the vehicle being serviced.

Continuous-Loop System

The front outboard safety belt, for Ranger vehicles and the front and rear outboard for Aerostar vehicles, is a continuous-loop system. The outboard combination lap and shoulder belts use a common sliding tongue. To secure the belts, the tongue is inserted into the inboard buckle.

The webbing for the lap belt is anchored inboard to the floor pan or seat frame.

The shoulder safety belt retractor is designed to let the webbing freely move in or out at all times, except during hard braking, hard cornering or impacts of approximately 8 km/h (5 mph) or more, when it is automatically locked by a mechanically actuated inertia sensor. The front outboard safety belt retractors for Ranger and Aerostar can be made to lock by pulling or jerking on the belt.

Lap/Shoulder Belt Retractor

WARNING: DO NOT INTRODUCE SLACK INTO THE SAFETY BELT SYSTEM BECAUSE THE BELT LOCKS UPON IMPACT WHERE IT IS POSITIONED. USE THE SHOULDER SAFETY BELT ON THE OUTSIDE SHOULDER ONLY. NEVER WEAR THE SHOULDER SAFETY BELT UNDER THE ARM. NEVER SWING IT AROUND THE NECK OVER THE INSIDE SHOULDER. NEVER USE A SINGLE BELT FOR MORE THAN ONE PERSON. ENSURE THE LAP PORTION OF THE BELT IS FITTED SNUGLY AND AS LOW AS POSSIBLE AROUND THE HIPS, NOT ON THE WAIST. FAILURE TO FOLLOW THESE PRECAUTIONS COULD INCREASE THE CHANCE AND/OR SEVERITY OF INJURY IN A COLLISION.

CAUTION: After unbuckling the safety belt, it is recommended that care be taken during retraction to prevent it from striking other passengers, or hitting trim panels or painted door surfaces.

Dual Locking Mode Seat Belt Retractor

Your vehicle is equipped with a dual locking mode retractor on the shoulder belt portion of the combination

tomsn048@gmail.com

lap/shoulder safety belt for the front seat passenger and all rear outboard passengers. The retractor modes function in the following ways:

Vehicle Sensitive (Emergency) Locking Mode

In this operating mode, the lap/shoulder belt retractor will allow the occupant freedom of movement, locking tight only on hard braking, hard cornering or impacts of approximately 8 km/h (5 mph) or more. The front seat retractors, can be made to lock by pulling on the belt.

Automatic Locking Mode

In this operating mode, the lap/shoulder belt retractor will remain locked and does not allow the occupant freedom of movement. This mode provides the following:

- A tight lap/shoulder belt on the hips.
- Child seat restraint installation.

This mode must be used when installing a child seat or infant carrier on the front seat passenger side and rear outboard seats where dual locking retractors are provided. To switch the retractor from the emergency locking mode to the automatic locking mode, perform the following steps:

1. Buckle the lap/shoulder belt.

2. Grasp the shoulder portion of the belt and pull downward until all of the belt is extracted. When allowed to retract, a clicking sound will be heard. At that point, the belt retractor is in the automatic locking mode (child restraint mode).

3. A clicking sound will continue to be heard as the belt is allowed to retract. This indicates that the retractor is in the "automatic locking mode" (child restraint mode).

   NOTE: When the combination lap/shoulder belt is unbuckled and allowed to retract completely, the retractor will switch back to the vehicle sensitive (emergency) locking mode. See the detailed instructions under safety seats for children in this section.

tomsn048@gmail.com

Safety Belt, Lap/Shoulder — Front and Rear Ranger

Energy Absorbing Sew Pattern

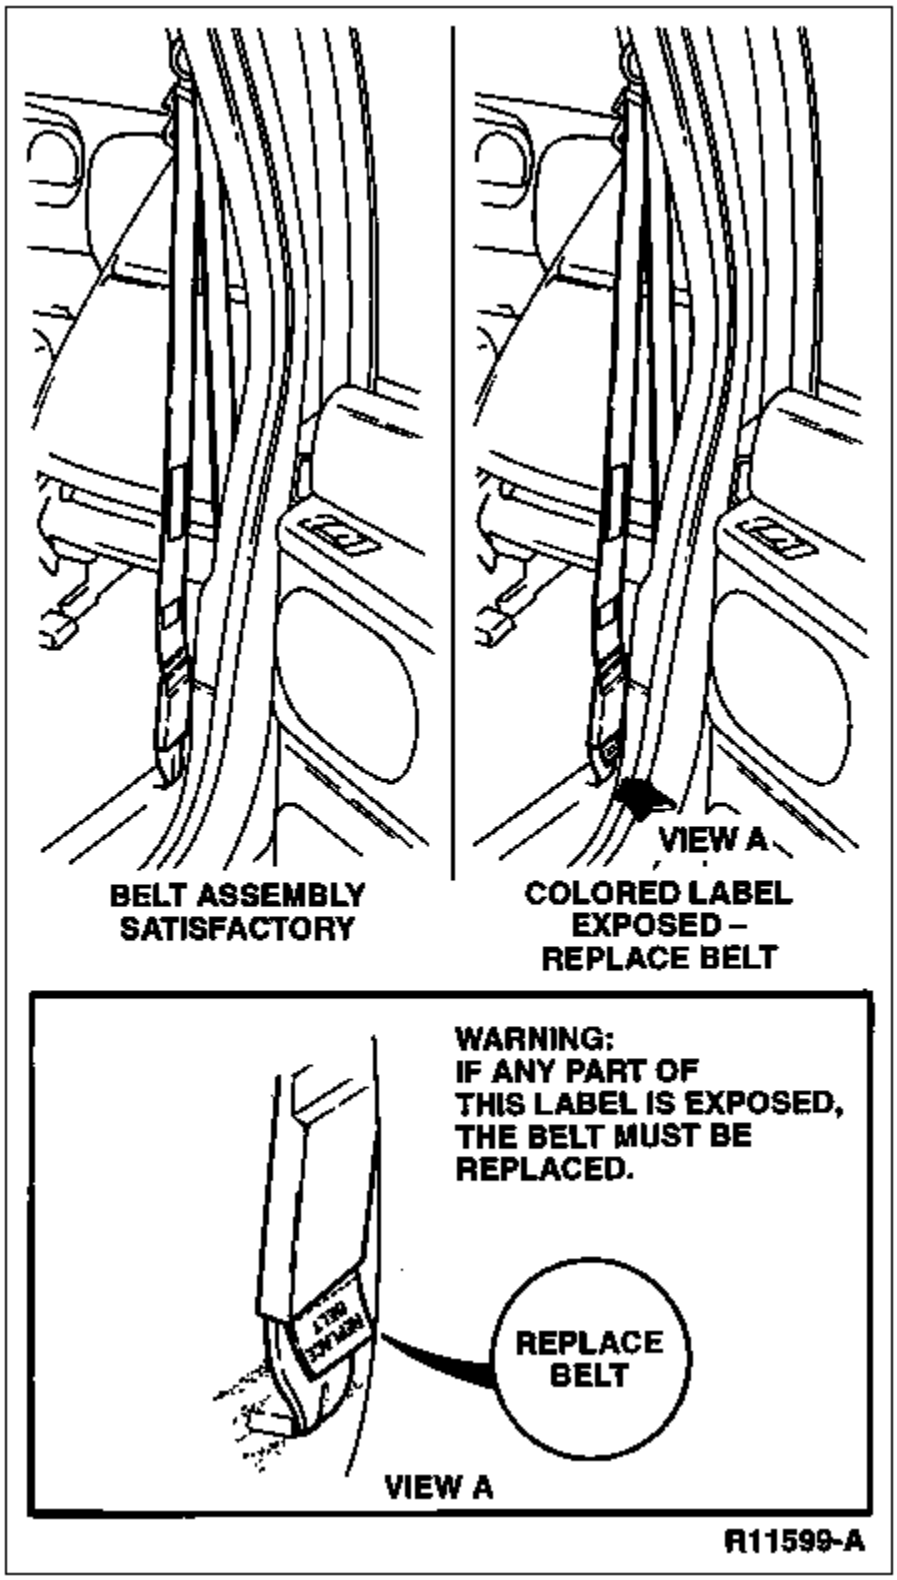
The short plastic boot on the front safety belt at the outboard anchor location on some vehicles covers an energy absorbing sew pattern on the safety belt.

WARNING: FAILURE TO REPLACE THE SAFETY BELT ASSEMBLY UNDER THE FOLLOWING CONDITIONS COULD RESULT IN SEVERE PERSONAL INJURIES IN THE EVENT OF A COLLISION.

In the event of an accident, sew pattern may release, and the colored REPLACE BELT label may become visible. If this occurs, **the safety belt, retractor and the safety belt buckle must be replaced** .

Safety Belt Energy Absorbing Sew Pattern Label

tomsn048@gmail.com



Fastening Safety Belts

After entering the vehicle, adjust the front seat (60012) to obtain the best position for driving comfort, access

tomsn048@gmail.com

to controls and visibility. Then, use the following procedure for fastening safety belts.

1. **WARNING: USE THE SHOULDER BELT ON THE OUTSIDE SHOULDER ONLY. NEVER WEAR THE SHOULDER BELT UNDER THE ARM. NEVER SWING IT AROUND YOUR NECK OVER THE INSIDE SHOULDER. NEVER USE A SINGLE BELT FOR MORE THAN ONE PERSON. MAKE SURE THE LAP PORTION OF THE BELT IS FITTED SNUGLY AND AS LOW AS POSSIBLE AROUND THE HIPS, NOT ON THE WAIST. FAILURE TO FOLLOW THESE PRECAUTIONS COULD INCREASE THE CHANCE AND/OR SEVERITY OF INJURY IN A COLLISION.**

   To fasten the belt, pull the lap/shoulder belt from the safety belt retractor so the shoulder portion of the safety belt crosses the shoulder and chest. Be sure the belt is not twisted. If it is, remove the twist. Insert the belt tongue into the proper buckle until a snap is heard and the safety belt is latched.

   On Ranger SuperCab: Adjust the driver and/or passenger shoulder belt height adjuster up or down until the shoulder belt rests across the middle of your shoulder. To adjust, pinch the release button and adjust down to any of five (5) positions. You do not have to pinch the button for up adjustments.

   On Ranger Regular Cab: Adjust the shoulder belt up or down until the shoulder belt rests across the middle of your shoulder. To adjust, push the release button and slide the adjuster down. Then release the button. Make sure the adjuster is firmly in one of the four (4) positions. Pull up on the shoulder portion of the safety belt to tighten the lap portion to a snug fit. Make sure the safety belt is as low on the hips as possible.

2. To tighten the lap portion of the belt, pull up on the shoulder belt until it fits snugly. The belt should rest as low on the hips as possible.

3. **NOTE: The shoulder restraint portion of the safety belt adjusts automatically to a snug position.**

   NOTE: The rear retractors cannot be made to lock up when jerking on the shoulder belt.

   The safety belt system allows freedom of movement, locking only on hard braking or impacts of approximately 8 km/h (5 mph) or more. The front seat retractors can be made to lock by jerking on the safety belt.

tomsn048@gmail.com

Safety Belt Extension Assembly

For some people, the safety belt may be too short even when it is fully extended. You can add about 20cm (8 inches) to the belt length with a safety belt extension assembly. Safety belt extensions Part number 611C22 are available at no cost from your dealer. The safety belt extension assembly is only available with black webbing and standard buckle and must be of the same manufacture as the belt system to which it is attached.

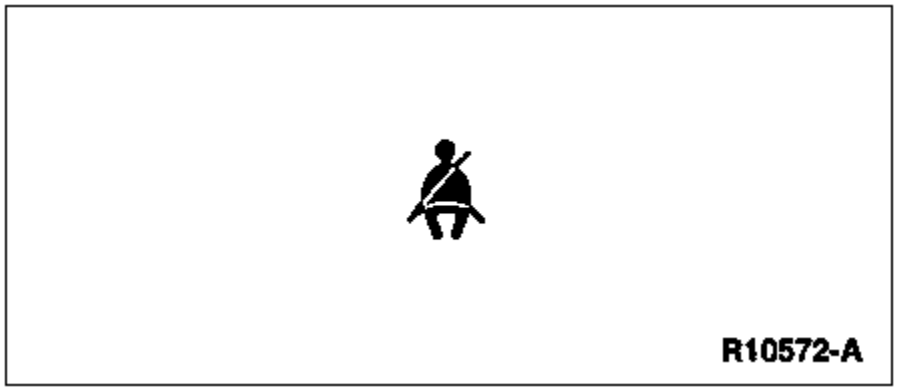
tomsn048@gmail.com

Warning System, Safety Belt

The continuous-loop system units incorporate a safety belt warning indicator switch (10B924), warning lamp and chime. The warning lamp and chime function as reminders to fasten the safety belt. The following events will take place:

- If safety belt is not buckled when the key is turned to the ON position, the lamp comes on for 1 to 2 minutes and the chime sounds for 4 to 8 seconds.
- If the safety belt is buckled while the lamp is on and the chime is sounding, both the lamp and chime turn off.
- If safety belt is buckled before the key is turned to the ON position, both the lamp and chime will not turn on.

Safety Belt Warning Lamp



On the Ranger the safety belt warning indicator switch and safety belt warning chime (10D840) are located below the instrument panel ash receptacle (04810) in the center of the instrument panel finish panel (044D70).

tomsn048@gmail.com

Child Safety Seat, Tether Attachment

Some manufacturers make safety seats with a tether strap that goes over the back of the vehicle seat and attaches to an anchoring point behind the vehicle seat.

Ford recommends the placement of tethered safety seats in a rear seating position with the tether strap attached to the tether anchoring point. The right front seating position may be used if it is the only seating position available.

tomsn048@gmail.com

Child Restraint

For children who are too large for child safety seats, (see instructions with your child seat to determine maximum recommended size), the lap belts in the center rear or center front seats (60012) can be used. Lap/shoulder belts in other seats may be used if the lap belt portion fits snugly and low on the hips and the shoulder belt does not touch or rest in front of the face, chin, neck or throat. If you do not adjust the safety belt properly, the child's chances of being injured in a collision increase.

When installing a child safety seat be sure to use the correct safety belt buckle for that seating position, and make sure the tongue is securely fastened in the buckle.

Ford recommends placement of tethered safety seats in a rear seating position with the tether strap attached to the tether anchoring point as shown in this section.

If a tethered seat is installed in the front seat, it should be positioned in the center front seating position **only** and the tether strap should be secured to the center rear lap belt tongue or the webbing of the buckled center rear lap belt behind the child safety seat.

WARNING: FAILURE TO FOLLOW THESE PRECAUTIONS COULD INCREASE THE CHANCE AND/OR SEVERITY OF INJURY IN AN ACCIDENT.

Inspection and Verification

Verify the vehicle owner's original concern by operating the restraint system to duplicate the vehicle owner's concern.

Check system fuses and operation of safety belt warning lamp. Check for bare, broken or misrouted wires. Make sure connectors are tightly engaged. Inspect the safety belt webbing for integrity.

tomsn048@gmail.com

Symptom Chart — Active Restraints

ACTIVE RESTRAINTS

Condition	Possible Source	Action
• Safety Belt Warning Never/Always On	• Fuse. • Circuitry. • Warning indicator switch. • Connectors.	• REFER to Section 13-09 .
• Safety Belt Warning Chime Does Not Sound or Safety Belt Warning Indicator Lamp Does Not Function Properly	• Fuse. • Circuitry. • Connectors. • Safety belt warning chime. • Warning indicator switch.	• REFER to Section 13-09 .

Safety Belts, Front Seats — Aerostar

SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
Seat Belt Bolt Bit (No. 50 Torx®)	T77L-2100-A

NOTE: Safety belt buckles, center adjust tongues and belt and retractors can be replaced separately. However, if a safety belt assembly was in use during a collision, the belt and retractor must be replaced as well as the center adjust tongue and belt and buckle assembly or the center adjust tongue and the cable and buckle assembly. When replacing safety belt and buckle, safety cable and buckle, center adjust tongues and belt and retractors, use only the replacement parts specified in the Ford Master Parts Catalogs for the make and model of the vehicle being serviced. Safety belt assemblies must not be interchanged between vehicle models.

Removal

1. Remove the quarter trim panel (31012).

2. **CAUTION: To prevent damage to the safety belt webbing when cutting through the slot in the belt loop, place a smooth, flat, hard object such as a metal ruler between the webbing and the back side of the belt loop.**

   NOTE: If the belt loop is damaged, the belt loop can be removed from the belt assembly by carefully cutting through the slot located on the back side of the belt loop.

   Remove the belt loop by carefully prying the belt loop away from the sheet metal.

3. Remove the bolt from front safety belt retractor and tongue to front floor pan (11135).

4. Lift floor carpet (13000) and remove bolt retaining floor anchor to front floor pan.

5. Remove front safety belt retractor cover (612C36) and remove bolt.

6. Remove front safety belt retractor.

Installation

1. Position the retractor and cover on the vehicle. Install the retractor bolt. Use Seat Belt Bolt Bit (No. 50 Torx®) T77L-2100-A, tighten to 40 Nm (30 lb-ft).

2. Position safety belt guide to vehicle and install the bolt. Using Seat Belt Bolt Bit (No. 50 Torx®) T77L-2100-A, tighten bolt to 40 Nm (30 lb-ft).

3. Install the front seat shoulder strap guide cover (60262).

4. Install the belt loop.

tomsn048@gmail.com

5. Feed the floor anchor end of the front safety belt through the quarter trim panel.
6. Install the quarter trim panel. Place bezel around front safety belt retractor and tongue (611B08) and snap onto quarter trim panel.
7. Position the floor anchor anti-rotation tab to the bead in the front floor pan. Install the bolt. Tighten the bolt to 40 Nm (30 lb-ft).
8. Check the restraint system for proper operation.

Safety Belts, Rear Seats, Outboard, Second Row Two-Passenger Bench — Aerostar

SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
Seat Belt Bolt Bit (No. 50 Torx®)	T77L-2100-A

NOTE: Safety belt buckles, center adjust tongues and belt and retractors can be replaced separately. However, if a safety belt assembly was in use during a collision, the belt and retractor must be replaced as well as the center adjust tongue and belt and buckle assembly or the center adjust tongue and the cable and buckle assembly. When replacing safety belt and buckle, safety cable and buckle, center adjust tongues and belt and retractors, use only the replacement parts specified in the Ford Master Parts Catalogs for the make and model of the vehicle being serviced. Safety belt assemblies must not be interchanged between vehicle models.

Removal

1. **NOTE: Bolt securing third row sling assembly must be removed.**

   Remove front seat shoulder belt guide cover and remove safety belt guide bolt.

2. Remove quarter trim panel screws.

3. Move the quarter trim panel (31012) toward the inside of the vehicle.

4. Remove front safety belt retractor and tongue bolt.

5. Remove front safety belt retractor and tongue (611B08) by passing belt and sling through opening in quarter trim panel.

Installation

To install, reverse removal procedures. Use Seat Belt Bolt Bit (No. 50 Torx®) T77L-2100-A to tighten front safety belt retractor and tongue bolt to 40 Nm (30 lb-ft).

- Make sure tab is secure in the quarter trim panel before securing with screw.

tomsn048@gmail.com

Safety Belts, Rear Seats, Outboard, Third Row Bench or Bed Seat — Aerostar

SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
Seat Belt Bolt Bit (No. 50 Torx®)	T77L-2100-A

WARNING: WHEN REINSTALLING A REAR SEAT IN THE VEHICLE, INSTALL THE SEAT IN ITS ORIGINAL LOCATION. IMPROPER INSTALLATION OF THE SEAT WILL PREVENT CORRECT USE OF THE SHOULDER SAFETY BELT AND COULD INCREASE THE RISK AND/OR SEVERITY OF INJURY IN AN ACCIDENT.

NOTE: Safety belt buckles, center adjust tongues and belt and retractors can be replaced separately. However, if a safety belt assembly was in use during a collision, the belt and retractor must be replaced as well as the center adjust tongue and belt and buckle assembly or the center adjust tongue and the cable and buckle assembly. When replacing safety belt and buckle, safety cable and buckle, center adjust tongues and belt and retractors, use only the replacement parts specified in the Ford Master Parts Catalogs for the make and model of the vehicle being serviced. Safety belt assemblies must not be interchanged between vehicle models.

Removal

1. Detach safety belt anchor from rear seat back frame (613A38).
2. Remove seats from vehicle. Refer to Section 01-10 .
3. Fold down the sling cover and remove bolt.
4. Remove bezel from quarter trim panel (31012).
5. Remove screws securing quarter trim panel. The bolt securing the second row D-ring or sling must be removed.
6. Move quarter trim panel toward center of vehicle for access to rear safety belt retractor and tongue (611B68).
7. Remove bolt securing belt and rear safety belt retractor and tongue.
8. Remove rear safety belt retractor and tongue by passing through hole in quarter trim panel.

Installation

To install, reverse the removal procedures. Use Seat Belt Bolt Bit (No. 50 Torx®) T77L-2100-A and tighten all bolts to 40 Nm (30 lb-ft). Check safety belt for proper operation.

- Make sure the belt is not twisted before you insert it into the detachable anchor. A twisted safety belt may cause the safety belt retractor and tongue to not work properly. Insert the detachable anchor

tomsn048@gmail.com

tongue into the detachable anchor until you hear a "snap" and feel the latch engage.

tomsn048@gmail.com

Safety Belt, Rear Seats, Second Row, Aerostar

NOTE: Safety belt BUCKLES, center adjust tongues and belt and retractors can be replaced separately. However, if a safety belt assembly was in use during a collision, the belt and retractor must be replaced as well as the center adjust tongue and belt and buckle assembly or the center adjust tongue and the cable and BUCKLE assembly. When replacing safety belt and BUCKLE, safety cable and BUCKLE, center adjust tongues and belt and retractors, use only the replacement parts specified in the Ford Master Parts Catalogs for the make and model of the vehicle being serviced. Safety belt assemblies must not be interchanged between vehicle models.

SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
Seat Belt Bolt Bit (No. 50 Torx®)	T77L-2100-A

Removal

1. Detach safety belt from rear seat back frame (613A38).
2. Remove seats from vehicle. Refer to Section 01-10 for procedures.
3. Remove D-ring cover and remove bolt securing D-ring.
4. Remove bezel from quarter trim panel (31012).
5. Remove screws securing quarter trim panel. Bolt securing third row sling must be removed.
6. Move the quarter trim panel toward the center of vehicle for access to rear safety belt retractor and tongue (611B68).
7. Remove rear safety belt retractor and tongue assembly by passing through hole in quarter trim panel.
8. Remove bolt securing rear safety belt retractor and tongue. Remove rear safety belt retractor and tongue from vehicle.

Installation

WARNING: WHEN REINSTALLING A REAR SEAT IN THE VEHICLE, INSTALL THE SEAT IN ITS ORIGINAL LOCATION. IMPROPER INSTALLATION OF THE SEAT WILL PREVENT CORRECT USE OF THE SHOULDER SAFETY BELT AND COULD INCREASE THE RISK AND/OR SEVERITY OF INJURY IN AN ACCIDENT.

For installation, follow removal procedures in reverse order. Using Seat Belt Bolt Bit (No. 50 Torx®) T77L-2100-A, tighten bolts to 34-46 Nm (25-34 lb-ft). Check safety belt for proper operation.

tomsn048@gmail.com

Make sure the belt is not twisted before you insert it into the detachable anchor. A twisted safety belt may cause the safety belt retractor and tongue to not work properly. Insert the detachable anchor tongue into the detachable anchor until you hear a "snap" and feel the latch engage.

tomsn048@gmail.com

Safety Belt, Rear, Second Row Quad Bucket Seats and Three-Passenger Bench, Aerostar

NOTE: Safety belt BUCKLES, center adjust tongues and belt and retractors can be replaced separately. However, if a safety belt assembly was in use during a collision, the belt and retractor must be replaced as well as the center adjust tongue and belt and buckle assembly or the center adjust tongue and the cable and BUCKLE assembly. When replacing safety belt and BUCKLE, safety cable and BUCKLE, center adjust tongues and belt and retractors, use only the replacement parts specified in the Ford Master Parts Catalogs for the make and model of the vehicle being serviced. Safety belt assemblies must not be interchanged between vehicle models.

SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
Seat Belt Bolt Bit (No. 50 Torx®)	T77L-2100-A

Removal

1. Fold down sling cover and remove bolt securing sling.
2. Remove rear safety belt retractor cover (613C46).
3. Remove safety belt retractor cover bolt access plug (611B32).
4. Remove bolt securing anchor in step well.
5. Remove screws securing quarter trim panel (31012).
6. Move quarter trim panel toward the center of the vehicle.
7. Remove the bolt securing rear safety belt retractor and tongue (611B68) to vehicle.
8. Remove rear safety belt retractor and tongue by passing the rear safety belt retractor and tongue and sling through opening in the quarter trim panel.

Installation

1. Pass the rear safety belt retractor and tongue and sling through opening of quarter trim panel.
2. Position belt and retractor assembly to vehicle and secure with bolt. Using Seat Belt Bolt Bit (No. 50 Torx®) T77L-2100-A, tighten bolt to 34-46 Nm (25-34 lb-ft).
3. **NOTE: Make sure tab is secure in quarter trim panel before securing with screws.**

   Position quarter trim panel and secure with screws.
4. Position sling and secure with bolt. Using Seat Belt Bolt Bit (No. 50 Torx®) T77L-2100-A, tighten bolt

tomsn048@gmail.com

to 34-46 Nm (25-34 lb-ft). Reposition sling cover.

5. Position anchor to step well and secure with bolt. Using Seat Belt Bolt Bit (No. 50 Torx®) T77L-2100-A, tighten bolt to 34-46 Nm (25-34 lb-ft).

6. Install safety belt retractor cover bolt access plug.

7. Position rear safety belt retractor cover and secure with screws.

8. Check the restraint system for proper operation.

Safety Belt, Rear, Detachable, Outboard, Aerostar

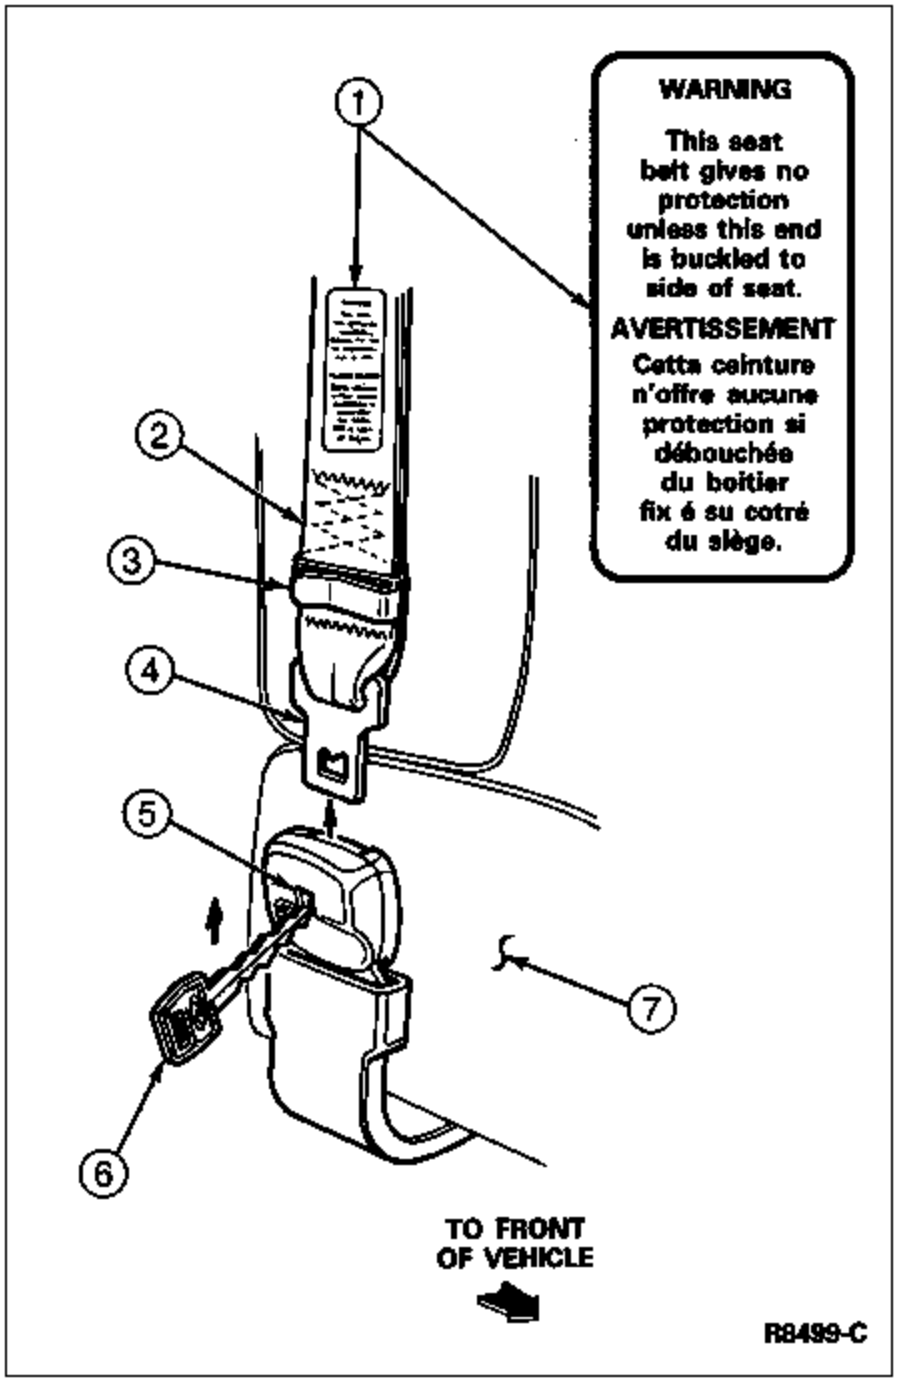
All rear outboard seating positions in Aerostar vehicles are equipped with rear seat shoulder safety belts. Rear seat shoulder safety belts with detachable anchors are provided on the second row RH bench seat, second row LH seat and third row RH and LH seat.

In addition to anchors in the rear floor and roof structure, some safety belts have a detachable anchor mounted to the outboard side of the rear seat cushion frames (63160).

NOTE: The following bilingual (English/French) WARNING statement is shown on the WARNING label attached to the lower portion of the safety belt.

WARNING: THIS SEAT BELT GIVES NO PROTECTION UNLESS THIS END IS BUCKLED TO SIDE OF REAR SEAT CUSHION FRAME.

tomsn048@gmail.com



Item	Part Number	Description
1	—	Detachable Anchor Warning Label on Safety Belt (Part of 613C46)
2	611B68/611B69	Rear Safety Belt Assembly (Detached Position)
3	—	Shoulder Safety Belt Stowage Retainer (Part of 611B68/611B69)
4	—	Tongue End of Detachable Anchor (Part of 611B68/611B69)

tomsn048@gmail.com

5	—	Slot in Detachable Anchor (PIA with Seat Kit)
6	—	Key or Small Screwdriver
7	63160	Rear Seat Cushion Frame

NOTE: The following bilingual (English/French) CAUTION statement is shown on the CAUTION labels attached to the upper portion of the safety belts.

Removal

NOTE: Prior to vehicle delivery, customers must be shown the locations of the detachable anchors and their proper use.

NOTE: Safety belt must be detached when removing rear seat. Refer to Section 01-10 for rear seat removal procedures.

Rear seat shoulder safety belts should remain engaged in detachable anchors, except when the rear seat assembly is removed.

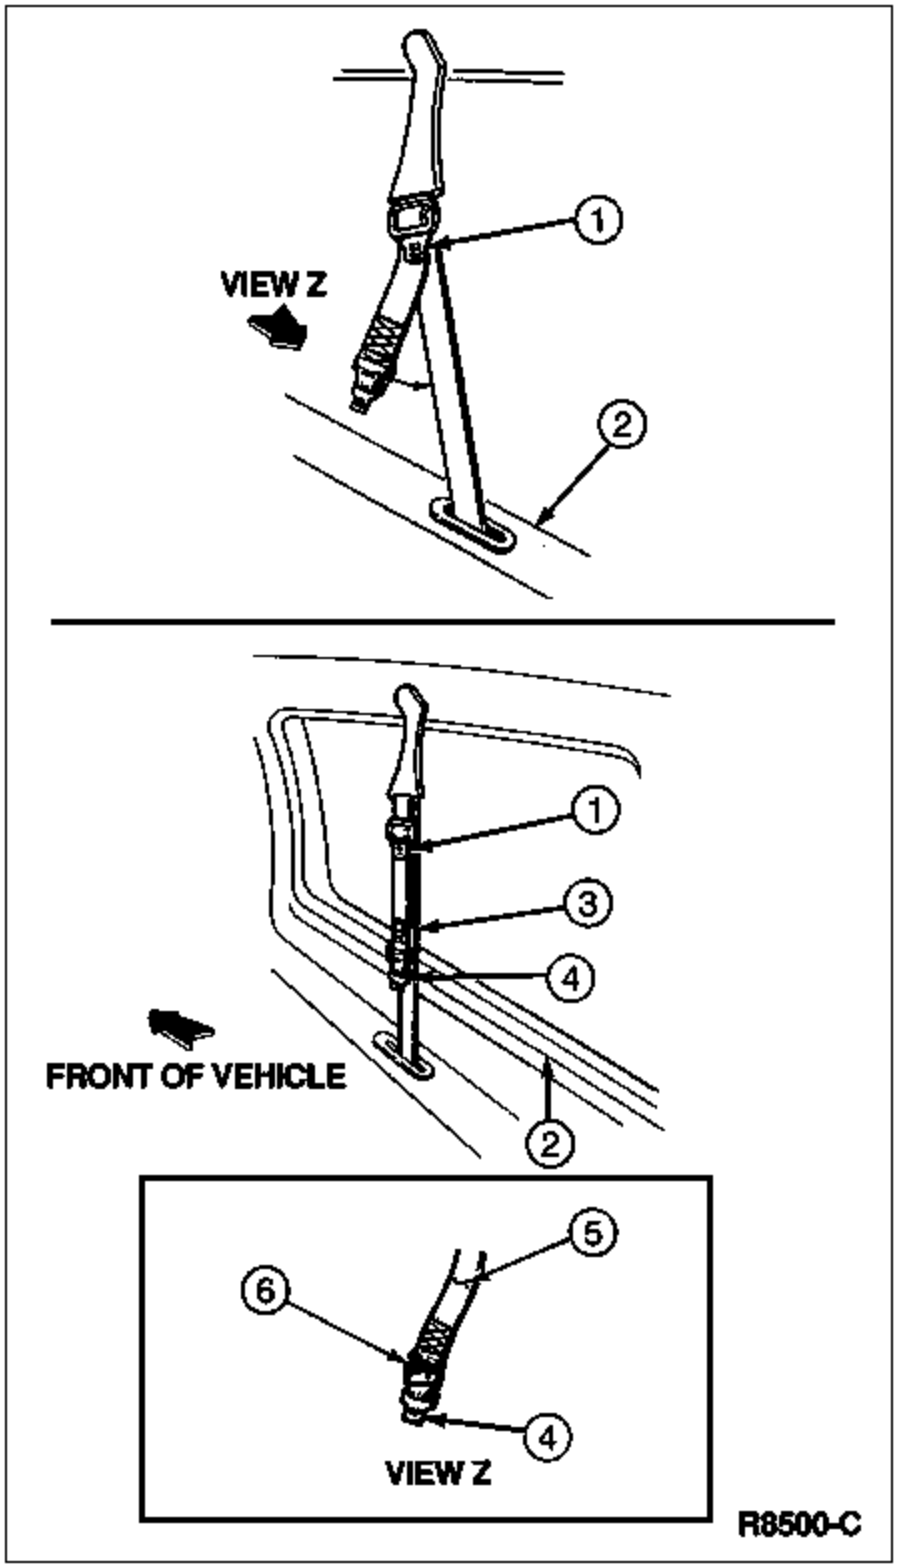
WARNING: WHEN INSTALLING A REAR SEAT IN THE VEHICLE, INSTALL THE REAR SEAT IN ITS ORIGINAL LOCATION. IMPROPER INSTALLATION OF THE SEAT WILL PREVENT CORRECT USE OF THE SHOULDER SAFETY BELTS. IMPROPER USE OF THE SAFETY BELTS COULD INCREASE THE RISK AND/OR SEVERITY OF INJURY AND ACCIDENTS.

1. Disengage belt from seat by inserting key or small screwdriver into slot located in detachable anchor.
2. Lift screwdriver up and disengage belt.
3. Whenever a rear seat has been removed, the tongue end of the detachable anchor must be on the rear shoulder belt hook. Refer to illustration.

Installation

1. Install rear seat. Refer to Section 01-10 for rear seat installation procedures.

tomsn048@gmail.com



Item	Part Number	Description
1	60044	Rear Safety Belt Assembly
2	—	Shoulder Safety Belt Stowage Retainer

tomsn048@gmail.com

		(Part of 60044)
3	—	Tongue End of Shoulder Safety Belt (Part of 60044)
4	—	Tongue End of Detachable Anchor (Part of 60044)
5	31012	Quarter Trim Panel
6	—	Shoulder Safety Belt in Stowed Position (Part of 60044)

2. Prior to inserting the detachable anchor tongue end into the detachable anchor, make sure the safety belt is not twisted. Insert the detachable anchor tongue end into the detachable anchor until you hear a "snap" and feel the latch engage. If the safety belt is twisted, disengage the tongue end from the detachable anchor, remove the twist and reinsert the tongue end until you hear a "snap" and feel the latch engage.

tomsn048@gmail.com

Safety Belts, Rear, Center — Aerostar

NOTE: Safety belt BUCKLES, center adjust tongues and belt and retractors can be replaced separately. However, if a safety belt assembly was in use during a collision, the belt and retractor must be replaced as well as the center adjust tongue and belt and buckle assembly or the center adjust tongue and the cable and BUCKLE assembly. When replacing safety belt and BUCKLE, safety cable and BUCKLE, center adjust tongues and belt and retractors, use only the replacement parts specified in the Ford Master Parts Catalogs for the make and model of the vehicle being serviced. Safety belt assemblies must not be interchanged between vehicle models.

SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
Seat Belt Bolt Bit (No. 50 Torx®)	T77L-2100-A

The third row rear seat center belts (611B66) do not have rear safety belt retractor and tongues (611B68). To lengthen the rear seat center belt, tip the tongue at a right angle to the belt, and pull the tongue until the ends can be joined over the lap.

To fasten the third row rear seat center belt, insert the tongue into the open end of the rear safety belt and buckle (60044) until a "snap" is heard. To shorten the rear seat center belt, pull on the loose end of the webbing. The rear seat center belt should be snug across the hips, never across the waist.

tomsn048@gmail.com

Child Safety Seat, Tether Attachment

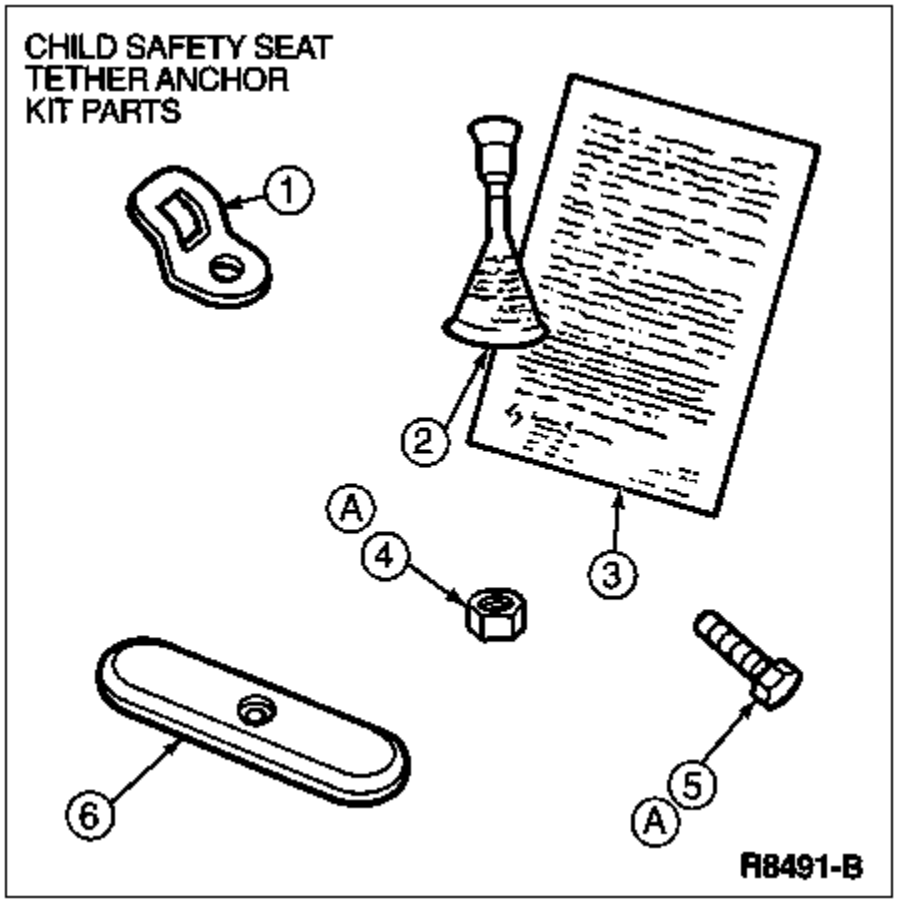
Some manufacturers make safety seats with a tether strap that goes over the back of the vehicle seat and attaches to the anchoring point behind the vehicle seat.

Ford recommends placement of tethered safety seats in a rear seating position with the tether strap attached to the tether anchoring point.

You can attach a tether strap anchor bracket to the rear floor by using a tether anchor kit available at no charge from any Ford dealership.

On four-door models, if a tethered seat is installed in the seat, it should be located only at the center front seating position, with the tether strap secured to the webbing of the buckled center rear lap belt behind the child safety seat. The rear lap/shoulder belts should not be used to secure the tether strap of a safety seat located in the front seat.

WARNING: FAILURE TO FOLLOW THESE PRECAUTIONS COULD INCREASE THE CHANCE AND/OR SEVERITY OF INJURY IN AN ACCIDENT.



tomsn048@gmail.com

Instructions For Locating Tether Strap Anchor Drill Dimples For The Right Front Passenger Seat

General Instructions — Aerostar

Read these instructions carefully prior to installation of the child tether strap anchor kit. (See Kit Contents.)

Some manufacturers make safety seats with a tether strap that goes over the back of the vehicle seat and attaches to an anchoring point behind the vehicle seat.

Ford recommends placement of tethered safety seats in a rear seating position with the tether strap attached to the tether anchoring point as shown in this instruction sheet.

Four (4) tether strap anchor locations have been provided in the vehicle. If the child's safety seat located in the front, right-hand passenger seat, the tether strap anchor attachment location under the **second** row bench seat or right-hand bucket seat must be used. For second row seating positions, you must use one of the three (3) tether strap anchor locations under the third row bench seat. (Refer to following illustration.)

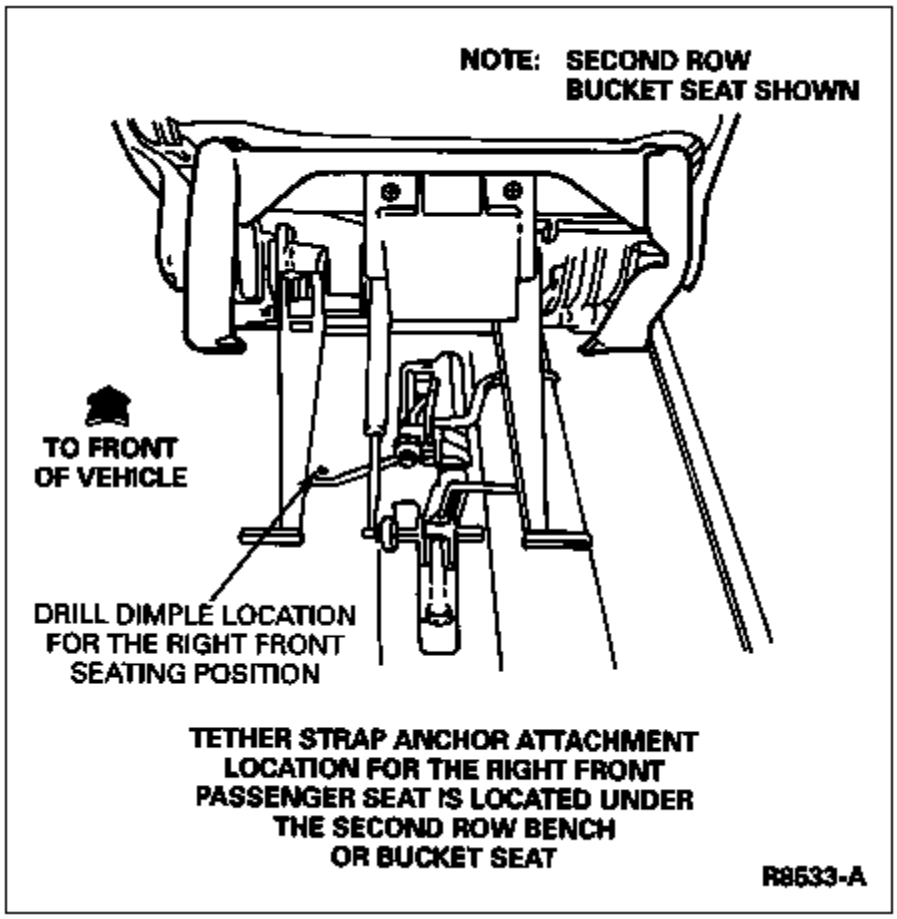
You can attach a tether strap anchor bracket to the rear floor by using a tether anchor kit, available at no charge from any Ford dealership.

The rear lap/shoulder safety belts should not be used to secure the tether strap of a safety seat located in the front seat.

WARNING: FAILURE TO FOLLOW THESE PRECAUTIONS COULD INCREASE THE CHANCE AND/OR SEVERITY OF INJURY IN AN ACCIDENT.

1. Remove the second row bench seat or both bucket seats.

tomsn048@gmail.com



2. Locate the front and rear attaching screws **A** and **B** holding both the right and left floor well bezels to the floor.

3. From screw attachments **A** and **B** , working toward the center of the vehicle, apply a 15.2cm (six-inches) strip of 51mm (two inches) wide masking tape onto the floor carpet.

4. Lay a straightedge from the right-hand bezel attaching screw **A** to the left-hand bezel attaching screw **A** . Draw a line on the masking tape. Repeat this procedure for screw **B** .

5. From screw **A** , measure approximately 10.8cm (4-1/4 inches) toward the center of the vehicle and mark the tape **Point A** .

6. From screw **B** , measure the same distance and mark the tape **Point B** .

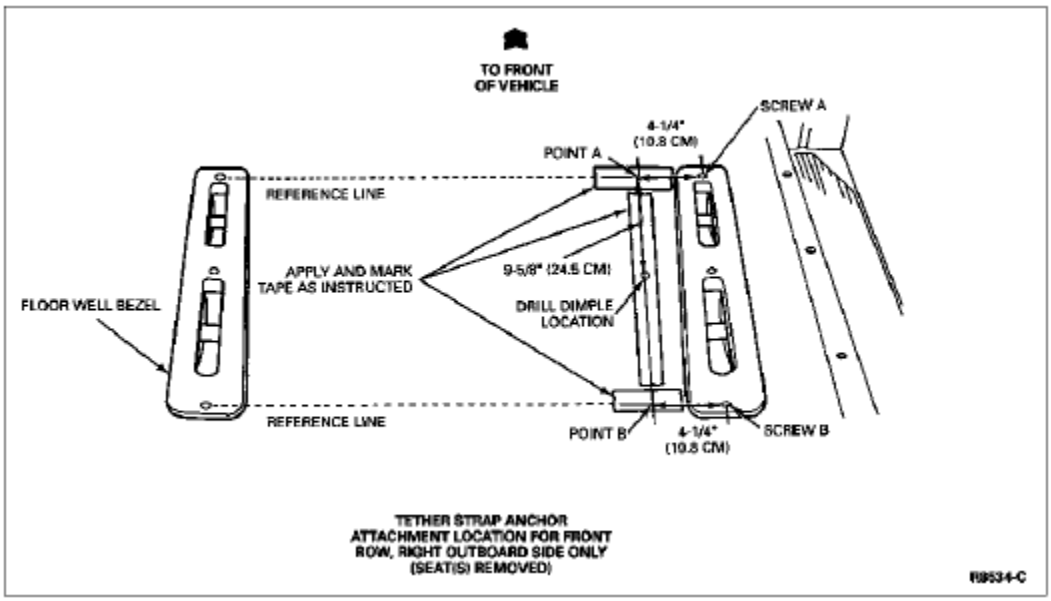
7. Apply a strip of tape connecting the two previously marked locations **(Points A and B)** .

8. Lay a straightedge from **Point A** to **Point B** and draw a line on the tape. Measure from **Point A** toward **Point B** , approximately 24.5cm (9-5/8 inches), and mark the tape.

9. Refer to "Instructions for Exposing Drill Dimples Underneath the Carpet" in this section.

Tether Attachment

tomsn048@gmail.com



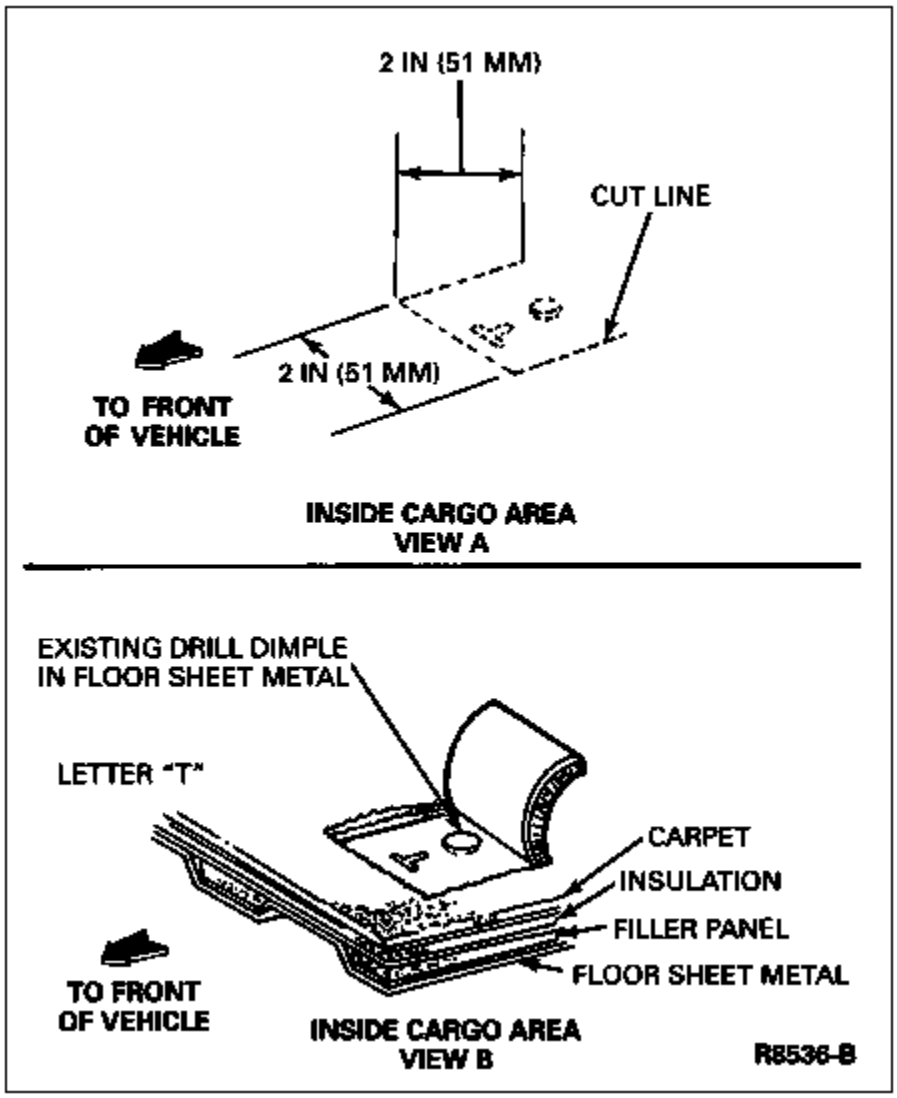
Instructions for Exposing Drill Dimples Underneath the Carpet — Aerostar

1. After the approximate location(s) have been determined, using the masking tape, press the carpeting where you marked the tape and feel the unsupported area beneath the carpeting. This will indicate the location of the floor drill dimple provided for the tether strap anchor.

2. Feel the unsupported edge of the 51mm x 51mm (2 inches by 2 inches) opening under the carpet. Cut the carpet as shown and fold it back to expose both the drill dimple and the embossed letter "T" near the drill dimple.

3. Refer to "Locations of the Drill Dimples for Mounting the Tether Strap Anchors" in this section.

tomsn048@gmail.com



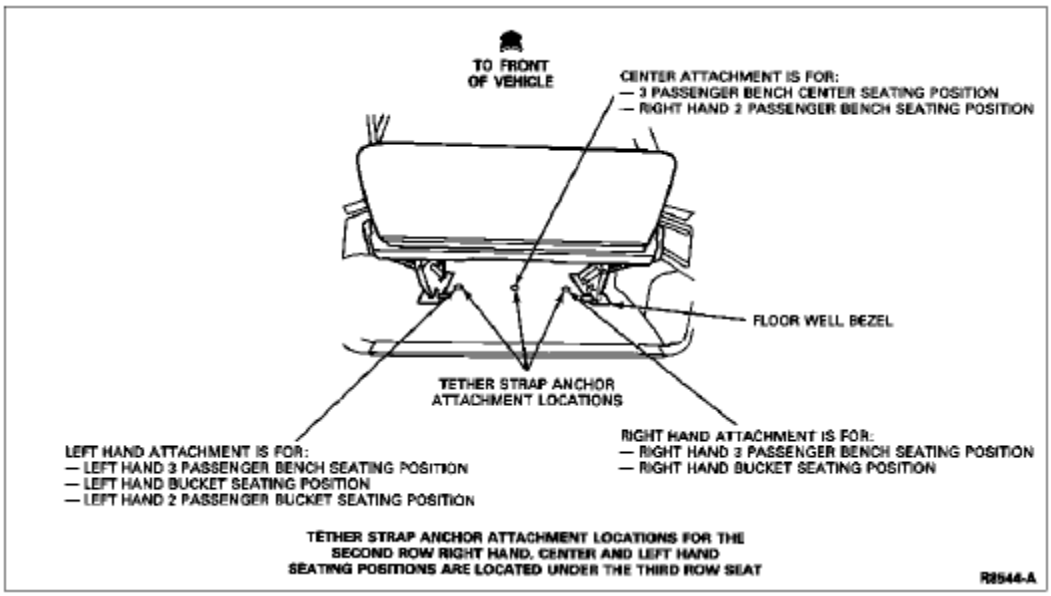
Tether Strap Anchor Locations for:

- Second Row Right-Hand:
  - 3-Passenger Bench.
  - Bucket Seat.

- Second Row Left-Hand:
  - 3-Passenger Bench.
  - 2-Passenger Bench.
  - Bucket Seat.

Tether Attachment Locations, 2nd Row RH and LH Bench and Bucket Seats

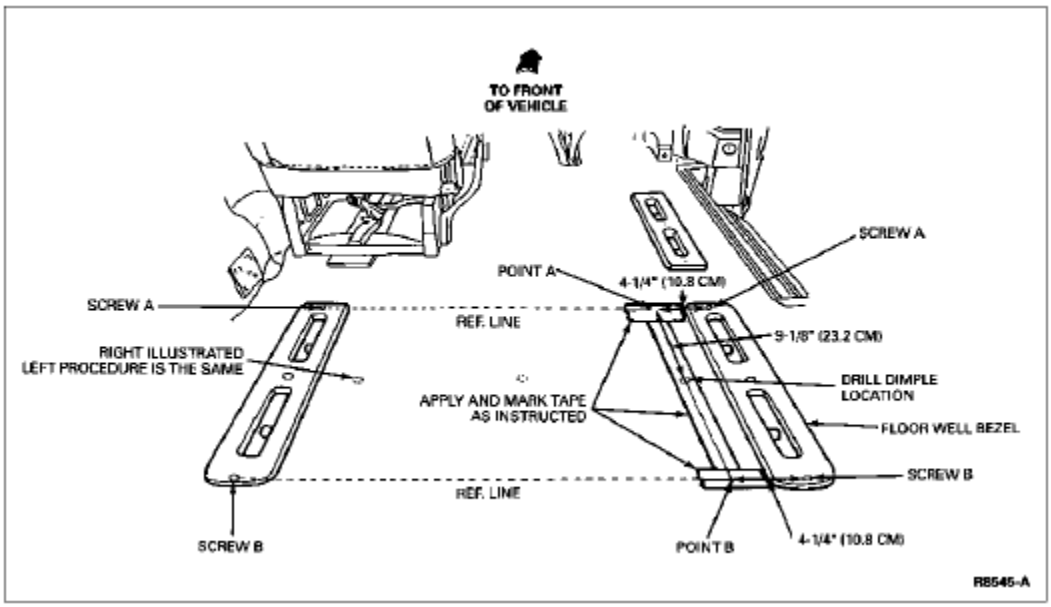
tomsn048@gmail.com



1. Remove the third row passenger bench seat.
2. Locate front and rear attaching screws **A** and **B** retaining the floor well bezels to the floor.
3. From screw attachments **A** and **B** , working toward the center of the vehicle, apply a 15.2cm (6-inches) strip of 51mm (2-inches) wide masking tape onto the floor carpet.
4. Lay a straightedge from the right-hand bezel attaching screw **A** to the left-hand bezel attaching screw **A** and draw a line on the masking tape. Repeat this procedure for screw **B** .
5. From screw **A** , measure approximately 10.8cm (4-1/4 inches) toward the center of the vehicle and mark the tape at **Point A** .
6. From screw **B** , measure the same distance and mark the tape at **Point B** .
7. Apply a strip of tape connecting the two previously marked locations (**Points A and B**).
8. Lay a straightedge from **Point A** to **Point B** and draw a line. Measure from **Point A** toward **Point B** , approximately 23.2cm (9-1/8 inches), and mark the tape.
9. Refer to "Instructions for Exposing Drill Dimples Underneath the Carpet" in this section.

Drill Dimple Location, 2nd Row RH and LH Bench and Bucket Seats

tomsn048@gmail.com



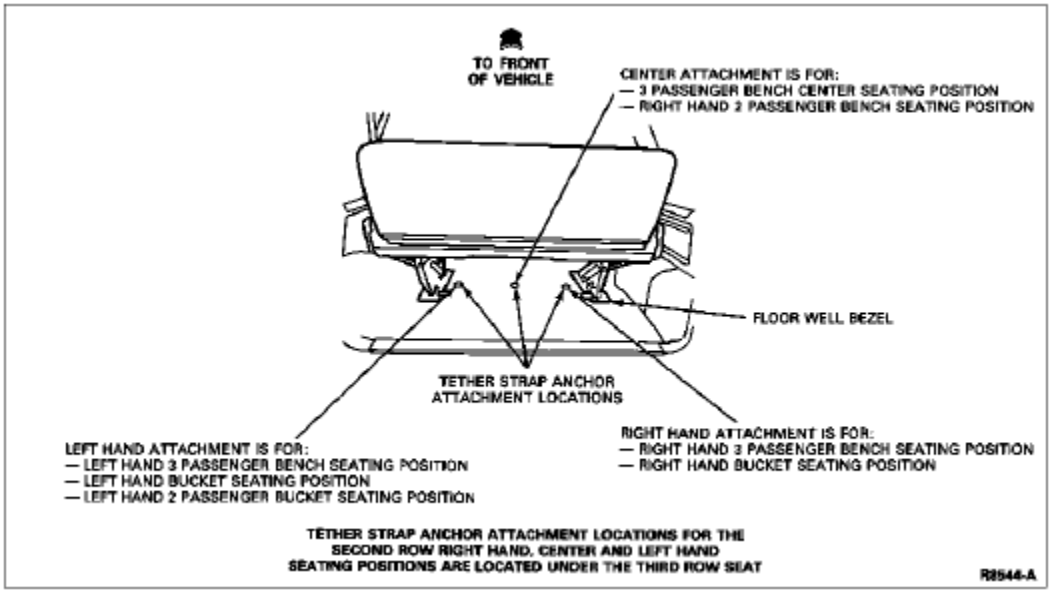
10. Refer to Steps 1-9 (finding the RH tether strap anchor location) and use the same procedure to find the left-hand tether strap anchor location.

Tether Strap Anchor Location for:

- Second Row:
  - Center 3-Passenger Bench.
  - Right-Hand 2-Passenger Bench.

1. Remove the third row passenger bench seat.

Tether Attachment Locations, 2nd Row Center and RH Bench Seats



tomsn048@gmail.com

2. Locate front and rear attaching screws **A** and **B** retaining the floor well bezels to the floor. Refer to illustration in previous procedure.

3. From screw attachments **A** and **B** , working toward the center of the vehicle, apply a 45.7cm (1-1/2 feet) strip of 51mm (two inches) wide masking tape onto the floor carpet.

4. Lay a straightedge from right-hand bezel attaching screw **A** to the left-hand bezel attaching screw **A** . Draw a line on the masking tape. Repeat this procedure for attaching screw **B** .

5. From screw **A** , using a straightedge, measure approximately 32cm (12-5/8 inches) toward the center of the vehicle and mark the tape.

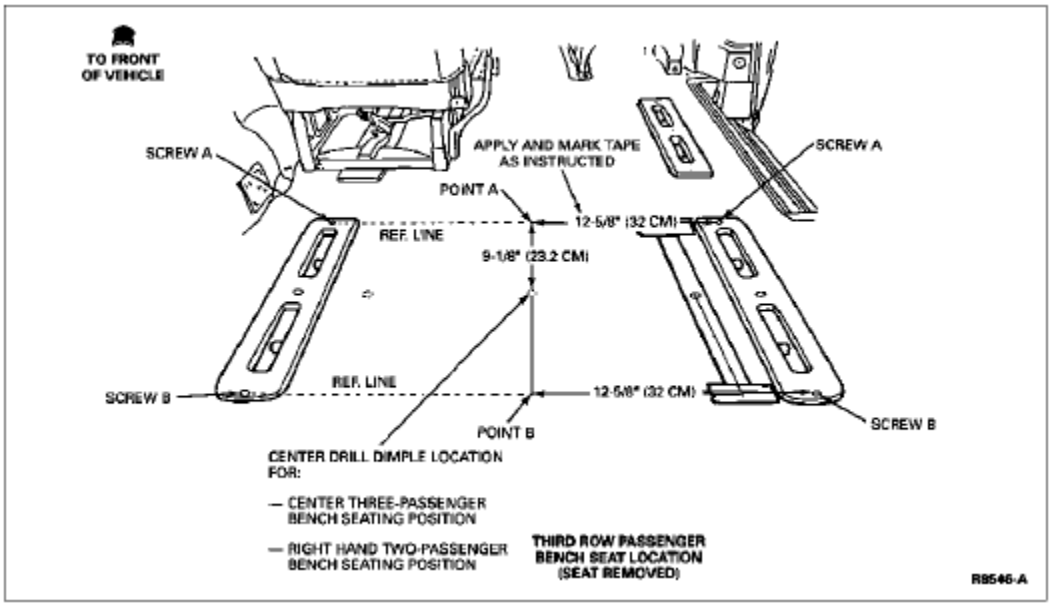
6. From screw **B** , measure the same distance and mark the tape.

7. Apply a 30cm (one-foot) strip of tape connecting the two previously marked locations (**Points A and B**).

8. Lay a straightedge from **Point A** to **Point B** and draw a line. Measure from **Point A** toward **Point B** , approximately 23.2cm (9-1/8 inches), and mark the tape.

9. Refer to "Instructions for Exposing Drill Dimples Underneath the Carpet" in this section.

Drill Dimple Locations, 2nd Row Center and RH Bench Seats

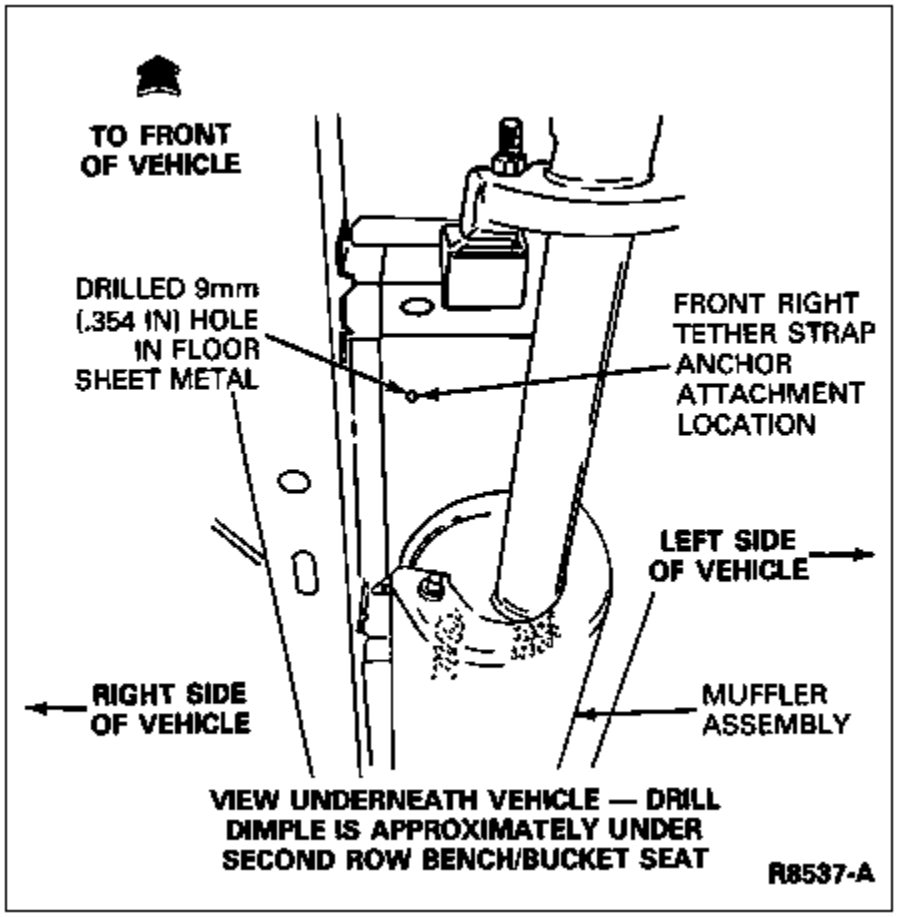


Locations of the Drill Dimples for Mounting the Tether Strap Anchors (View from Underneath the Vehicle) — Aerostar

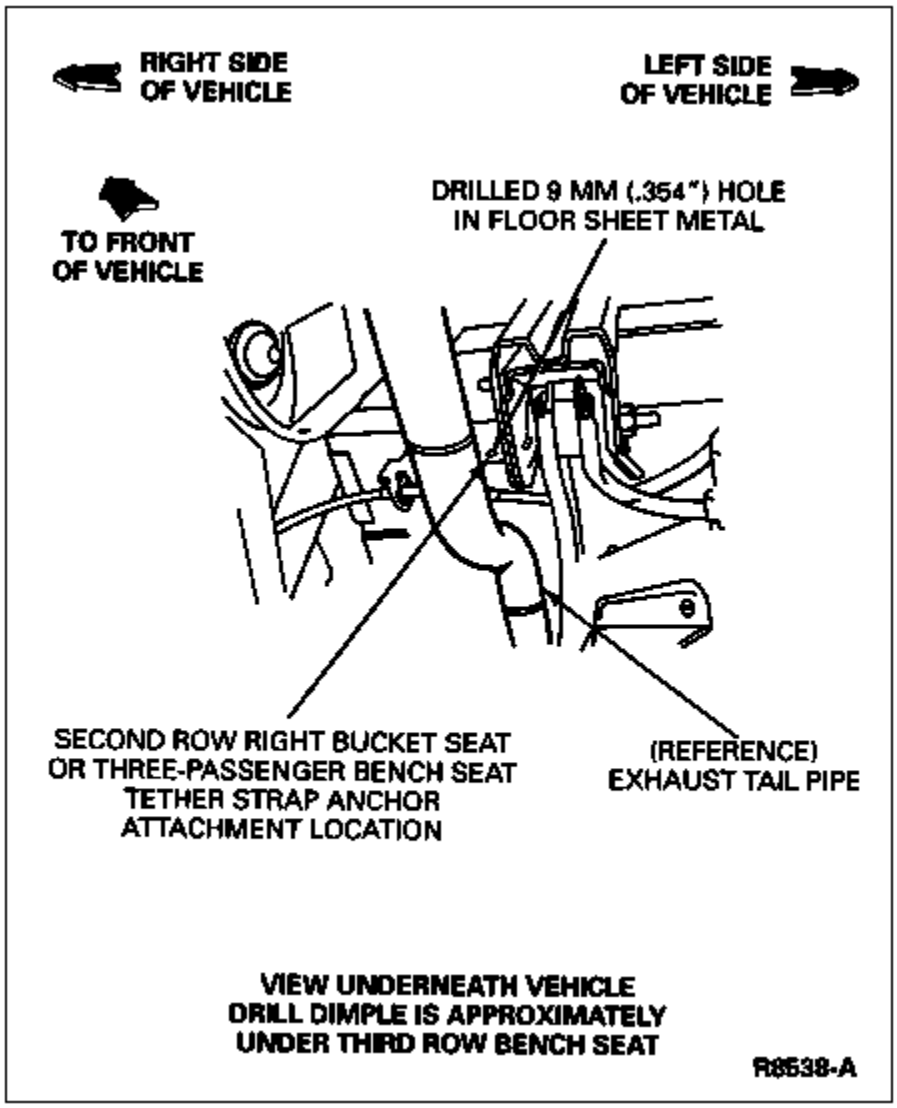
1. Refer to the following illustration to find the drill dimple locations underneath the vehicle. Verify, before drilling hole through the floorpan, that the drill will not damage any underbody components.

tomsn048@gmail.com

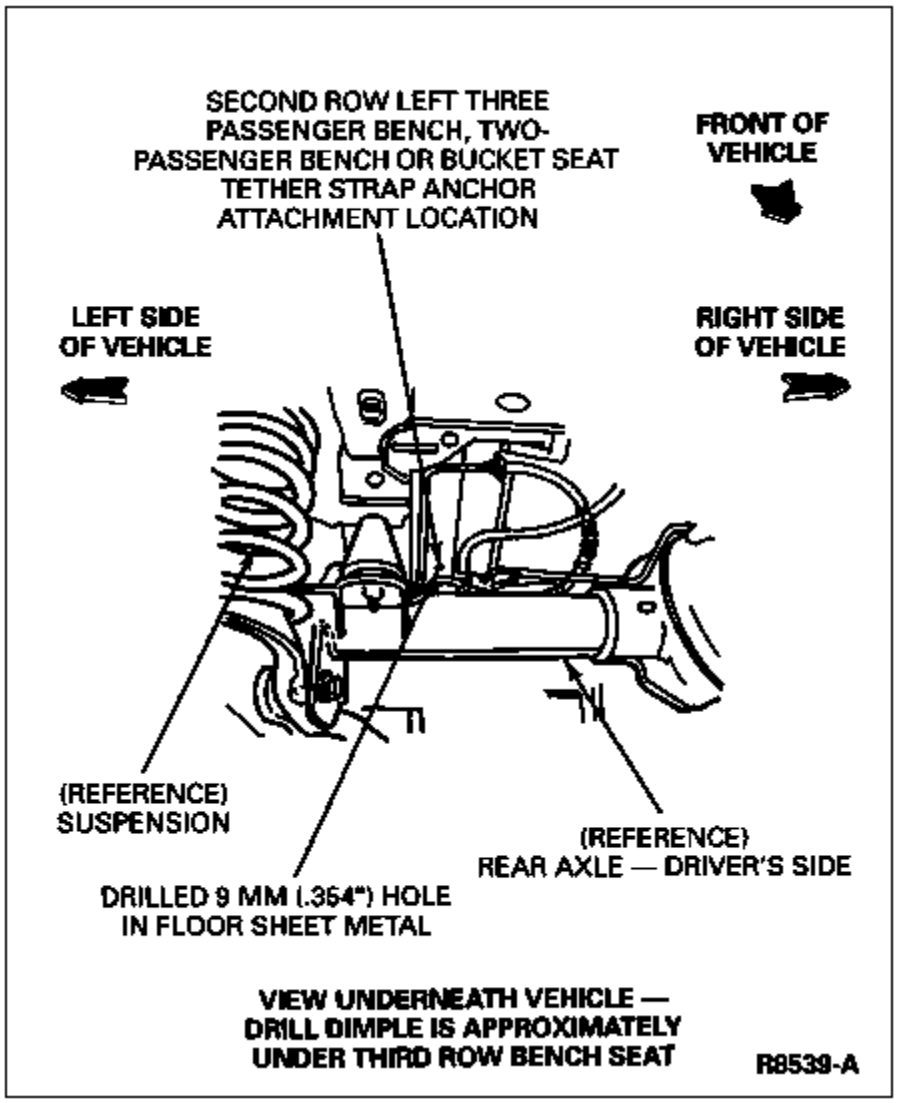
2. Refer to "Instructions for Installing Tether Strap Anchor Attachments" in this section.



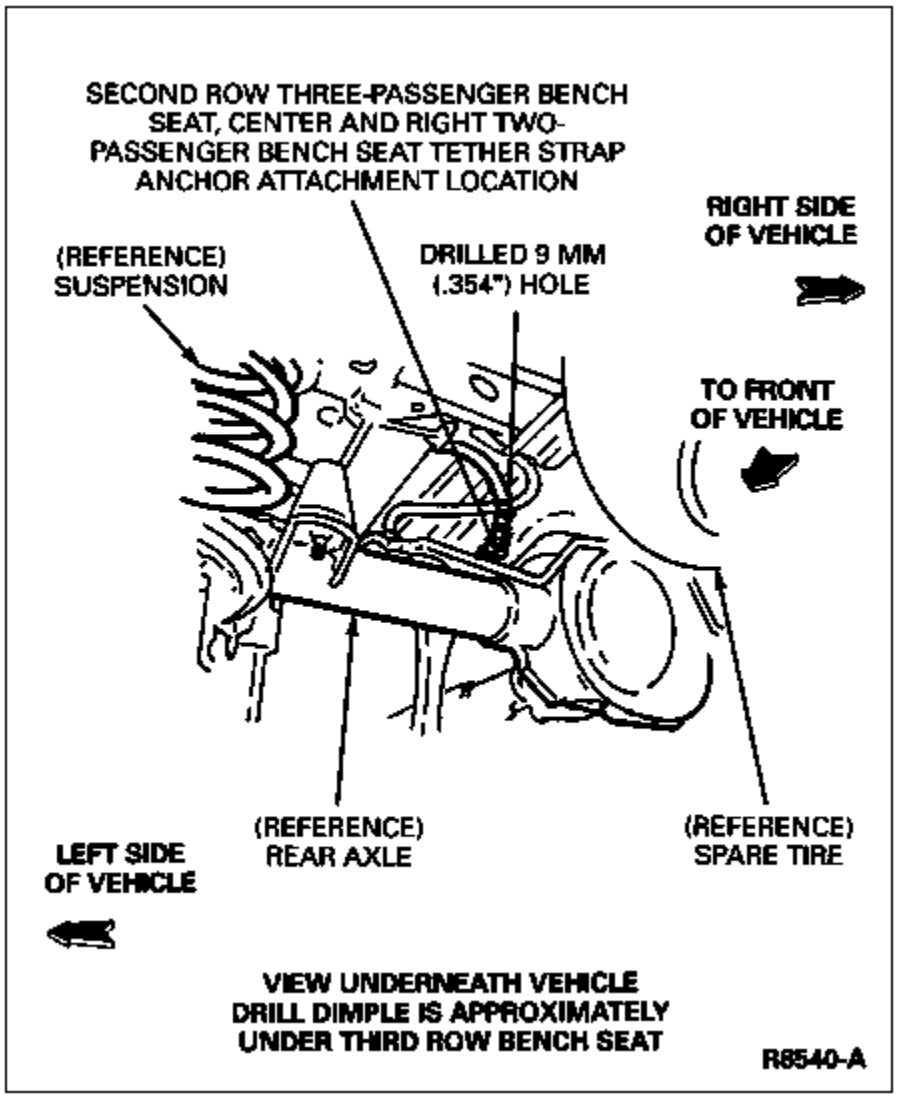
tomsn048@gmail.com



tomsn048@gmail.com



tomsn048@gmail.com



Instructions for Installing Tether Strap Anchor Attachments All Locations — Aerostar

1. From inside the cargo area, drill a 9mm (.354-inch) hole through the desired dimple(s).

2. **WARNING: THE TETHER BRACKET MUST BE BOLTED DIRECTLY TO THE FLOOR SHEET METAL. INTERIOR TRIM MUST NOT BE TRAPPED BETWEEN THE ANCHOR BRACKET AND THE SHEET METAL. FAILURE TO PROPERLY INSTALL THE ANCHOR BRACKET COULD RESULT IN IMPROPER PERFORMANCE IN THE EVENT OF AN ACCIDENT.**

   An assistant will be needed underneath the vehicle to attach the tether anchor. Before installing the tether hardware, read the instructions on the package containing thread locking material, then open the capsule and apply thread locking material to all threads on the tether attachment bolt. Install the child tether hardware as shown. It is important that the tether attachment bolt be tightened to 22-34 Nm (16-25 lb-ft).

3. **WARNING: THE THREADED HOLE IN THE TETHER ANCHOR HAS AN 8MM METRIC THREAD. A WRENCH WILL BE NEEDED TO TIGHTEN THE 8MM BOLT TO THE REQUIRED**

tomsn048@gmail.com

TORQUE. SOME CHILD RESTRAINTS COME WITH A NON-METRIC BOLT WITH A DIFFERENT THREAD. DO NOT USE A NON-METRIC BOLT AS IT MAY BE IMPOSSIBLE TO SCREW IT ALL THE WAY INTO THE HOLE, RESULTING IN INADEQUATE RETENTION OF THE CHILD RESTRAINT. USE ONLY THE METRIC ANCHOR BOLT SUPPLIED IN THE KIT. IF YOU NEED A REPLACEMENT METRIC BOLT OR ASSISTANCE, ANY FORD DEALER WILL BE HAPPY TO ASSIST YOU.

WARNING: IF THE ANCHOR BOLT(S) ARE EVER REMOVED, THE HOLE(S) IN THE FLOOR MUST BE SEALED TO PREVENT THE POSSIBILITY OF EXHAUST FUMES ENTERING THE PASSENGER COMPARTMENT.

Follow the child seat manufacturer's instructions to attach the tether strap to the tether bracket.

Supplemental Air Bag Restraint System (SRS)

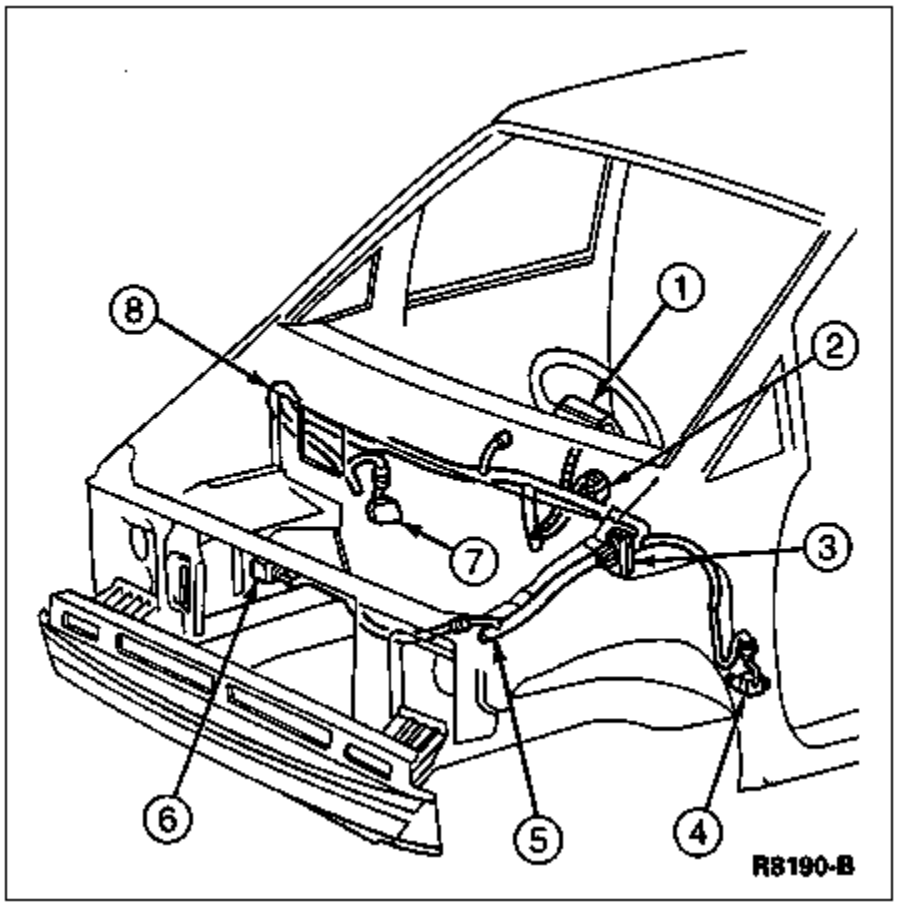
The Supplemental Air Bag Restraint System is designed to provide increased accident protection for front seat occupants IN ADDITION TO that provided by the three point safety belt system. Safety belt use is necessary to obtain the best occupant protection and to receive the full advantages of the supplemental air bag restraint system. **FORD RECOMMENDS THE USE OF SAFETY BELT SYSTEMS FOR ALL VEHICLE OCCUPANTS.**

Refer to Section 01-20A for information on seat and shoulder belts.

The Supplemental Air Bag Restraint System (SRS) consists of:

- Electrical system
- Driver side air bag module (043B13)
- Sensors:
  - Cowl panel air bag sensors
  - Center air bag sensor
- Air bag diagnostic monitor (14B056)
- Air bag indicator
- Tone generator

tomsn048@gmail.com



Item	Part Number	Description
1	043B13	Driver Side Air Bag Module
2	14B056	Air Bag Diagnostic Monitor
3	—	Connector at Safety Wall (Part of 12A580)
4	14B005	Cowl Side Air Bag Sensor and Bracket (LH)
5	12A581	Engine Control Sensor Wiring

7	14B004	Cowl Side Air Bag Sensor and Bracket (RH)
8	14401	Main Wiring

tomsn048@gmail.com

tomsn048@gmail.com

Air Bag Module, Driver Side

The driver side air bag module (043B13) is mounted in the center of the steering wheel (3600). The module consists of:

- Inflator
- Air bag
- Mounting plate and retainer ring
- Steering wheel trim cover

Inflator

NOTE: The inflator is a component of the driver side air bag module and is not a serviceable item. The driver side air bag module is serviced as a complete assembly.

When the LH cowl panel air bag safing and either the center air bag sensor or the RH cowl side panel air bag sensor close, signaling a crash, electric current flows to the air bag inflator. Inside the inflator, an igniter converts the electrical signal to thermal (heat) energy, causing the ignition of the inflator gas generant. This ignition reaction combusts the sodium azide/copper oxide gas generant in the inflator, producing nitrogen gas, which inflates the air bag.

Air Bag

NOTE: The air bag is a component of the driver side air bag module and is not a serviceable item. The driver side air bag module is serviced as a complete assembly.

The air bag:

- is constructed of neoprene coated nylon.
- is 711mm (28 inches) in diameter.
- fills to a volume of 0.065m ^{3} (2.3 ft ^{3}) in approximately 40 milliseconds.

Mounting Plate and Retaining Ring

NOTE: The mounting plate and retaining ring are components of the driver side air bag module and are not serviceable items. The driver side air bag module is serviced as a complete assembly.

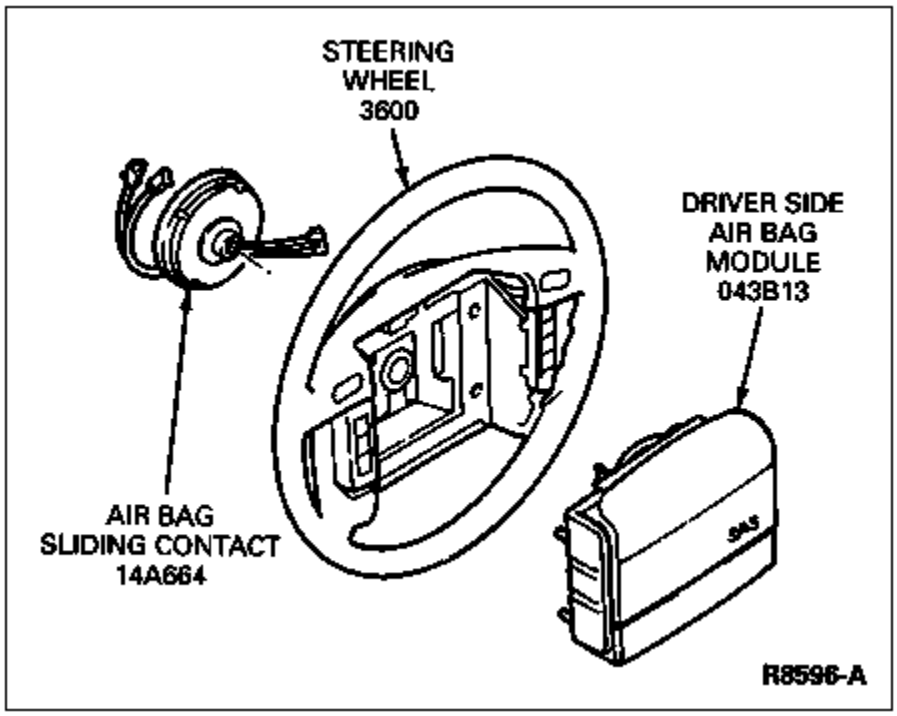
The mounting plate and retainer ring attach and seal the air bag assembly to the inflator. The mounting plate is also used to attach the trim cover and to mount the entire driver side air bag module to the steering wheel.

Steering Wheel Trim Cover

NOTE: The steering wheel trim is a component of the driver side air bag module and is not a serviceable item. The driver side air bag module is serviced as a complete assembly.

The steering wheel trim cover is made of injection-moulded plastic and encases the air bag. When the supplemental air bag restraint system is activated, tear seams moulded into the steering wheel trim cover separate, allowing inflation of the air bag.

tomsn048@gmail.com

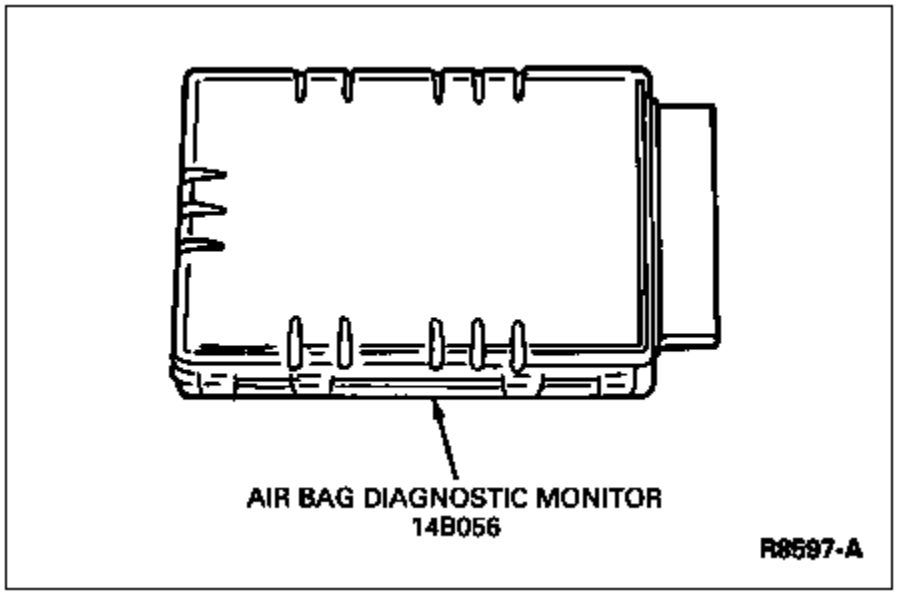


tomsn048@gmail.com

Air Bag Diagnostic Monitor

The air bag diagnostic monitor (14B056) continually monitors all supplemental air bag restraint system components and wiring connections for possible faults in the system. If the air bag diagnostic monitor detects a fault in the supplemental air bag restraint system when the ignition switch (11572) is in the RUN position, a diagnostic trouble code will be displayed on the air bag indicator, located in the instrument cluster. Performing system diagnostics is the main purpose of the air bag diagnostic monitor.

The air bag diagnostic monitor does not deploy the air bag in the event of a crash. The center air bag sensor and RH cowl side air bag sensor are "hard wired" to the air bag; therefore, the center and RH cowl side air bag sensors and LH cowl side air bag sensor determine when to deploy the air bag.



tomsn048@gmail.com

tomsn048@gmail.com

Air Bag System Functions

Features and functions of the air bag diagnostic monitor (14B056) are described below.

- The air bag diagnostic monitor illuminates the air bag indicator for approximately six seconds when the ignition switch (11572) is in the RUN position and then turns the indicator off. This shows that the air bag indicator is operational. **If the air bag indicator does not illuminate or the indicator stays on or flashes at any time, a fault has been detected by the air bag diagnostic monitor.**
- Diagnostic trouble code 52 will display in approximately 30 seconds after the ignition switch is placed in the RUN position. All other codes will be displayed within 10 seconds of "Key On." This is the amount of time the air bag diagnostic monitor requires to perform all tests and verify system faults, if present.
- Each diagnostic trouble code (a series of flashes and pauses of the air bag indicator) represents a two digit number. Each diagnostic trouble code is always displayed at least twice. For example, a diagnostic trouble code 32 is displayed as three flashes, followed by a one second pause, then two flashes, followed by a three second pause.
- If a system fault is present and the air bag indicator is malfunctioning, an audible tone will be heard, indicating that system service is required. The tone is a series of five sets of beeps. **This does not indicate a diagnostic trouble code 55.** If the tone is heard, the air bag indicator is inoperative and a system fault that requires service is present.

CAUTION: The thermal fuse does not blow (open) because of excessive current flowing through it. DO NOT attempt to jumper out the thermal fuse with a circuit breaker or any other type of fuse.

- If a fault exists that makes unwanted air bag deployment possible, the air bag diagnostic monitor has an internal thermal fuse that will blow (open) automatically. This removes all power to the air bag deployment circuit.
- The air bag indicator will flash the appropriate diagnostic trouble code to indicate the suspect circuit. If the indicator is malfunctioning, the tone will be heard.
- Diagnostic trouble codes are prioritized numerically so if two or more different faults occur at the same time, the fault having the highest priority will be displayed first. After that fault has been corrected, the next highest priority fault will be displayed.
- The air bag diagnostic monitor includes an internal backup power supply. This feature provides sufficient backup power to deploy the air bag in the event that the battery or battery cables are damaged in an accident before the center air bag and front air bag sensors close. The backup power supply will deplete its stored energy approximately one minute after the **positive** battery cable is disconnected.

tomsn048@gmail.com

tomsn048@gmail.com

Features and Functions

The following four steps show how the supplemental restraint system functions.

NOTE: Steps 1-3 take place in a fraction of a second.

1. The sensors in the vehicle detect a severe frontal impact. When a center air bag sensor or RH cowl side air bag sensor and the LH cowl side air bag sensor are closed at the same time, electrical current flows to the inflator and ignites the chemicals.

2. The chemicals then rapidly burn in the metal container. The rapid burning produces nitrogen gas and small amounts of dust. The nitrogen gas and dust are cooled and filtered during inflation of the air bag.

3. The inflating air bag splits open the trim cover. The air bag then rapidly unfolds and inflates in front of the driver.

4. After inflation, the gas empties through holes in the air bag. The air bag deflates very rapidly.

tomsn048@gmail.com

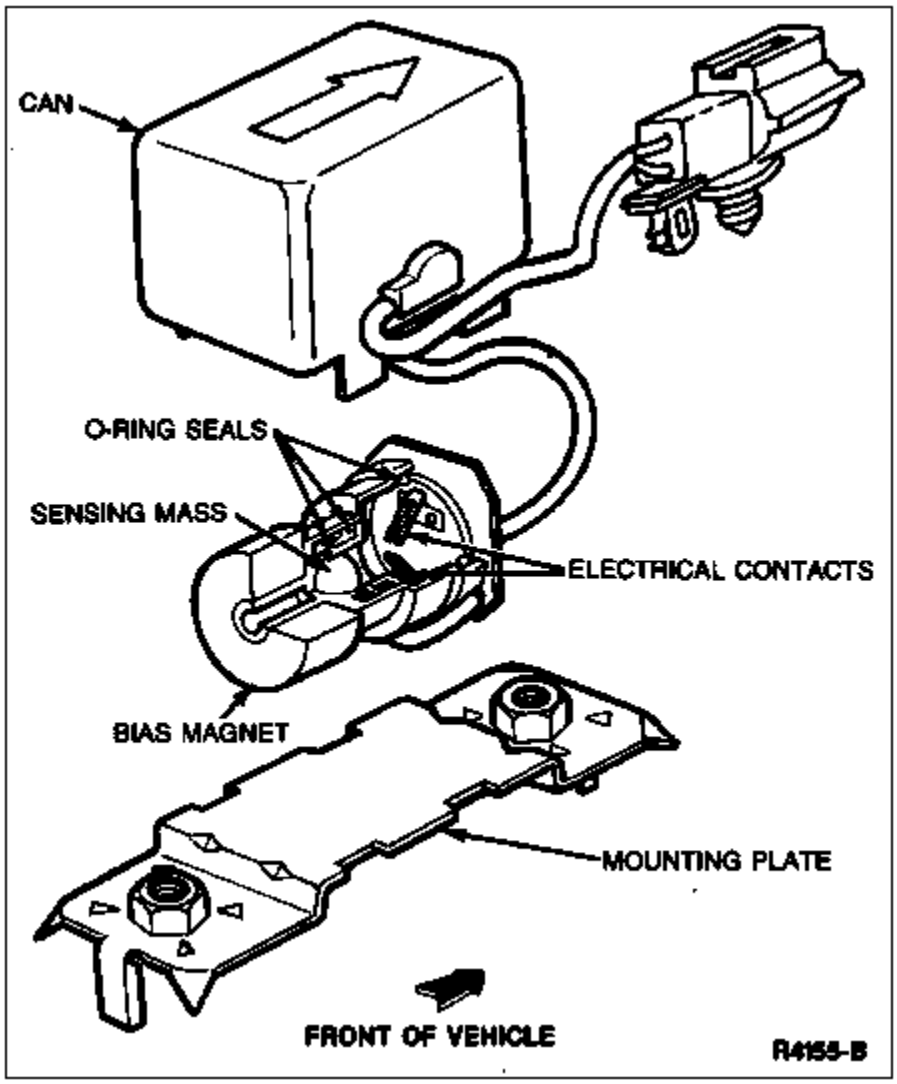
Sensors

WARNING: VEHICLE SENSOR ORIENTATION IS CRITICAL FOR PROPER SYSTEM OPERATION. IF A VEHICLE EQUIPPED WITH A SUPPLEMENTAL AIR BAG RESTRAINT SYSTEM HAS BEEN INVOLVED IN A CRASH WHERE THE FRONT FENDERS OR RADIATOR GRILLE HAVE BEEN DAMAGED, INSPECT THE SENSOR MOUNTING BRACKETS FOR DEFORMATION. IF DAMAGED, THE SENSOR SHOULD BE REPLACED WHETHER OR NOT THE AIR BAG IS DEPLOYED. IN ADDITION, MAKE SURE THAT THE BODY STRUCTURE IN THE AREA OF THE SENSOR MOUNTING IS RESTORED TO ITS ORIGINAL CONDITION.

NOTE: Undamaged sensors will reset automatically after an accident and can be reused.

The center air bag sensor and bracket (14B006) and RH front air bag sensor and bracket (14B004) are electrical switches which react to impacts according to direction and force. Sensors discriminate between impacts that require air bag inflation and impacts that do not require air bag inflation. When an impact occurs that requires air bag inflation, the sensor contacts close, completing the electrical circuit necessary for system operation.

tomsn048@gmail.com



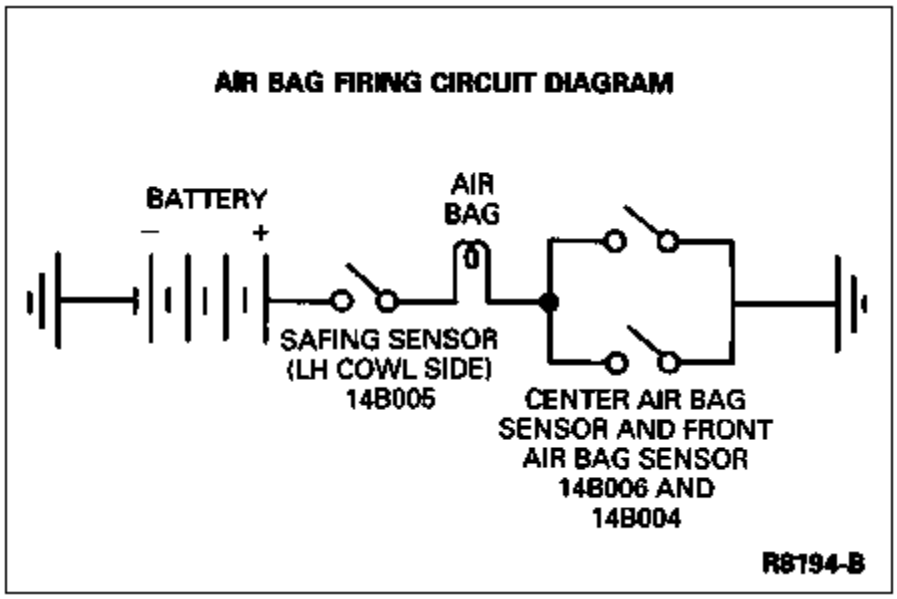
Three sensors are mounted in the vehicle. Their locations are as follows:

- A center air bag sensor and bracket at the center, upper radiator support.
- A RH front air bag sensor and bracket at the cowl side panel (02038) (RH).
- A LH front air bag sensor and bracket (14B005) at the cowl side panel (02039) in the passenger compartment.

At least two sensors (LH cowl side sensor and either the center air bag sensor or RH cowl side air bag sensor) must be activated to inflate the air bag.

Center air bag sensor and bracket and RH front air bag sensor and bracket and LH front air bag sensor and bracket automatically "reset" after a collision and do not require replacement unless physically damaged. Replace sensors only if proper alignment is not possible due to bent brackets, cut wires, etc.

tomsn048@gmail.com



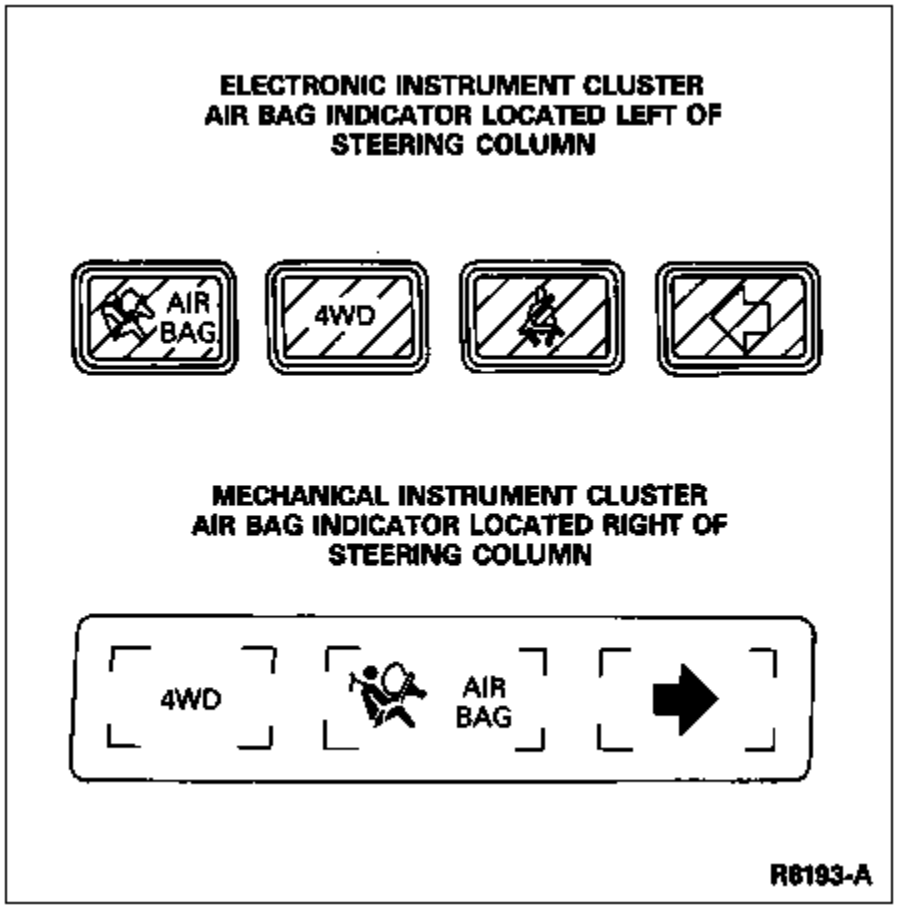
tomsn048@gmail.com

Air Bag Indicator

The air bag indicator will light continuously for approximately six seconds whenever the ignition switch (11572) is turned from OFF to RUN if the air bag is working properly. If system fault is present, the indicator will either fail to light, remain lit continuously or light in a flashing manner. The flashing manner may not occur until approximately 30 seconds after the ignition switch has been turned from OFF to RUN. This is the time required by the air bag diagnostic monitor (14B056) to test and verify any and all system faults. If the air bag indicator is inoperative and supplemental air bag restraint system fault exists, a tone will sound signaling the air bag indicator is inoperative and a system fault exists.

Tone Generator

The air bag indicator is the prime means of determining the supplemental air bag restraint system status. However, if the air bag indicator is inoperative and system fault exists, a tone will sound in a pattern of five sets of five beeps. If this occurs, the air bag indicator will need to be serviced before further diagnosing and testing can be completed. **Unless serviced, the supplemental air bag restraint system may not function properly in the event of an accident.**

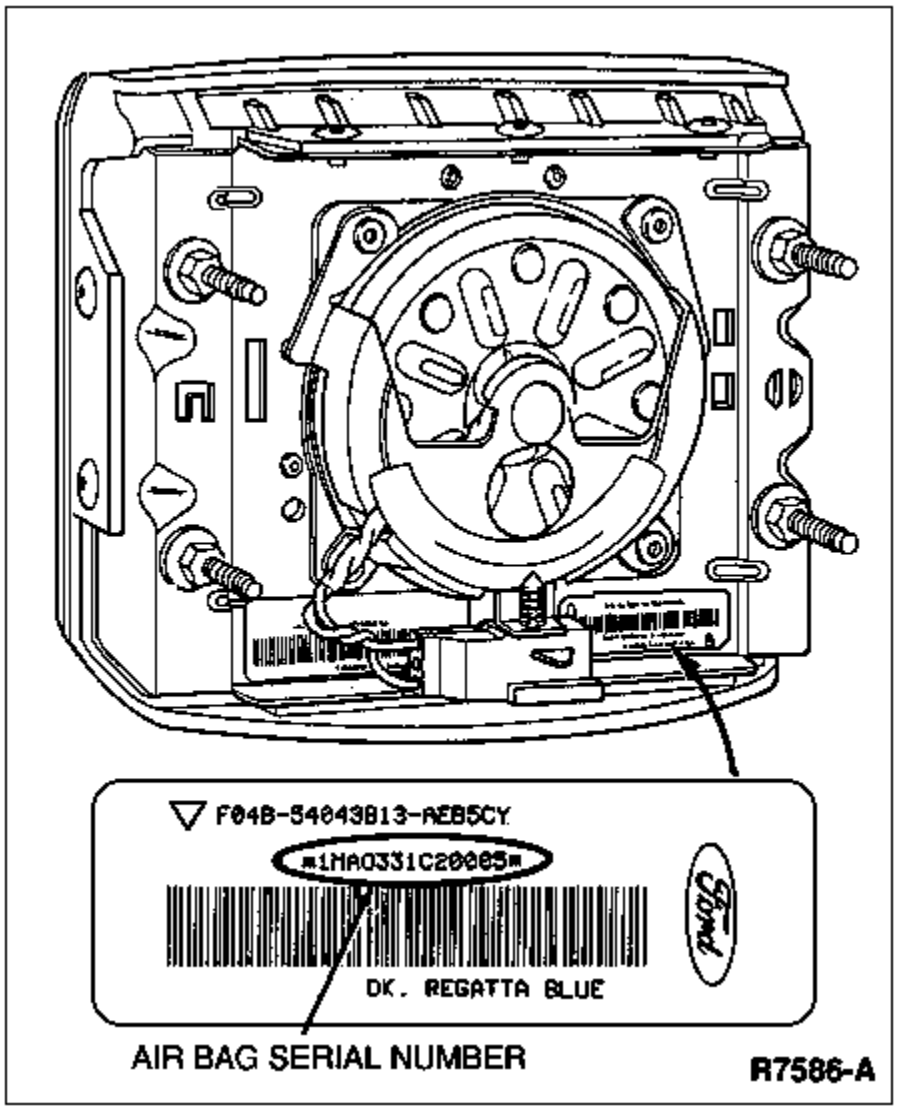


tomsn048@gmail.com

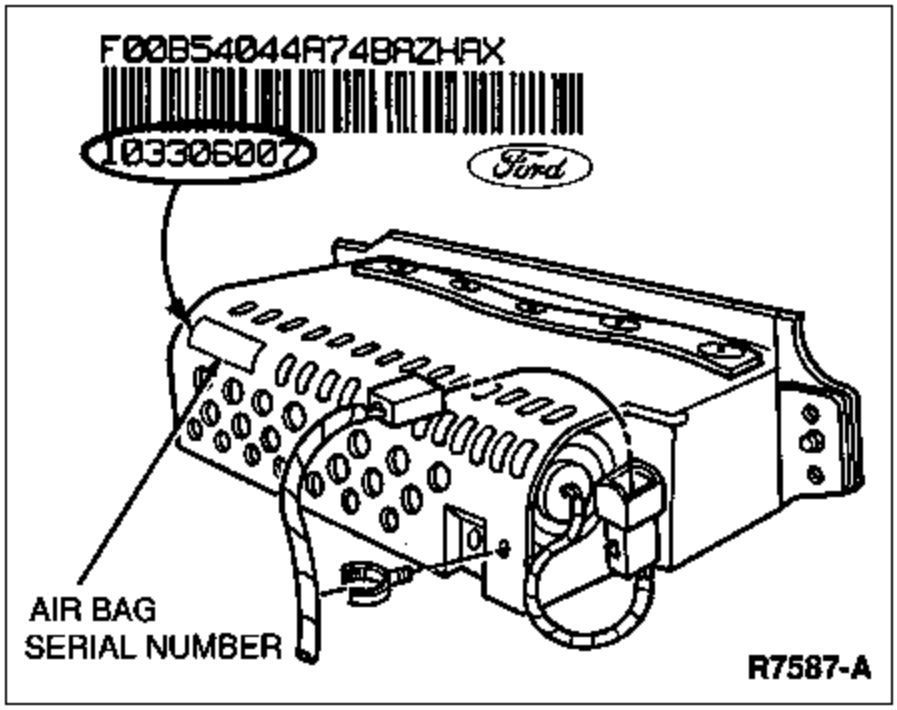
tomsn048@gmail.com

Warning Labels

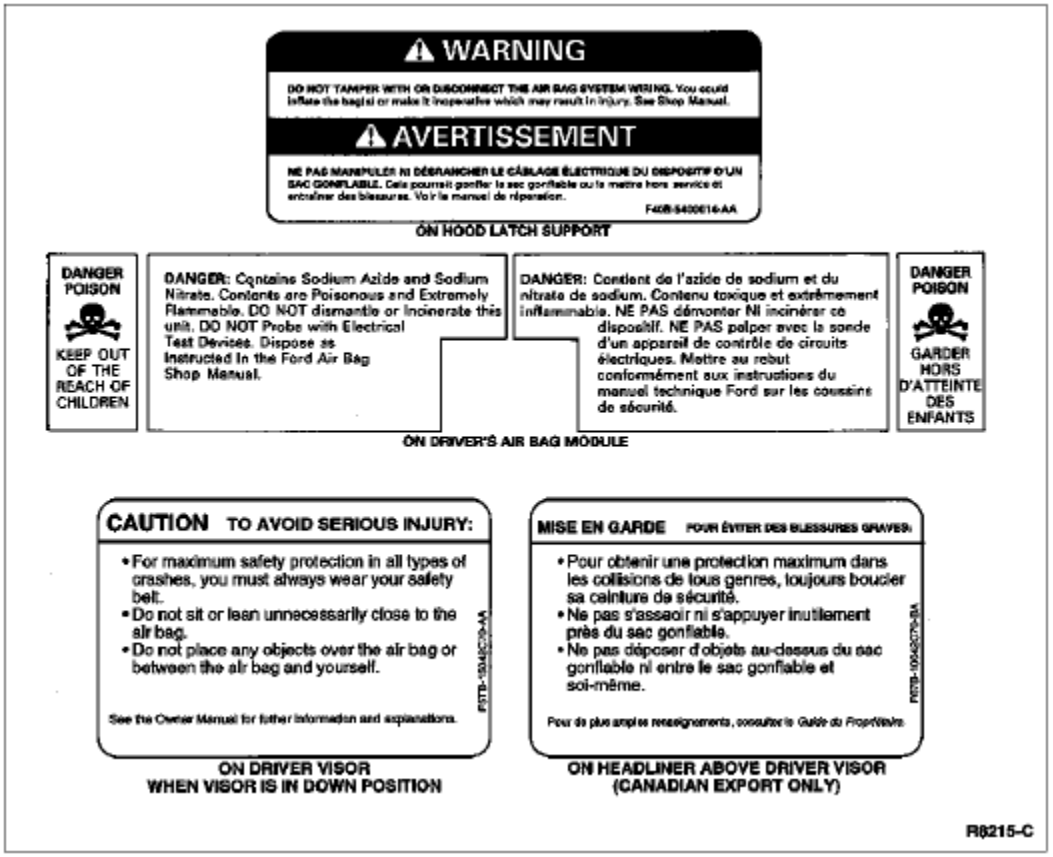
Labels for the supplemental air bag restraint system are shown in the following illustrations.



tomsn048@gmail.com



Air Bag Warning Labels



tomsn048@gmail.com

tomsn048@gmail.com

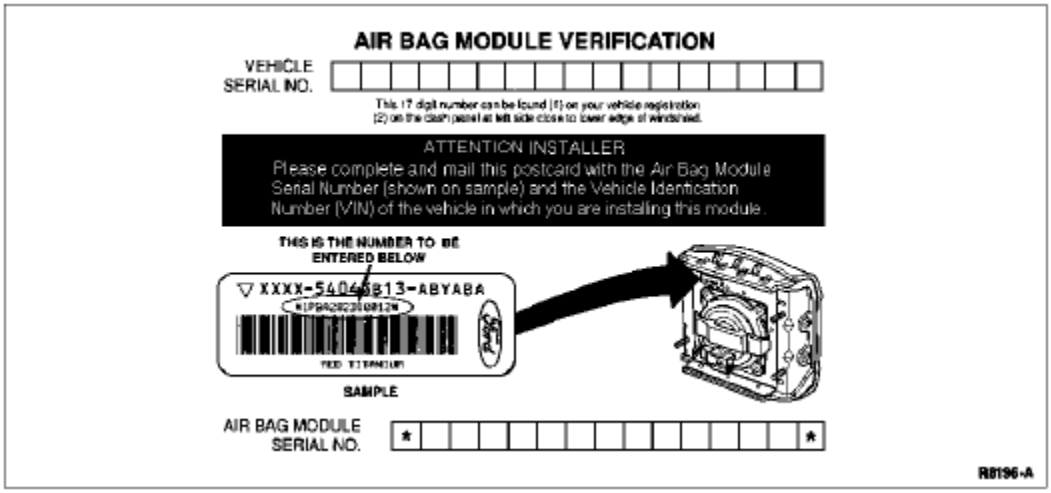
Air Bag Modules

Information on safe and effective replacement supplemental air bag restraint system components and handling are provided in this section. Refer to Diagnosis and Testing and Removal and Installation portions of this section for complete and effective service of the supplemental air bag restraint system.

When replacing a driver side air bag module (043B13), a prepaid return postcard is provided with the replacement driver side air bag module. The serial number for the new part and vehicle VIN number must be recorded and sent to Ford Motor Company.

For information on proper handling, storage, and disposal of the air bag inflator assemblies, refer to Removal and Installation in this section.

Vehicle Identification Number Location



tomsn048@gmail.com

tomsn048@gmail.com

Service of Air Bag Equipped Vehicles Involved in a Collision

If the accident involved an air bag deployment, while servicing a vehicle equipped with a driver side air bag module (043B13), check the sensors and wiring for damage.

Sensors

WARNING: VEHICLE SENSOR ORIENTATION IS CRITICAL FOR PROPER SYSTEM OPERATION. IF A VEHICLE EQUIPPED WITH A SUPPLEMENTAL AIR BAG RESTRAINT SYSTEM HAS BEEN INVOLVED IN A CRASH WHERE THE UPPER RADIATOR SUPPORT OR COWL SIDE PANEL (RH) AND COWL SIDE PANEL (LH) HAVE BEEN DAMAGED, INSPECT THE SENSOR MOUNTING BRACKETS FOR DEFORMATION. IF DAMAGED, THE SENSOR SHOULD BE REPLACED WHETHER OR NOT THE AIR BAG IS DEPLOYED. IN ADDITION, MAKE SURE THE BODY STRUCTURE IN THE AREA OF THE SENSOR MOUNTING IS RESTORED TO ITS ORIGINAL CONDITION.

NOTE: Do not attempt to replace air bag cover with one from another driver side air bag module, for any reason.

NOTE: Undamaged sensors will reset automatically after an accident and can be reused.

Damaged Wiring

Inspect the sensor wiring and the wiring harness for any damage that may have occurred as a result of the accident. Replace as required any damaged:

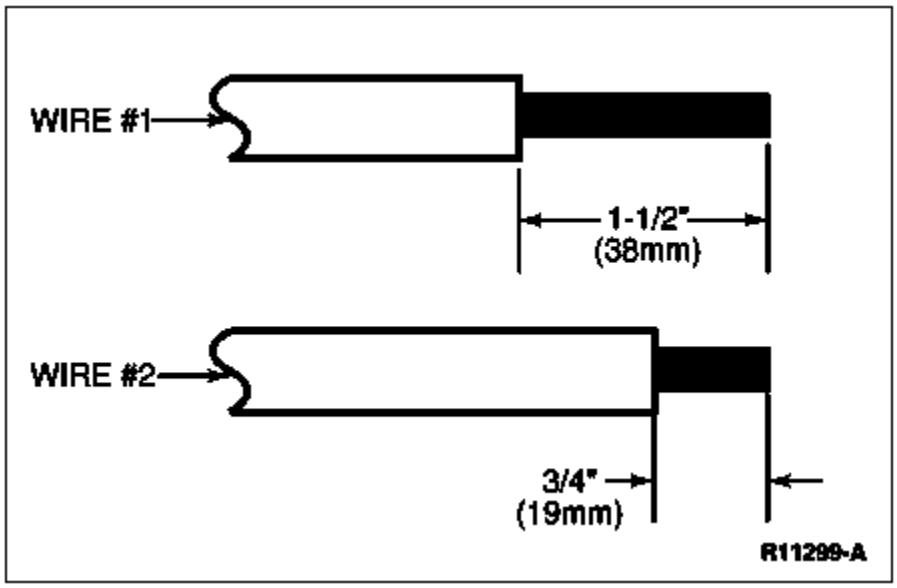
- wiring
- terminals
- insulation
- connectors

If splices are required in adjacent wiring, the splices should be staggered 50mm (2 inches) apart from each other. Service splices as follows:

A durable splice is a 5-step process. Use for 16 gauge wire and smaller. For larger than 16 gauge wire, a jiffy splice must be used.

1. Correctly strip the wires.

tomsn048@gmail.com

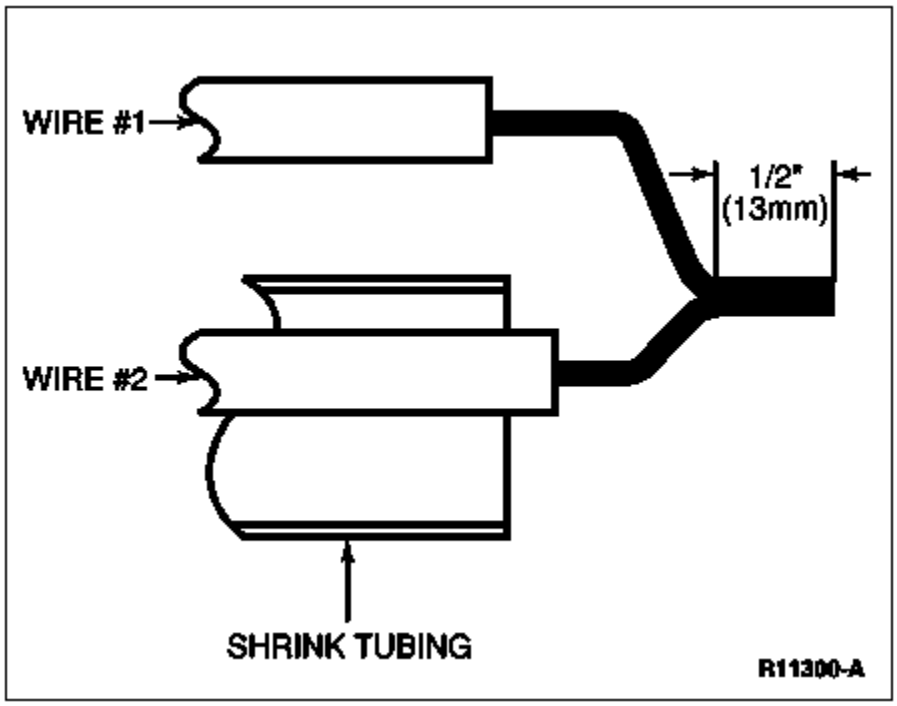


2. **NOTE: Durability of a splice is dependent on keeping the moisture out of the joint. The heat shrink tubing alone won't do the job. The tubing must contain a "hot melt sealant" which is squeezed from both ends of the tube during heating and forms an adhesive seal between the cable and the tube.**

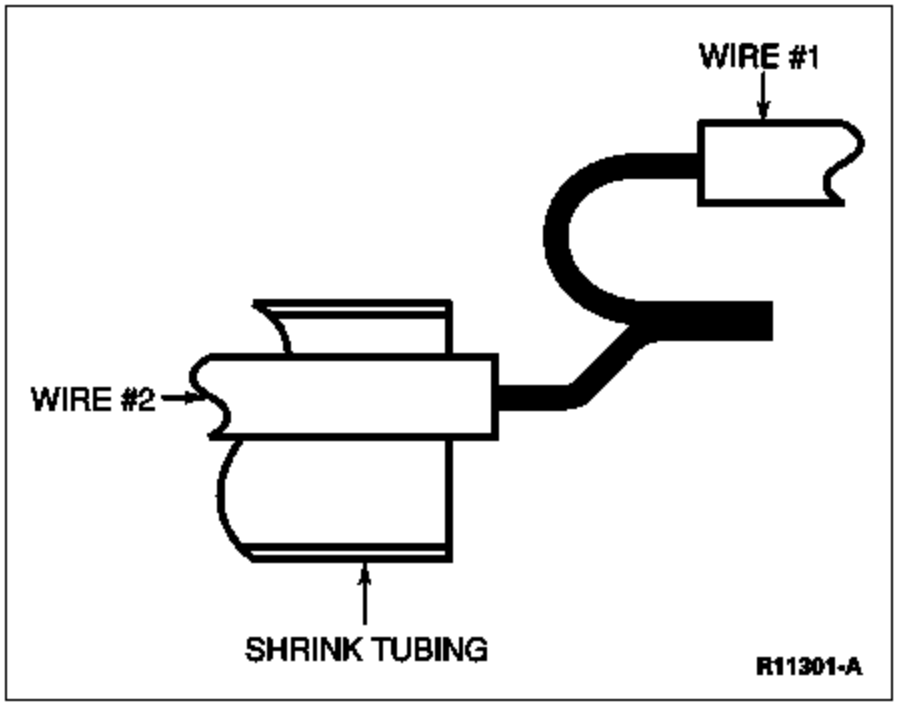
   Durability of a wire splice is dependent on getting a joint that does not oxidize. Soldering is effective in keeping the air (oxide) out of the joint. Electronic circuits, and the very high current circuits, may fail because of oxidized joints. Oxidization cannot be seen with the naked eye.

   Twist and solder the wire (don't forget to install the shrink tubing first). Use rosin core, mildly activated (RMA) solder. (Do not use acid core.)

tomsn048@gmail.com

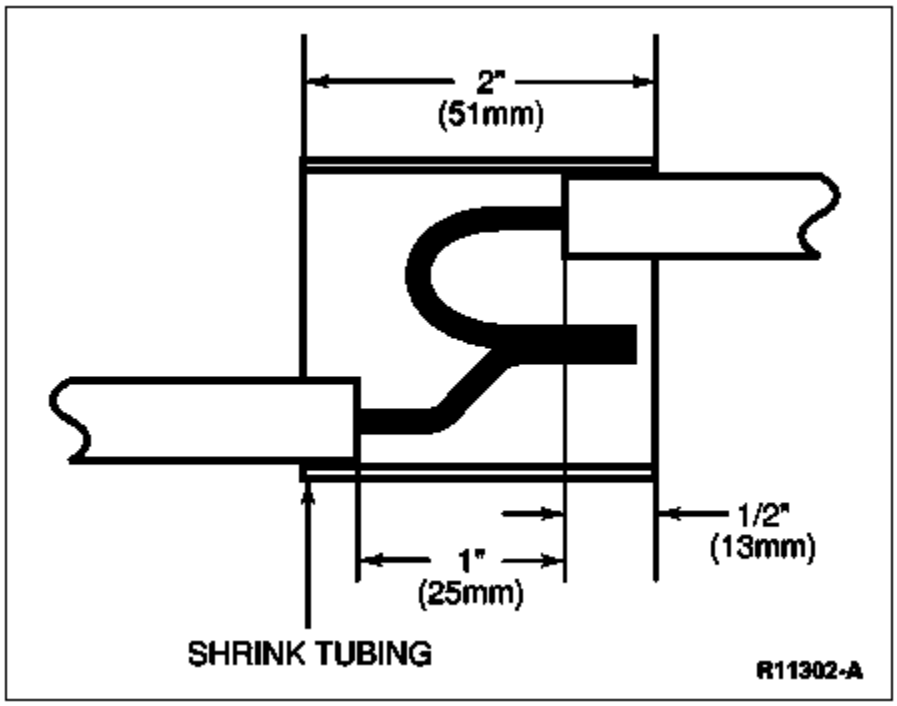


3. Form (bend) the circuit into a shape for sealing, as shown below.



4. Reposition the shrink tubing over the splice.

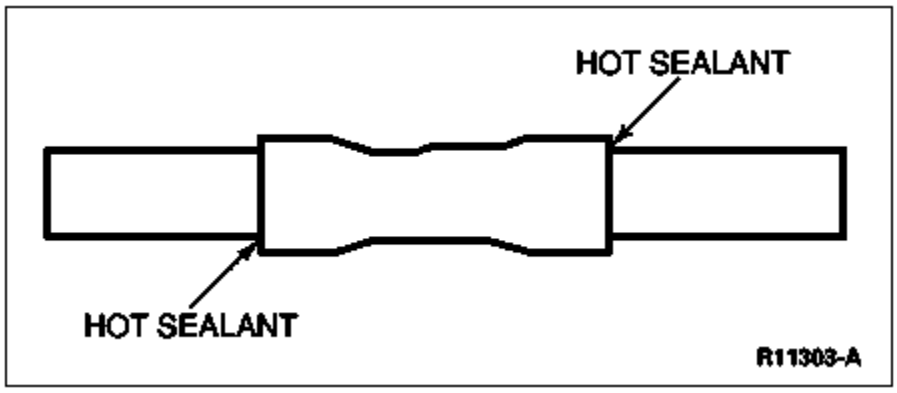
tomsn048@gmail.com



5. **NOTE: When the "hot sealant" flows out of both ends of the tube, it has been heated long enough.**

   CAUTION: Use a heat gun only. Do not use a hair dryer or any flame to heat the shrink tubing.

   Heat the entire length of the shrink tubing until the "hot sealant" comes out of both ends.



Steering Column and Air Bag Sliding Contact

If the collision involved air bag deployment, the steering column may have been loaded sufficiently to deform steering column instrument panel brackets (3676) or damage column wiring. An inspection should be made of the column structure and wiring to air bag sliding contact (14A664) to make sure that any damaged components are replaced. Refer to Section 11-04B .

tomsn048@gmail.com

tomsn048@gmail.com

Air Bag System

CAUTION: Before attempting diagnostic prove out, check all sensors and wiring for damage or shorts that could cause the air bag diagnostic monitor thermal fuse to blow (open), causing unnecessary replacement.

After all service is completed, verify the air bag indicator operation as follows:

- Turn the ignition switch (11572) to the RUN position.
- If the indicator flashes, count the air bag indicator flashes only after the code (series of flashes) has cycled twice. Service as required.
- If the air bag indicator illuminates continuously for four to eight seconds and then goes out, the supplemental air bag restraint system is functioning properly and all faults have been serviced. If the air bag indicator does not illuminate, illuminates continuously for four to eight seconds then goes out, or remains continuously illuminated, there is a malfunction within the system. Refer to Diagnosis and Testing in this section.

tomsn048@gmail.com

Diagnosing Customer Concerns Without Hard Diagnostic Trouble Codes

If a diagnostic trouble code is reported by the customer but is not present when the vehicle comes in for service, pinpoint diagnostics cannot be used. Following the pinpoint tests or fault tree diagnosis when the code is not flashing will result in needless replacement of the air bag diagnostic monitor (14B056) and repeat repairs.

The air bag diagnostic monitor does not contain any memory of the diagnostic trouble code after the ignition switch lock cylinder (11582) is turned off. If the code is unknown, instruct the customer on how to count a code.

- Demonstrate a diagnostic trouble code by disconnecting a center or front air bag sensor, turn the ignition switch lock cylinder to the ON position, and allow customer to count diagnostic trouble code.
- Reconnect the primary crash sensor and instruct customer to return when the code is known.

Once the diagnostic trouble code is known, read the "Normal Operation" section for the code involved.

- Study the circuit diagram and determine the location of components involved in creating that code.
- Do a thorough visual inspection of components, connectors, splices and wiring harnesses, looking for pinched wires, worn insulation on conductors, opens, shorts, or loosely mounted sensors.

The section "Possible Causes" lists the common concerns that relate to that particular code. Each concern is listed in the order in which it is most likely to occur.

tomsn048@gmail.com

Diagnosing Customer Concerns With Hard Diagnostic Trouble Codes

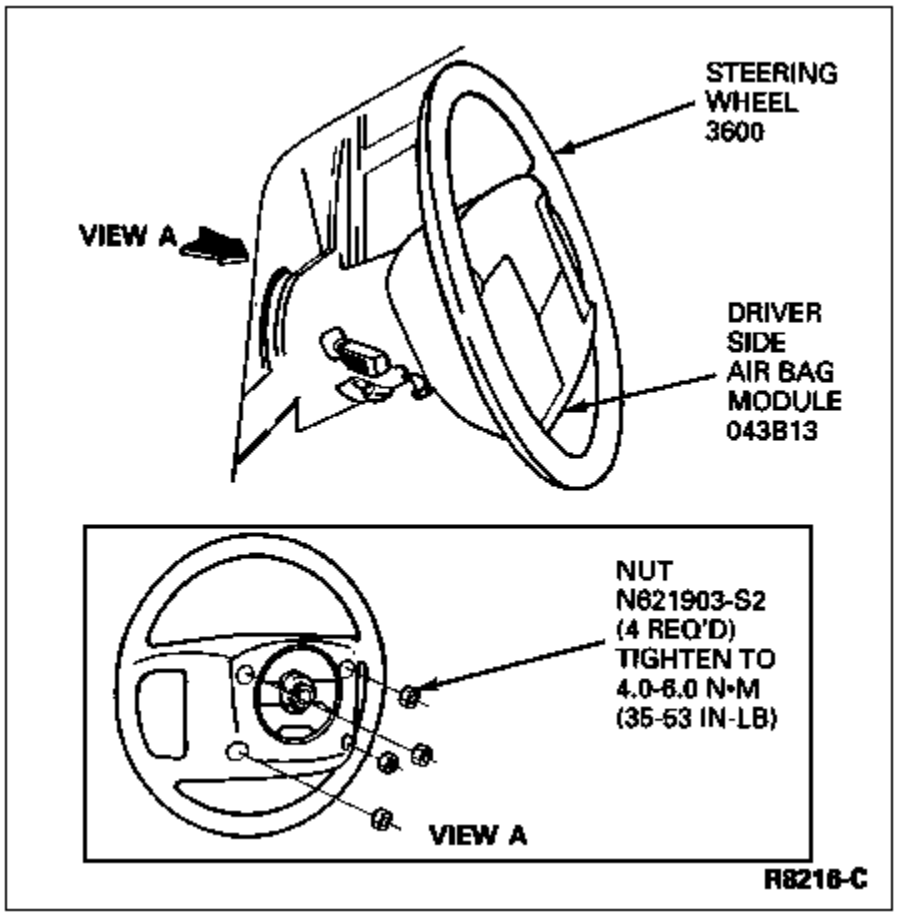
Most supplemental air bag restraint system diagnostic procedures will require the use of the system deactivation and system reactivation procedures described below. These procedures allow the removal of the driver side air bag modules (043B13) from the vehicle, removing the risk of air bag deployment while diagnostics are performed.

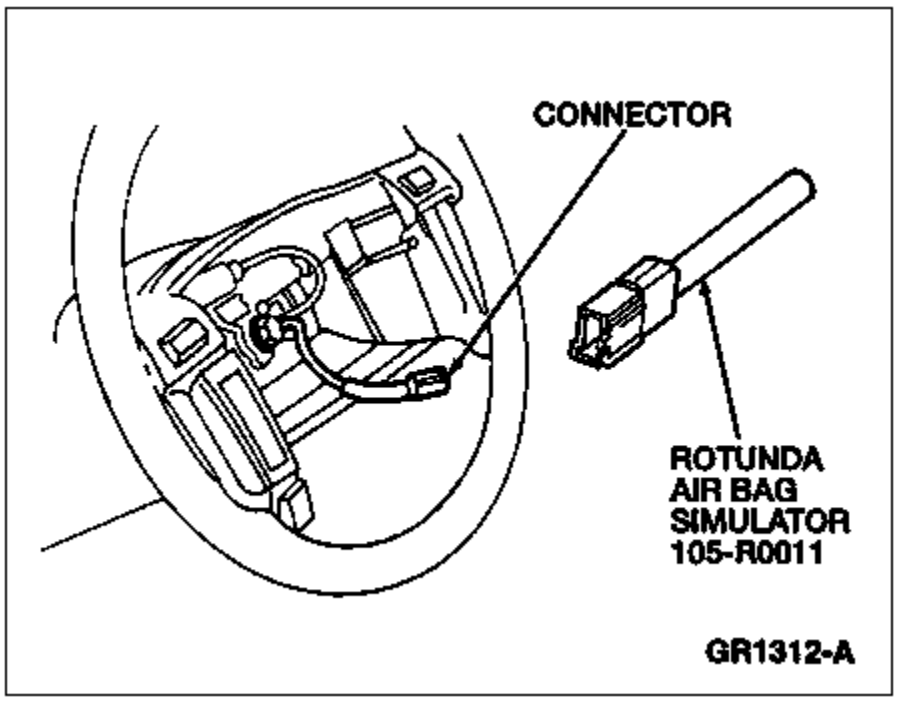
The Rotunda Air Bag Simulator 105-R0010 or equivalent is required to perform diagnostics and testing of the supplemental air bag restraint system. The air bag simulator is a 2-ohm resistor that must be used to simulate an air bag connection in the system as specified in the deactivation procedure. It is not acceptable to jump the air bag connection with a zero ohm jumper wire. If a zero ohm jumper wire is used, a system fault may be displayed (Diagnostic Trouble Code 34 or 35) according to the priority scheme.

Deactivation Procedure

1. Disconnect battery positive cable.
2. Wait one minute. This is the time required for backup power supply in air bag diagnostic monitor (14B056) to deplete its stored energy.
3. Remove four nut and washer assemblies retaining driver side air bag module to steering wheel (3600).
4. Disconnect driver air bag connector.
5. Connect air bag simulator to vehicle harness at top of steering wheel.

tomsn048@gmail.com





6. Connect battery positive cable.

tomsn048@gmail.com

- When the battery has been disconnected and reconnected, some abnormal drive symptoms may occur while the powertrain control module (PCM) (12A650) relearns its adaptive strategy. The vehicle may need to be driven 16 km (10 mi) or more to relearn the strategy.

Reactivation Procedure

1. Disconnect battery positive cable.
2. Wait one minute for backup power supply to deplete stored energy.
3. Remove air bag simulator from vehicle harness connector at top of steering column. Reconnect driver air bag module connector. Position driver side air bag module on steering wheel and secure with four nut and washer assemblies (10mm). Tighten nut and washer assemblies to 4-6 Nm (36-53 lb-in).
4. **WARNING: THE AIR BAG SIMULATOR MUST BE REMOVED AND THE AIR BAG RECONNECTED FOR THE SYSTEM TO BE REACTIVATED.**

   Connect battery positive cable.

   - When the battery has been disconnected and reconnected, some abnormal drive symptoms may occur while the powertrain control module relearns its adaptive strategy. The vehicle may need to be driven 16 km (10 mi) or more to relearn the strategy.
5. Prove out system.

---

tomsn048@gmail.com

Air Bag System Reconnect Check List

The check list below should be completed following diagnosis or repair of any air bag system concern.

1. Are center air bag sensor and bracket (14B006) and RH front air bag sensor and bracket (14B004) connected and mounted to vehicle?
2. Is LH front air bag sensor and bracket (14B005), in the cowl side panel (02039), connected and mounted to vehicle?
3. Is black three-way connector at base of steering column connected?
4. Is driver side air bag module (043B13) or air bag simulator connected?
5. Is air bag diagnostic monitor (14B056) connected?
6. Is vehicle battery connected?

tomsn048@gmail.com

Air Bag System Component Location

1. Center air bag sensor and bracket (14B006) — center of radiator support upper bracket reinforcement
2. RH front air bag sensor and bracket (14B004) — cowl side panel (02038) (RH)
3. LH front air bag sensor and bracket (14B005) — cowl side panel (02039) (LH)
4. Driver side air bag module (043B13) — steering wheel (3600)
5. Air bag sliding contact (14A664) — behind steering wheel
6. Air bag diagnostic monitor (14B056) — under instrument panel (04320) left of steering column

    - A thermal fuse is built into the air bag diagnostic monitor. If a short to ground should occur in the air bag deployment circuit, the microcomputer in the air bag diagnostic monitor will send a signal to the fuse causing it to open. The open fuse removes all firing power (battery/backup power) from the deployment circuits. This prevents unwanted air bag deployments due to damaged vehicle wiring.
    - Code 51 is displayed whenever the diagnostic monitor thermal fuse is open and no other higher priority faults exist (consult Diagnostic Trouble Code Priority Table). Code 51 is normally seen after service of a Code 13 condition.
    - If a Code 51 exists and a Code 13 condition has not been serviced, this means an **intermittent** short-to-ground exists in the air bag deployment wiring. The intermittent short-to-ground must be located and serviced before servicing the Code 51 condition.
    - Since the thermal fuse is built into the air bag diagnostic monitor, the monitor must be replaced to service a Code 51 condition. NEVER replace the air bag diagnostic monitor without first determining the cause for the Code 51 condition. If the short-to-ground is not properly serviced, the short may reoccur, once again destroying the thermal fuse in the air bag diagnostic monitor.

Pinpoint Tests

PINPOINT TEST N: NO AIR BAG INDICATOR — INOPERATIVE LAMP CIRCUIT OR NO IGNITION VOLTAGE TO AIR BAG DIAGNOSTIC MONITOR

Normal Operation

The air bag indicator is designed to illuminate for 6 (± 2) seconds when the ignition switch lock cylinder (11582) is turned to the RUN position. This initial 6 seconds of air bag indicator illumination (continuous) is considered normal operation and is called prove out of the air bag indicator.

The air bag diagnostic monitor (14B056) requires power at Pins 1 and 6 in order to energize the air bag indicator circuit. If the air bag indicator circuit is open or the air bag diagnostic monitor does not have battery positive voltage at Pins 1 and 6, the air bag indicator will not illuminate.

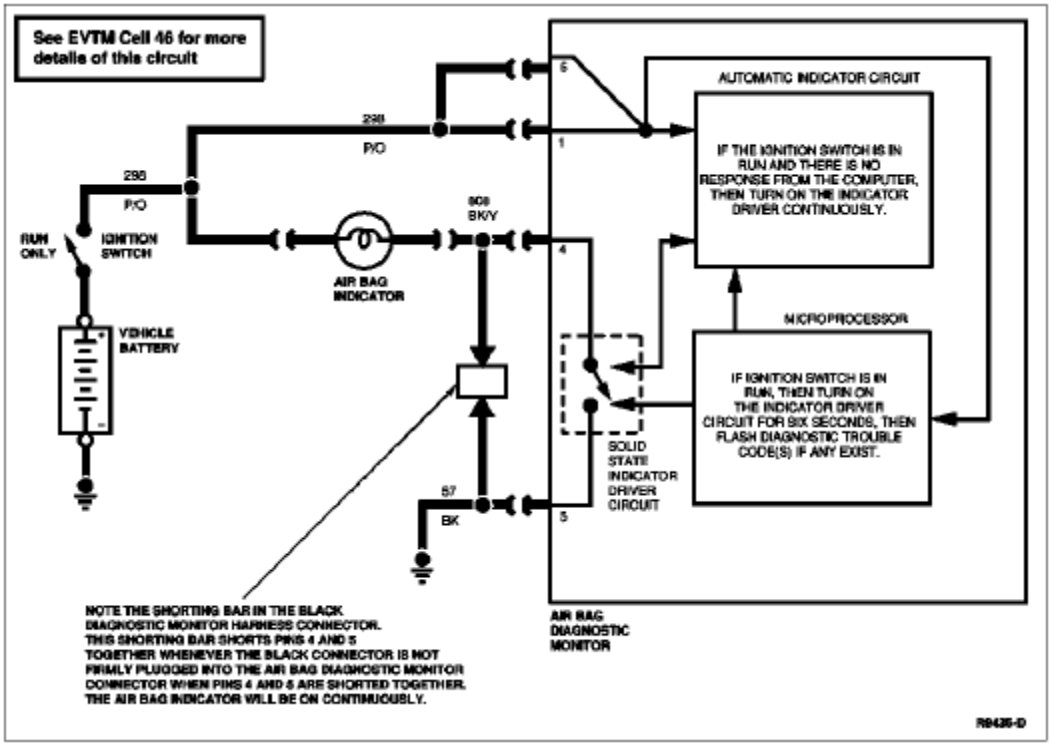
Possible Causes

A No Air Bag Indicator condition can be caused by:

1. A burned out bulb or an open circuit in the wiring for air bag indicator circuit.
2. Loss of battery positive voltage at Pins 1 and 6 of the air bag diagnostic monitor.

No Air Bag Indicator — Inoperative Lamp Circuit or No Ignition Voltage to Air Bag Diagnostic Monitor

tomsn048@gmail.com



N1 CHECK BATTERY POSITIVE VOLTAGE

- Deactivate supplemental air bag restraint system.
- Disconnect air bag diagnostic monitor.
- Turn ignition switch lock cylinder to ON position.
- Measure voltage between Pins 1 (+) and 3 (-). Use Rotunda 73 Digital Multimeter 105-R0051 or equivalent.

Is the voltage measured equal to battery voltage?

Yes	No
GO to **N2** .	LOCATE and SERVICE the open circuit in the "hot in run" feed from the fuse block. CHECK the fuse, connector, etc. CHECK for proper ground on Pin 3 of air bag diagnostic monitor connector. RECONNECT system. VERIFY system. REACTIVATE system.

N2 CHECK FOR OPEN INDICATOR CIRCUIT

- Leave air bag diagnostic monitor disconnected and ignition switch lock cylinder in ON position.

Is air bag indicator ON?

Yes	No

tomsn048@gmail.com

REPLACE air bag diagnostic monitor. RECONNECT system. VERIFY system. REACTIVATE system.	GO to **N3** .

N3 CHECK INSTRUMENT CLUSTER

Is the air bag indicator operated by an electronic (digital) instrument cluster?

Yes	No
GO to **N4** .	LOCATE and SERVICE the open circuit in the air bag indicator circuitry. CHECK for a burned out bulb, open connectors, pushed out pins, blown fuse, etc. RECONNECT system. VERIFY system. REACTIVATE system.

N4 CHECK ELECTRONIC INSTRUMENT CLUSTER

- Remove the block locking wedge from the air bag diagnostic monitor harness connector.
- Measure the voltage between Pin 4 (+) and 3 (-). Use Rotunda 73 Digital Multimeter 105-R0051 or equivalent.

Is the voltage equal to battery voltage?

Yes	No
REPLACE instrument cluster RECONNECT/ VERIFY/REACTIVATE system.	CHECK connectors on cluster. REPLACE instrument cluster if no poor connections are located. RECONNECT system. VERIFY system. REACTIVATE system.

PINPOINT TEST C: CONTINUOUS AIR BAG INDICATOR — AIR BAG DIAGNOSTIC MONITOR DISCONNECTED OR INOPERATIVE

Normal Operation

The air bag indicator is designed to illuminate for 6 (± 2) seconds when the ignition switch lock cylinder (11582) is turned to the ON position. This initial 6 seconds of air bag indicator illumination (continuous) is considered normal operation and is called prove out of the air bag indicator. If the air bag diagnostic monitor (14B056) detects any faults in the system following prove out, it will flash the air bag indicator a series of times to indicate the diagnostic trouble code that has been detected. If the air bag indicator comes on when the ignition switch lock cylinder is turned to the ON position and stays on for more than 8 seconds continuously, then a fault exists in the air bag indicator circuit.

The air bag diagnostic monitor incorporates a solid state circuit that shorts the air bag indicator line (Circuit 608 BK/Y) to ground to turn the air bag lamp on. When the gray diagnostic monitor harness connector is unplugged from the air bag diagnostic monitor, a shorting bar within the harness connector connects Pins 4 (air bag indicator) and 5 (ground) together. Therefore, the shorting bar will turn the air bag indicator ON whenever the gray diagnostic monitor harness connection is disconnected. Because the shorting bar makes

tomsn048@gmail.com

a continuous connection between Pins 4 and 5 when the connector is disconnected, the air bag indicator will not flash; instead, it will be illuminated continuously.

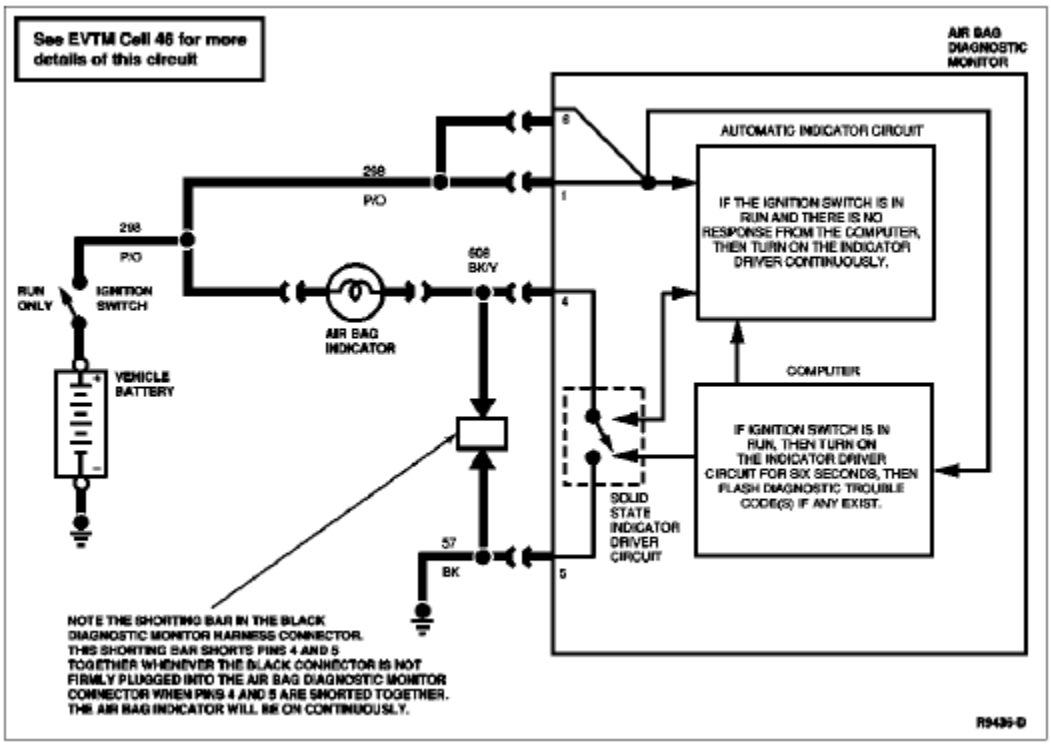
When the ignition switch lock cylinder is turned ON, the computer inside the air bag diagnostic monitor "wakes up" and after approximately 6 seconds turns the air bag indicator off. If the computer fails to wake up, the indicator driver circuit will automatically turn the air bag indicator on continuously indicating a problem in the air bag diagnostic monitor or at the black diagnostic monitor connector.

Possible Causes

Continuous illumination of the air bag indicator can be caused by:

1. A disconnected or poorly connected air bag diagnostic monitor may not push the shorting bar between Pins 4 and 5 into its fully retracted position. This shorts the air bag indicator line to ground and causes the air bag indicator to glow continuously.
2. Shorted air bag indicator wiring.
3. A faulty air bag diagnostic monitor.

Continuous Air Bag Indicator — Air Bag Diagnostic Monitor Disconnected or Inoperative



C1 CHECK IF AIR BAG DIAGNOSTIC MONITOR IS CONNECTED

- Deactivate the supplemental air bag restraint system.
- Inspect connectors on air bag diagnostic monitor.

tomsn048@gmail.com

Are the connectors fully pushed together?

Yes	No
GO to **C2** .	Firmly MATE the connectors to the air bag diagnostic monitor. VERIFY system. REACTIVATE system.

C2 CHECK INDICATOR CIRCUITRY

- Disconnect air bag diagnostic monitor.
- Remove plastic locking wedge from the gray air bag diagnostic monitor harness connector.
- Turn ignition switch lock cylinder to ON position.

Is the air bag indicator on?

Yes	No
LOCATE and SERVICE the short to ground (in Circuit) RECONNECT system. VERIFY system. REACTIVATE system.	GO to **C3** .

C3 INSPECT SHORTING BAR

- Inspect the shorting bars on the plastic locking wedge for proper operation. Compare with another vehicle if necessary.

Is the shorting bar in good working condition?

Yes	No
REPLACE air bag diagnostic monitor. RECONNECT system. VERIFY system. REACTIVATE system.	REPLACE the plastic locking wedge with the correct replacement. Make sure air bag diagnostic monitor has shorting bars on the locking wedge. RECONNECT system. VERIFY system. REACTIVATE system.

PINPOINT TEST 12: LOW BATTERY VOLTAGE (CODE 12)

Normal Operation

The air bag diagnostic monitor measures the voltage at Pin 13 of the diagnostic monitor connector. Voltage at Pin 13 should be equal to battery voltage. If the voltage measured at Pin 13 drops to less than 9 volts, the air bag diagnostic monitor will flash out code 12.

Possible Causes

A drop in battery voltage at Pin 13 of the air bag diagnostic monitor can be caused by:

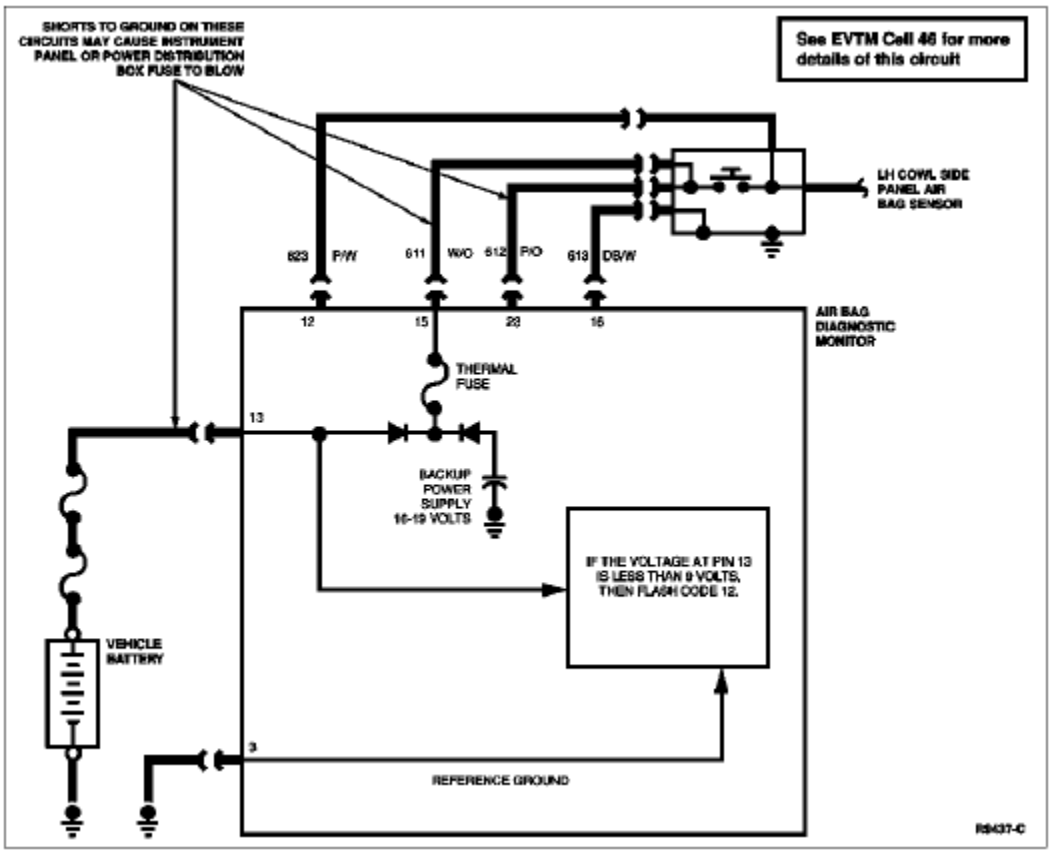
tomsn048@gmail.com

1. An open circuit that would prevent battery voltage from reaching Pin 13 of the air bag diagnostic monitor.

   NOTE: If the instrument panel fuse and/or the power distribution fuse are blown, make sure to diagnose the system for possible causes 2 and 3.

2. A short to ground in Circuit 611 (W/O) or 612 (P/O) may result in a blown instrument panel fuse and/or power distribution fuse.
3. An internal short to ground within the LH cowl side front air bag sensor and bracket (14B005) may result in a blown instrument panel fuse and/or power distribution fuse.
4. A problem in the charging system causing battery voltage to drop below 9 volts.

Low Battery Voltage



12-1 CHECK FOR DTC 12

- Turn ignition switch lock cylinder to ON.
- Count diagnostic trouble code (if any).

Is code 12 flashing?

tomsn048@gmail.com

Yes	No
GO to 12-2 .	READ the normal operation description for this diagnostic trouble code. EXAMINE the trouble code schematic and look for areas where intermittent problems would occur (connectors, splices, crimps, etc.). Do not proceed with pinpoint tests until the code is flashing! Failure to do so will result in needless replacement of the air bag system components and repeat repairs.

12-2 VOLTAGE CHECK

- Deactivate system.
- Disconnect air bag diagnostic monitor.
- Turn ignition switch lock cylinder from OFF to ON.
- Measure voltage between air bag diagnostic monitor connector Pins 13 (+) and 3 (-). Use Rotunda 73 Digital Multimeter 105-R0051 or equivalent.

Is voltage on Pin 13 equal to battery voltage?

Yes	No
REPLACE air bag diagnostic monitor. REPEAT 12-1 .	GO to 12-3 .

12-3 CHECK FUSE

- Check power feed fuse.

Is fuse blown?

Yes	No
REPLACE fuse. GO to 12-4 .	LOCATE and SERVICE the open circuit between fuse 10 and Pin 13 of the harness connection. GO to 12-6 .

12-4 CHECK FOR SHORT IN HARNESS

- Replace fuse.

Does fuse blow again?

Yes	No
LOCATE and SERVICE the short to ground between fuse and Pin 13 of the air bag diagnostic monitor harness connector. GO to 12-6 .	GO to 12-5 .

tomsn048@gmail.com

12-5 CHECK FOR SHORT IN CIRCUIT 611 AND 612

- Reconnect air bag diagnostic monitor.
- Turn ignition switch lock cylinder from OFF to ON.

Did fuse blow again?

Yes	No
LOCATE and SERVICE short to ground in Circuit 611 (W/O) Pin 15 or Circuit 612 (P/O) Pin 13. GO to **12-6** .	The short to ground is intermittent. CHECK all circuits between the fuse air bag diagnostic monitor Pin 13 for pinched wires. Also CHECK Circuit 611 (W/O) and 612 (P/O) for intermittent shorts. LOCATE and SERVICE intermittent short. GO to **12-6** .

12-6 REACTIVATE SYSTEM

- Replace fuse if necessary.
- Reconnect system.
- Prove out system.

Does system prove out OK?

Yes	No
RETURN vehicle to customer.	RETURN to **12-1** .

PINPOINT TEST 13: AIR BAG MODULE OR FRONT AIR BAG PRIMARY CRASH SENSOR CIRCUIT SHORTED TO GROUND (CODE 13)

Normal Operation

The air bag diagnostic monitor measures the voltage at Pin 11 (Circuit 614 GY/O) of the air bag diagnostic monitor connector. The voltage at Pin 11 varies with charging system voltage (the expected voltage at Pin 11 is shown in the chart below).

Pin 11 Voltage	System Voltage
1.9	9.0
2.0	9.5
2.1	10.0
2.2	10.5
2.3	11.0
2.4	11.5

tomsn048@gmail.com

2.5	12.0
2.6	12.5
2.7	13.0
2.8	13.5
2.9	14.0
3.0	14.5
3.1	15.0
3.2	15.5
3.3	16.0

Note that Circuit 614 is connected to Circuit 615 (GY/W) through the driver side air bag module (043B13). Also, note that Circuit 615 is connected to the center air bag sensor feed Circuits (617 [PK/O] and 619 [PK/W]) through a diode inside the air bag diagnostic monitor. If the air bag diagnostic monitor measures a voltage of 2.0 volts or less at Pin 11, the air bag diagnostic monitor will flash out code 13 to indicate a possible short to ground on this circuit (see possible causes below for additional circuits that may be shorted to ground). When flashing code 13, the air bag diagnostic monitor blows its internal thermal fuse. This disables the air bag deployment circuit. If the short to ground is corrected, the voltage at Pin 11 will return to normal and a diagnostic trouble code 51 will flash, indicating an open thermal fuse (see Diagnostic Trouble Code 51 for details).

- Diagnostic Trouble Code 13 will flash only while the short to ground is present.

Possible Causes

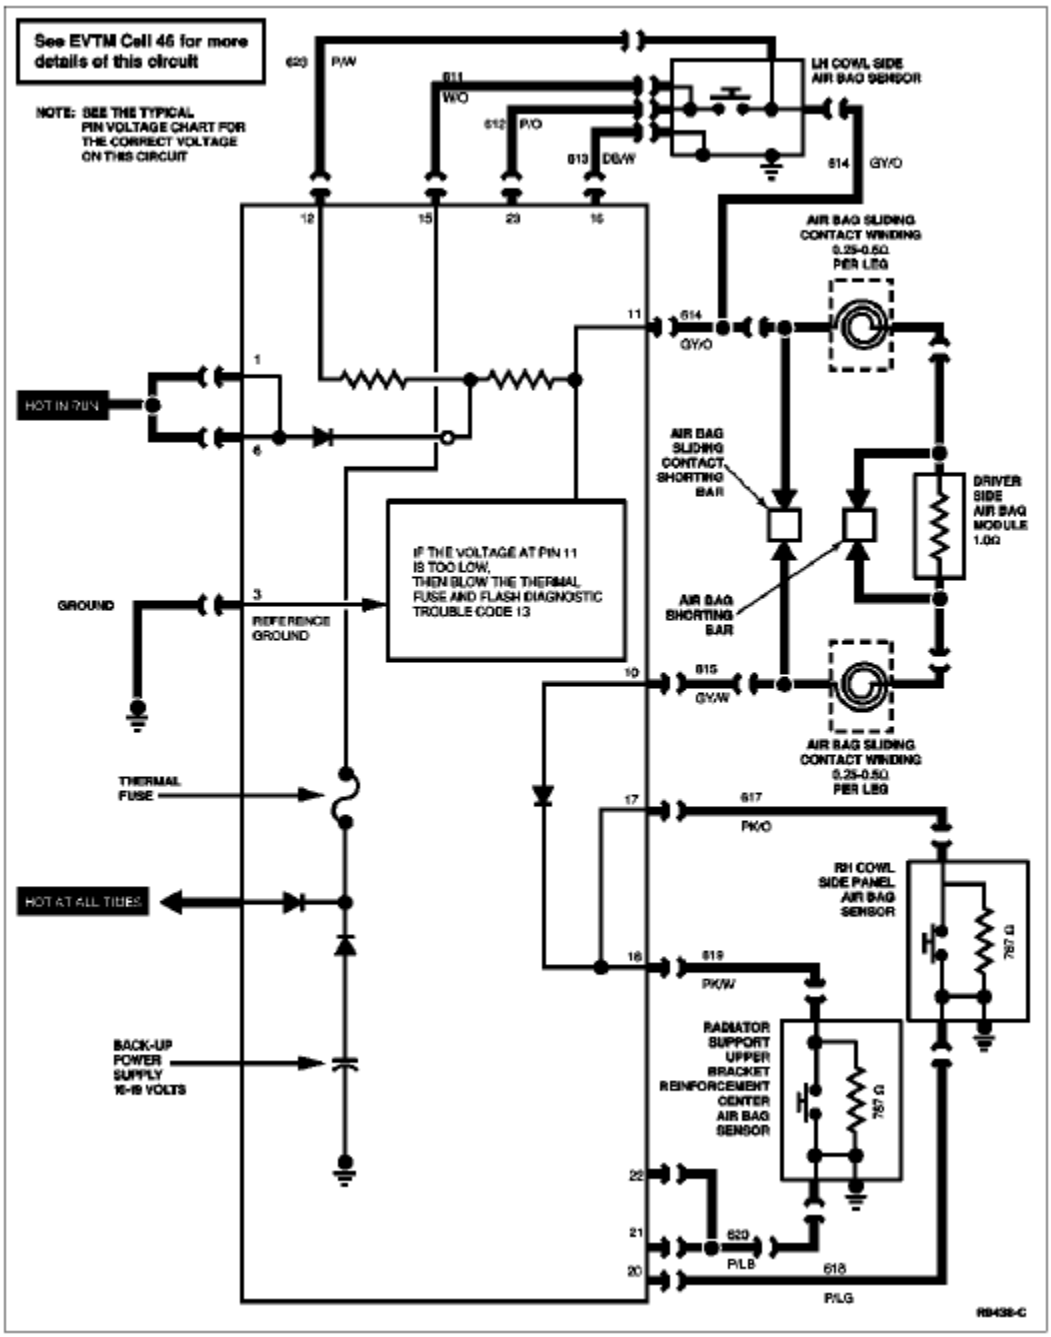
NOTE: Circuits 617 (PK/O) and 619 (PK/W) are connected together inside the air bag diagnostic monitor. Therefore, a short to ground on any of these circuits will short all of the circuits to ground.

Low voltage at Pin 11 of the air bag diagnostic monitor can be caused by:

1. A short to ground within the main wiring (14401) on Circuits 614 (GY/O), 615 (GY/W), 623 (P/W), 617 (PK/O) or 619 (PK/W) causing the diagnostic voltage to drop.
2. An internal short to ground within the air bag sliding contact (14A664) causing the driver side air bag circuit(s) to be shorted to ground.
3. An internal short to ground within the LH cowl side front air bag sensor and bracket causing Circuit 614 (GY/O) or 623 (P/W) to be shorted to ground.
4. An internal short to ground within one or both center air bag sensor and bracket (14B006) and RH cowl side front air bag sensor and bracket (14B004) causing Circuits 617 (PK/O) and 619 (PK/W) to be shorted to ground.
5. An internal short to case ground within the driver side air bag module.

Air Bag Module or Primary Crash Sensor Circuit Shorted to Ground

tomsn048@gmail.com



13-1 CHECK FOR DTC 13

- Turn ignition switch lock cylinder to ON.
- Count diagnostic trouble code (if any).

Is code 13 flashing?

Yes	No
	READ the normal operation description for this

tomsn048@gmail.com

GO to **13-2** .	diagnostic trouble code. EXAMINE the fault code schematic and LOOK for areas where intermittent problems would occur (connectors, splices, crimps, etc.). Do not proceed with pinpoint tests until the code is flashing! Failure to do so will result in needless replacement of the air bag system components and repeat repairs.

13-2 CHECK FOR SHORTED AIR BAG MODULE

- Deactivate system. Carefully disconnect the air bag module. Do not disturb the wiring.
- Turn ignition switch lock cylinder to ON.

Is code 13 still flashing?

Yes	No
GO to **13-3** .	GO to **13-6** .

13-3 CHECK FOR SHORTED WIRING

- Set the Rotunda 73 Digital Multimeter 105-R0051 or equivalent to 2000 ohms scale or auto.
- Disconnect negative battery cable.
- Measure the resistance between Pin 3 (ground) and all of the following: Pin 11 (Circuit 614, GY/O) Pin 17 (Circuit 617, PK/O) Pin 18 (Circuit 619, PK/W) Normal resistance for these pins is as follows: Pin 11 open, infinite resistance, Pin 17 787 ± 10 ohms, Pin 18 787 ± 10 ohms.

Are any of these circuits shorted to ground?

Yes	No
If Pin 11 is shorted to ground, GO to **13-4** . If Pin 17 or 18 is shorted to ground, GO to **13-5** .	GO to **13-7** .

13-4 CHECK RESISTANCE IN AIR BAG SLIDING CONTACT

- Examine wiring connector where air bag sliding contact mates to the main vehicle harness underneath the steering column. Check for pinched and/or chafed wires. Service any damaged wiring. GO to **13-7** if damaged wiring is located.
- If no damaged wiring is located, disconnect air bag sliding contact from main harness, connect the air bag simulator to main vehicle harness in place of the air bag sliding contact.
- Measure the resistance of Pin 11 to ground.

Is Pin 11 still shorted to ground?

Yes	No
LOCATE and SERVICE the short to ground in either Circuit: 623 — (P/W) 614 — (GY/O) 615	

tomsn048@gmail.com

— (GY/W) 616 — (PK/BK) Pass. BA. Vehicles Only. CHECK OASIS for potential locations where shorts may occur. When short has been serviced, GO to **13-7** .	REPLACE air bag sliding contact clockspring. GO to **13-7** .

13-5 LOCATE SHORTED SENSOR WIRING

NOTE: Make sure to measure across the PK/W and P/LB wires to the radiator support center air bag sensor.

- Locate and disconnect the center air bag or front air bag (RH) sensor that was shorted to ground.
- Measure resistance across the sensor contacts at the sensor connector. Normal resistance for a center air bag or front air bag (RH) sensor is 787 ± 10 ohms.

Is the sensor shorted?

Yes	No
REPLACE the sensor. GO to **13-7** .	LOCATE and SERVICE the short to ground in the wiring harness on the shorted circuit. GO to **13-7** .

13-6 CHECK AIR BAG SLIDING CONTACT

- Examine the air bag sliding contact in the steering wheel hub for pinched or chafed wires.

Do wires check OK?

Yes	No
REPLACE driver side air bag module. GO to **13-7** .	REPLACE air bag sliding contact. GO to **13-7** .

13-7 SHORT TO GROUND REPAIRED OR CORRECTED

- After a short to ground has been corrected, the air bag diagnostic monitor will flash out code 51. Code 51 indicates that the fuse inside the air bag diagnostic monitor is blown and the short to ground no longer exists. If a short to ground has not been located and serviced (short to ground corrected itself), consult OASIS for potential wiring shorts.

Has short to ground been correctly located and serviced?

Yes	No
REFER to Diagnostic Trouble Code 51 in this section.	RECONNECT system. VERIFY system. REACTIVATE system.

PINPOINT TEST 21: SAFING SENSOR NOT MOUNTED TO VEHICLE PROPERLY (CODE 21)

tomsn048@gmail.com

Normal Operation

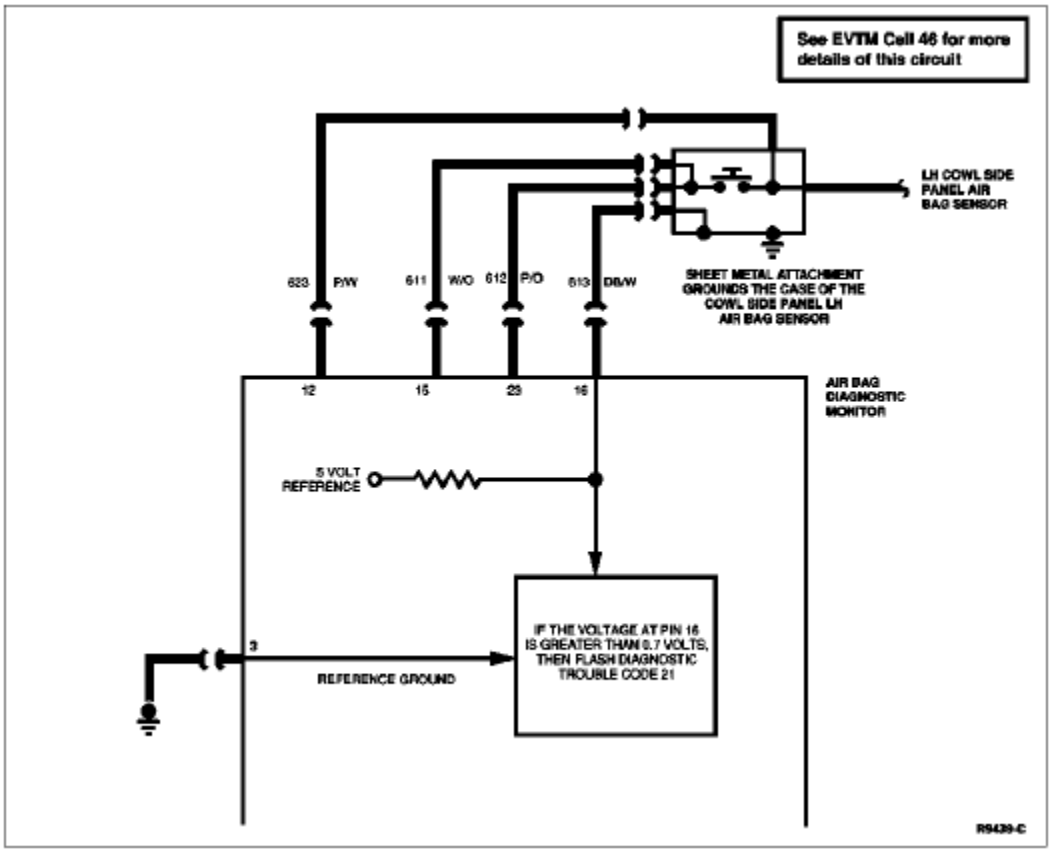
Circuit 613 (DB/W) is riveted to the side housing of LH cowl side front air bag sensor and bracket. The housing is grounded to the vehicle. A resistor inside the air bag diagnostic monitor is connected to Pin 16 (Circuit 613 DB/W) and a 5-volt reference voltage. If Circuit 613 is properly grounded, the voltage at Pin 16 will be 0 volts. If the voltage on Circuit 613 is greater than 0.7 volts, the air bag diagnostic monitor may flash diagnostic trouble Code 21, indicating that the LH cowl side front air bag sensor and bracket is not grounded properly to the vehicle.

Possible Causes

High voltage at Pin 16 can be caused by:

1. A poor connection due to loose mounting, dirt, or corrosion at the sensor mounting surface.
2. An open or damaged wire in Circuit 613 (DB/W) from Pin 16 of the diagnostic monitor connector to the LH cowl side front air bag sensor and bracket.
3. An open wire or loose rivet inside the LH cowl side front air bag sensor and bracket.

Safing Sensor Not Mounted to Vehicle Properly



tomsn048@gmail.com

21-1 CHECK FOR DTC 21

- Turn ignition switch lock cylinder to ON.
- Count diagnostic trouble code (if any).

Is code 21 flashing?

Yes	No
GO to 21-2 .	READ the normal operation description for this diagnostic trouble code. EXAMINE the diagnostic trouble code schematic and look for areas where intermittent problems would occur (connectors, splices, crimps, etc.). Do not proceed with Pinpoint Test until the code is flashing! Failure to do so will result in needless replacement of the air bag system components and repeat repairs.

21-2 CHECK LEFT FRONT AIR BAG (LH) SENSOR

- Deactivate system.
- Disconnect battery ground cable.
- Measure resistance between Pin 3 (ground) and Pin 16 — Circuit 613 (DB/W) — front air bag (LH) sensor ground using Rotunda 73 Digital Multimeter 105-R0051 or equivalent.

Is the resistance greater than 2 ohms?

Yes	No
GO to 21-3 .	REPLACE air bag diagnostic monitor. RECONNECT system. VERIFY system. REACTIVATE system.

21-3 CHECK LH COWL SIDE SENSOR CIRCUIT

- Disconnect cowl side panel front air bag sensor.
- Measure resistance of Circuit 613 (DB/W) sensor wire to the sensor mounting sheet metal.

Is resistance greater than 2 ohms?

Yes	No
GO to 21-4 .	LOCATE and SERVICE the high resistance or open circuit in Circuit 613 (DB/W). RECONNECT system. VERIFY system. REACTIVATE system.

21-4 CHECK LH COWL SIDE AIR BAG SENSOR

tomsn048@gmail.com

- Remove LH cowl side panel front air bag sensor and bracket from mounting to vehicle.
- Thoroughly clean sensor mounting surface.
- Install the LH cowl side panel front air bag sensor and bracket.
- Measure the Circuit 613 (DB/W) sensor wire to ground.

Is the resistance greater than 2 ohms?

Yes	No
REPLACE the LH cowl side front air bag sensor and bracket. RECONNECT system. VERIFY system. REACTIVATE system.	RECONNECT system, VERIFY system. REACTIVATE system.

PINPOINT TEST 22: SAFING SENSOR OUTPUT SHORTED TO BATTERY VOLTAGE (CODE 22)

Normal Operation

The air bag diagnostic monitor measures voltage at Pins 11 (Circuit 614, GY/O) and 12 (Circuit 623, P/W). The voltage at these pins is controlled by two resistors inside the air bag diagnostic monitor (along with the resistors inside the center air bag sensor and bracket and RH cowl side air bag sensor and bracket). Refer to normal operation for Code 24 for more information. This voltage varies with charging system voltage (the expected voltage at Pins 11 and 12 are shown in the chart below).

If the voltage at both of these pins exceeds 5 volts, the air bag diagnostic monitor will flash out code 22.

Pin 11 and Pin 12 Voltage	System Voltage
1.9	9.0
2.0	9.5
2.1	10.0
2.2	10.5
2.3	11.0

Possible Causes

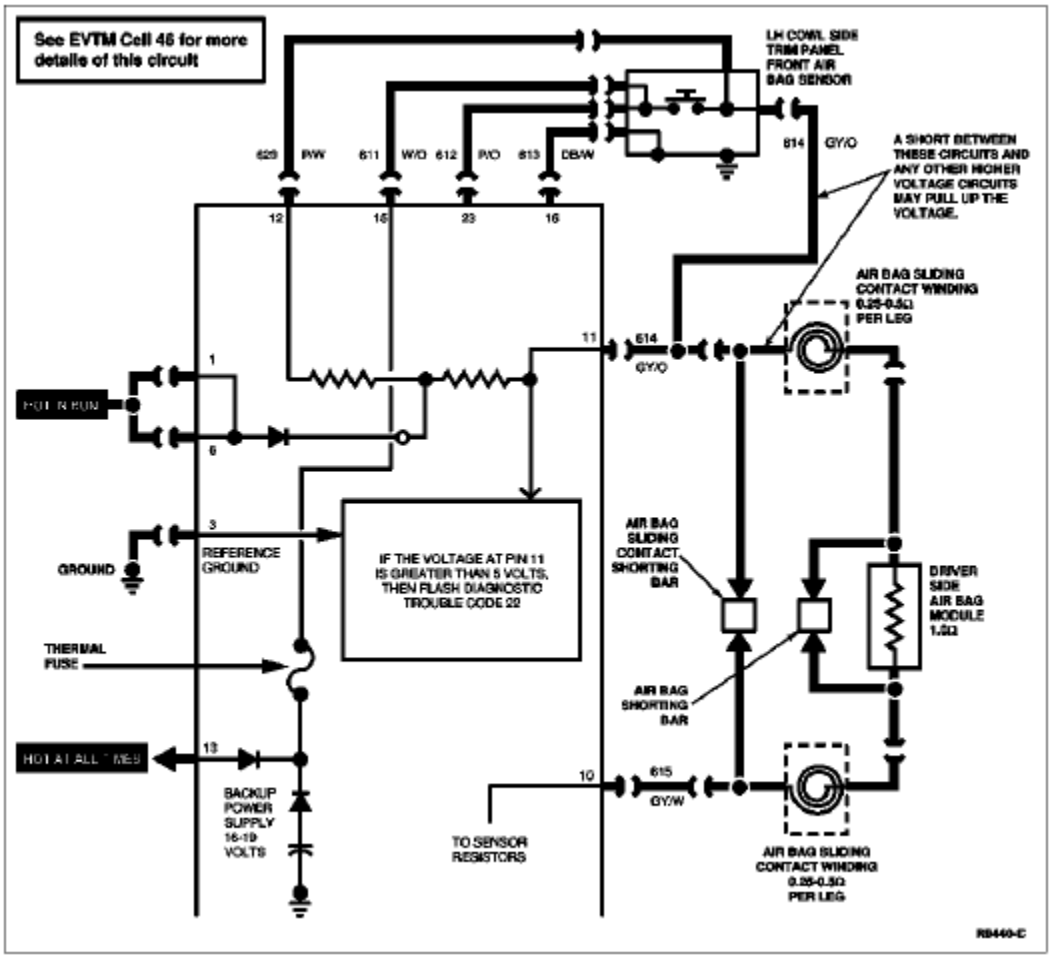
tomsn048@gmail.com

High voltage at Pins 11 and 12 can be caused by:

NOTE: The wiring harness leading to the LH cowl side front air bag sensor and bracket carries higher voltage circuits that may short to Circuits 614 and 623.

1. A short in the wiring harness between Circuits 614 (GY/O) or 623 (P/W) and another wire can cause high voltage on these circuits.
2. A short in the air bag sliding contact between Circuit 614 and some of the horn or speed control wiring.
3. A short across the normally open contacts of the LH cowl side front air bag sensor and bracket.
    - · The voltage at Circuit 611 and 612 inside the LH cowl side front air bag sensor and bracket is usually battery voltage or higher. There should be an open circuit across the contacts of the LH cowl side front air bag sensor and bracket, if the sensor is operating normally. If sensor contacts are closed, the voltage on Circuits 614 and 623 would be high (at least battery voltage).
4. Vehicle charging system voltage too high. If the generator output voltage is too high (greater than 17 volts) it may cause a code 22 to occur.

Safing Sensor Circuit Output Shorted to Battery Voltage



tomsn048@gmail.com

22-1 PROVE OUT CONDITION

- Turn ignition switch lock cylinder to ON.
- Count diagnostic code (if any).

Is code 22 flashing?

Yes	No
GO to **22-2** .	READ the normal operation description for this diagnostic trouble code. EXAMINE the diagnostic trouble code schematic and look for areas where intermittent problems would occur (connectors, splices, crimps, etc.) Do not proceed with Pinpoint Test until the code is flashing! Failure to do so will result in needless replacement of the air bag system components and repeat repairs.

22-2 CHECK FOR SHORTED CIRCUIT

- Deactivate system.
- Measure voltage on Circuit 614 (GY/O) — Pin 11 to Pin 3 (ground).
- Use voltage table for the normal voltage specification.

Is the voltage measured high?

Yes	No
LOCATE and SERVICE the short to B+ on Circuit 614 (GY/O). GO to **22-3** .	REPLACE air bag diagnostic monitor. RECONNECT system. VERIFY system. REACTIVATE system.

22-3 CHECK FOR SHORTED WIRING

- Check for resistance across cowl side panel (LH) front air bag sensor and bracket contacts, circuit 611 (W/O) and circuit 614 (GY/O).

Is resistance infinite (open)?

Yes	No
CHECK for other wire to wire shorts. REPAIR shorts. RECONNECT system. VERIFY system. REACTIVATE system.	REPLACE LH cowl side front air bag sensor and bracket. RECONNECT system. VERIFY system. REACTIVATE system.

PINPOINT TEST 23: SAFING SENSOR INPUT FEED/RETURN CIRCUIT OPEN (CODE 23)

tomsn048@gmail.com

Normal Operation

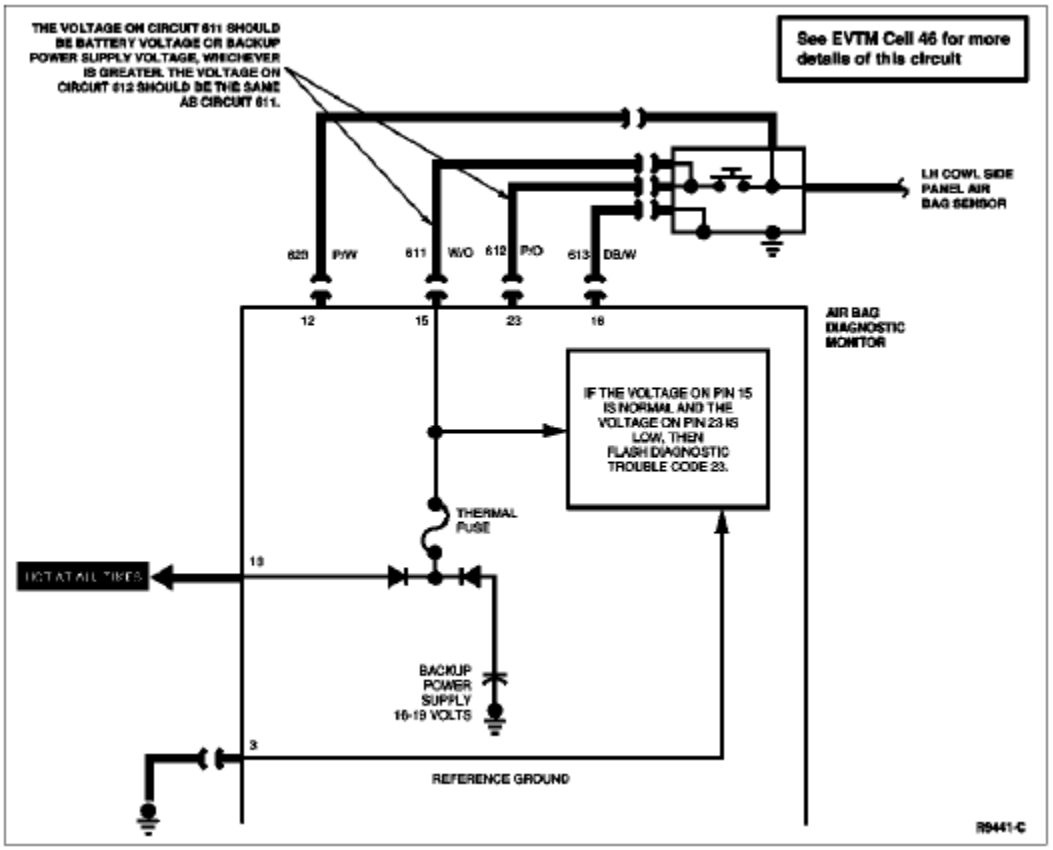
Battery voltage is provided at air bag diagnostic monitor Pin 15 (Circuit 611 W/O) at all times. However, voltage at Pin 15 can be as high as 19 volts (as provided by the backup power supply) when the ignition switch (11572) is in the RUN position and the backup power supply in the air bag diagnostic monitor is charged up. Circuit 612 (P/O) is connected to Circuit 611 (W/O) inside the LH cowl side air bag sensor and bracket. Therefore, the voltage at Pin 23 (Circuit 612 P/O) should be the same as the voltage at Pin 15 at all times. The air bag diagnostic monitor compares the voltage available at Pins 15 and 23. If the voltage at Pin 23 is low, the air bag diagnostic monitor will flash out Code 23 to indicate an open between these two circuits.

Possible Causes

Low voltage at Pin 23 can be caused by:

1. An open circuit in the wiring harness in either Circuit 611 (W/O) or 612 (P/O).
2. An open circuit inside the LH cowl side front air bag sensor and bracket across the Circuit 611 (W/O) and Circuit 612 (P/O) wires.

Safing Sensor Circuit Input Feed/Return Circuit Open



tomsn048@gmail.com

23-1 CHECK FOR DTC 23

- Turn ignition switch lock cylinder to ON.
- Count diagnostic trouble code (if any).

Is code 23 flashing?

Yes	No
GO to 23-2 .	READ the normal operation description for this diagnostic trouble code. EXAMINE the diagnostic trouble code schematic and look for areas where intermittent problems would occur (connectors, splices, crimps, etc.). Do not proceed with Pinpoint Test until the code is flashing! Failure to do so will result in needless replacement of the air bag system components and repeat repairs.

23-2 DEACTIVATE SYSTEM

- Deactivate system.
- Turn ignition switch lock cylinder off then on.
- Wait 30 seconds.
- Measure voltage on the following pins using Pin 3 as a ground: Pin 15 — Circuit 611 (W/O). Pin 23 — Circuit 612 (P/O).
- Use the voltage table for the normal specification.

Is voltage on these pins normal?

Yes	No
REPLACE air bag diagnostic monitor. RECONNECT system. VERIFY system. REACTIVATE system.	GO to 23-3 .

23-3 CHECK CIRCUIT CONTINUITY

- Disconnect the cowl side panel (LH) front air bag sensor and bracket.
- Measure resistance across the Circuit 611 (W/O) and Circuit 612 (P/O) wires on the sensor connector.

Is there continuity across these circuits?

Yes	No
An open exists in the harness. LOCATE and SERVICE the open wire in either Circuit 611 or 612. RECONNECT the system. VERIFY The system. REACTIVATE the system.	REPLACE the LH cowl side panel front air bag sensor and bracket. RECONNECT the system. VERIFY the system. REACTIVATE the system.

tomsn048@gmail.com

PINPOINT TEST 24: SAFING SENSOR OUTPUT FEED/RETURN CIRCUIT OPEN OR LOW RESISTANCE IN A PRIMARY CRASH SENSOR (CODE 24)

Normal Operation

The center air bag sensor and bracket and RH cowl side front air bag sensor and bracket have an internal resistor. The air bag diagnostic monitor uses the resistor in the center air bag sensor and bracket and RH cowl side front air bag sensor and bracket in combination with the two resistors inside the air bag diagnostic monitor to create a tightly controlled diagnostic voltage at Pin 11 (Circuit 614, GY/O). The sensors are tied together inside the air bag diagnostic monitor at Pins 17 (Circuit 617, PK/O) and 18 (Circuit 619, PK/W). Therefore, the resistors in the sensors are connected in parallel. The parallel combination of all the sensor resistors should be equal to 393 ohms.

The resistors inside the air bag diagnostic monitor are connected to Pins 11 (Circuit 614, GY/O) and 12 (Circuit 623, P/W) and are equal in value. Note that Circuits 614 and 623 are tied together inside the LH cowl side front air bag sensor and bracket. Therefore, the two resistors inside the air bag diagnostic monitor are connected in parallel and will function the same as one resistor of half the original value. Current flows from the battery positive voltage within the air bag diagnostic monitor, through the resistors, out to Circuits 614 (GY/O) and 623 (P/W) on Pins 11 and 12, through the LH cowl side panel front air bag sensor and bracket and out to the driver side air bag module. Current flows through the driver side air bag module and into Pin 10 (Circuit 615, GY/W).

Current then flows from Pin 10 through the diode inside the air bag diagnostic monitor and out to the center air bag sensor and bracket and RH cowl side air bag front air bag sensor and bracket through Pins 17 and 18. The current flows through each sensor resistor and terminates at the case ground of each sensor. Pin 11 is the midpoint of the resistor network and voltage at Pin 11 will change with vehicle charging system voltage. The expected voltage at Pin 11 is shown in the table below. The air bag diagnostic monitor measures the vehicle charging system voltage at Pin 13 (battery input). By measuring the voltage at Pin 13, the air bag diagnostic monitor can accurately predict what the voltage at Pin 11 should be in a normal functioning system.

If the connection between Circuits 614 (GY/O) and 623 (P/W) inside the air bag diagnostic monitor is broken, then the resistor on Pin 12 is no longer in the diagnostic circuit explained above. Both resistors are needed to pull up the diagnostic voltage to the correct value. In this situation, the resistor on Pin 11 is the only resistor inside the air bag diagnostic monitor pulling up the voltage. Therefore, the voltage on Pin 11 will be half of the normal expected voltage and the voltage on Pin 12 will be approximately equal to the vehicle charging system voltage.

The air bag diagnostic monitor does not measure the voltage on Pin 12, so the monitor bases its decision strictly on the voltage at Pin 11. If the voltage at Pin 11 is lower than it should be, the monitor will flash code 24.

Another situation that can cause low voltage at Pin 11 is a decrease in air bag sensor resistance (resistance is too low). If this occurs, the voltage at Pin 11 will be pulled down to a lower than normal value because the parallel combination resistance of center air bag sensor and bracket and RH cowl side front air bag sensor and bracket will be less than 390 ohms. In this situation, the voltage at Pins 11 and 12 will be identical, but the air bag diagnostic monitor does not measure the voltage at Pin 12. Therefore, a center air bag sensor and bracket or RH cowl side with low resistance may cause low voltage at Pin 11 and the air bag diagnostic monitor will flash code 24 on the air bag indicator.

Possible Causes

Low voltage at Pin 11 and high voltage at Pin 12 can be caused by:

1. An open circuit or high resistance in the wiring harness in Circuit 614 (GY/O) or 623 (P/W).

tomsn048@gmail.com

2. An open circuit or high resistance inside the RH cowl side front air bag sensor and bracket across the GY/O and P/W wires.
    - Low voltage on both Pins 11 and 12 can be caused by:
3. Resistance to ground on Circuit 614 or 623. Circuits 614 and 623 should be open circuits to ground when the air bag diagnostic monitor is disconnected from main wiring. Resistance to ground on these circuits can cause a drop in the diagnostic voltage on both circuits.
4. Low resistance in one or more of center air bag sensor and bracket and RH cowl side front air bag sensor and bracket. If the resistance of one or more of the center air bag sensor and bracket and RH cowl side front air bag sensor and bracket is lower than normal, the voltage on Pin 11 will be pulled down too low.
5. A poor ground on Pin 3 of the air bag diagnostic monitor may cause voltage to appear on the diagnostic monitor ground reference. Any voltage on the ground reference will cause the air bag diagnostic monitor to measure the voltage at Pin 11 as low, even though the voltage on Pin 11 with respect to sheet metal is normal.
6. Intermittent battery voltage at Pin 13 can cause the reference voltage inside the air bag diagnostic monitor to fluctuate and can cause diagnostic trouble code 24 in some circumstances.

Pin 11 and Pin 12 Voltage	System Voltage

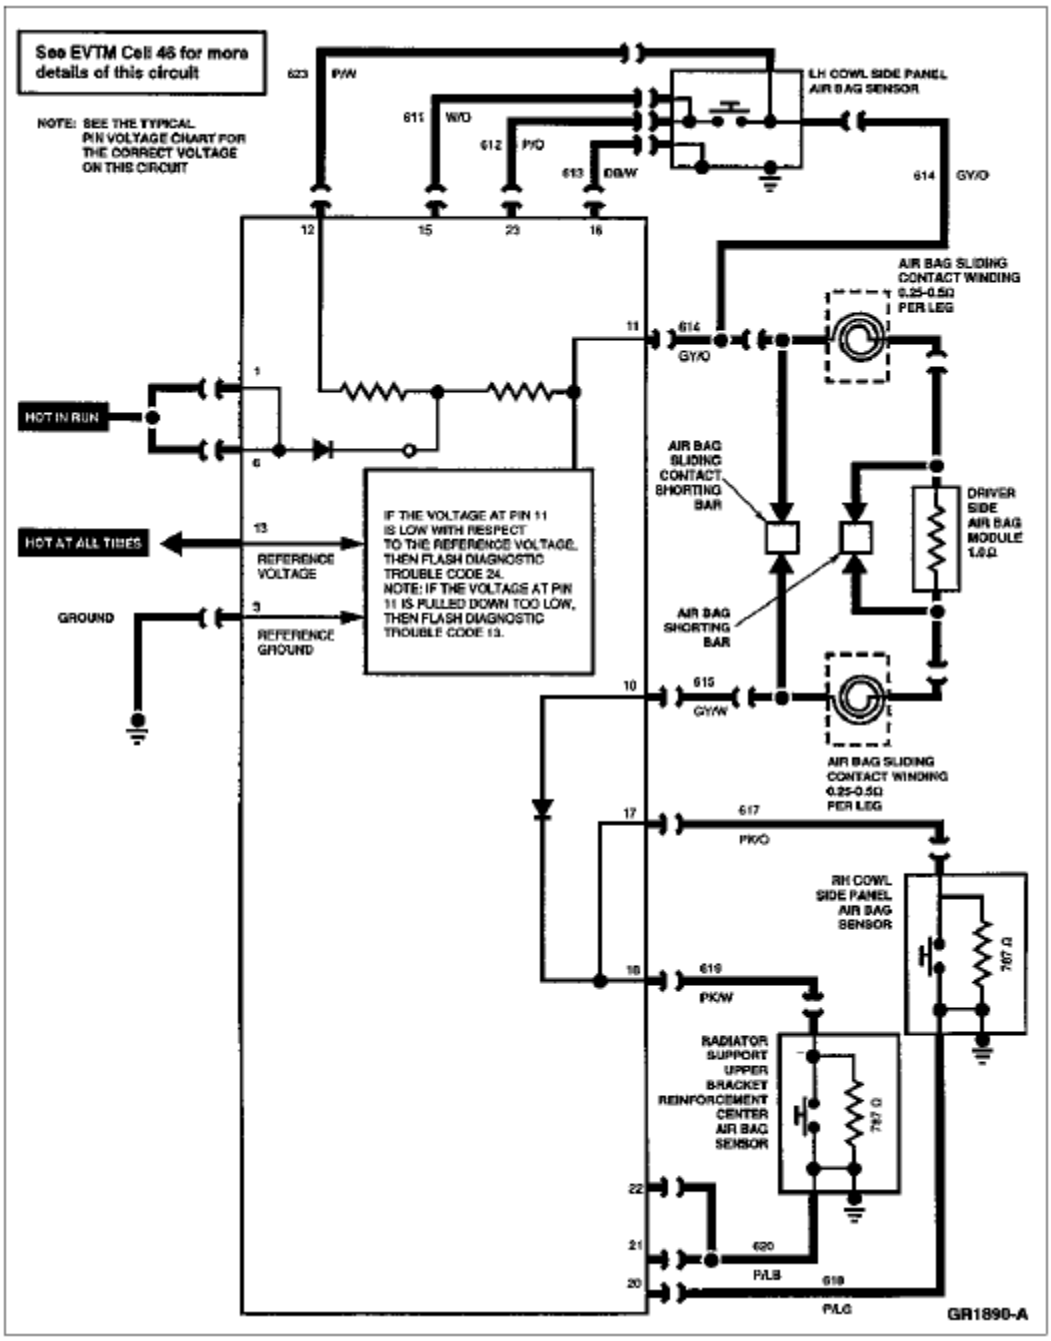
Safing Sensor Output Feed/Return Circuit Open or Low Resistance in a Primary Crash Sensor

tomsn048@gmail.com



24-1 CHECK FOR DTC 24

- Turn ignition switch lock cylinder to ON.
- Count diagnostic code (if any).

Is code 24 flashing?

Yes	No
	READ the normal operation description for this

tomsn048@gmail.com

GO to 24-2 .	diagnostic trouble code. EXAMINE the diagnostic trouble code schematic and LOOK for areas where intermittent problems would occur (connectors, splices, crimps, etc.) Do not proceed with Pinpoint Test until the code is flashing! Failure to do so will result in needless replacement of the air bag system components and repeat repairs.

24-2 DEACTIVATE SYSTEM

- Deactivate system.
- Turn the ignition switch lock cylinder off then on.
- Using Pin 3 as a ground, measure voltage on the following circuits: Pin 11 — Circuit 614 (GY/O) Pin 12 — Circuit 612 (P/W)
- Use the voltage table for normal specifications.

Are voltages at these terminals within specification?

Yes	No
CHECK the "Hot At All Times" voltage feed circuit, from the fuse block to Pin 13 of the air bag diagnostic monitor harness connector for intermittent open circuits. If none are found, REPLACE the air bag diagnostic monitor. RECONNECT the system. VERIFY the system. REACTIVATE the system.	If both Pin 11 and Pin 12 measure low voltage then GO to 24-3 . If Pin 11 measures high and Pin 12 measures low then GO to 24-4 .

24-3 CHECK CIRCUIT RESISTANCE

- Turn the ignition switch lock cylinder off.
- Disconnect the air bag diagnostic monitor.
- Disconnect the battery ground cable.
- Using Pin 3 as a ground, measure the resistance of the following pins in the air bag diagnostic monitor harness connector: Pin 17 — Circuit 617 (PK/O) Pin 18 — Circuit 619 (PK/W)

Are all resistance measurements 787 ohms (± 10) ohms?

Yes	No
GO to 24-6 .	GO to 24-5 .

24-4 CHECK FOR SHORTED CIRCUIT

- Turn ignition switch lock cylinder off then on.
- Disconnect the LH cowl side trim panel front air bag sensor and bracket.
- Measure the resistance across the Circuit 614 (GY/O) and Circuit 623 (P/W) wires in the sensor connector.

tomsn048@gmail.com

Is there a short circuit across the Circuit 614 (GY/O) and Circuit 623 (P/W) wires?

Yes	No
LOCATE and SERVICE the open in Circuit 614 (GY/O) or Circuit 623 (P/W) of the wiring harness. RECONNECT system. VERIFY system. REACTIVATE system.	REPLACE the LH cowl side front air bag sensor and bracket. RECONNECT system. VERIFY system. REACTIVATE system.

24-5 CHECK SENSOR RESISTANCE

- Disconnect the abnormal front air bag sensor from the harness.
- Measure the resistance directly across the front air bag sensor contacts.

Is the resistance 787 ohms (±10 ohms)?

Yes	No
LOCATE and SERVICE the short to ground in the wiring harness. RECONNECT system. VERIFY system. REACTIVATE system.	REPLACE the LH cowl side front air bag sensor and bracket. RECONNECT system. VERIFY system. REACTIVATE system.

24-6 CHECK FOR SHORTED CIRCUIT ON PIN 11

- Using Pin 3 as a ground, measure the resistance of Pin 11 — Circuit 614 (GY/O) to ground (ohmmeter must be on its highest scale).

Is the circuit open?

Yes	No
REPLACE the air bag diagnostic monitor. RECONNECT system. VERIFY system. REACTIVATE system.	LOCATE and SERVICE short to ground in either Circuit 614 (GY/O), 615 (GY/W), 623 (P/O). Also check driver side air bag module, air bag sliding contact, LH cowl side front air bag sensor and bracket for internal shorts to ground. Once repaired, RECONNECT system. VERIFY system. REACTIVATE system.

PINPOINT TEST 32: DRIVER SIDE AIR BAD CIRCUIT HIGH RESISTANCE OR OPEN (DIAGNOSTIC TROUBLE CODE 32)

Normal Operation

NOTE: The connectors for the driver side air bag module and the air bag sliding contact have metal spring clips that act as shorting bars. These shorting bars are built into the plastic hardshell connectors. The shorting bars are designed to short Circuits 614 and 615 together when the connectors are not mated. Do not attempt to remove the air bag shorting bar and measure the resistance of the driver side air bag module.

The air bag diagnostic monitor measures the resistance across Pin 10 (Circuit 615, GY/W) and Pin 11 (Circuit 614, GY/O) every time the ignition switch is turned to the RUN position. Normal resistance across

tomsn048@gmail.com

these circuits is between 1.5 and 2.0 ohms. This resistance comes from the driver side air bag module (approximately 1.0 ohms) and the windings of the air bag sliding contact (approximately 0.25 to 0.5 ohms per winding, two windings in all). If the resistance across these two circuits exceeds 4.0 ohms, this indicates a high resistance and the air bag diagnostic monitor will flash code 32.

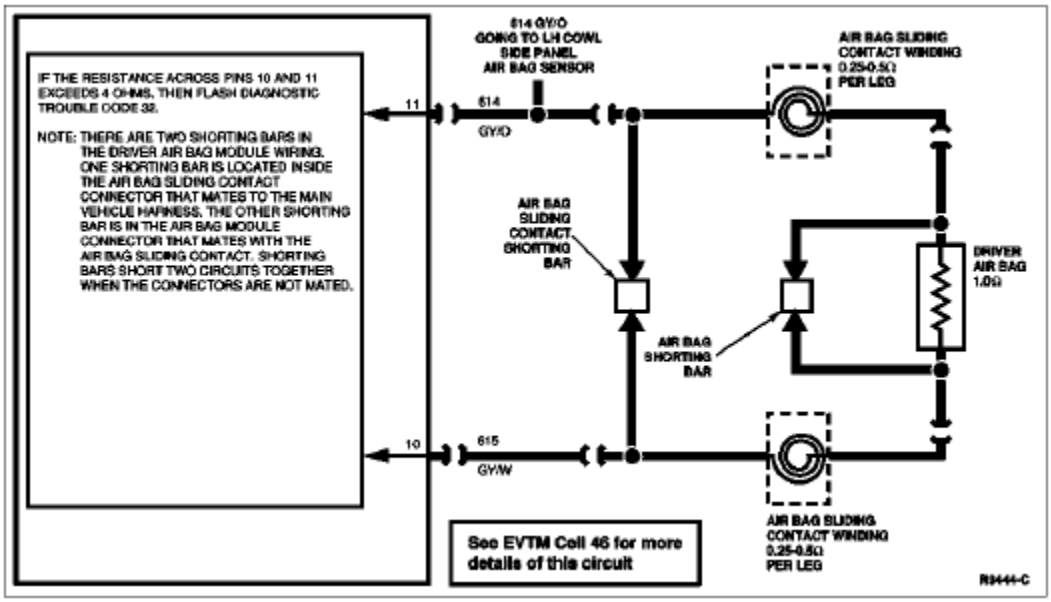
The shorting bar of the air bag sliding contact may be removed to measure the resistance of the air bag sliding contact. Use extreme care when reinstalling the shorting bar to make sure it is installed correctly.

Possible Causes

Excessive resistance across Pins 10 and 11 can be caused by:

1. A poor connection where the air bag sliding contact connects into the main wiring. The air bag sliding contact connector at the base of the steering column may have excessive resistance between the male and female terminals in the connector.
2. An open circuit or high resistance in the windings inside the air bag sliding contact.
3. An open circuit or high resistance in the wiring harness in either Circuit 614 (GY/O) or Circuit 615 (GY/W).
4. An open circuit or high resistance in the driver side air bag module. DO NOT attempt a direct resistance measurement of the driver side air bag module. Follow the diagnostic procedures to determine if the resistance is higher than normal.

Driver Side Air Bag Circuit High Resistance or Open



32-1 CHECK FOR DTC 32

- Turn ignition switch lock cylinder to ON.
- Count diagnostic trouble code (if any).

tomsn048@gmail.com

Is code 32 flashing?

Yes	No
GO to 32-2 .	READ the normal operation description for this diagnostic trouble code. EXAMINE the diagnostic trouble code schematic and LOOK for areas where intermittent problems would occur (connectors, splices, crimps, etc.). Do not proceed with Pinpoint Test until the code is flashing! Failure to do so will result in needless replacement of the air bag system components and repeat repairs.

32-2 CHECK CIRCUIT RESISTANCE

- Deactivate system.
- Disconnect air bag diagnostic monitor.
- Set ohmmeter, Rotunda 73 Digital Multimeter 105-R0051 or equivalent on lowest scale possible (200 ohms for most meters).
- "Zero" the ohmmeter by touching the leads together and record the resistance reading.
- Remove the plastic locking wedge from the black harness connector.
- Measure the resistance across Pin 11 — Circuit 614 (GY/O) and Pin 10 — Circuit 615 (GY/W). Record the measurement. Subtract this reading from the reading made when zeroing the ohmmeter.

Is the result less than 2.5 ohms?

Yes	No
Make sure that the locking wedge has been removed from the block harness connector. Make sure to use the 2-ohm air bag simulator and not jumper wire. GO to 32-3 .	GO to 32-3 .

32-3 CIRCUIT RESISTANCE RESULTS

Is the result greater than 3.0 ohms?

Yes	No
GO to 32-5 .	GO to 32-4 .

32-4 CHECK CONNECTOR

- Reconnect the air bag diagnostic monitor.
- Turn the ignition switch lock cylinder OFF, then ON.

Is code 32 still flashing?

Yes	No

tomsn048@gmail.com

REPLACE the air bag diagnostic monitor. RECONNECT system. VERIFY system. REACTIVATE system.	INSPECT air bag diagnostic monitor harness connector for improperly retained Pins 10 and 11. If OK, INSPECT sliding contact wiring in steering wheel for damaged wiring. If OK, RECONNECT driver side air bag module and VERIFY system. If Code 32 is still flashing, REPLACE driver side air bag module. RECONNECT system. VERIFY system. REACTIVATE system.

32-5 CHECK AIR BAG SLIDING CONTACT

- Disconnect the air bag sliding contact at the base of the steering column.
- Install the Rotunda Air Bag Simulator 105-R0011 or equivalent, on the main wiring harness at the base of the steering column.
- Measure the resistance across Pin 10 — Circuit 615 (GY/W) and Pin 11 Circuit 614 (GY/O) on the air bag diagnostic monitor harness connector. Subtract this reading from the reading made when zeroing the ohmmeter.

Is the result equal to 2.0 ohm ± 0.2-ohm?

Yes	No
REPLACE the air bag sliding contact. REFER to Section 11-04B for removal and installation procedures. RECONNECT system. VERIFY system. REACTIVATE systems.	LOCATE and SERVICE the open in Circuit 614 or 615. RECONNECT system. VERIFY system. REACTIVATE system.

PINPOINT TEST 33: PASSENGER SIDE AIR BAG CIRCUIT HIGH RESISTANCE OR OPEN (DIAGNOSTIC TROUBLE CODE 33)

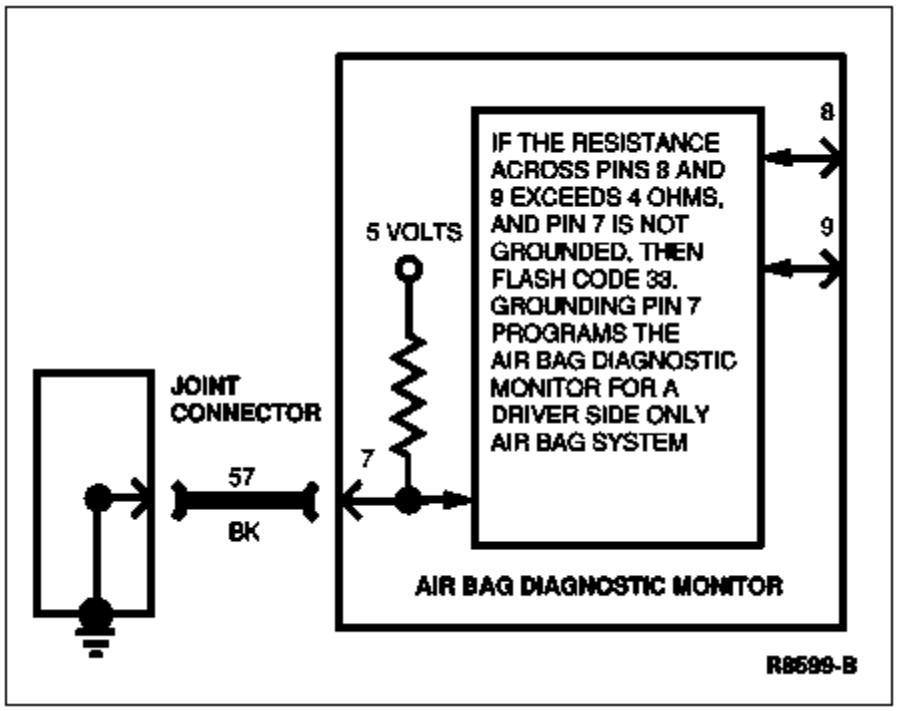
Normal Operation

The air bag diagnostic monitor measures the resistance across Pin 8 and Pin 9 every time the ignition switch is turned to the RUN position. Normal resistance across these circuits is between 0.9 ohms and 1.1 ohms with a passenger air bag installed. Pin 7 of the air bag diagnostic monitor should be connected to ground. Connecting Pin 7 to ground programs the air bag diagnostic monitor to ignore high resistance on the passenger air bag circuits. If the resistance across these two circuits exceeds 4.0 ohms and Pin 7 is not grounded, the air bag diagnostic monitor will flash a code 33 on the air bag lamp.

Possible Causes

A high resistance or open in the air bag circuit can be caused by Pin 7 not connected to ground.

tomsn048@gmail.com



33-1 CHECK FOR GROUND

- Deactivate system.
- Disconnect air bag diagnostic monitor.
- Disconnect both battery cables.
- Measure resistance across air bag diagnostic monitor harness Pin 7 and Pin 3 (Ground).

Is the resistance less than 10 ohms?

Yes	No
REPLACE air bag diagnostic monitor. RECONNECT system. VERIFY air bag indicator.	LOCATE and CONNECT wire from Pin 7 to Ground. Make sure it is connected to proper area.

PINPOINT TEST 34: DRIVER SIDE AIR BAG CIRCUIT LOW RESISTANCE OR SHORTED (CODE 34)

Normal Operation

The air bag diagnostic monitor measures the resistance across Pin 10 (Circuit 615, GY/W) and Pin 11 (Circuit 614, GY/O) every time the ignition switch is turned to the RUN position. Normal resistance across these circuits is between 1.5 and 2.0 ohms. This resistance comes from the driver side air bag module (approximately 1.0 ohms) and the air bag sliding contact windings (0.25 to 0.5 ohms per winding, two windings in all). If the resistance across these two circuits is less than 0.7 ohms, the air bag diagnostic monitor will flash code 34 on the air bag indicator.

tomsn048@gmail.com

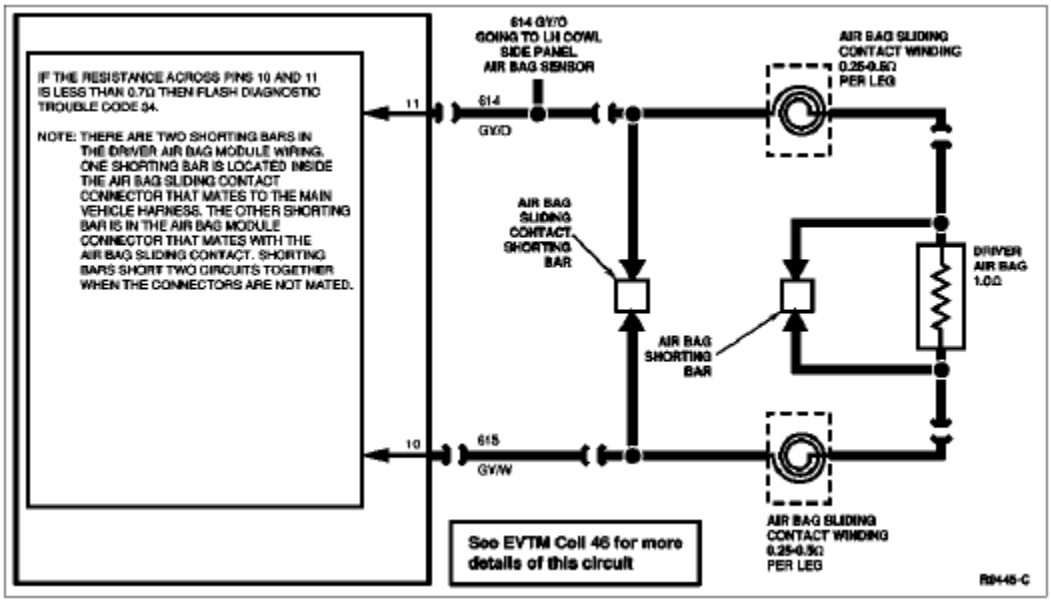
- The connectors for the driver side air bag module and the air bag sliding contact have metal spring clips that act as shorting bars. These shorting bars are built into the plastic hardshell connectors. The shorting bars are designed to short Circuits 614 and 615 together when the connectors are not mated. Do not attempt to remove the air bag shorting bar and measure the resistance of the driver side air bag module. The air bag sliding contact shorting bar may be removed to measure the resistance of air bag sliding contact. Use extreme care when reinstalling the shorting bar to make sure it is installed correctly.

Possible Causes

Low resistance across Pins 10 and 11 can be caused by:

1. A poorly mated air bag sliding contact connector may not push the shorting bars back into their fully retracted positions.
2. A faulty shorting bar may short Circuits 614 (GY/O) and 615 (GY/W) together.
3. A short in the air bag sliding contact windings between Circuits 614 and 615.
4. A short across the terminals within the driver side air bag module. DO NOT attempt a direct resistance measurement of the driver side air bag module. Follow the diagnostic procedures to determine if the resistance is lower than normal.

Driver Side Air Bag Circuit Low Resistance or Shorted



34-1 CHECK FOR DTC 34

- Turn ignition switch lock cylinder to ON.
- Count diagnostic trouble code (if any).

Is code 34 flashing?

tomsn048@gmail.com

Yes	No
GO to **34-2** .	READ the normal operation description for this diagnostic trouble code. EXAMINE the diagnostic trouble code schematic and look for areas where intermittent problems would occur (connectors, splices, crimps, etc.). Do not proceed with pinpoint tests until the code is flashing! Failure to do so will result in needless replacement of the air bag system components and repeat repairs.

34-2 DEACTIVATE SYSTEM

- Deactivate system — leave driver side air bag harness connector empty (do not install the air bag simulator).
- Disconnect the air bag diagnostic monitor.
- Remove the plastic locking wedge from the block harness connector.
- Measure the resistance across Pin 11 — Circuit 614 (GY/O) and Pin 10 — Circuit 615 (GY/W).

Is the resistance across Pins 10 and 11 infinite (open)?

Yes	No
GO to **34-3** .	GO to **34-4** .

34-3 CHECK COMPONENT INSTALLATION

- Install Rotunda Air Bag Simulator 105-R0011 or equivalent, onto the air bag sliding contact connector at the steering wheel.
- Reconnect the air bag diagnostic monitor.
- Turn ignition switch lock cylinder from OFF to ON.
- Wait 30 seconds.

Is code 34 flashing?

Yes	No
REPLACE air bag diagnostic monitor. REACTIVATE system. VERIFY air bag indicator.	EXAMINE the shorting bar on the driver side air bag connector for proper function. **NOTE: EXAMINE the air bag sliding contact to main harness connector as an example of a normal shorting bar.** REPLACE the driver side air bag if the shorting bar is normal. REACTIVATE system. VERIFY air bag indicator.

34-4 CHECK AIR BAG SLIDING CONTACT

tomsn048@gmail.com

- Disconnect the air bag sliding contact at the base of the steering column where it mates with the main vehicle harness.
- Measure the resistance across Pin 11 (Circuit 614, GY/O) and Pin 10 (Circuit 615, GY/W).

Is the resistance across Pins 10 and 11 infinite (open)?

Yes	No
EXAMINE the shorting bar on air bag sliding contact and main harness connector for proper function. **NOTE: EXAMINE the driver side air bag connector as an example of a normal shorting bar.** REPLACE the air bag sliding contact if the short bar is normal. REACTIVATE system. VERIFY air bag indicator.	LOCATE and SERVICE the short across Circuits 614 & 615 in the wiring harness. INSPECT the air bag diagnostic monitor harness connector and the air bag sliding contact harness connector for shorted terminals. REACTIVATE system. VERIFY air bag indicator.

PINPOINT TEST 35: PASSENGER SIDE AIR BAG CIRCUIT LOW RESISTANCE OR SHORTED (CODE 35)

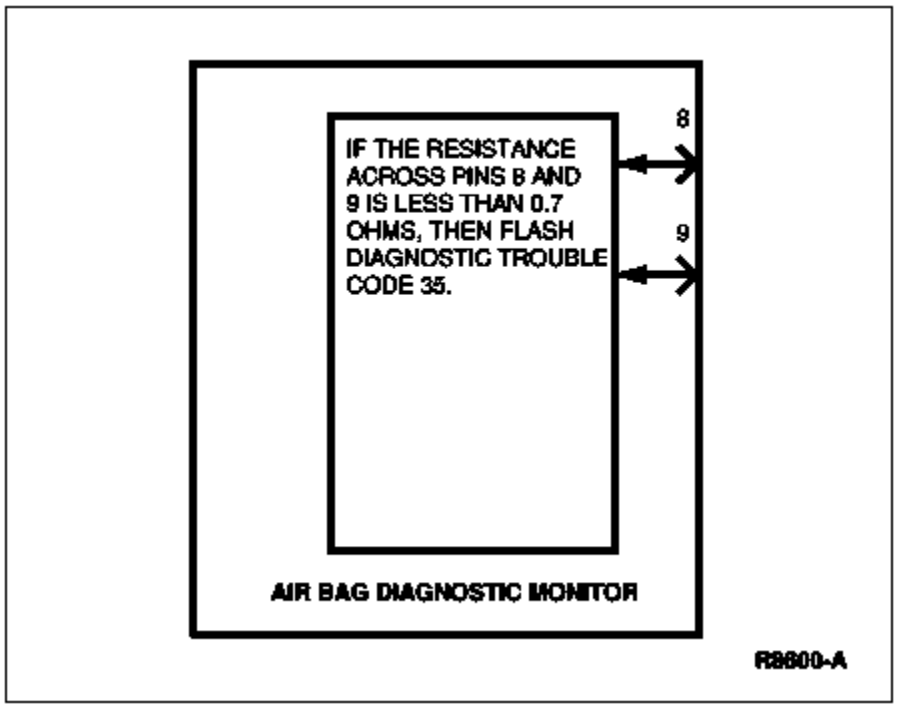
Normal Operation

The air bag diagnostic monitor measures the resistance across Pin 8 and Pin 9 every time the ignition switch is turned to the RUN position. Normal resistance across these circuits is between 0.9 ohms and 1.1 ohms. If the resistance across Pins 8 and 9 is less than 0.7 ohms, the monitor will flash a code 35. Note that it does not matter if Pin 7 is grounded or not. If low resistance is measured across Pins 8 and 9 a diagnostic trouble code 35 will appear.

Possible Causes

Low resistance across Pins 8 and 9 can be caused by a short between Pins 8 and 9 at the air bag diagnostic monitor.

tomsn048@gmail.com



35-1 CHECK FOR DTC 35

- Turn ignition switch lock cylinder to ON.
- Count diagnostic trouble code.

Is code 35 flashing?

Yes	No
GO to 35-2 .	READ the normal operation description for this diagnostic trouble code. EXAMINE the diagnostic trouble code schematic and look for areas where intermittent problems would occur (connectors, splices, crimps, etc.). DO NOT proceed with Pinpoint Test until the code is flashing! Failure to do so will result in needless replacement of the air bag system components and repeat repairs.

35-2 CHECK FOR SHORT ACROSS PINS 8 AND 9 AT THE AIR BAG DIAGNOSTIC MONITOR

- Deactivate system.
- Disconnect the air bag diagnostic monitor.
- Remove the plastic locking wedge from the black harness connector.
- Measure the resistance across Pin 8 (Circuit 614, GY/O) and Pin 9 (Circuit 616, PK/BK).

tomsn048@gmail.com

Is the resistance across these Pins infinite (open)?

Yes	No
REPLACE air bag diagnostic monitor. RECONNECT system. REACTIVATE system. VERIFY system.	LOCATE and SERVICE the short across Pins 8 and 9 of the wiring harness. INSPECT the diagnostic monitor harness connector and terminal for possible short circuits. RECONNECT system. REACTIVATE system. VERIFY air bag indicator.

PINPOINT TEST 41: PRIMARY CRASH SENSOR CIRCUITS HIGH RESISTANCE OR OPEN (CODE 41)

Normal Operation

The center air bag sensor and bracket and RH cowl side front air bag sensor and bracket each have an internal resistor. The air bag diagnostic monitor uses the resistor in center air bag sensor and bracket and RH cowl side air bag sensor and bracket in combination with the two resistors inside the air bag diagnostic monitor to create a tightly controlled diagnostic voltage at Pin 11 (Circuit 614, GY/O). The center air bag sensor and bracket and RH cowl side front air bag sensor and bracket are tied together inside the air bag diagnostic monitor at Pins 17 (Circuit 617, PK/O) and 18 (Circuit 619, PK/W). Therefore, the resistors in the sensors are connected in parallel. The parallel combination of all the sensor resistors should be equal to 393 ohms. The resistance of each sensor should be 787 ohms ± 10 ohms.

The resistors inside the air bag diagnostic monitor are connected to Pins 11 (Circuit 614, GY/O) and 12 (Circuit 623, P/W) and are equal in value. Note that Circuits 614 and 623 are tied together inside the LH cowl side panel front air bag sensor and bracket. Therefore, the two resistors inside the air bag diagnostic monitor are connected in parallel and will function the same as one resistor of half the original value. Current flows from the battery positive voltage within the air bag diagnostic monitor, through the resistors, out to Circuits 614 (GY/O) and 623 (P/W) on Pins 11 and 12, through the 5-wire LH cowl side front air bag sensor and bracket and out to the driver side air bag module. Current flows through the driver side air bag module and into Pin 10 (Circuit 615, GY/W). Current then flows from Pin 10 through the diode inside the air bag diagnostic monitor and out to the center air bag sensor and bracket and RH cowl side front air bag sensor and bracket through Pins 17, 18 and 19. The current flows through each sensor resistor and terminates at the case ground of each sensor. Pin 11 is the midpoint of the resistor network and voltage at Pin 11 will change with vehicle charging system voltage. The expected voltage at Pin 11 is shown in the table below. The air bag diagnostic monitor measures the vehicle charging system voltage at Pin 13 (battery input). By measuring the voltage at Pin 13, the air bag diagnostic monitor can accurately predict what the voltage at Pin 11 should be in a normal functioning system.

If the resistance of one or more of the sensors has increased in value, then the equivalent resistance of the sensors will be greater than 393 ohms. When sensor resistance increases, there is less overall resistance pulling the diagnostic voltage down. Therefore, the voltage at Pin 11 will increase and the air bag diagnostic monitor will flash code 41 to indicate high resistance (or an open circuit) in one of the sensor circuits. Another situation that may cause high voltage on Pin 11 is if resistance builds up across the normally open contacts of the LH cowl side front air bag sensor and bracket. Front air bag sensor and brackets do not normally have resistance across contacts. If resistance appears across the sensor contacts, then current will flow from Pin 15 (Circuit 611, W/O) through the abnormal resistance across the contacts of the LH cowl side front air bag sensor and bracket and into Circuit 614 (GY/O). Since the voltage at Pin 15 is battery voltage or higher, this will also cause an increase in voltage at Pin 11 and the air bag diagnostic monitor will flash code 41.

Possible Causes

tomsn048@gmail.com

Higher than normal voltage on Pin 11 can be caused by:

1. An open in one or more of the circuits between the air bag diagnostic monitor and the center air bag sensor and bracket or front air bag sensor and bracket (RH). Circuit 617 (PK/O or 619 (PK/W) may have an open circuit in the wiring.
2. An abnormally high resistance value across one or more of the sensors. One or more of the sensor resistors may have too high resistance or may be a completely open circuit.
3. An intermittent open between the positive terminal of the battery and Pin 13 may cause the air bag diagnostic monitor to determine that voltage on Pins 17 and 18 is too high with respect to the voltage on Pin 13.
4. Resistance across the front air bag sensor and bracket (LH). The sensor is a normally open switch with infinite resistance across its contacts. If the sensor is faulty and some resistance builds up across the open contacts, the voltage on Circuit 611 (W/O) will pull up the voltage on Circuit 614 (GY/O).

Pin No. 10 and Pin No. 11 Voltage	Pin No. 17 and Pin No. 18 Voltage	System Voltage

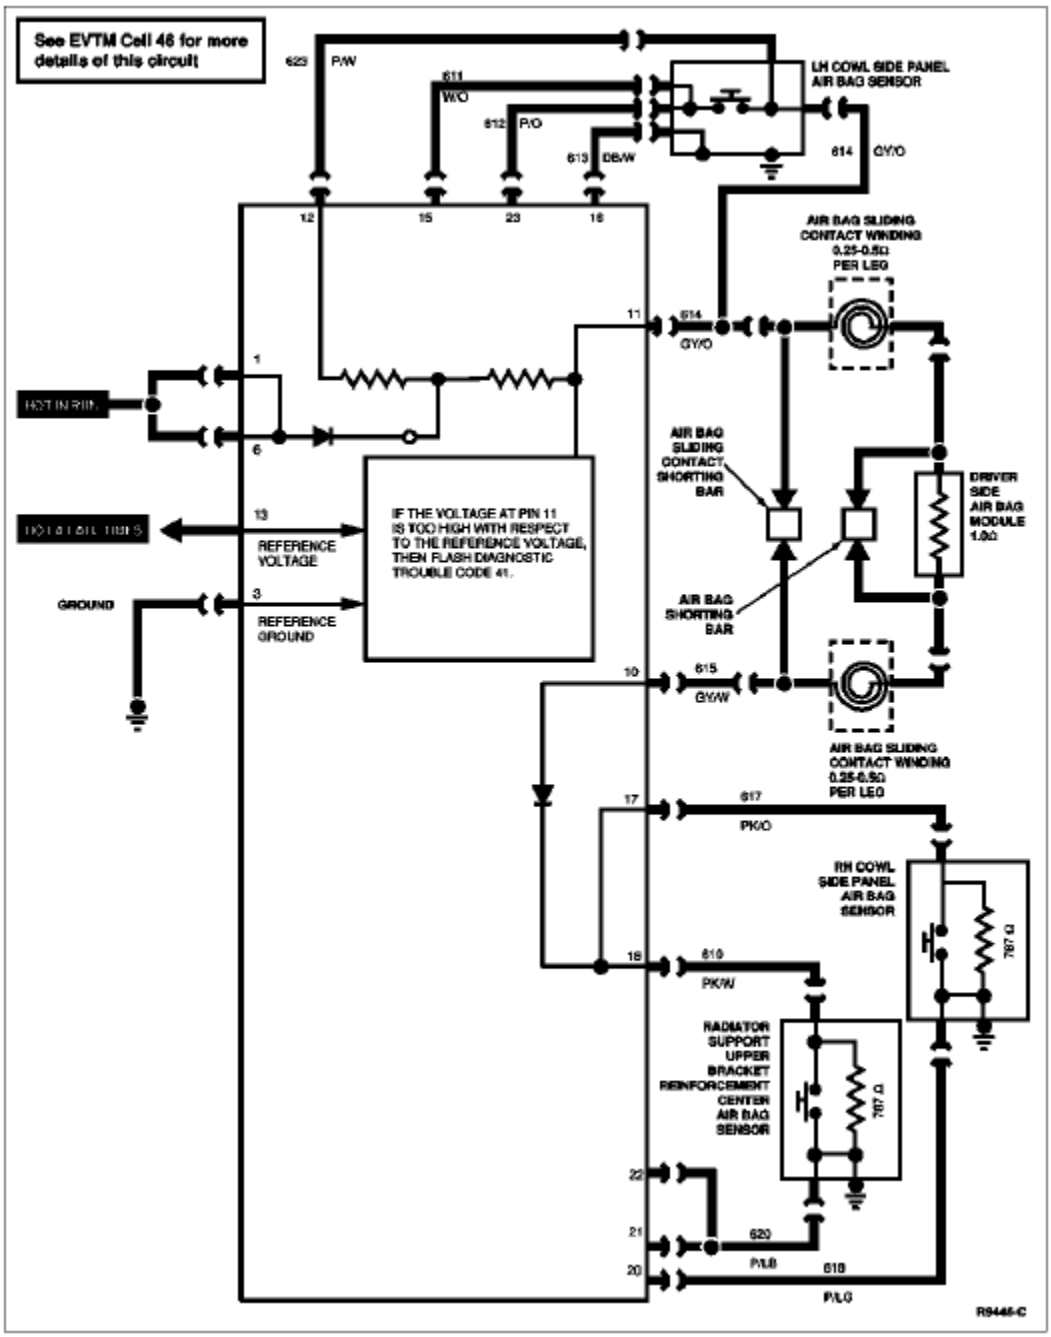
Primary Crash Sensor Circuits High Resistance or Open

tomsn048@gmail.com



41-1 CHECK FOR DTC 41

- Turn ignition switch lock cylinder to ON.
- Count diagnostic trouble code (if any).

Is code 41 flashing?

Yes	No
	READ the normal operation description for this

tomsn048@gmail.com

GO to 41-2 .	diagnostic trouble code. EXAMINE the diagnostic trouble code schematic and LOOK for areas where intermittent problems would occur (connectors, splices, crimps, etc.). Do not proceed with Pinpoint Test until the code is flashing! Failure to do so will result in needless replacement of the air bag system components and repeat repairs.

41-2 DEACTIVATE SYSTEM/MEASURE PIN 11

- Deactivate system.
- Turn ignition switch lock cylinder OFF then ON.
- Measure voltage between Pin 13 (+) and Pin 3 (-). Record the voltage as Charging System Voltage.
- Measure voltage between Pin 11 (Circuit 614, GY/O) and Pin 3 (ground).
- Use the Voltage Table to determine if the voltage at Pin 11 is within specification (± 1 volt).

Is the voltage measured within specification?

Yes	No
TURN ignition switch lock cylinder ON. INSPECT all terminations and connections between the positive terminal, the battery, and Pin 13 of the air bag diagnostic monitor. This includes the fuse terminal crimps, splices, etc. GO to 41-3 .	GO to 41-4 .

41-3 SERVICE POOR CONNECTIONS

During inspection of all connections, were any poor connections found?

Yes	No
SERVICE poor connections found. RECONNECT system. VERIFY system. REACTIVATE system.	REPLACE air bag diagnostic monitor. RECONNECT system. VERIFY system. REACTIVATE system.

41-4 MEASURE RESISTANCE ACROSS SENSOR CIRCUITS

- Turn ignition switch lock cylinder OFF.
- Disconnect air bag diagnostic monitor.
- Measure the resistance of both sensor circuits from Pins 17 and 18 of the air bag diagnostic monitor harness connector to Pin 3 (ground).

Does resistance measure 787 ± 10 ohms?

Yes	No
GO to 41-6 .	LOCATE and DISCONNECT the sensor with

tomsn048@gmail.com

	abnormal reading. GO to **41-5** .

41-5 MEASURE RESISTANCE

- Measure the resistance across the abnormal sensor connector terminals.

Is the reading 787 ± 10 ohms?

Yes	No
LOCATE and SERVICE the open circuit in the wiring harness for the affected sensor. RECONNECT system. VERIFY system. REACTIVATE system.	REPLACE the abnormal sensor. RECONNECT system. VERIFY system. REACTIVATE system.

41-6 CHECK RESISTANCE ACROSS PINS 15 AND 11

- Place Rotunda 73 Digital Multimeter 105-R0051 or equivalent, on the highest ohm scale available (200,000 ohms or auto).
- Measure the resistance across Pin 15 — Circuit 611 (W/O) and Pin 11 of the air bag diagnostic monitor harness connector.

Is the reading infinite (open)?

Yes	No
LOCATE and SERVICE the short between the air bag circuits (614, 615 and 616) and B+, in the wire harness. RECONNECT system. VERIFY system. REACTIVATE system.	GO to **41-7** .

41-7 MEASURE RESISTANCE OF LH COWL SIDE AIR BAG SENSOR

- Disconnect the LH cowl side panel front air bag sensor and bracket.
- Measure the resistance across the GY/O and W/O wires in the LH cowl side front air bag sensor and bracket.

Is the reading infinite (open)?

Yes	No
LOCATE and SERVICE the short between Circuit 611 and 614 in the wiring harness. RECONNECT system. VERIFY system. REACTIVATE system.	REPLACE the sensor. RECONNECT system. VERIFY system. REACTIVATE system.

PINPOINT TEST 44: RH PRIMARY CRASH SENSOR NOT MOUNTED TO VEHICLE PROPERLY (CODE 44)

tomsn048@gmail.com

Normal Operation

The air bag diagnostic monitor measures the resistance between Pin 20 Circuit 618 (P/LG) and Pin 3 (diagnostic monitor reference ground). If the air bag diagnostic monitor measures a difference of more than 2.0 ohms between Pin 20 and Pin 3, it will flash out code 44.

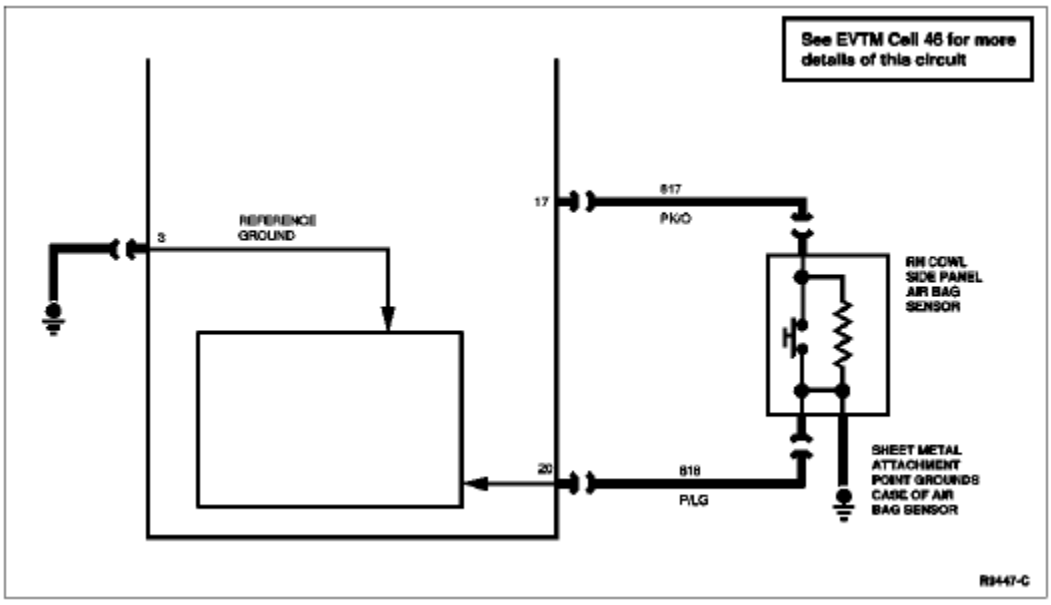
Note that Circuit 618 (P/LG) is attached to the side case of the RH cowl side trim panel front air bag sensor and bracket. In addition, the case is grounded to the vehicle.

Possible Causes

High Resistance on Pin 20 (Circuit 618, P/LG) to ground can be caused by:

1. A poor connection due to loose mounting, dirt, or corrosion at the mounting location in the RH cowl side trim panel front air bag sensor and bracket.
2. An open or damaged wire in Circuit 618 (P/LG) from Pin 20 of the diagnostic monitor harness connector to RH cowl side trim panel front air bag sensor and bracket.
3. An open wire or loose Circuit 618 (P/LG) wire attachment inside RH cowl side trim panel front air bag sensor and bracket.

RH Primary Crash Sensor Not Mounted to Vehicle Properly



44-1 CHECK FOR DTC 44

- Turn ignition switch lock cylinder to ON.
- Count diagnostic trouble code (if any).

tomsn048@gmail.com

Is code 44 flashing?

Yes	No
GO to 44-2 .	READ the normal operation description for this diagnostic trouble code. EXAMINE the diagnostic trouble code schematic and look for areas where intermittent problems would occur (connectors, splices, crimps, etc.). Do not proceed with Pinpoint Test until the code is flashing! Failure to do so will result in needless replacement of the air bag system components and repeat repairs.

44-2 DEACTIVATE SYSTEM

- Deactivate system (leave battery positive cable disconnected).
- Disconnect air bag diagnostic monitor.
- Set Rotunda 73 Digital Multimeter 105-R0051 or equivalent, on the lowest ohm scale possible (200 ohms).
- Zero ohmmeter. RECORD resistance reading with the two leads together.
- Measure the resistance between Pin 20 and Pin 3 (ground).

Is the resistance greater than 2 ohms?

Yes	No
GO to 44-3 .	REPLACE air bag diagnostic monitor. RECONNECT system. VERIFY system. REACTIVATE system.

44-3 CHECK RH COWL SIDE PANEL AIR BAG SENSOR GROUND

- Disconnect the cowl side panel (RH) front air bag sensor and bracket from the harness.
- Measure the resistance between the P/LG "ground" wire in the sensor connector and a nearby, "good", chassis ground (make sure this ground is clean and bare).

Is the resistance less than 2 ohms?

Yes	No
INSPECT circuit between Pin 20 and the sensor. CHECK all terminal crimps, interconnections and splices for four connections. SERVICE any poor connections. RECONNECT system. VERIFY system. REACTIVATE system.	REMOVE screws retaining sensor. CLEAN mounting surface of sensor chassis. REMOUNT sensor. TIGHTEN screws to 10.0-14.0 Nm (7-10 lb-ft). GO to 44-4 .

44-4 MEASURE RESISTANCE OF SENSOR TO GROUND.

- Measure the resistance between the P/LG "ground" wire in the sensor connector and the chassis

tomsn048@gmail.com

ground.

Is the resistance less than 2 ohms?

Yes	No
RECONNECT system. VERIFY system. REACTIVATE system.	REPLACE RH cowl side panel front air bag sensor and bracket. RECONNECT system. VERIFY system. REACTIVATE system.

PINPOINT TEST 45: CENTER PRIMARY CRASH SENSOR NOT MOUNTED TO VEHICLE PROPERLY (CODE 45)

Normal Operation

The air bag diagnostic monitor measures the resistance between Pin 21 (Circuit 620, P/LB) and Pin 3 (diagnostic monitor reference ground). If the air bag diagnostic monitor measures a difference of more than 2.0 ohms between Pin 21 and Pin 3, it will flash out code 45.

Note that Circuit 620 (P/LB) is attached to the side case of the center air bag sensor and bracket. In addition, the case is grounded to the vehicle.

Note that Circuit 620 (P/LB) is spliced into another wire going to Pin 22 of the air bag diagnostic monitor. Note also that Circuit 620 (P/LB) passes through an in-line connector between the main instrument panel harness and the engine compartment harness that connects to the center air bag sensor and bracket.

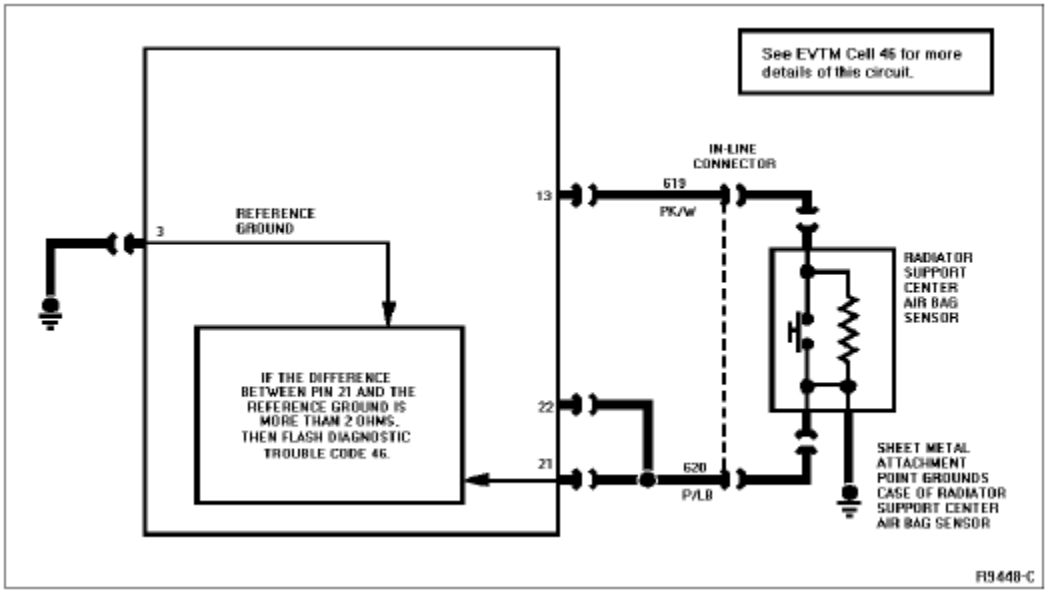
Possible Causes

High resistance on Pin 21 (Circuit 620, P/LB) to ground can be caused by:

1. A poor connection due to loose mounting, dirt, or corrosion at the mounting location of the center air bag sensor and bracket.
2. An open or damaged wire in Circuit 620 (P/LB) from Pin 21 of the diagnostic monitor harness connector to center air bag sensor and bracket. This includes splices and in-line connectors.
3. An open wire or loose Circuit 620 (P/LB) wire attachment inside center air bag sensor and bracket.

Center Radiator Primary Crash Sensor Not Mounted to Vehicle Properly

tomsn048@gmail.com



45-1 CHECK FOR DTC 45

- Turn ignition switch lock cylinder to ON.
- Count diagnostic trouble code (if any).

Is code 45 flashing?

Yes	No
GO to 45-2 .	READ the normal operation description for this diagnostic trouble code. EXAMINE the diagnostic trouble code schematic and look for areas where intermittent problems would occur (connectors, splices, crimps, etc.). Do not proceed with pinpoint tests until the code is flashing! Failure to do so will result in needless replacement of the air bag system components and repeat repairs.

45-2 DEACTIVATE SYSTEM

- Deactivate system (leave positive battery cable disconnected).
- Disconnect air bag diagnostic monitor.
- Set Rotunda 73 Digital Multimeter 105-R0051 or equivalent on the lowest ohm scale possible (200 ohms).
- Zero ohmmeter. Record resistance reading with the two leads together.
- Measure the resistance between Pin 21 and Pin 3 (ground).

Is the resistance greater than 2 ohms?

Yes	No

tomsn048@gmail.com

GO to **45-3** .	REPLACE air bag diagnostic monitor.

45-3 CHECK CENTER AIR BAG SENSOR GROUND

- Disconnect the center air bag sensor and bracket from the harness.
- Measure the resistance between the P/LB "ground" wire in the sensor connector and a nearby, "good", chassis ground (make sure this ground is clean and bare.)

Is the resistance less than 2 ohms?

Yes	No
INSPECT circuit between Pin 21 and the sensor. CHECK all interconnects and splices for poor connections. SERVICE any poor connections. RECONNECT system. VERIFY system. REACTIVATE system.	REMOVE screws retaining sensor. CLEAN mounting surface of sensor and chassis. REMOUNT sensor. TIGHTEN screws to 10.0-14.0 Nm (7-10 lb-ft). GO to **45-4** .

45-4 MEASURE RESISTANCE OF SENSOR TO GROUND

- Measure the resistance between the P/LB "ground" wire in the sensor connector and the chassis ground.

Is the resistance less than 2 ohms?

Yes	No
RECONNECT system. VERIFY system. REACTIVATE system.	REPLACE center air bag sensor and bracket. RECONNECT system. VERIFY system. REACTIVATE system.

PINPOINT TEST 46: OPEN SPLICE CENTER AIR BAG SENSOR GROUND MONITOR (CODE 46)

Normal Operation

The air bag diagnostic monitor measures the resistance between Pin 22 (Circuit 620 P/LB) and Pin 3 (diagnostic monitor reference ground). If the air bag diagnostic monitor measures a difference of more than 2.0 ohms between Pin 22 and Pin 3, it will flash a code 46.

- Pin 22 is used in a three air bag sensor system as the third sensor ground monitor. In this case Pin 22 is spliced into the center radiator crash ground monitor of the center air bag sensor and bracket, because only two sensors are used.

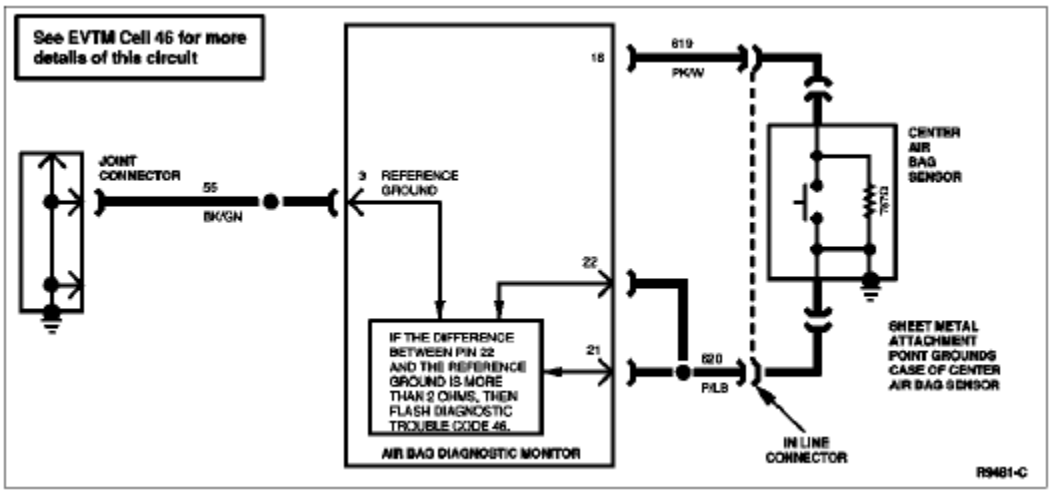
Possible Causes

High resistance on Pin 22 (Circuit 934 "BR") to ground can be caused by:

tomsn048@gmail.com

1. An open or damaged wire in Circuit 620 P/LB from Pin 22 of the diagnostic monitor harness connector to the splice which joins it to the P/LB wire coming from Pin 21.

Open Splice Center Air Bag Sensor Ground Monitor



46-1 CHECK FOR DTC 46

- Turn ignition switch lock cylinder to ON.
- Count diagnostic trouble code (if any).

Is code 46 flashing?

Yes	No
GO to **46-2** .	READ the normal operation description for this diagnostic trouble code. EXAMINE the diagnostic trouble code schematic and look for areas where intermittent problems would occur (connectors, splices, crimps, etc.). Do not proceed with pinpoint tests until the code is flashing! Failure to do so will result in needless replacement of the air bag system components and repeat repairs.

46-2 DEACTIVATE SYSTEM

- Deactivate system. Make sure positive battery cable is disconnected.
- Disconnect air bag diagnostic monitor.
- Set Rotunda 73 Digital Multimeter 105-R0051 or equivalent on lowest ohm scale (200 ohms).
- Zero ohmmeter, (record resistance value with the two leads together).
- Measure resistance across Pin 22, (Circuit 620, P/LB) and Pin 3, (Ground).

tomsn048@gmail.com

Is resistance greater than 2 ohms?

Yes	No
SERVICE 620 P/LB splice where Pin 22 connects with Pin 21 of air bag diagnostic monitor. RECONNECT system. VERIFY system. REACTIVATE system.	REPLACE air bag diagnostic monitor. RECONNECT system. VERIFY system. REACTIVATE system.

Air Bag Diagnostic Monitor Internal Thermal Fuse — Fuse Blown Due to Intermittent Short to Ground

Normal Operation

NOTE: The air bag diagnostic monitor contains an internal thermal fuse that is not serviceable. The thermal fuse is controlled by a computer inside the air bag diagnostic monitor. The computer will blow the thermal fuse whenever a short on the deployment circuits occurs. The thermal fuse does not blow because of excessive current flowing through it. DO NOT attempt to jumper out the thermal fuse with a circuit breaker or any other type of fuse.

NOTE: DO NOT install a new air bag diagnostic monitor until the short has been located and corrected. If a short to ground has not been located and corrected, then the short to ground is intermittent and IS NOT PRESENT AT THIS TIME. Installing a new air bag diagnostic monitor with an intermittent short in the system will result in blown air bag diagnostic monitors and repeat repairs.

The air bag diagnostic monitor measures the voltages at the diagnostic monitor connector pins. When certain air bag deployment wires are shorted to ground (heavy lines illustrated in the schematic below), the supplemental air bag restraint system may become susceptible to unwanted deployment of the air bag(s). The air bag diagnostic monitor senses a short to ground on any of these circuits and helps prevent unwanted air bag deployant by blowing the diagnostic monitor thermal fuse. Blowing this fuse removes all power (battery and back-up power) from the air bag deployment circuits. While the short to ground exists, the monitor will flash code 13. If the short to ground is intermittent and temporarily corrects itself, the air bag diagnostic monitor will flash code 51.

NOTE: If the short to ground returns, the high priority code 13 will flash instead of 51.

If the air bag indicator is flashing code 51 and a short to ground has not been serviced, this means that an intermittent short to ground exists in the supplemental air bag restraint system. The air bag diagnostic monitor should be replaced only after repairs to the intermittent short have been completed.

Some service tips for finding an intermittent short to ground are:

1. Consult OASIS (Restraint Systems Service Code 104000) for up-to-date diagnostics and descriptions of wiring concern locations for the vehicle (VIN number) you are working on. OASIS is updated daily using concern descriptions from engineering and Dealership Service sources.

2. Inspect wiring and harness in areas where they pass through or are located next to metal components (i.e., engine compartment bulkhead, body sheet metal, component mounting brackets, etc.).

Code 51 After Air Bag Deployment

Occasionally, immediately after an air bag deploys, the internal wiring of the driver side air bag module may become shorted to the metal housing of the driver side air bag module. This internal driver side air bag module short in driver side air bag module is detected by the air bag diagnostic monitor as short to ground in

tomsn048@gmail.com

the air bag deployment wiring. Since the air bag diagnostic monitor is still operating immediately after most deployments, the monitor will detect the shorted wiring and will flash code 13 and blow the internal thermal fuse. After the deployment, as the air bag cools off, the internal shorted wiring may correct itself, therefore the short to ground will no longer exist and the air bag diagnostic monitor will flash code 51. If a vehicle with a deployed air bag is flashing code 51, inspect and replace all the damaged areas of the vehicle with crushed wiring, sensors, etc. If no damage is found, assume that the deployed air bag was the cause for the intermittent short and replace the air bag diagnostic monitor when the new driver side air bag module is installed.

NOTE: Air bag diagnostic monitors can withstand several air bag deployments and do not need to be replaced after every deployment. Only replace the air bag diagnostic monitor if it is damaged.

Code 51 Sequence of Events

1. Short to ground occurs on one or more of the circuits shown in heavy lines in the schematic.

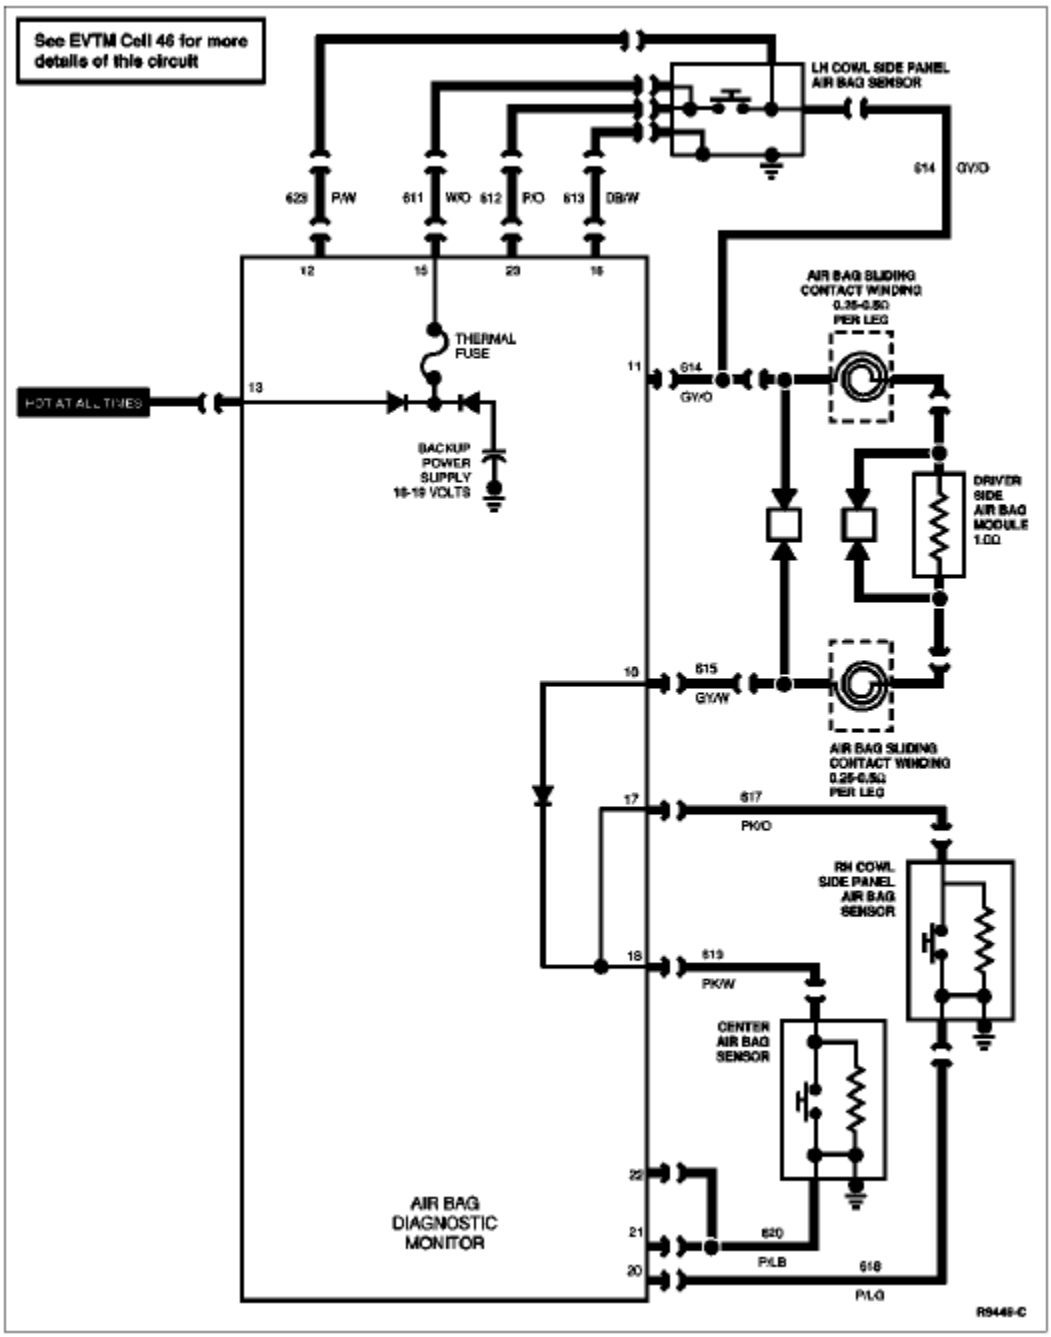
2. The air bag diagnostic monitor recognizes the shorted wiring and flashes out a diagnostic trouble code 13 and sends a signal to the internal thermal fuse, causing it to blow.

3. The air bag diagnostic monitor will continue to flash code 13 while the short to ground is present. If the short to ground goes away, a Diagnostic Trouble Code 51 appears.

4. The air bag diagnostic monitor only flashes a code 51 when the thermal fuse is blown and the short to ground is not present. Do not replace the air bag diagnostic monitor until the short to ground has been located and serviced. Consult OASIS for shorted wiring information.

Air Bag Diagnostic Monitor Internal Fuse Blown and Short to Ground No Longer Exists

tomsn048@gmail.com



PINPOINT TEST 52: BACKUP POWER SUPPLY— VOLTAGE BOOST FAULT (CODE 52)

Normal Operation

A backup power supply is contained within the air bag diagnostic monitor that consists of four capacitors and a voltage boost circuit. The voltage boost circuit charges the capacitors to 16-19 volts when the ignition switch is turned to RUN. The backup power supply is connected through a diode to Pin 15 (Circuit 611,

tomsn048@gmail.com

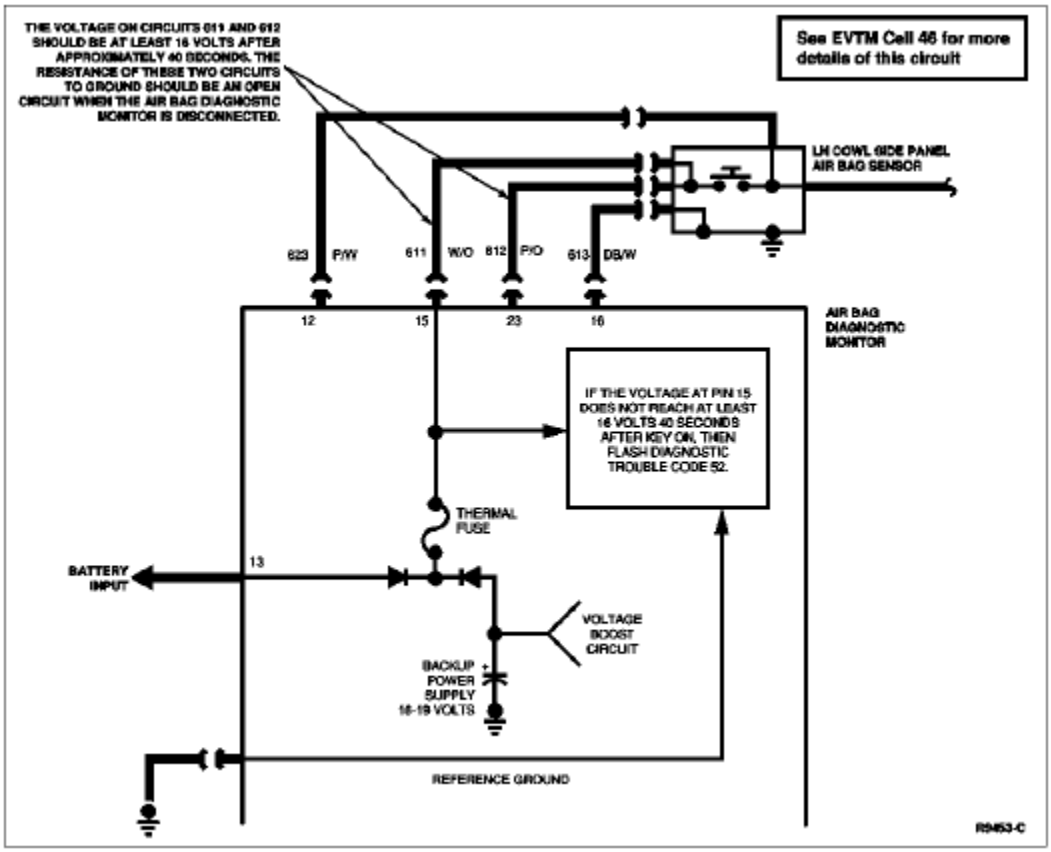
W/O) of the air bag diagnostic monitor. The resistance of Circuit 611 to ground is infinite since it is an open circuit. This open circuit allows the capacitor to maintain its higher voltage because there is no discharge path for the capacitor. The air bag diagnostic monitor measures the voltage on the backup power supply capacitors. If the voltage on the capacitors does not reach and maintain a minimum of 16 volts after approximately 30 seconds, the air bag diagnostic monitor will flash code 52 to indicate low voltage in the backup power supply voltage boost circuit.

Possible Causes

Low backup power supply voltage can be caused by:

1. Resistance on Circuit 611 (W/O) to ground. Resistance to ground on Circuit 611 or Circuit 612 (P/O) will cause the backup power supply capacitors to discharge and the boost circuit will not be able to boost the voltage.
2. Boost circuit failure within the air bag diagnostic monitor. If the voltage boost circuit in the air bag diagnostic monitor is faulty it is unable to raise backup power supply voltage on the capacitor.

Backup Power Supply Voltage Boost Fault



52-1 CHECK FOR DTC 52

tomsn048@gmail.com

- Turn ignition switch lock cylinder to ON.
- Count diagnostic trouble code (if any).

Is code 52 flashing?

Yes	No
GO to 52-2 .	READ the normal operation description for this diagnostic trouble code. EXAMINE the diagnostic trouble code schematic and look for areas where intermittent problems would occur (connectors, splices, crimps, etc.). Do not proceed with Pinpoint Test until the code is flashing! Failure to do so will result in needless replacement of the air bag system components and repeat repairs.

52-2 DEACTIVATE SYSTEM

- Deactivate system.
- Turn ignition switch lock cylinder OFF then ON.
- Wait 30 seconds.
- Measure voltage between Pin 15 — Circuit 611 (W/O) and Pin 3 (ground).

Is the voltage measured within 16-19 volts?

Yes	No
REPLACE air bag diagnostic monitor. RECONNECT system. VERIFY system. REACTIVATE system.	GO to 52-3 .

52-3 CHECK FOR OPEN IN CIRCUIT 611

- Turn ignition switch lock cylinder off.
- Disconnect air bag diagnostic monitor.
- Set Rotunda 73 Digital Multimeter 105-R0051 or equivalent on 200,000 or auto scale.
- Measure resistance of Pin 15 — Circuit 611 (W/O) to Pin 3 (ground).

Is the resistance measured infinite (open)?

Yes	No
REPLACE air bag diagnostic monitor. RECONNECT system. VERIFY system. RECONNECT system.	GO to 52-4 .

52-4 MEASURE RESISTANCE OF CIRCUIT 611

- Disconnect the LH cowl side panel front air bag sensor and bracket.

tomsn048@gmail.com

- Measure resistance between Pin 15 (Circuit 611, W/O) and Pin 3 (ground).

Is the resistance measured infinite (open)?

Yes	No
GO to **52-5** .	LOCATE and SERVICE the short to ground in Circuit 611, W/O. RECONNECT system. VERIFY system. REACTIVATE system.

52-5 CHECK FOR SHORT IN SENSOR

- Measure resistance of the Circuit 611 (W/O) wire in the LH cowl side panel front air bag sensor and bracket connector to sheet metal ground.

Is the resistance measured infinite (open)?

Yes	No
LOCATE and SERVICE the short to ground in Circuit 612 (P/O). RECONNECT system. VERIFY system. REACTIVATE system.	REPLACE LH cowl side panel front air bag sensor and bracket. RECONNECT system. VERIFY system. REACTIVATE system.

PINPOINT TEST 53: PRIMARY CRASH SENSOR CIRCUITS RESISTANCE TO GROUND OR AIR BAG DIAGNOSTIC MONITOR FAULT

Normal Operation

The air bag diagnostic monitor performs several self-tests every time the ignition switch is turned on. If any of these tests fail, the air bag diagnostic monitor will flash code 53.

Possible Causes

1. Internal self-test failure on air bag diagnostic monitor.

53-1 CHECK FOR DTC 53

- Turn ignition switch lock cylinder to ON.
- Count diagnostic trouble code (if any).

Is code 53 flashing?

Yes	No
REPLACE air bag diagnostic monitor.	READ the normal operation description for this diagnostic trouble code. EXAMINE the diagnostic trouble code schematic and LOOK for areas where intermittent problems would

tomsn048@gmail.com

RECONNECT system. VERIFY system. REACTIVATE system.	occur (connectors, splices, crimps, etc.). Do not proceed with pinpoint tests until the code is flashing. Failure to do so will result in needless replacement of the air bag system components and repeat repairs.

Rapid Continuous Flashing of Air Bag Indicator (No Diagnostic Trouble Code), All Primary Crash Sensors Disconnected

Normal Operation

Each sensor has two wires. One wire is used for air bag deployment and monitoring the sensor's connection to the air bag diagnostic monitor (see Code 41 diagnosis for details). The other wire is used for monitoring the mounting (ground) of the sensor to sheet metal (see Code 44 and Code 45 diagnosis for details). If the code 41 diagnosis reveals the sensors are not connected **AND** if the code 44 and 45 diagnosis reveals that sensors are not properly grounded, then the air bag diagnostic monitor will flash the air bag indicator continuously at a fast rate.

Possible Causes

Rapid continuous flashing of the air bag indicator can be caused by:

1. Both the center air bag sensor and bracket and RH cowl side panel front air bag sensor and bracket are disconnected from the wiring harness or main wiring is not connected with engine control sensor wiring (12A581).

   A thermal fuse is built into the air bag diagnostic monitor. If a short to ground should occur in the air bag deployment circuit, the microcomputer in the air bag diagnostic monitor will send a signal to the fuse causing it to open. The open fuse removes all firing power (battery/backup power) from the deployment circuits. This prevents unwanted air bag deployments due to damaged vehicle wiring.

   Code 51 is displayed whenever the diagnostic monitor thermal fuse is open and no other higher priority faults exist (consult Diagnostic Trouble Code Priority Table). Code 51 is normally seen after service of a code 13 condition.

   If a code 51 exists and a code 13 condition has not been serviced, this means an **intermittent** short to ground exists in the air bag deployment wiring. The intermittent short to ground must be located and serviced before servicing the code 51 condition.

   Since the thermal fuse is built into the air bag diagnostic monitor, the monitor must be replaced to service a code 51 condition. NEVER replace the air bag diagnostic monitor without first determining the cause for the code 51 condition. If the short to ground is not properly serviced, the short may reoccur, once again destroying the thermal fuse in the air bag diagnostic monitor.

   Rapid Continuous Flashing

Removal and Installation

1. **WARNING: THE ELECTRICAL CIRCUIT NECESSARY FOR SYSTEM DEPLOYMENT IS POWERED DIRECTLY FROM THE BATTERY AND BACKUP POWER SUPPLY. TO AVOID ACCIDENTAL DEPLOYMENT AND POSSIBLE PERSONAL INJURY, THE BATTERY POSITIVE CABLE MUST BE DISCONNECTED FOR ONE MINUTE PRIOR TO SERVICING OR REPLACING ANY SYSTEM COMPONENTS.**

   NOTE: To service stripped screws retaining LH cowl side front air bag sensor and bracket (14B005), replace old screws with N802455-S190. Tighten to 13-17 Nm (10-13 lb-ft).

   Disconnect battery positive cable and wait one minute for backup power supply to be depleted.

   - When the battery has been disconnected and reconnected, some abnormal drive symptoms may occur while the powertrain control module (PCM) (12A650) relearns its adaptive strategy. The vehicle may need to be driven 16 km (10 miles) or more to relearn the strategy.

2. Remove cowl side panel (02039) LH. Refer to Section 01-05B .

3. Disconnect connector on front air bag sensor and bracket from wiring connector on main wiring (14401).

4. Remove connector locator from cowl side panel.

5. Remove two screws retaining front air bag sensor and bracket to cowl side panel LH.

6. Remove front air bag sensor and bracket.

For installation, follow removal procedures in reverse order.

- Tighten retaining screws to 10-14 Nm (89-124 lb-in).
- Run system prove out check.

tomsn048@gmail.com

Diagnostic Monitor, Air Bag

CAUTION: When servicing the air bag diagnostic monitor (14B056) with a blown internal fuse (diagnostic trouble code 51), find and repair all wire damage or shorts. A blown air bag diagnostic monitor can be used to find electrical faults without replacing components unnecessarily. The Diagnosis and Testing portion of this section is written to give safety first priority.

The following steps may be taken to find the cause that initiated a blown fuse:

1. Verify the system using the old air bag diagnostic monitor and verify the wiring repairs success before proceeding. Repeat as many times as required.
2. Replace the air bag diagnostic monitor when all wire repairs are complete.
3. If the diagnostic trouble code returns after making all wiring repairs, then replace the indicated component.

Removal and Installation

1. **WARNING: THE ELECTRICAL CIRCUIT NECESSARY FOR SYSTEM DEPLOYMENT IS POWERED DIRECTLY FROM THE BATTERY AND BACKUP POWER SUPPLY. TO AVOID ACCIDENTAL DEPLOYMENT AND POSSIBLE PERSONAL INJURY, THE BATTERY POSITIVE CABLE MUST BE DISCONNECTED FOR ONE MINUTE PRIOR TO SERVICING OR REPLACING ANY SYSTEM COMPONENTS.**

   Disconnect battery positive cable and wait one minute for backup power supply energy to be depleted.
2. Locate air bag diagnostic monitor beneath and to the left of the steering column and disconnect the two connectors.
3. Depress tabs retaining air bag diagnostic monitor to air bag monitor bracket (14B058). Slide air bag diagnostic monitor off air bag monitor bracket.
4. Disconnect wiring connectors on air bag diagnostic monitor. Remove air bag diagnostic monitor.

For installation, follow removal procedures in reverse order.

- Run system prove out check.

Module, Driver Side Air Bag

NOTE: In general, if the air bag did not deploy in an accident, it was not needed. Complete all diagnosis procedures before replacing any air bag system component.

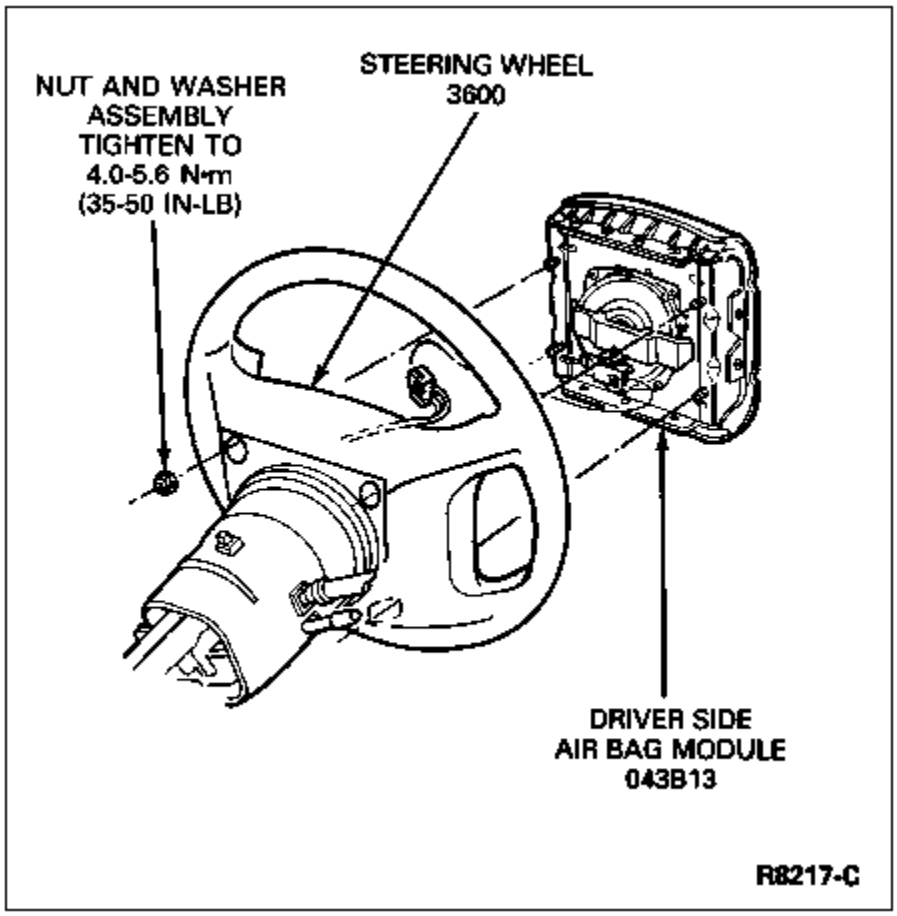
Removal

WARNING: THE ELECTRICAL CIRCUIT NECESSARY FOR SYSTEM DEPLOYMENT IS POWERED DIRECTLY FROM THE BATTERY AND BACKUP POWER SUPPLY. TO AVOID ACCIDENTAL DEPLOYMENT AND POSSIBLE PERSONAL INJURY, THE BATTERY POSITIVE CABLE MUST BE DISCONNECTED FOR ONE MINUTE PRIOR TO SERVICING OR REPLACING ANY SYSTEM COMPONENTS.

1. Disconnect battery positive cable and wait one minute for backup power supply energy to be depleted.

2. Remove four nut and washer assemblies retaining driver side air bag module (043B13) to steering wheel (3600).

tomsn048@gmail.com

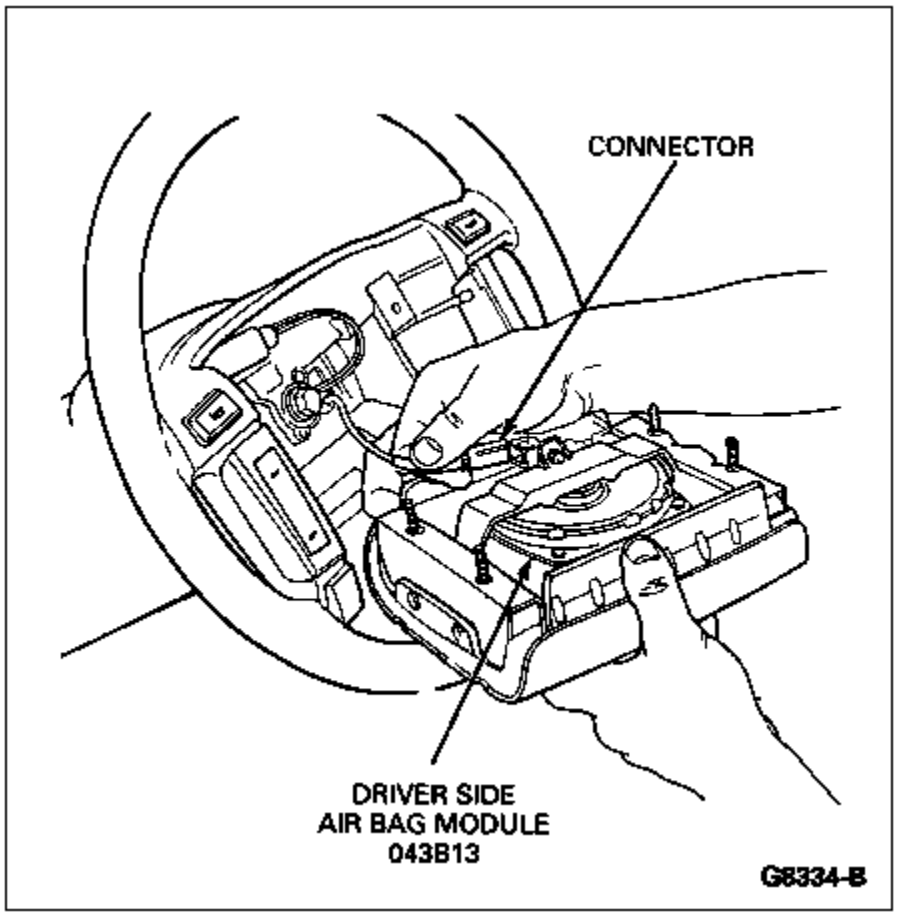


3. Disconnect the electrical connector on driver side air bag module from connector on air bag sliding contact (14A664).

4. **WARNING: AFTER REMOVING DRIVER SIDE AIR BAG MODULE , PLACE ON BENCH WITH TRIM COVER FACING UP.**

   Remove driver side air bag module.

tomsn048@gmail.com



Installation

1. Fill out the traceability postcard supplied with the new driver side air bag module and return it to Ford Motor Company. Note the diagnostic trouble code.

2. Connect driver side air bag module wiring connector to connector on air bag sliding contact.

3. Position driver side air bag module to steering wheel and secure with four nut and washer assemblies. Tighten to 4-6 Nm (36-53 lb-in).

4. Connect battery positive cable.

    - When the battery has been disconnected and reconnected, some abnormal drive symptoms may occur while the powertrain control module (PCM) (12A650)

5. Turn ignition switch (11572) to ON position. Allow system to perform self-test.

Frame and Crossmembers

WARNING: BEFORE REMOVAL OF ANY FRAME OR CROSSMEMBER COMPONENT BE SURE ANY ATTACHED OR SUPPORTED COMPONENT IS SECURELY HELD IN PLACE. OTHERWISE VEHICLE DAMAGE OR TECHNICIAN INJURY COULD RESULT FROM THESE COMPONENTS SHIFTING OR FALLING.

Removal

1. Raise vehicle and support on safety stands, Rotunda 077-00018 or equivalent.
2. Remove any attachment fasteners as required. If component to be removed is held in place by rivets, drill out rivet head using the appropriate size drill bit. Drive the remainder of the rivet out with a hammer and drift.
3. Remove component.

Installation

To install component, follow removal steps in reverse order. Make sure any replacement rivets are securely fastened.

Frame Inspection

Frame misalignment is the result of damaged or loose frame components.

Before checking frame alignment, inspect the frame (5005) for damage and loose parts. Inspect all frame members for cracks or bends. Check all welded connections for cracks. Inspect all rivets, bolts, and body support brackets for looseness. Make all necessary repairs or replacements.

Diagonal or X-Frame Checking Method

Alignment can be checked without removing the vehicle body from the frame (5005) by using the diagonal or X checking method.

This method should be used to identify misalignment prior to any attempt to straighten a frame.

1. Place the vehicle on a clean, level floor and set the parking brake.

2. Select at least four points along one frame side rail (5015) and very carefully transfer these points to the floor with a plumb bob. If desired, paper can be taped on the floor along both sides of the vehicle below the frame. Mark the point on the floor as accurately as possible.

3. Locate the corresponding points along the opposite frame side rail and very carefully transfer these points to the floor in the same manner.

4. Move the vehicle away from the marks on the floor, and measure between diagonal points. Both corresponding measurements should be equal within 6.35mm (1/4 inch). Measure diagonally between all points on the floor.

5. Measure between the corresponding points parallel to the frame side rail. These measurements should be within 6.36mm (1/4 inch) of each other.

   The squareness of the frame side rail web and the lower flanges at the spring hangers should be within 1.59mm (1/16 inch). The squareness of the side member web at the steering gear mounting location should be within 1.59mm (1/16). The web and the flange should be square at all other points within 3.18mm (1/8 inch).

   Any point on one sidemember should be within 3.18mm (1/8 inch) ahead, behind, above, or below the corresponding point on the opposite frame side rail. The frame side rail should not be bowed more than 3.18mm (1/8 inch) for each 2540mm (100 inches) of frame length. The overall width of frame should not vary more than 3.18mm (1/8 inch). The frame and frame side rail web and flanges should be square to each other and within 3.18mm (1/8 inch).

Misalignment Check, Unitized Body, Aerostar

To align or square up a body, take two opposite diagonal measurements between pillars. Use a measuring tram for these measurements. Take the measurements between reference points such as crease lines or weld joints which are diagonally opposite each other on the two pillars being measured. Since all measurements should be made from the bare metal, remove all interior trim from the checking points.

In some cases, it is difficult to obtain proper body alignment when repairing a body that is damaged on both sides. In these cases, horizontal and vertical measurements can be taken from a body of the same body style. Once these basic dimensions are taken and established on the damaged body, alignment can be made by diagonal measurements taken from points on two pillars.

Do not attempt to correct any serious misalignment with one jacking operation. This is particularly true if other sections of the body also require aligning. Align each section proportionately until the proper dimensions are obtained.

Door openings are checked in the same manner as the body. Horizontal, vertical, and diagonal checking points are established on all four sides of the door opening that is being measured.

Frame Service

Drilling Precautions

Do not drill holes in the flanges, since this tends to reduce the strength of frame (5005). Do not drill holes and/or attach any aftermarket components to the boxed, convoluted area of the frame side rails (5015) between thefront crossmember (5019) andfront bumper (17757) attachment.

NOTE: The following recommendations for straightening, reinforcement, and weld attachment DO NOT APPLY to the boxed, convoluted area of the frame side rails between the front crossmember and front bumper attachment (front frame horns). Repair of collision damage to this area of the frame will require installation of the appropriate frame repair kit.

Welding Precautions

CAUTION: Disconnect thebattery ground cable (14301) before using any electric welding equipment.

All frame welding should be done with a MIG welder, Rotunda 106-00052 or equivalent, and the heat should be kept in a small area to prevent change in metal hardness. **Do not apply heat to or weldframes without using a reinforcement on the repaired area. When a reinforcement is welded to a side member, run the welds lengthwise along the reinforcement.**

After any welding operation is complete, the welded area should be allowed to cool naturally.

Frame Straightening

Misalignment can be corrected by straightening the out-of-line parts or by replacing the crossmembers, braces, or brackets if they are badly damaged.

Straightening should be attempted onframes that fail to meet specification of the diagonal checking method or where damage is visually apparent.

CAUTION: If heat is to be used to assist in frame straightening, a protective welding blanket should be used to protect adjacent areas.

To prevent internal stresses in the metal, straightening should be limited to parts which are not severely bent. **If heat is needed to straighten a frame member, keep the temperature below 649°C (1200℉) (a dull red glow). Excessive heat may weaken the metal and cause permanent damage.** A temperature-sensitive thermal melt crayon should be used to monitor heat buildup. After any heat is applied to frame members, they should be allowed to cool naturally.

Frame Reinforcing

After a bent frame member has been straightened, inspect it closely for cracks. If any cracks show, the frame member should be reinforced or replaced.

Reinforcements can be made from channel, angle, or flat stock. The reinforcement stock should be of the same material and the same thickness as the frame member being reinforced and should extend a minimum

of 152mm (6 inches) to either side of the crack. SAE 1008/1010 (Low Carbon) Steel is recommended for reinforcements. Material specification for frame side rails is ESA-M1A35-C and for crossmembers and gussets is ESA-M1A33-C.

Weld Attachment

To make sure the repair is sound, the crack should be prepared before the reinforcement is welded to a cracked frame member. **The cracked area should be wire brushed to remove paint and expose the crack.** To prevent the crack from spreading, drill a 6.35mm (1/4-inch) hole at the root of the crack. Grind out the crack to form a V-shaped slot which will allow proper weld penetration.

The appropriate location of the reinforcement depends upon the location of the crack. If the crack is at the bottom of the channel, the reinforcement should be welded to the channel bottom. If the crack extends along the side of the channel, an additional reinforcement should be welded to the side. Drill clearance holes in the reinforcements to clear rivet and bolt heads when necessary.

Frame Member Replacement

If a damaged frame member is to be replaced, new bolts and Grade 8 fasteners required for replacement of parts should be of the same specification as the original bolts. In cases where it is necessary to substitute a bolt for a rivet, use the next larger size bolt.

The following chart lists recommended replacement specifications.

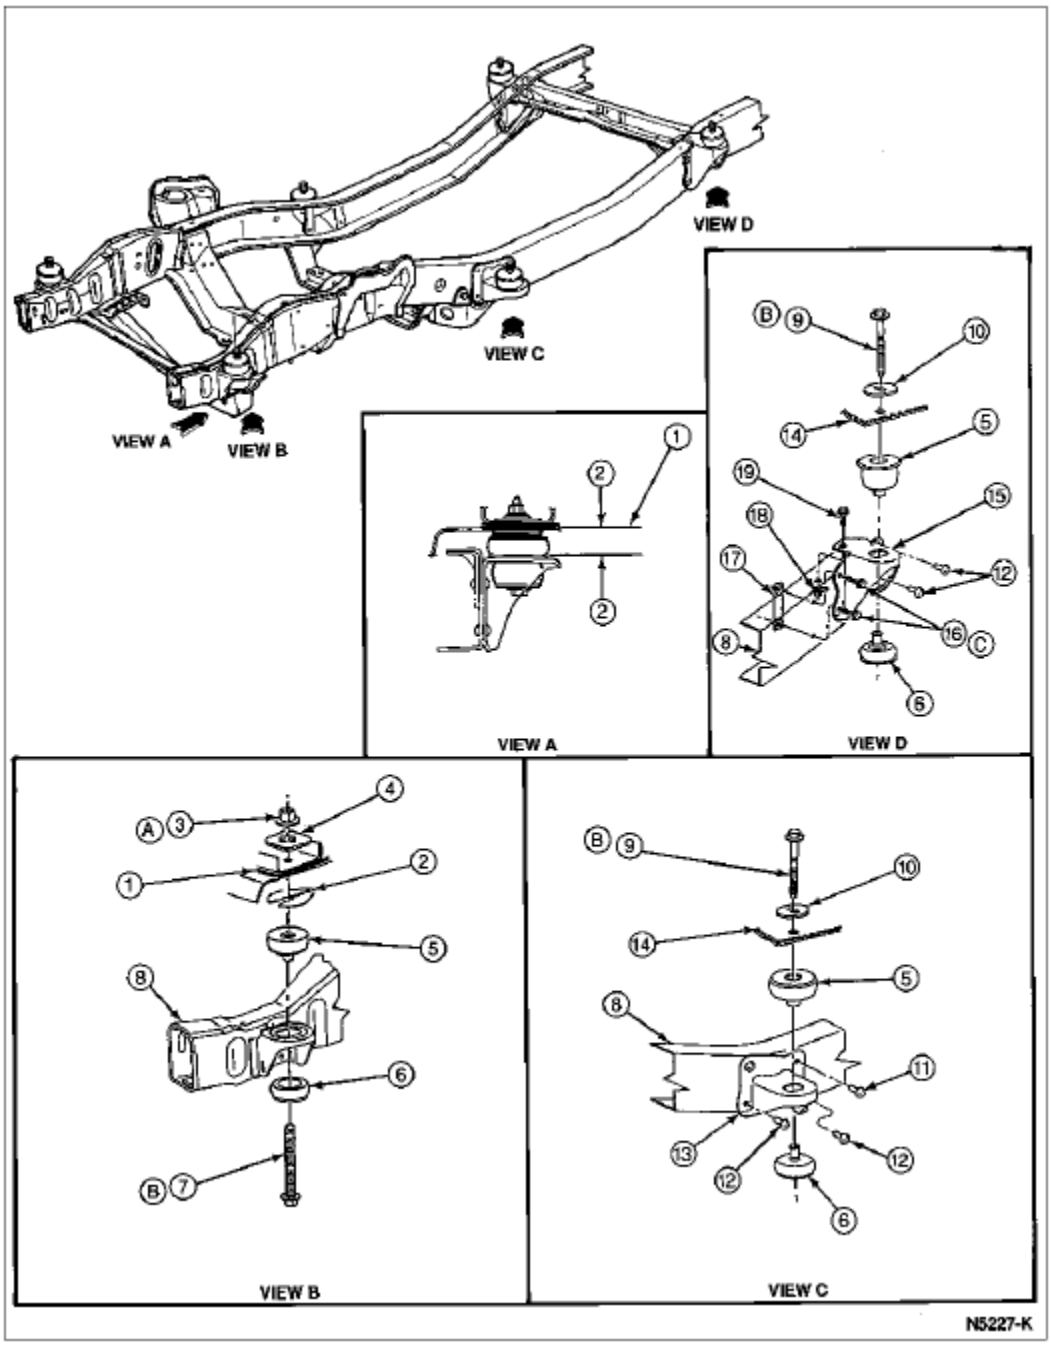
Frame Member Replacement Bolt Selection Chart

Rivet Diameter	Bolt Size	Bolt Part Number	Washer Part Number	Nut Part Number	Torque Specification
3/8 Inch and 10mm	7/16-14x1.25	56561-S2	Not Required	382400-S2	45-68 Nm (33-50 Lb-Ft)
3/8 Inch and 10mm	7/16-14x1.75	56563-S2	Not Required	382400-S2	45-68 Nm (33-50 Lb-Ft)
7/16 Inch	1/2-13x1.5 (Grade 5)	56783-S100	Not Required	33773-S2	72-102 Nm (53-75 Lb-Ft)
7/16 Inch	1/2-13x2.0 (Grade 8)	58677-S2	44879-S2	33773-S2	102-142 Nm (75-105 Lb-Ft)

Body Insulators

The body insulators are shown in the following illustrations.

Body to Frame Insulators, Ranger Regular Cab



Item	Part Number	Description
1	8A297	Radiator Support
2	1000145	Split Shim
3	N621946-S2	Nut and Washer
4	N800788-S2	Spacer
5	1000192	Upper Insulator Assembly
6	1000193	Lower Insulator Assembly

A	—	Tighten to 53-72 Nm (39-53 Lb-Ft)

Body Insulators (Except Under Radiator Support)

Disassembly

1. Remove interior trim as required.
2. Back out body mount bolt four or five turns and strike with a hammer to drive out the lower insulator. If the body mount bolt is not long enough to drive out the lower insulator, install a longer bolt or drift, and strike with a hammer to drive out the insulator.

Assembly

1. Position the upper insulator on top of the frame (5005) or frame bracket and install any shims that were removed during disassembly.
2. Position the body on the upper insulator and install the body mount bolts.
3. Position the lower absorber assembly to the bottom of the frame or frame bracket.
4. Tighten the body mount bolts. Refer to the appropriate illustration for the correct bolt torque specification.

Body Insulators at Radiator Support

Disassembly

1. Remove nut and washer from top of radiator support.
2. Back out bolt from under lower insulator.

Assembly

1. Place upper absorber assembly on frame bracket. Replace shims that were removed during disassembly.
2. Position lower insulator on bolt and thread bolt into shaft of upper insulator. Tighten bolt to 68-92 Nm (50-68 lb-ft). Make sure upper insulator is properly seated into frame bracket.
3. Replace nut and washer on top of radiator support (body mount surface). Tighten nut to 46-64 Nm (34-47 lb-ft).

SPECIFICATIONS

TORQUE SPECIFICATIONS

Insulator Assembly Nuts and Washers Attaching Radiator Support to Frame	46-64	34-47
Rear Bracket Nut Retainers and Bolts Attaching Insulator Assemblies to Frame	40-55	30-40
Nut Retainers and Bolts Attaching Pickup Box to Frame	53-72	39-53

Support Insulators, Front Engine

Removal

1. Remove the rubber overflow tube from the radiator coolant recovery reservoir (8A080) and detach it from the fan shroud (8146) (where appropriate).
2. Remove the fan shroud attaching screws and lift the fan shroud back and drape it onto the fan blade (8600).
3. Support the engine (6007) using a wood block and a jack placed under the oil pan (6675).
4. Remove the nut and washer assemblies attaching front engine support insulators (6038) to front engine support brackets (6028). Lift the engine sufficiently to disengage the front engine support insulator upper stud from the front engine support brackets (6029).
5. Remove bolt attaching fuel pump shield (9A397) to left front engine support bracket, if required.
6. Remove front engine support insulator-to-front engine support mounting brackets (6031) attaching nut and washer assembly. Remove front engine support mounting brackets assembly.

Installation

1. **NOTE: For some applications it may be necessary to remove the front engine support brackets to gain access to the lower stud nuts of the front engine support insulator.**

   Install the front engine support insulator to the front engine support mounting bracket. If front engine support mounting bracket was removed, install it to the crossmember.
2. Install the bolt attaching fuel pump shield to left front engine support bracket, if required. Tighten to specification.
3. Lower the engine until the insulator stud engages in the slot/hole of front engine support brackets. Install attaching nuts and tighten to specification. Refer to the appropriate illustration for torque specifications.
4. Remove the jack and wood block from the engine oil pan.
5. Position the fan shroud to the radiator (8005) and install the attaching screws and tighten to specifications. Refer to Section 03-03 for fan shroud torque specifications.
6. Install the radiator overflow hose (8075) to the radiator coolant recovery reservoir and attach it to the shroud (where appropriate).

Support Insulator, Rear Engine

Removal

1. Place a block of wood and a jack under the transmission (7003).
2. Remove the two nuts attaching the transmission support crossmember (6A023) to the rear frame crossmember (5035). Raise the transmission sufficiently to lift the transmission support crossmember from the rear frame crossmember.
3. Remove the two bolts attaching the transmission support crossmember to the transmission and remove the transmission support crossmember.
4. On vehicles so equipped, remove the fasteners attaching theexhaust hanger insulator (5F262) to theengine and transmission support (6F065).
5. Remove the bolts and nuts attaching the rear frame crossmember to the frame side rails (5015) and remove the rear frame crossmember if necessary.

Installation

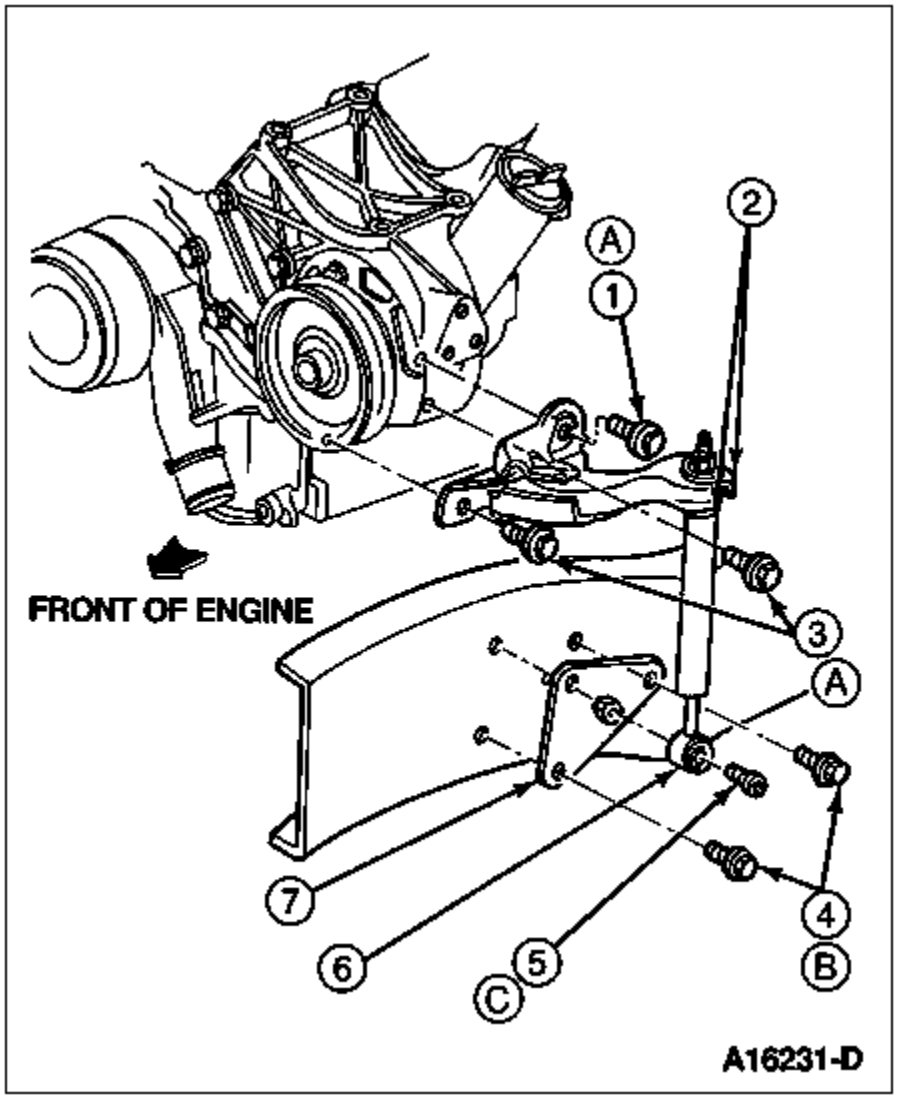
1. Position the fluid cooler inlet tube (7A030) to the transmission. Install the two attaching bolts and tighten to specification.
2. If so equipped, install the fasteners attaching the exhaust hanger insulator to the fluid cooler inlet tube. Tighten to specification listed in Section 09-00 .
3. Install the rear frame crossmember to the frame side rails. Refer to the appropriate illustration for torque specifications.
4. Lower the transmission and install the attaching nuts. Refer to the appropriate illustration for torque specifications.
5. Remove the jack and wood block from under the transmission.

Engine Damper, Ranger

Removal and Installation

1. Remove the Torx® screw from the bottom of the engine mounting damper (6M046).
2. Remove the nut from the top damper stud and remove engine mounting damper from engine mount damper bracket reinforcement.
3. Remove attaching screws and remove engine mount damper bracket reinforcement (6F024), if required.

For installation follow removal procedures in reverse order. Refer to the following illustration for torque specifications.



Item	Part Number	Description

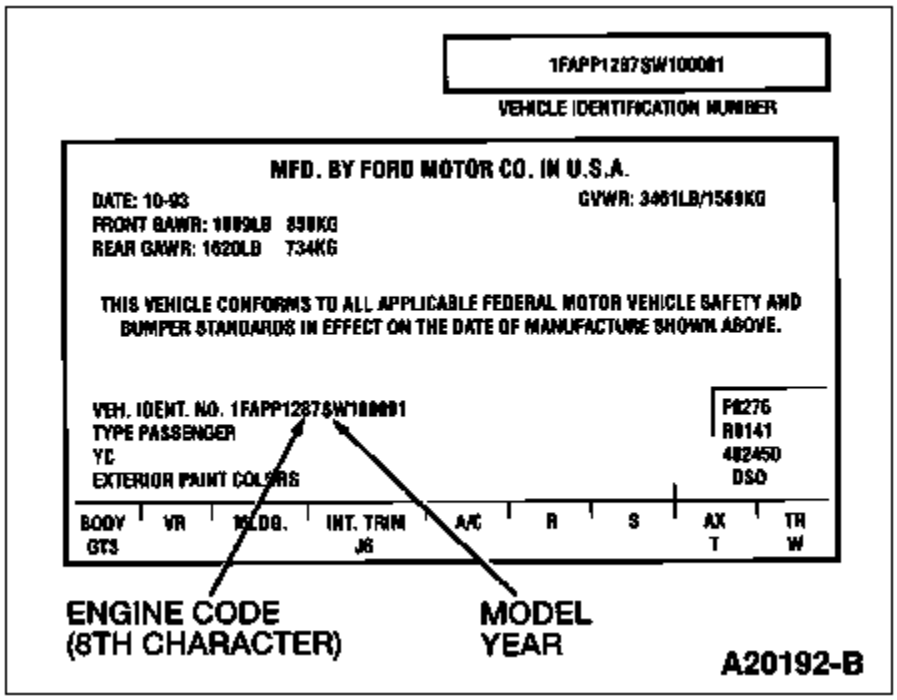
D	—	Tighten to 98-132 Nm (72-97 Lb-Ft)

Engine Identification

For quick engine identification, refer to the Vehicle Emission Control Information (VECI) Decal mounted under the hood (16612). This decal lists engine information required for proper servicing of the engine (6007). Refer to Section 00-03 for further information. An engine identification label is also attached to the engine. The symbol code on the identification tag identifies each engine for determining parts usage, for instance, engine displacement and model year. Engine decal information is located in Section 03-01A , Section 03-01B , or Section 03-01C . The vehicle identification number (VIN) also gives engine information. The eighth digit identifies the engine. Refer to Section 00-01 for further information.

Vehicle Certification Label

Vehicle Certification Decal — Typical



The English certification label is attached to the door latch edge on the driver side door. The French certification label is attached to the door latch edge on the passenger side door.

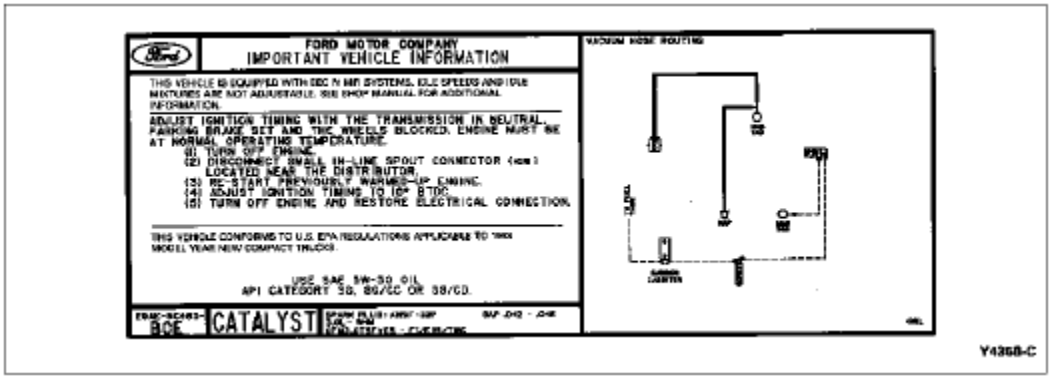
The label contains the name of the manufacturer, the month and year of manufacture, the certification statement, and the vehicle identification number (VIN). The label also contains gross vehicle weight ratings, wheel and tire data, and information codes for additional vehicle data.

Safety Certification Decal

tomsn048@gmail.com

For quick engine identification, refer to the Safety Certification Decal. The decal is mounted on the LH front door lock face panel. Find the engine code (letter or number) on the decal, then refer to the engine identification chart to determine the engine type and size. An engine identification label is also attached to the engine. The symbol code on the identification tag identifies each engine for determining parts usage; for instance, engine displacement and model year. Engine decal information is located in Section 03-01A , Section 03-01B , and Section 03-01C .

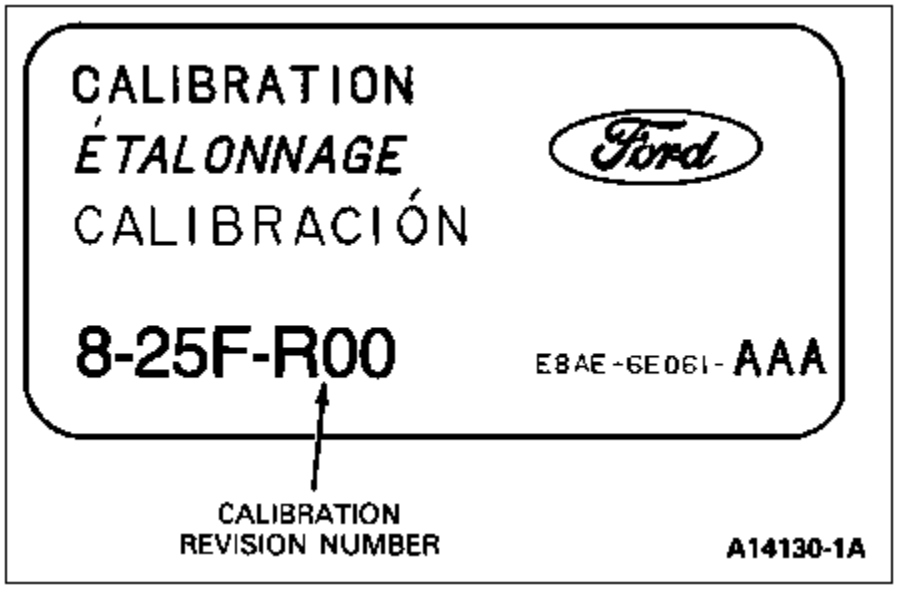
Safety Certification Decal



Emission Calibration Number Label

The emission calibration number label is located on the left side door or left door post pillar. It identifies the engine calibration number, the engine code number and revision level.

These numbers are used to determine if parts are unique to specific engines.



Always refer to these labels when replacement parts are required or when checking engine calibrations. Engine parts often differ within a displacement (liter or CID) family. Verification of identification codes will make sure that the proper parts are obtained. The codes contain all pertinent information relating to dates, optional equipment and revisions. The Ford Master Parts Catalog contains a complete listing of the codes and their application.

tomsn048@gmail.com

Symptom Chart — Engine Diagnosis

ENGINE DIAGNOSIS

Condition	Possible Source	Action
• Difficult Starting	• Burnt intake valve or exhaust valve.	• REPLACE intake valve or exhaust valve.
	• Worn piston.	• REPLACE piston.
	• Worn piston ring(s).	• REPLACE piston ring(s).
	• Worn cylinder.	• SERVICE or REPLACE cylinder blocks.
	• Damaged cylinder head gasket.	• REPLACE cylinder head gasket.
	• Malfunctioning or damaged fuel system.	• REFER to Section 4A in the Powertrain Control/Emissions Diagnosis Manual for diagnosis and testing of the fuel system.
	• Malfunctioning or damaged ignition system.	• REFER to Section 4A in the Powertrain Control/Emissions Diagnosis Manual for diagnosis and testing of the ignition system.
• Poor Idling	• Damaged hydraulic valve tappet.	• REPLACE hydraulic valve tappet.
	• Damaged hydraulic valve tappet guide.	• REPLACE hydraulic valve tappet guide.
	• Improper valve-to-valve seat contact.	• REPLACE intake valve or exhaust valve and/or valve seat.
	• Damaged cylinder head gasket.	• REPLACE cylinder head gasket.
	• Malfunctioning or damaged fuel system.	• REFER to Section 4A in the Powertrain Control/Emissions Diagnosis Manual for diagnosis and testing of the fuel system.
	• Malfunctioning or damaged ignition system.	• REFER to Section 4A in the Powertrain Control/Emissions Diagnosis Manual for diagnosis and testing of the ignition system.
	• Worn or damaged valve stem seal/fouled spark plug.	• Replace valve stem seals.
• Abnormal Combustion	• Damaged hydraulic valve tappet.	• REPLACE hydraulic valve tappet.
	• Damaged hydraulic valve tappet bore.	• REPLACE cylinder head.
	• Burnt or sticking intake valve or exhaust valve.	• SERVICE or REPLACE intake valve or exhaust valve.

tomsn048@gmail.com

	• Weak or broken valve spring.	• REPLACE valve spring.
	• Carbon accumulation in combustion chamber.	• ELIMINATE carbon buildup.
	• Malfunctioning or damaged fuel system.	• REFER to Section 4A in the Powertrain Control/Emissions Diagnosis Manual for diagnosis and testing of the fuel system.
	• Malfunctioning or damaged ignition system.	• REFER to Section 4A in the Powertrain Control/Emissions Diagnosis Manual for diagnosis and testing of the ignition system.
• Excessive Oil Consumption	• Worn piston ring groove.	• REPLACE piston.
	• Sticking piston ring(s).	• SERVICE or REPLACE piston ring(s).
	• Worn piston or cylinder.	• SERVICE and/or REPLACE piston or cylinder blocks.
	• Worn valve stem seal.	• REPLACE valve stem seal.
	• Worn valve stem or valve guide.	• REPLACE valve stem and guide.
	• Leaking oil.	• SERVICE oil leakage.
	• Worn piston rings.	• REPLACE piston rings.
	• Plugged PCV system.	• SERVICE PCV System.
• Engine Noise	• Excessive main bearing oil clearance.	• ADJUST clearance or REPLACE crankshaft main bearing.
	• Seized or heat damaged crankshaft main bearing.	• REPLACE crankshaft main bearing.
	• Excessive crankshaft end play.	• ADJUST end play or REPLACE crankshaft.
	• Excessive connecting rod bearing oil clearance.	• ADJUST clearance or REPLACE connecting rod.
	• Damaged connecting rod bearings.	• REPLACE connecting rod bearings.
	• Worn cylinder.	• SERVICE or REPLACE cylinder blocks.
	• Worn piston or piston pin.	• REPLACE piston or piston pin.
	• Damaged piston ring (s).	• REPLACE piston ring(s).
	• Bent connecting rod.	• REPLACE connecting rod.
	• Malfunctioning hydraulic valve tappet.	• REPLACE hydraulic valve tappet.
	• Excessive hydraulic valve tappet clearance.	• ADJUST clearance or REPLACE hydraulic valve tappet.

tomsn048@gmail.com

	• Broken valve spring.	• REPLACE valve spring.
	• Excessive valve guide clearance.	• SERVICE clearance or REPLACE valve guide/stem.
	• Malfunctioning or damaged cooling system.	• REFER to Section 03-03 .
	• Malfunctioning or damaged fuel system.	• REFER to Section 4A in the Powertrain Control/Emissions Diagnosis Manual for diagnosis and testing of the fuel system.
	• Leaking exhaust system.	• SERVICE exhaust leakage.
	• Improper drive belt tension.	• REFER to Section 03-05 .
	• Malfunctioning generator bearing.	• REFER to Section 14-02 .
	• Loose timing chain/belt.	• ADJUST or REPLACE timing chain/belt.
	• Damaged timing chain/belt tensioner.	• REPLACE timing chain/belt tensioner.
	• Malfunctioning water pump bearing.	• REFER to Section 03-03 .
• Insufficient Power	• Malfunctioning hydraulic valve tappet.	• REPLACE hydraulic valve tappet.
	• Damaged hydraulic valve tappet bore.	• REPLACE cylinder head.
	• Compression leakage at valve seat.	• SERVICE or REPLACE valve, valve seat and/or cylinder head.
	• Seized valve stem.	• REPLACE valve stem.
	• Weak or broken valve spring.	• REPLACE valve spring.
	• Damaged cylinder head gasket.	• REPLACE cylinder head gasket.
	• Cracked or distorted cylinder head.	• REPLACE cylinder head.
	• Damaged, worn or sticking piston ring(s).	• SERVICE or REPLACE piston ring(s).
	• Worn or damaged piston.	• REPLACE piston.
	• Malfunctioning or damaged fuel system.	• REFER to Section 4A in the Powertrain Control/Emissions Diagnosis Manual for diagnosis and testing of the fuel system.
	• Malfunctioning or damaged ignition system.	• REFER to Section 4A in the Powertrain Control/Emissions Diagnosis Manual for diagnosis and testing of the ignition system.
	• Slipping transmission.	• REFER to Section 07-01A or Section 07-01B depending on transmission.

tomsn048@gmail.com

	• Dragging brakes. • Incorrect tire size.	• REFER to Section 06-00 . • REFER to Section 04-04 .

tomsn048@gmail.com

Positive Crankcase Ventilation (PCV) System Closed-Type

A malfunctioning closed crankcase ventilation system may be indicated by loping or rough engine idle. Do not attempt to compensate for this idle condition by disconnecting the crankcase ventilation system and making an air bypass or idle speed adjustment. **The removal of the crankcase ventilation system from the engine (6007) will adversely affect the fuel economy and engine ventilation with resultant shortening of engine life.** To determine whether the loping or rough idle condition is caused by a malfunctioning crankcase ventilation system, refer to the Powertrain Control/Emissions Diagnosis Manual.

tomsn048@gmail.com

Engine Oil Leaks

When diagnosing engine oil leaks, the source and location of the leak must be identified prior to service.

Fluorescent Oil Additive Method

1. Add Rotunda Gas Engine Dye 164-R3705 or equivalent to the engine oil. Use 29.6 ml (1 ounce) of fluorescent additive in all engines.
2. Clean engine with a suitable solvent to remove all traces of oil.
3. Run engine for 15 minutes.
4. Stop engine and inspect all seal, gasket and galley plug areas for leaks using Rotunda Oil Leak Detector 164-R0756 or equivalent. A clear bright yellow or orange area will identify leak. For extremely small leaks, several hours may be required for the leak to appear.
5. **NOTE: For minor gasket leaks tightening the retaining bolts may resolve the problem.**

   Service all leaks as required.

tomsn048@gmail.com

Leakage Points

Examine the following areas for oil leakage.

Underhood

- Valve cover sealant or gaskets
- Intake manifold gaskets/end seals
- Head gaskets (6051)
- Oil filter
- Oil level dipstick tube connection
- Oil pressure sensor (9278)

Under Engine — With Vehicle on Hoist

- Oil pan gasket (6710)
- Oil pan front and rear end seals
- Crankshaft front seal (6700)
- Crankshaft rear oil seal (6701)
- Oil pump (6600)

tomsn048@gmail.com

Compression Test

Compression Gauge Check

1. Make sure oil in crankcase is of the correct viscosity and at proper level, and battery (10655) is properly charged. Operate vehicle until engine (6007) is at normal operating temperature. Turn off ignition, then remove all spark plugs (12405).

2. Set throttle plates in wide-open position.

3. Install Rotunda Compression Tester 014-00707 or equivalent in No. 1 cylinder.

4. Install an auxiliary starter switch in starting circuit. With ignition in the OFF position, and using auxiliary starter switch, crank engine at least five compression strokes and record highest reading. Note the approximate number of compression strokes required to obtain the highest reading.

5. Repeat test on each cylinder cranking the engine approximately the same number of compression strokes.

Test Results

The indicated compression pressures are considered within specification if the lowest reading cylinder is within 75 percent of the highest. Refer to the chart below.

Compression Pressure Limit Chart

Maximum		Minimum		Maximum		Minimum	
kPa	psi	kPa	psi	kPa	psi	kPa	psi
924	134	696	101	1131	164	848	123

1531	222	1145	166				

Compression Readings — Interpreting

It is recommended the Compression Pressure Limit Chart be used when checking cylinder compression so that the lowest reading number is 75 percent of the highest reading.

If one or more cylinders reads low, squirt approximately one tablespoon of SAE 50 weight or equivalent engine oil on top of the pistons (6108) in the low reading cylinders. Repeat compression pressure check on these cylinders.

1. If compression improves considerably, piston rings (6149) are at fault.
2. If compression does not improve, valves are sticking or seating poorly.
3. If two adjacent cylinders indicate low compression pressures and squirting oil on pistons does not increase compression, cause may be a head gasket leak between cylinders. Engine oil and/or coolant in cylinders could result from this problem.

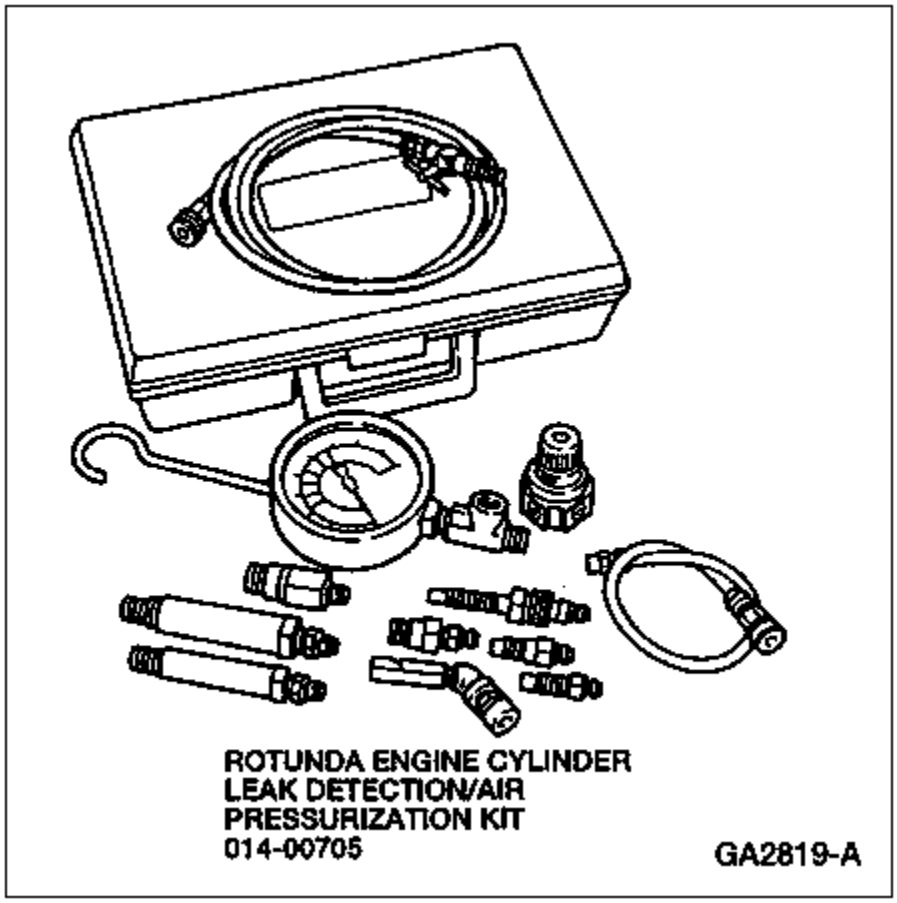
Example Readings

If, after checking the compression pressures in all cylinders, it was found that the highest reading obtained was 1351 kPa (196 psi) and the lowest pressure reading was 1069 kPa (155 psi), the engine (6007) is within specification and the compression is considered satisfactory.

tomsn048@gmail.com

tomsn048@gmail.com

Cylinder Leakage Detector



When a cylinder produces a low reading, the use of Rotunda Engine Cylinder Leak Detection/Air Pressurization Kit 014-00708 or equivalent will be helpful in pinpointing the exact cause.

The leakage detector is inserted in the spark plug hole, the piston (6108) is brought up to top dead center (TDC) on the compression stroke, and compressed air is admitted.

Once the combustion chamber is pressurized, a special gauge will read the percentage of leakage. Leakage exceeding 20 percent is considered excessive.

While the air pressure is retained in the cylinder, listen for the hiss of escaping air. A leak by the intake valve (6507) will be audible in the throttle body (9E926). A leak by the exhaust valve (6505) can be heard at the tail pipe. Leakage past the piston rings (6149) will be audible at the positive crankcase ventilation (PCV) connection. (Oil filler neck in valve cover for 3.0L.) If air is passing through a blown head gasket (6051) to an adjacent cylinder, the noise will be evident at the spark plug hole of the cylinder into which the air is leaking. Cracks in the cylinder blocks (6010), or head gasket leakage into the cooling system may be detected by a stream of bubbles in the radiator (8005). To detect a cracked cylinder wall, it may be necessary to remove air supply at tool and move piston to BDC to expose full length of cylinder bore.

tomsn048@gmail.com

tomsn048@gmail.com

Oil Leak and Valve Stem Seal Test

The cylinder leakage detector can be used to test for engine oil leaks and to check the valve stem seals (6571) for leakage.

1. Plug all crankcase openings except the one used for connecting the leakage detector.

2. **CAUTION: Use extreme caution when pressurizing crankcase. Applying air pressure above specified pressure risks damage to seals, gaskets and core plugs. Under no circumstances should pressure be allowed to exceed 21 kPa (3 psi).**

   Connect the leakage detector to a crankcase opening. The oil level indicator tube (6754) is convenient. Adjust the air pressure to approximately 21 kPa (3 psi).

3. Using a solution of liquid soap and water, brush the solution along the gasket sealing surfaces and bearing seals. Look for bubbles or foam.

4. Remove the spark plugs (12405) and rotate the crankshaft (6303) slowly with a wrench. Check for large amounts of air escaping into the cylinders as each intake valve (6507) and exhaust valve (6505) opens.

   The spark plugs on the leaking cylinders will probably show deposits of burned oil.

tomsn048@gmail.com

Intake Manifold Vacuum Test

Bring the engine (6007) to normal operating temperature. Connect Rotunda Vacuum/Pressure Tester 164-R0253 or equivalent to the intake manifold (9424). Run the engine at the specified idle speed.

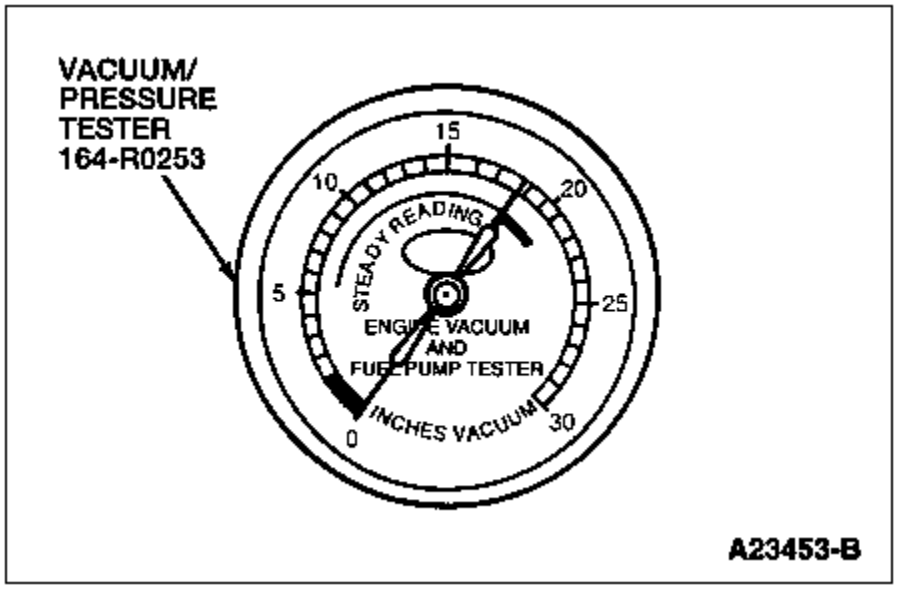
The vacuum gauge should read between -51 and -74 kPa (15 and 22 in-Hg) depending upon the engine condition and the altitude at which the test is performed. Subtract 5.5 kPa from the specified reading for every 500 meters (1 in-hg for every 1,000 feet) of elevation above sea level.

The reading should be quite steady. It may be necessary to adjust the gauge damper control (where used) if the needle is fluttering rapidly. Adjust damper until needle moves easily without excessive flutter.

Vacuum Gauge Readings — Interpretation

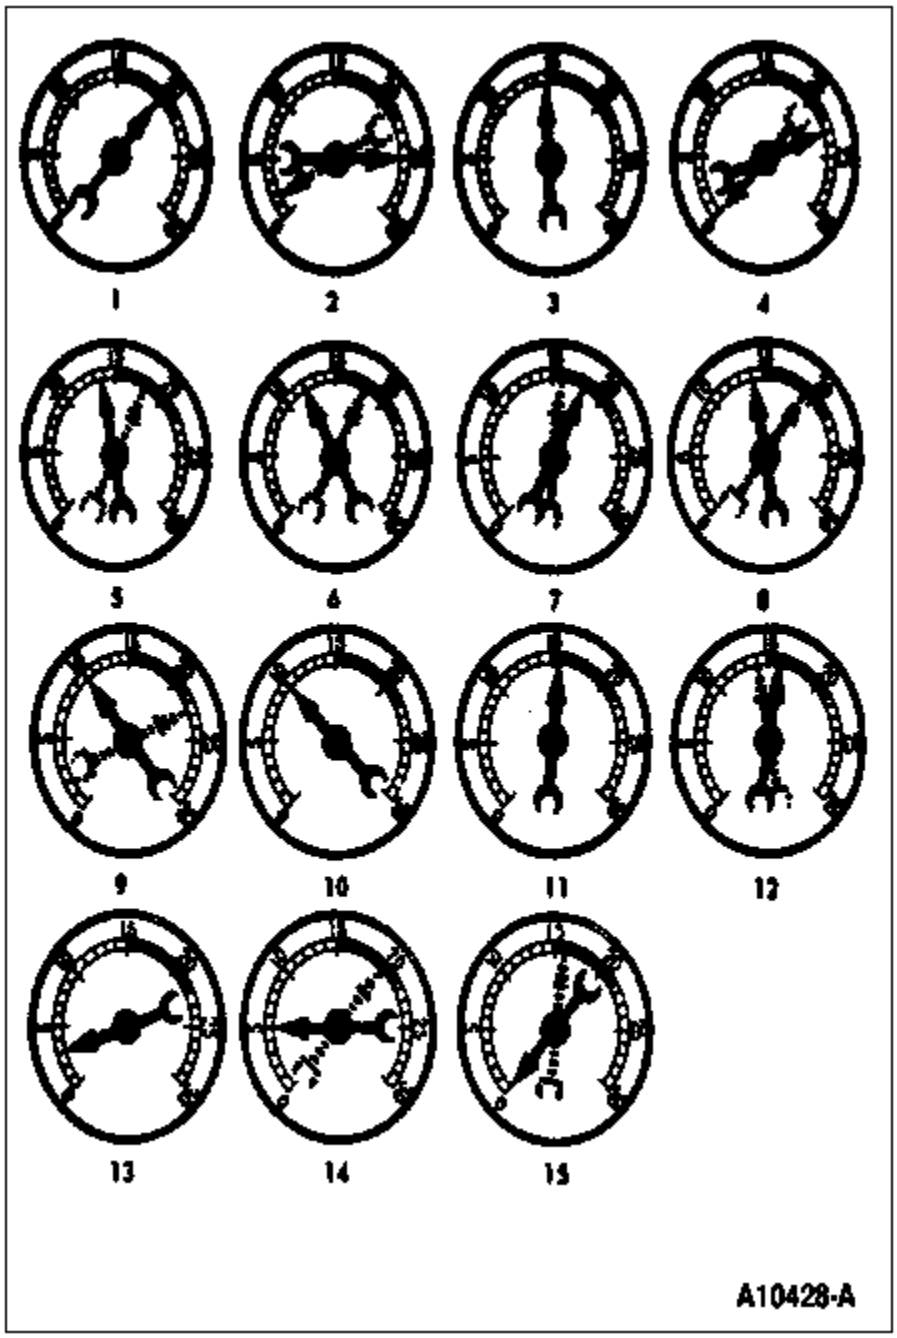
A careful study of the vacuum gauge reading while the engine is idling will help pinpoint trouble areas. Always conduct other appropriate tests before arriving at a final diagnostic decision. Remember that vacuum gauge readings, although helpful, must be interpreted with care.

Most vacuum gauges have a "normal" band indicated on the gauge face.



Following are potential gauge readings. Some should be considered as normal; others should be investigated further.

tomsn048@gmail.com



1. NORMAL READING: Needle between -51 and -74 kPa (15 and 20 in-Hg) and holding steady.

2. NORMAL READING DURING RAPID ACCELERATION AND DECELERATION: When engine is rapidly accelerated (dotted needle), needle will drop to a low (not to 0) reading. When throttle is suddenly released, the needle will snap back up to a higher than normal figure.

3. NORMAL FOR HIGH LIFT CAM WITH LARGE OVERLAP: Needle will register as low as -50 kPa (15 in-Hg) but will be relatively steady. Some oscillation is normal.

4. WORN RINGS OR DILUTED OIL: When engine is accelerated (dotted needle), needle drops to 0 kPa (0 in-Hg). Upon deceleration, needle runs slightly above 74 kPa (22 in-Hg).

tomsn048@gmail.com

5. STICKING VALVE(S): When the needle (dotted) remains steady at a normal vacuum but occasionally flicks (sharp, fast movement) down and back about 13 kPa (4 in-Hg), one or more valves may be sticking.

6. BURNED OR WARPED VALVES: A regular, evenly spaced, downscale flicking of the needle indicates one or more burned or warped valves. Insufficient hydraulic valve tappet clearance will also cause this action.

7. POOR VALVE SEATING: A small but regular downscale flicking can mean one or more valves are not seating.

8. WORN VALVE GUIDES: When the needle oscillates (swings back and forth) over a 13 kPa (4 in-Hg) range at idle speed, the valve guides (6510) could be worn. As engine speed is increased, the needle will become steady if the valve guides are responsible.

9. WEAK VALVE SPRINGS: When the needle oscillation becomes more violent as engine rpm is increased, weak valve springs (6513) are indicated. The reading at idle could be relatively steady.

10. LATE VALVE TIMING: A steady but low reading could be caused by late valve timing.

11. IGNITION TIMING RETARDING: Retarded ignition timing will produce a steady but low reading.

12. INSUFFICIENT SPARK PLUG GAP: When spark plugs (12405) are gapped too close, a regular, small pulsation of the needle can occur.

13. INTAKE LEAK: A low, steady reading can be caused by an intake manifold or throttle body mounting flange gasket leak.

14. BLOWN HEAD GASKET: A regular drop of approximately 33-50 kPa (10-15 in-Hg) can be caused by a blown head gasket (6051) or warped head-to-block mounting surface.

15. RESTRICTED EXHAUST SYSTEM: When the engine is first started and is idled, the reading may be normal. But, as the engine rpm is increased, the back pressure caused by a clogged muffler, kinked tail pipe, etc., will cause the needle to slowly drop to 0. The needle then may slowly rise. Excessive exhaust clogging will cause the needle to drop to a low point even if the engine is only idled.

    When vacuum leaks are indicated, search out and correct the condition. Excess air leaking into the system will upset the fuel mixture and cause conditions such as rough idle, missing or acceleration, or burned valves. If the leak exists in an accessory unit such as the power brake, the unit will not function correctly. Always service vacuum leaks.

---

tomsn048@gmail.com

tomsn048@gmail.com

Engine Oil Consumption, Excessive

The amount of oil an engine (6007) uses will vary with the way the vehicle is driven in addition to normal engine-to-engine variation.

Oil usage is normally greater during the first 16093 km (10,000 miles) of service. As mileage increases, oil usage generally improves. Cars and light trucks in normal service should get at least 1440 km (900 miles) to 0.95L (1 qt) after 16093 km (10,000 miles) of service.

Vehicles used in heavy-duty operation (severe service) may consume more oil. The following are examples of heavy-duty operation:

- High ambient temperatures
- Trailer towing applications
- Taxi cab applications
- Police service applications
- Severe loading applications
- Sustained high speed operation

Engines need oil to lubricate the following internal components:

- Engine block cylinder walls
- Pistons (6108) and piston rings (6149)
- Intake and exhaust valve stems
- Intake and exhaust valve guides (6510)
- All internal engine components

When the pistons move downward, a thin film of oil is left on the cylinder walls. The thin film of oil is burned away on the firing stroke during combustion. If an engine burned a drop of oil during each firing stroke, oil consumption would be about one quart for every mile traveled. Fortunately modern engines use much less oil than this example. However, even efficient engines will use some oil or they would quickly wear out. Additionally, as the vehicle is operated, some oil is drawn into the combustion chambers past the intake and exhaust valve stem seals (6571) and burned.

Many different conditions can affect oil consumption rates. A partial list of those conditions includes:

- Operator driving habits
- Ambient temperature
- Quality and viscosity of the oil
- Vehicle load and driving terrain

Operation under certain conditions can create a false impression of excessive oil consumption. Most commonly, this happens when the vehicle has been operated for repeated short trips at low ambient temperatures. Under these conditions, substantial amounts of condensed water and fuel can build up in the oil. If the vehicle is then run for a significant time at highway speeds and/or with heavy loads, much of the accumulated water and fuel can be removed by the engine ventilation system. Removing the water and fuel in a relatively short time will often create the appearance of an excessive consumption rate to the customer. In this situation, the customer could be assured that these events are normal for the conditions noted. The customer might also be advised to change oil and filter more frequently, especially prior to starting a long trip

tomsn048@gmail.com

in cold weather if unduly concerned about this condition.

Make sure the selected engine oil meets the recommended API performance category "SH" and SAE viscosity grade as shown in the vehicle Owner Guide. It is also important that the engine oil is changed at the intervals specified for the typical operating conditions. Refer to Section 00-03 .

Oil Consumption Test

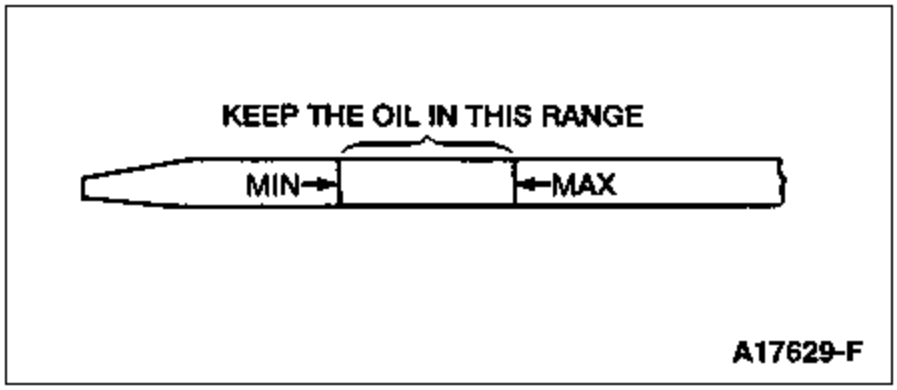
CAUTION: Care should be taken to direct the oil control nozzle away from the closure hose port in the oil fill tube during engine oil fill.

NOTE: To prevent oil from entering the PCV system during air powered oil fills, the closure hose should be disconnected from the oil fill tube and positioned aside. Cover the closure hose port with a shop towel to prevent oil from spilling onto the engine during engine oil fill. Connect closure hose after the oil has been filled to the proper level.

The following diagnostic procedure is intended to be used to determine the source of excessive internal oil consumption.

1. Determine what the customer considers excessive oil consumption to be. Note vehicle mileage and the following observations:
    a. How many kilometers (miles) are typically driven per 0.95L (1 qt) of oil used?
    b. How is the vehicle being used (e.g., sustained high speed operation, heavy loads, trailer towing, high ambient temperature, etc.)?
    c. What does the customer expect normal oil consumption to be?
2. Verify that the engine has no external oil leak as described under Engine Oil Leaks in this section.
3. Verify that the engine has the proper oil level dipstick (6750) by comparing the part number stamped on it against the Ford Master Parts Catalog. Verify that the oil level dipstick and oil level indicator tube (6754) are unmodified and in good condition. Verify that the oil level indicator tube is properly seated in the cylinder blocks (6010), and the oil level dipstick seats properly in the oil level indicator tube.
4. Verify that the engine is not being run in an overfilled condition. Check the oil level at least five minutes after a hot shutdown with the vehicle parked in a level area. Under no circumstances should the oil level be above the FULL line. If a significant overfill is indicated, perform Steps 5a through 5d to verify the oil level dipstick calibration. If the oil level dipstick calibration checks OK, instruct the customer to avoid overfilling the engine and return the vehicle to service. To verify the vehicle's actual oil consumption, perform Steps 5e and 5f only after the oil level dipstick has been calibrated.

tomsn048@gmail.com



5. Perform engine oil consumption test as follows:

    a. Drain engine oil. Remove and replace oil bypass filter (6714). Use 0.95L (1 qt) less engine oil than recommended to refill crankcase with recommended quantity of oil.
    b. Run the engine for three minutes (ten minutes if cold), then turn engine off. Allow oil to drain into the oil pan (6675) for an additional five minutes (vehicle should be on level ground).
    c. Remove oil level dipstick and wipe clean. Do not wipe with anything contaminated with silicone compounds. Reinstall oil level dipstick being sure to seat it firmly in the oil level indicator tube. Remove the oil level dipstick and scribe a mark on the back (unmarked) surface at the indicated oil level. This should be about the same level as the MIN line on the face of the oil level dipstick.
    d. Add 0.95L (1 qt) of oil. Restart the engine and allow it to idle for at least two minutes. Shut down and allow oil to drain back for at least five minutes. Mark the oil level dipstick using the procedure above. This level may range from 5mm (0.20 inch) below the MAX line up to the MAX line.
    e. Instruct the customer to drive the vehicle as usual and do the following:
        - Check the oil level regularly at intervals of 160 to 240 km (100 to 150 miles).
        - Return to the service facility when the oil level drops below the MIN line scribed on the oil level dipstick by the technician.
        - In an emergency, add only 0.95L (1 qt) of the same oil and note the mileage at which the oil was added.
    f. Check the oil level under the same conditions as in Steps 5c and 5d, reading the back of the oil level dipstick where the scribe marks are located.
        - Measure the distance from the oil level to the upper scribe mark on the oil level dipstick and record.
        - Measure the distance between the two scribe marks and record.
        - Divide the first measurement by the second. Add one to this total for every 0.95L (1 qt) added by the customer as instructed in Step 5e.
        - Divide the distance driven during the oil test by the result. This quantity is the approximate oil consumption rate in miles per quart (mpq).
    g. If the calculated oil consumption rate is unacceptable, proceed to Step 6.

6. Check PCV system. Make sure system is not plugged.

7. Check for plugged oil drain-back holes in cylinder heads (6049) and cylinder blocks.

8. If condition still exists, perform a cylinder compression test as described in this section, and/or perform a cylinder leak detection test with Rotunda Engine Cylinder Leak Detection/Air Pressurization Kit 014-00705 or equivalent. This can be helpful in determining source of oil consumption, i.e., valves, piston rings, etc.

9. Check valve guides for excessive valve guide clearance. Replace all valve stem seals after correct valve guide clearance has been verified.

tomsn048@gmail.com

10. **NOTE: After checking for worn parts, if it is determined parts should be replaced, make sure correct replacement parts are used.**

    Worn or damaged internal engine components can cause excessive oil consumption. Small deposits of oil on tip of spark plugs (12405) can be a clue to internal oil consumption. If internal oil consumption still persists, proceed as follows:

    a. Remove engine from vehicle and place it on an engine work stand. Remove intake manifold (9424)(s), cylinder heads, oil pan and oil pump (6600). Refer to procedure in Section 03-01A , Section 03-01B , Section 03-01C .
    b. Check piston ring clearance, ring gap and ring orientation. Refer to the procedure in this section. Service as required.
    c. Check for excessive bearing clearance as outlined in this section. Service as required.

11. Perform Step 5 again to confirm oil consumption concern has been resolved.

Oil Pressure Test

SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
Engine Oil Pressure Gauge	T73L-6600-A

1. Disconnect and remove the oil pressure sensor (9278) from the engine.

2. Connect Engine Oil Pressure Gauge T73L-6600-A and Transmission Test Adapter D87C-77000-A, or equivalent, to the oil pressure sender screw port.

3. Run the engine until normal operating temperature is reached.

4. Run the engine at 3,000 rpm and record the gauge reading.

5. The oil pressure should be:

    - 250-490 kPa (36-71 psi) at 3,000 rpm.

6. If the oil pressure is not within specification, check the following possible sources:

    a. Insufficient oil
    b. Oil leakage
    c. Worn or damaged oil pump
    d. Clogged oil pump screen cover and tube (6622)
    e. Excessive main bearing clearance
    f. Excessive connecting rod bearing clearance

tomsn048@gmail.com

tomsn048@gmail.com

Valve Train Analysis — Static (Engine Off)

Valve Cover Removed

NOTE: Static Valve Train Analysis, with the engine (6007) off, is to be performed before Dynamic Valve Train Analysis, which is performed with engine running.

NOTE: Remove valve cover (6582). Refer to the procedure in Section 03-01A , Section 03-01B , Section 03-01C .

Check for damaged and/or severely worn parts, correct assembly, and use of correct parts by proceeding with the static engine analysis.

Rocker Arm

- Check for loose bolts, studs and nuts.
- Check for plugged oil feed in the rocker arm (6564), cylinder head (6049), or rocker arm shaft (6563) (if equipped).

Camshaft — Overhead Camshaft Engines

Inspect camshaft (6250), camshaft lobes and journals for excessive wear or scoring. Repair or replace camshaft, if necessary.

Push Rods

- Check for bent push rods (6565) and restriction in push rod oil passage.

Valve Springs

- Check for broken or damaged parts.

Valve Spring Retainer and Valve Spring Retainer Keys

- Check for proper seating of valve spring retainer keys (6518) on valve stem and in valve spring retainer (6514).

Positive Rotator and Valve Spring Retainer Keys

- Check for proper seating in the exhaust valve spring retainer — rotator type on valve stem.

Valves and Cylinder Head

- Check for signs of improper head gasket (6051) installation, such as the shape of the cylinder head and cylinder blocks (6010) and shape of the head gasket not matching.
- Check for signs of cylinder head gasket leakage such as coolant or oil leaking between the cylinder blocks and cylinder head.
- Check for plugged oil drain-back holes.

tomsn048@gmail.com

- Check for worn or damaged valve tips.
- Check for missing or damaged intake and exhaust valve stem seals (6571)
- Check valve clearance as outlined in Section 03-01A , Section 03-01B , Section 03-01C .
- Check installed valve spring height.
- Check for missing or worn valve spring seats, if equipped.

---

tomsn048@gmail.com

Valve Train Analysis — Dynamic (Except 2.3L)

NOTE: Static Valve Train Analysis, with engine (6007) off, is to be performed before Dynamic Valve Train Analysis which is performed with the engine running.

Start the engine. While engine is running at idle, check for proper operation of all parts. Check the following:

Rocker Arm

- Check for plugged oil feed in rocker arm (6564) or cylinder head (6049).
- Check for proper overhead valve train lubrication.

Push Rods

- Check for bent push rods (6565) and restriction in oil passage.
- Check for proper rotation of push rod.

Positive Rotator and Valve Spring Retainer Keys

- Check for proper operation of positive rotator.

Valves and Cylinder Head

- Check for plugged oil drain-back holes.
- Check for missing or damaged valve stem seals (6571).

If a condition of insufficient oiling is suspected, check oil passages for blockage, then accelerate the engine to 1200 rpm with the transmission (7003) in NEUTRAL (N) and the engine at normal operating temperature. Oil should spurt from the rocker arm oil holes such that valve tips and rocker arms are well oiled.

tomsn048@gmail.com

tomsn048@gmail.com

Intake Valve Cleaning (Valves Installed) 2.3L OHC Engine

Cleaning and Inspection

NOTE: This procedure is to be used if there is a concern with hesitation on acceleration, rough idle, long crank times, and stall at idle and upon gear engagement after cold start.

NOTE: Many fluids are available to clean fuel injectors. Some injector cleaning fluids also claim to remove intake valve deposits (IVD). Engineering evaluation of these fluids indicates no ability to remove the intake valve deposits. If driveability concerns have been affected by injector cleaning fluids, it is most likely due to cleanup of fuel injector deposits. IVD is more difficult to remove than fuel injector deposits. IVD must be COMPLETELY removed to restore cold start driveability performance.

CAUTION: The overuse of fuel injector cleaning fluids may cause engine damage not covered under warranty.

CAUTION: Only walnut shell blasting using Rotunda 014-00975 Carbon Blaster and Automotive Borescope or equivalent is recommended for removing carbon from engine valves with the engine (6007) assembled. Other abrasives may cause engine damage on start-up if not completely removed.

1. Perform underhood inspection of vacuum lines and wiring.
2. Perform normal Engine Emission Diagnostics. Refer to the Powertrain Control/Emissions Diagnosis Manual.
3. If normal diagnostics have not resolved the driveability concerns, proceed with the following IVD inspection steps.
4. Remove any two spark plugs (12405).
5. **CAUTION: Do not bump the engine with the remote starter switch or ignition switch (11572) with the borescope in the spark plug hole or attempt to view the valve while rotating the engine. Damage to the borescope or engine may result.**

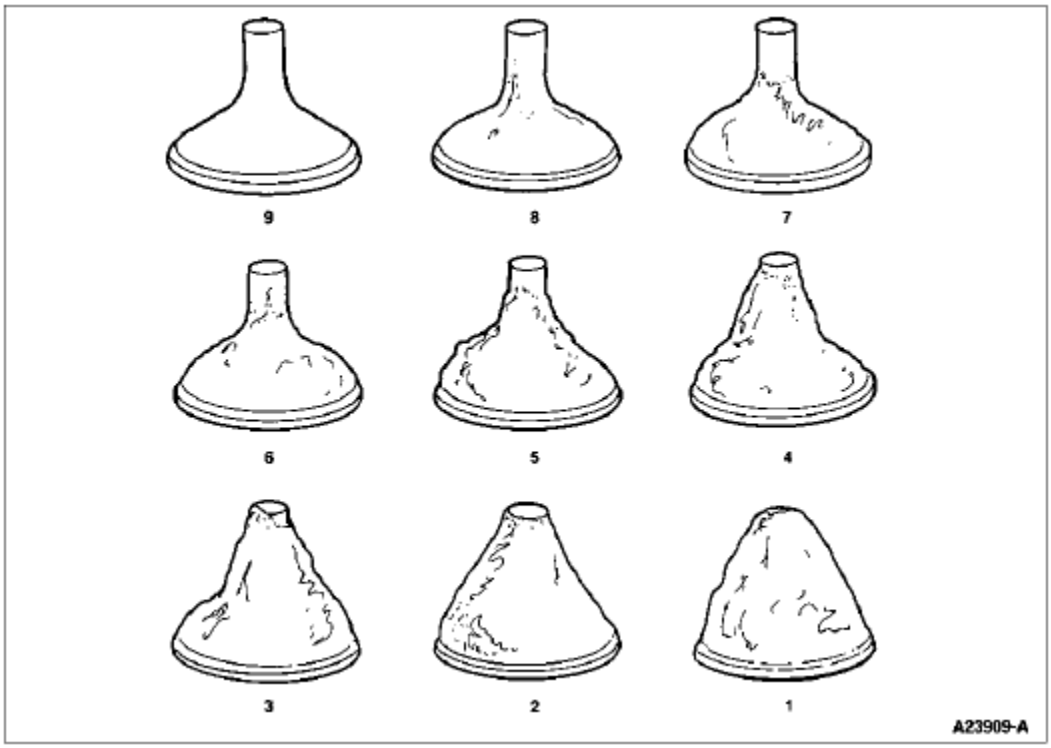
   Use a remote starter switch to bump the engine over until the intake valve (6507) is fully open in the cylinder to be inspected.
6. **CAUTION: Do not power the borescope light source from a vehicle battery (10655) while it is being charged, for example if the engine is running or the battery is connected to a charger, the lamp may fail.**

   Using the Rotunda Carbon Blaster and Automotive Borescope 014-00975 or equivalent automotive borescope, inspect the backside of the intake valves through the spark plug holes for the presence of carbon deposits. Compare the deposits with the deposit rating system chart. If any of the intake valves appear to have a carbon deposit level of 7 or less (lower number rating), intake valve cleaning

tomsn048@gmail.com

is required. If no carbon deposits are seen or the deposit level is 8 or cleaner, the drive concern may be the result of low volatility fuel. Refer to "Choosing the Right Fuel" in the vehicle owner guide.

Intake Valve Deposit Rating System



7. Remove the upper intake manifold assembly as outlined in Section 03-01A .
8. Remove the fuel injection supply manifold (9D280) and fuel injectors as outlined in Section 03-04A .
9. Remove flex hose and manifold adapter from the hand-held vacuum included with the Rotunda 014-00975 Carbon Blaster and Automotive Borescope. Insert tapered end of vacuum hose into intake port of lower intake manifold using a twisting motion to ensure a tight fit.
10. **NOTE: Detailed written instructions and a procedural video tape are included with the Rotunda 014-00975 Carbon Blaster and Automotive Borescope.**

    Perform the intake valve carbon cleaning procedure, using the Rotunda 014-00975 Carbon Blaster or equivalent on the intake valves that are in closed position. Cleaning takes approximately 1 to 1-1/2 minutes per valve.
11. Confirm the intake valve is clean using Rotunda 014-00975 or equivalent automotive borescope.
12. Using a remote starter switch bump the engine over until the remaining intake valves to be cleaned are in the closed position, and clean them as outlined above.
13. Install fuel injection supply manifold and fuel injectors as outlined in Section 03-04A .
14. Install the upper intake manifold as outlined in Section 03-01A .

tomsn048@gmail.com

15. Refer vehicle owner to fuel recommendations under "Choosing the Right Fuel" in the Vehicle Owner Guide.

---

tomsn048@gmail.com

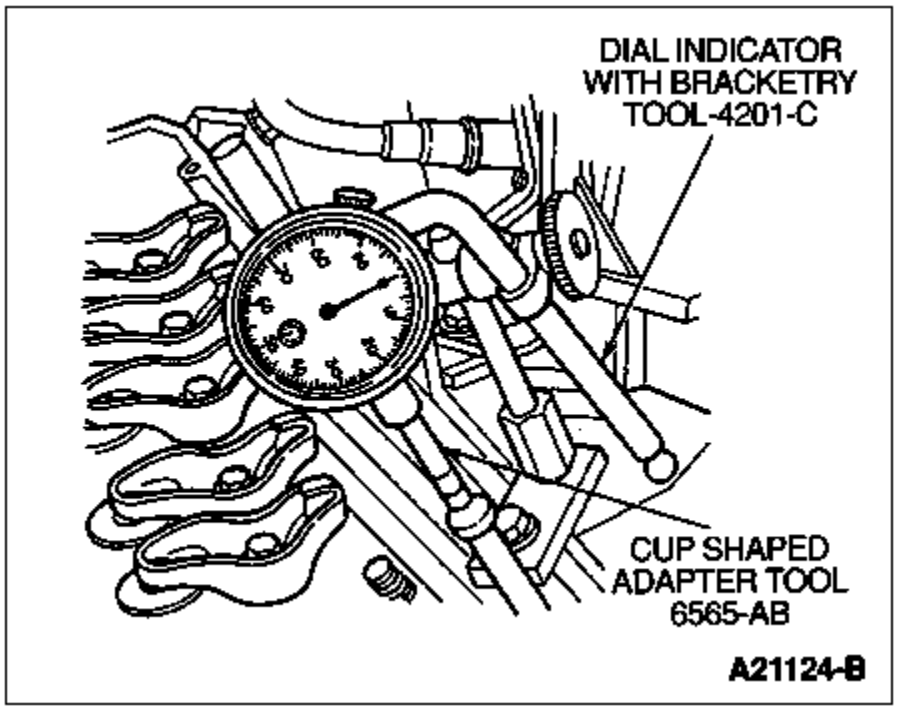
Camshaft Lobe Lift — 3.0L, 4.0L

This procedure is for checking lift with the camshaft (6250) installed. For checking with camshaft removed, refer to Service Procedures, Camshaft, Cam Lobe Lift in this section.

Check the lift of each lobe in consecutive order and make a note of the readings.

1. Remove valve covers (6582). Refer to the procedure in Section 03-01B or Section 03-01C .
2. Remove spark plugs (12405) wires and spark plugs.
3. On 3.0L engines, remove rocker arm bolts, rocker arm fulcrum and rocker arms (6564).
4. On 4.0L engines, remove rocker arm shaft (6563) and rocker arm assemblies. Refer to the procedure in Section 03-01C .
5. Make sure valve tappet (6500) is seated against camshaft lobe. Install Dial Indicator with Bracketry TOOL-4201-C or equivalent in such a manner as to have ball socket adapter of indicator on top of valve tappet or push rod (6565) and in same plane as valve tappet or push rod movement.

Typical Engine with Push Rods



6. Turn crankshaft (6303) using a socket and ratchet until valve tappet is on base circle of camshaft lobe. At this point, valve tappet will be in its lowest position.

tomsn048@gmail.com

7. Zero dial indicator. Continue to rotate crankshaft slowly until valve tappet is in fully raised position (highest indicator reading).

8. Compare total camshaft lobe lift recorded on indicator with specifications.

9. **NOTE: If camshaft lobe lift on any lobe is below specified service limits, camshaft and valve tappets operating on worn lobe(s) must be replaced, as well as any valve tappet showing pitting or having contact face worn flat or concave. Refer to Hydraulic Valve Tappets in this section.**

   To check accuracy of original indicator reading, continue to rotate crankshaft until valve tappet is once again riding on base circle of camshaft lobe and read indicator. If indicator does not read zero, repeat Steps 6 and 7.

10. Remove dial indicator and auxiliary starter switch.

11. **CAUTION: After installing rocker arms, do not rotate crankshaft until valve tappets have had sufficient time to bleed down. To do otherwise may cause serious valve damage. Manually bleeding down will reduce waiting time.**

    On 4.0L engine, install rocker arm shaft and assembled rocker arms. Refer to the procedure in Section 03-01C . On 3.0L engine, install rocker arm, rocker arm fulcrum, and bolts. Refer to the procedure in Section 03-01B .

12. Install valve cover.

13. Install spark plugs and spark plug wires.

tomsn048@gmail.com

Camshaft Lobe Lift, Overhead Camshaft Engines (2.3L) (Camshaft Installed)

This procedure is for checking lift with the camshaft (6250) installed. For checking with camshaft removed, refer to Service Procedures, Cam Lobe Lift (Camshaft Removed) in this section.

Check the lift of each lobe in consecutive order and make a note of the readings.

1. Remove valve cover (6582) as outlined in Section 03-01A .
2. Remove spark plugs (12405) as outlined in Section 03-01A .
3. Inspect the camshaft lobes for scoring and signs of abnormal wear.

   Lobe pitting, except in the general area of the lobe toe, is not detrimental to the operation of the camshaft. The camshaft should not be replaced unless lobe lift loss has exceeded the specifications or pitting has occurred in the lobe lift area.
4. Inspect for signs of camshaft bearing wear.
5. Using ratchet handle and socket on vibration damper bolt, rotate engine so cylinder number one exhaust valve is fully open — heel of cam at top.
6. Install TOOL-4201-C or equivalent Dial Indicator with Bracketry so tip of dial indicator is on heel of cam.
7. Zero dial indicator.
8. Slowly rotate engine until tip of dial indicator is on tip of cam and read. This is cam lift.
9. Write down cam lift and repeat for the rest of the cam lobes. If any lobe's lift is below the minimum lift specified in Section 03-01A , replace the camshaft.

Hydraulic Valve Tappet/Lash Adjuster

The hydraulic lash adjusters used in the overhead cam 2.3L I-4 engine are zero-lash hydraulic devices similar in construction and operation to the hydraulic valve tappets (6500) used on push rod engines. They are cleaned, inspected and checked in the same manner as hydraulic valve tappets. The instructions below apply equally to the lash adjuster and the valve tappet.

Hydraulic tappet noise may be caused by any of the following:

1. Excessive collapsed tappet gap
2. Sticking tappet plunger
3. Tappet check valve not functioning properly
4. Air in lubrication system

tomsn048@gmail.com

5. Leak-down rate too rapid

6. Excessive valve guide wear

   Excessive collapsed tappet gap may be caused by loose rocker arm fulcrum bolts/nuts, incorrect initial adjustment, wear of tappet face, or worn roller tappets, push rod (6565), rocker arm (6564), rocker arm fulcrum or valve tip. With valve tappet collapsed, check gap between valve tip and rocker to determine if any other valve train parts are damaged, worn or out of adjustment. Replace any worn or damaged parts.

   A sticking tappet plunger may be caused by dirt, chips, or varnish inside the tappet. The sticking can be corrected by disassembling the valve tappet and removing the dirt, chips or varnish that are causing the condition.

   A tappet check valve that is not functional may be caused by an obstruction such as dirt or chips preventing it from closing when the cam lobe is lifting the valve tappet, or it may be caused by a broken check valve spring.

   Air bubbles in the lubrication system will prevent the valve tappet from supporting the valve spring load and may be caused by too high or too low an oil level in the oil pan (6675), or by air being drawn into the system through a hole, crack or leaking gasket on the oil pump screen cover and tube (6622).

   If the leakdown time is below the specified time for used valve tappets, noisy operation may result. If no other cause for noisy valve tappets can be found, the leakdown rate should be checked and any outside the specification, outlined in Section 03-01A , Section 03-01B , or Section 03-01C depending on engine, should be replaced.

Leakdown Testing

Assembled valve tappets can be tested with Hydraulic Tappet Leak-Down Tester or equivalent to check the leak-down rate. The leak-down rate specification is the time in seconds for the plunger to move a specified distance of its travel while under a 22.7 kg (50 lb.) load. Test the valve tappets as follows:

Remove valve tappets. Refer to the procedure in Section 03-01A , Section 03-01B or Section 03-01C .

1. **NOTE: Do not mix parts from different valve tappets. Parts are select-fitted and are not interchangeable.**

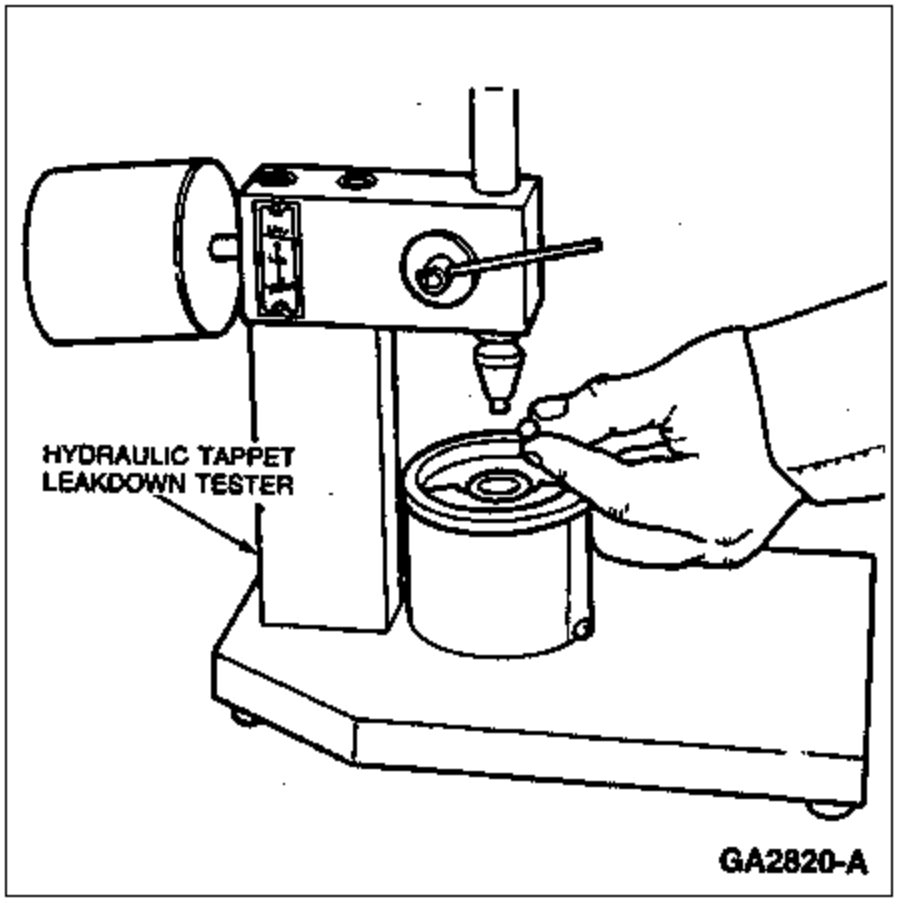
   NOTE: Valve tappets cannot be checked with engine oil in them. Only testing fluid can be used.

   Disassemble and clean valve tappet to remove all traces of engine oil.

2. Place valve tappet in tester, with plunger facing upward. Pour hydraulic tester fluid into cup to a level that will cover valve tappet assembly. The fluid can be purchased from manufacturer of tester. Using kerosene or any other fluid will not provide an accurate test.

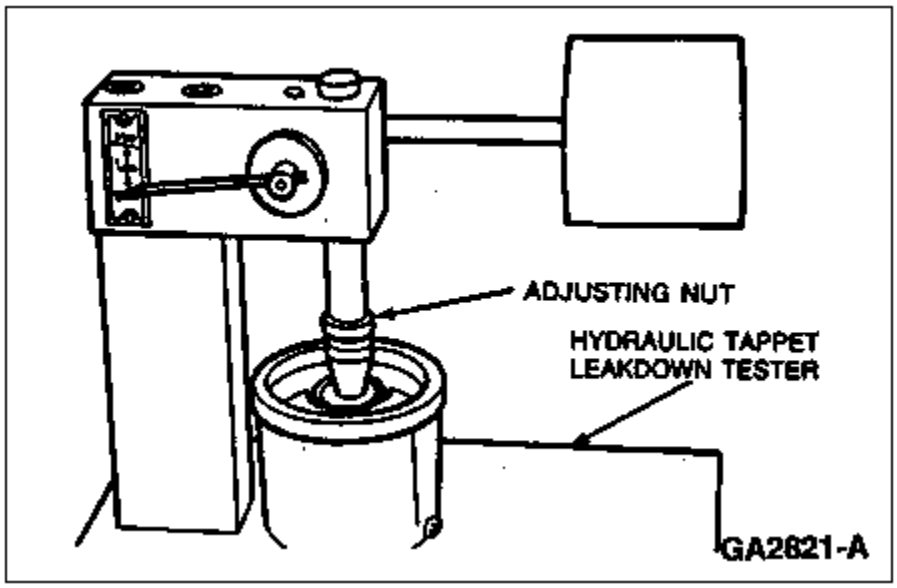
3. Place a 7.94mm (0.31 inch) steel ball, provided with tester, in plunger cap.

tomsn048@gmail.com



4. Work valve tappet plunger up and down until valve tappet fills with fluid and all traces of air bubbles have disappeared.

5. Adjust length of ram so that pointer is 1.59mm (0.06 inch) below starting mark when ram contracts valve tappet plunger, to facilitate timing as pointer passes Start Timing mark.



tomsn048@gmail.com

Use center mark on pointer scale as Stop Timing point instead of original Stop Timing mark at top of scale.

6. Allow ram and weight to force valve tappet plunger downward. Measure exact time it takes for pointer to travel from Start Timing to Stop Timing marks of tester.

7. A valve tappet that is satisfactory must have a leakdown rate (time in seconds) within minimum and maximum limits specified in Section 03-01A , Section 03-01B , or Section 03-01C .

8. Remove fluid from cup and bleed fluid from valve tappet by working plunger up and down. This step will aid in depressing valve tappet plungers when checking valve clearance.

9. If a valve tappet is not within specifications:

    - Replace defective valve tappets. It is not necessary to disassemble and clean new valve tappets to test them since they are shipped with testing fluid.

---

tomsn048@gmail.com

Camshaft End Play

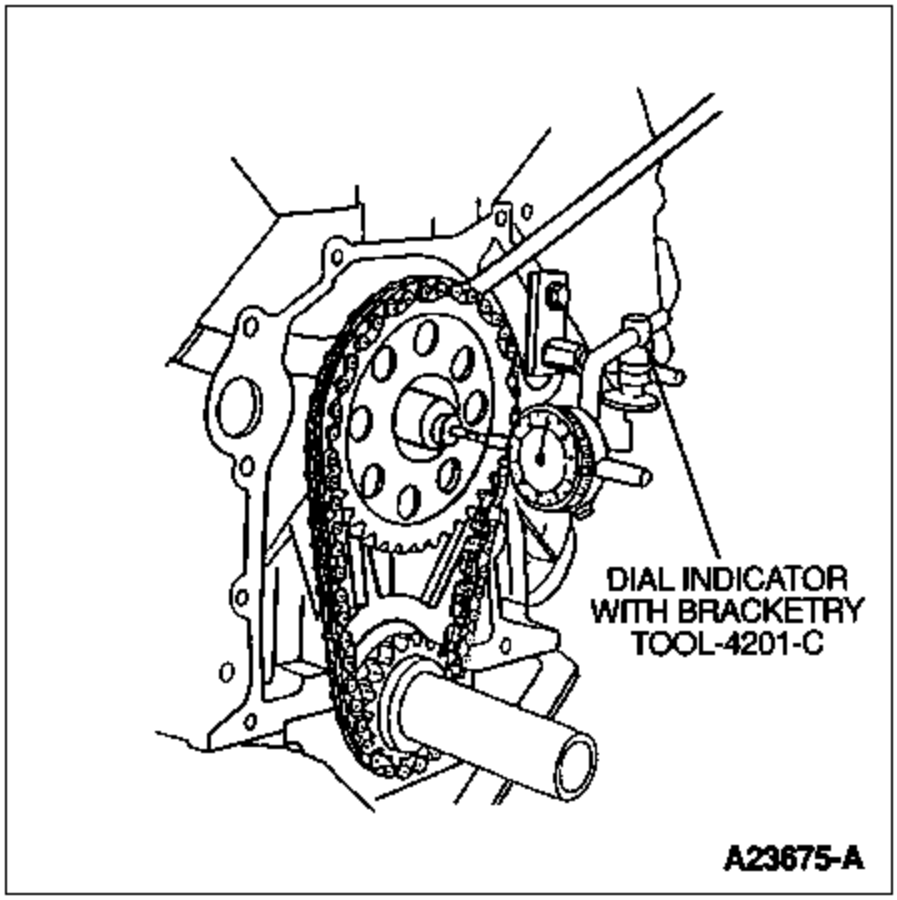
CAUTION: Prying against the camshaft sprocket (6256) with the valve train load on the camshaft (6250) can break or damage the camshaft sprocket. Therefore:

- **On 2.3L engine, remove the rocker arms. Refer to the procedure in Section 03-01A .**
- **On 3.0L engine, loosen rocker arm bolts and turn rocker arms (6564) off of push rods (6565). Refer to the procedure in Section 03-01B .**
- **On 4.0L engine, loosen rocker arm shaft bolts enough to free camshaft. Refer to the procedure in Section 03-01C .**

After checking camshaft end play, reinstall or retighten valve train components. Refer to Section 03-01A , Section 03-01B or Section 03-01C .

NOTE: For camshaft end play specifications, refer to Section 03-01A , Section 03-01B or Section 03-01C .

1. Install Dial Indicator with Bracketry TOOL-4201-C or equivalent so indicator point is on camshaft sprocket bolt.



tomsn048@gmail.com

2. Push camshaft toward rear of engine (6007).

3. Zero dial indicator. Pull camshaft forward and release it. Compare dial indicator reading with specifications in Section 03-01A , Section 03-01B or Section 03-01C . If end play is excessive, replace camshaft thrust plate (6269).

4. Remove dial indicator.

5. After replacing camshaft thrust plate, check end play again. If it is still out of specified range, inspect camshaft and cylinder head (6049)/ cylinder blocks (6010) for excessive wear.

---

tomsn048@gmail.com

Timing Chain Deflection — 3.0L and 4.0L

1. Remove engine front cover (6019). Refer to Section 03-01B or Section 03-01C .
2. Rotate the crankshaft (6303) so the camshaft sprocket (6256) and crankshaft sprocket timing marks line up.
3. Mark the top link(s) of the timing chain.
4. Have an assistant hold the crankshaft sprocket (6306) with a suitable tool so it cannot turn.
5. Place a machinist's scale above the timing chain (camshaft sprocket) so you can measure its movement.
6. Put a torque wrench and socket on the camshaft sprocket bolt.
7. Apply a maximum of 20 Nm (15 lb-ft) torque in a clockwise direction.
8. Note location of marked link on scale.
9. Apply a maximum of 20 Nm (15 lb-ft) torque in a counterclockwise direction while measuring the amount the marked link moves.
10. Movement should be less than 3.175mm (0.12 inch). If movement is excessive, replace timing chain. Refer to Section 03-01B or Section 03-01C .

tomsn048@gmail.com

Timing Belt/Chain (2.3L)

NOTE: If the timing belt has greater than 193,000 km (120,000 miles) of use, the timing belt will need to be replaced. Refer to Section 03-01A for service procedures.

Camshaft Timing and Cylinder Identification (CID) Timing Check

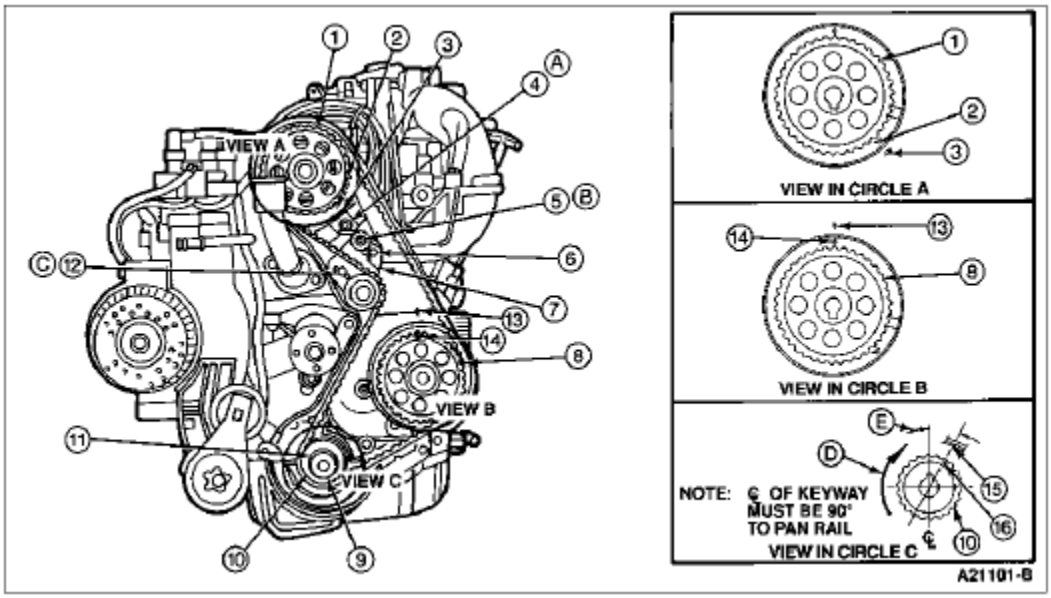
1. Remove both of the rubber access caps (camshaft sprocket and oil pump sprocket) from the outer timing cover.

2. Rotate crankshaft so that number one cylinder is at Top Dead Center (TDC) of the compression stroke. TDC will be indicated when the three timing marks are aligned:

    a. The timing mark on the crankshaft damper assembly will align with "TC" on the outer timing cover.
    b. The triangular timing mark on the camshaft sprocket will align with the timing mark on the inner timing cover.
    c. The diamond timing mark on the engine oil pump sprocket will align with the timing mark on the inner timing cover.

3. If the diamond or the triangle timing marks cannot be seen through the access holes of the outer timing cover, rotate crankshaft one revolution. TDC will be indicated when the three timing marks are aligned.

4. If the diamond or the triangle timing marks cannot be properly aligned, set the timing mark of the crankshaft damper assembly with "TC" on the outer timing cover. Remove the crankshaft damper assembly and outer timing cover as outlined in Section 03-01A .



tomsn048@gmail.com

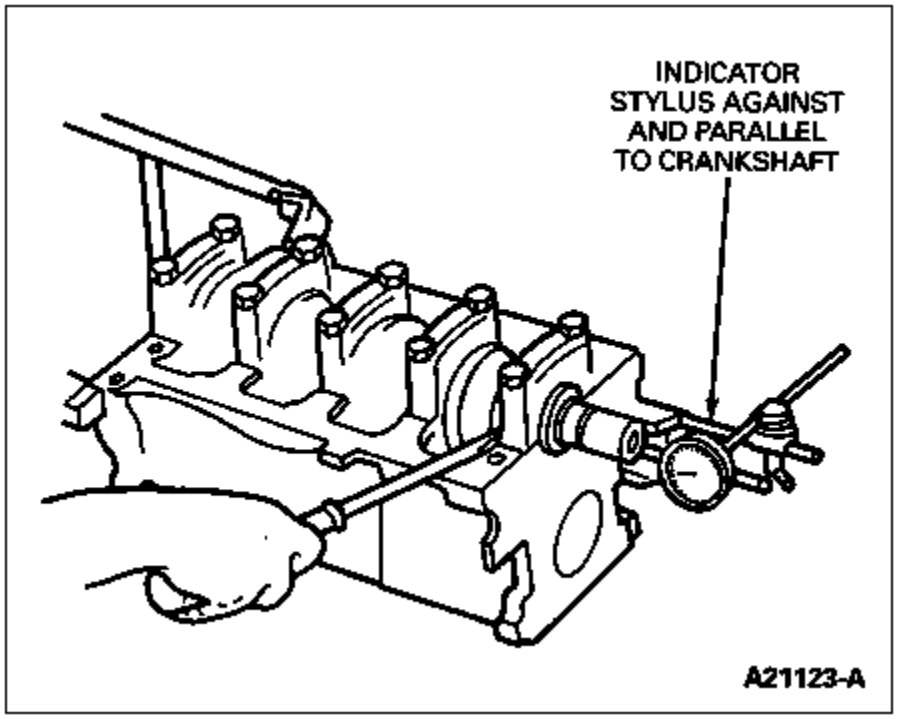
Crankshaft End Play

1. Install Dial Indicator with Bracketry TOOL-4201-C or equivalent so contact point rests against the end of the crankshaft post and indicator axis is parallel to crankshaft axis.

2. Force crankshaft (6303) toward rear of engine (6007).



3. Set indicator dial on zero mark. Push crankshaft forward and note reading on dial.

4. If the end play exceeds the wear limit listed in Section 03-01A , Section 03-01B or Section 03-01C . Replace the thrust bearing. Inspect the crankshaft for damage to the thrust face before installing the new bearing. If the end play is less than the minimum limit, inspect the thrust bearing faces for scratches, burrs, nicks, or dirt. If the thrust faces are not damaged or dirty, the main thrust bearing may not be aligned properly. Lubricate and install the thrust bearing and align the faces, following Main Bearing Replacement procedure in Section 03-01A , Section 03-01B or Section 03-01C . Check the crankshaft end play.

tomsn048@gmail.com

tomsn048@gmail.com

Timing Chain Deflection — 3.0L and 4.0L

1. Remove engine front cover (6019). Refer to Section 03-01B or Section 03-01C .
2. Rotate the crankshaft (6303) so the camshaft sprocket (6256) and crankshaft sprocket timing marks line up.
3. Mark the top link(s) of the timing chain.

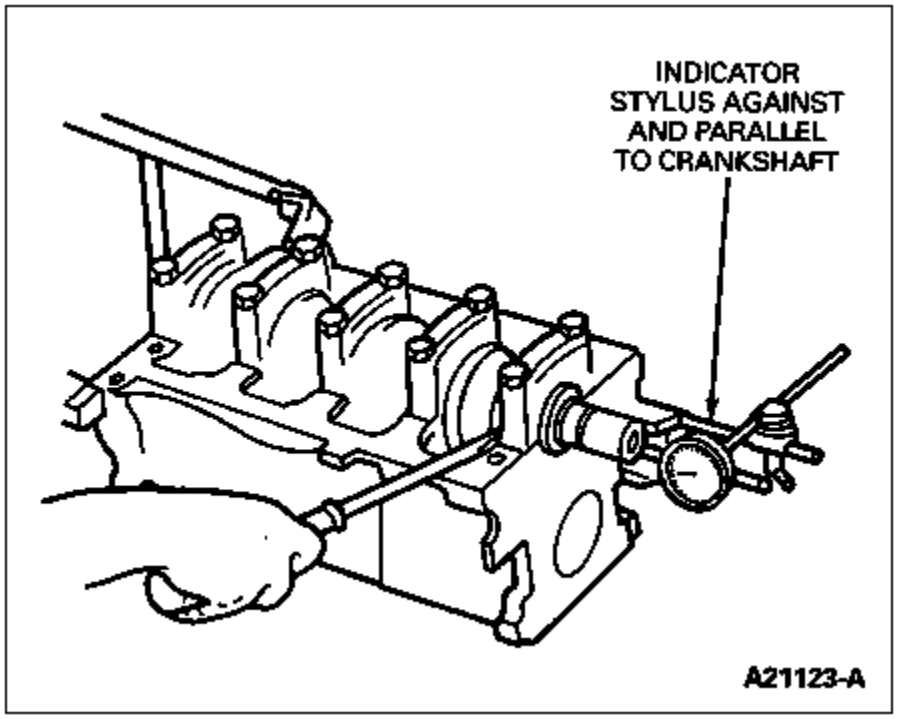
Crankshaft End Play

1. Install Dial Indicator with Bracketry TOOL-4201-C or equivalent so contact point rests against the end of the crankshaft post and indicator axis is parallel to crankshaft axis.

2. Force crankshaft (6303) toward rear of engine (6007).



3. Set indicator dial on zero mark. Push crankshaft forward and note reading on dial.

4. If the end play exceeds the wear limit listed in Section 03-01A , Section 03-01B or Section 03-01C . Replace the thrust bearing. Inspect the crankshaft for damage to the thrust face before installing the new bearing. If the end play is less than the minimum limit, inspect the thrust bearing faces for scratches, burrs, nicks, or dirt. If the thrust faces are not damaged or dirty, the main thrust bearing may not be aligned properly. Lubricate and install the thrust bearing and align the faces, following Main Bearing Replacement procedure in Section 03-01A , Section 03-01B or Section 03-01C . Check the crankshaft end play.

tomsn048@gmail.com

tomsn048@gmail.com

Connecting Rod Side Clearance

1. Install Dial Indicator with Bracketry TOOL-4201-C or equivalent so that the contact point rests against the connecting rod cap.

2. Pull connecting rod cap toward front of engine (6007) and zero the dial indicator.

3. Push connecting rod cap toward rear of engine and observe amount of side clearance on dial indicator.

4. If side clearance exceeds specification in Section 03-01A , Section 03-01B or Section 03-01C . Replace connecting rod and cap.

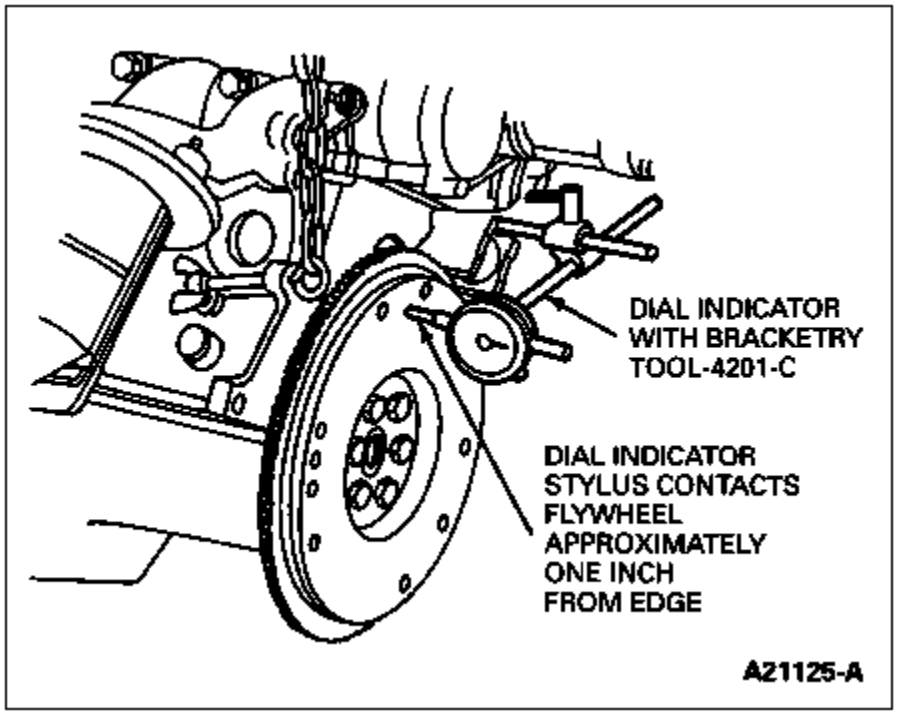
   If side clearance is less than specification, remove connecting rod and cap and inspect for scratches, burrs, nicks or dirt between crankshaft (6303) and connecting rod (6200).

tomsn048@gmail.com

Flywheel Runout, Manual Transmission

1. Remove spark plugs (12405).

2. Install Dial Indicator with Bracketry TOOL-4201-C or equivalent so indicator points rest on face of the flywheel (6375).



3. Hold flywheel and crankshaft (6303) forward or backward as far as possible to prevent crankshaft end play from being indicated as flywheel runout.

4. Set indicator dial on zero mark. Turn flywheel one complete revolution while observing total indicator reading (TIR). If TIR exceeds specification, flywheel and ring gear assembly must be replaced.

5. If clutch face runout exceeds specification, remove flywheel and check for burrs between flywheel and face of crankshaft mounting flange. If no burrs exist, check runout of crankshaft mounting flange. Replace flywheel or machine crankshaft flywheel mounting face sufficiently to true-up the surface.

tomsn048@gmail.com

tomsn048@gmail.com

Cylinder Block

Cleaning and Inspection

If the engine (6007) has been removed and disassembled, remove all core plugs and pipe plugs. Clean the cylinder blocks (6010) using solvent, preferably in a hot tank. Follow all safety and environmental precautions with regard to the solvent. Make sure all oil and dirt is cleaned from the cylinder blocks.

Make sure all oil passageways are clean. A rifle-cleaning brush is useful for this purpose.

Use a long-thin screwdriver to scrape the bottom of the water jackets through the openings in the top deck to make sure all scale and deposits are removed. Most engines have a "dead spot" at the back of the block where the coolant has to make a U-turn and drops any deposits. If the water jackets are not thoroughly cleaned, overheating will result.

Cylinder Block Distortion

Cylinder block distortion is rare because cylinder blocks are normalized after casting, and before machining, to relieve internal stresses from the casting process.

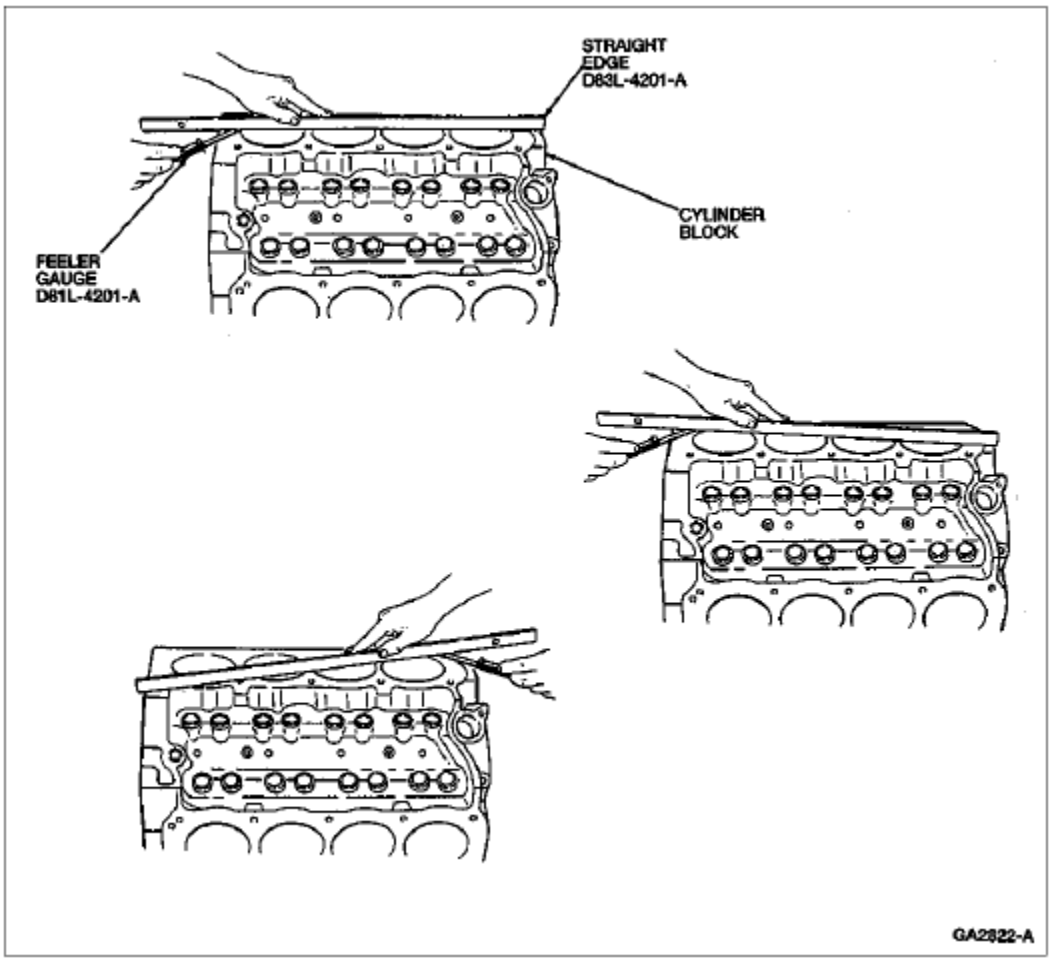
The most probable cause of cylinder block distortion would be extreme overheating which would probably be accompanied by other damage such as scored bearings or cylinder walls, warped cylinder heads (6049), and possible cylinder block cracks.

tomsn048@gmail.com

Cylinder Head Deck Flatness

1. Place a straightedge across the cylinder head deck in the three positions shown and measure any gaps between the straightedge and the deck with a feeler gauge. The deck should be flat within .076mm (0.003 in.) over 152mm (6 inches) and 0.152mm (0.006 in.) overall.

2. If necessary, resurface or replace cylinder blocks (6010).



tomsn048@gmail.com

tomsn048@gmail.com

Main Bearing Bore Alignment

Main bearing bore misalignment may be suspected in cases of premature bearing wear if one bearing wears considerably more than the others or bearings wear cone-shaped.

NOTE: Bearings are not available with oversize outside diameters to allow line boring.

If bearing misalignment is suspected:

1. Acquire a gauge bar the same diameter as the crankshaft journals and which is straight within 0.076mm (0.003 in.).
2. Put a thin coating of Prussian Blue or similar die on gauge bar.
3. Insert good bearings in block.
4. Insert gauge bar in bearings and rotate one turn.
5. Remove gauge bar.
6. Inspect bearings. Blue die should be deposited evenly on all bearings. If die appears on only one side or bottom of bearing or not at all, block is distorted and should be replaced.

tomsn048@gmail.com

Flywheel Housing Deck Flatness

A concern with the rear deck of the engine would be indicated by:

- Frequent replacement of pilot bearing and transmission input shaft bearing on manual transmission vehicles. Also hard shifting into high (not overdrive) gear or jumping out of gear.
- Frequent replacement of torque converter seals, input shaft seals or bearings, or transmission oil pump on an automatic transmission vehicle.

If cylinder block-to-transmission misalignment is suspected:

- With crankshaft (6303) installed and engine rear plate (7007) and flywheel (6375) removed, attach Dial Indicator with Bracketry TOOL-4201-C or equivalent to crankshaft. The dial indicator can be mounted by any method that holds the extension bar so it does not sag.
- Position the dial indicator on the machined flange slightly in from the left edge.
- Set the dial indicator on zero mark.
- Because the shape of the flange is irregular, lift the tip of the dial indicator off of the flange.
- Rotate the crankshaft to the 12 o'clock position and release the dial indicator tip.
- Take the reading.
- Lift the pointer off the flange and rotate the crankshaft so the dial indicator is just on the flange on the right side of the engine.
- Release the pointer and take the reading. The readings should vary less than 0.076mm (0.003 inch).
- Attach Dial Indicator with Bracketry TOOL-4201-C or equivalent to transmission input shaft (7017).
- Position dial indicator on transmission flange just above and inside of hole for left transmission bolt.
- Set dial indicator on zero mark.
- Slowly rotate transmission input shaft and take readings from dial indicator at 12 o'clock position and just above rightmost transmission-to-engine bolt hole.
- Reading should not vary more than 0.076mm (0.003 inch).

Sand Holes or Porous Engine Castings — Service

Porosity or sand hole(s), which will cause oil seepage or leakage, can occur with modern casting processes. A complete inspection of engine (6007) and transmission (7003) should be made. If the leak is attributed to the porous condition of the cylinder blocks (6010) or sand hole(s), service can be made with Devcon Aluminum Liquid F2 or equivalent meeting Ford manufacturing standard M3D35-A(E). Do not service cracks with this material. Service with this aluminum liquid F2 must be confined to those cast iron engine component surfaces where the inner wall surface is not exposed to engine coolant pressure or oil pressure, for example:

- Cylinder block surfaces extending along the length of the cylinder blocks, upward from the oil pan rail to the cylinder water jacket, but not including machined areas.
- Lower rear face of the cylinder blocks.

NOTE: Intake manifold casting. Service is not recommended to the intake manifold exhaust crossover section, since temperatures can exceed the recommended temperature limit of 260° C (500°F).

tomsn048@gmail.com

- Cylinder front cover on engines using cast iron material.
- Cylinder head (6049), along the valve cover gasket surface.

The following procedure should be used to service porous areas or sand holes in cast iron.

1. Clean surface to be serviced by grinding or rotary filing to a clean bright metal surface. Chamfer or undercut hole or porosity to a greater depth than rest of cleaned surface. Solid metal must surround hole. Openings larger than 6.35mm (0.25 inch) should not be serviced using aluminum liquid F2. Openings in excess of 6.35mm (0.25 inch) can be drilled, tapped and plugged using common tools. Clean service area thoroughly. Aluminum liquid F2 will not stick to a dirty or oily surface.

2. Mix aluminum liquid F2 base and hardener as directed on container. Stir thoroughly until uniform.

3. Apply service mixture with a suitable clean tool (putty knife, wood spoon, etc.) forcing epoxy into hole or porosity.

4. Allow service mixture to harden. This can be accomplished by two methods. Heat-cure with a 250-watt lamp placed 254mm (10 inches) from serviced surface, or air-dry for 10-12 hours at temperatures above 10°C (50℉).

5. Sand or grind serviced area to blend with general contour of surrounding surface.

6. Paint the surface to match the rest of the cylinder blocks.

---

tomsn048@gmail.com

Cylinder Walls, Refinishing

Cleaning

If the entire engine (6007) has not been disassembled, clean the individual cylinder bore(s) with a cloth soaked with solvent. Dry with a clean, lint-free cloth.

If the entire engine has been disassembled, refer to Cylinder Block Cleaning in this section.

After any cylinder bore service operation, such as honing or deglazing, clean the bore(s) with soap or detergent and water. Then thoroughly rinse the bore(s) with clean water to remove the soap or detergent, and wipe the bore(s) dry with a clean lint-free cloth. Finally wipe the bore(s) with a clean cloth dipped in XO-10W30-QSP or -DSP or equivalent motor oil meeting Ford specification ESE-M2C153-E.

Inspection

Before removing the piston (6108):

1. Check the amount of ridge at the top of the bore. A thick ridge is a sign of considerable wear.

2. Look for signs of coolant in the bore, especially rust on the bore surface indicating possible leaking head gasket (6051) or a crack in the cylinder bore.

3. Check the top of the piston for possible oversize. If oversize pistons have been installed, the oversize will be stamped in the top of the piston.

   After the piston is removed and the bore cleaned:

4. Look for scoring. These are parallel gouges usually on the piston thrust side, that is, at right angles to the piston pin (6135). If scored, the cylinder will have to be refinished.

5. Look for cracks. If unsure about a crack, tiny cracks may be detected by coating the bore with a mixture of 25 percent kerosene and 75 percent light engine oil. Wipe the bore dry and immediately apply a coating of zinc oxide dissolved in wood alcohol. Do not use rubbing alcohol as a substitute. If cracks are present, the coating will become discolored at the damaged area. Replace the cylinder blocks (6010) if it is cracked. Magnafluxing may also be used.

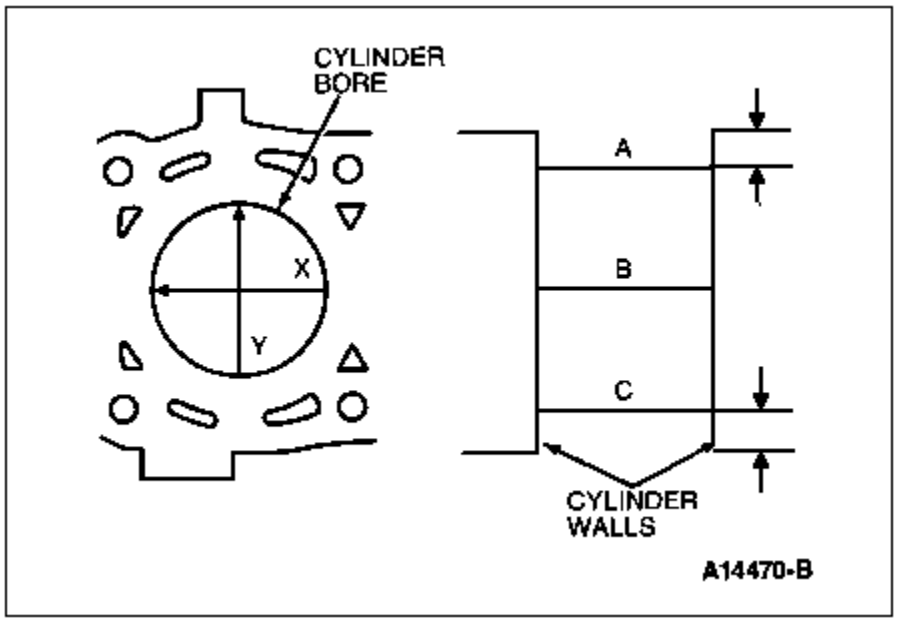
6. Check for cylinder wall glazing. When refinished, the cylinder bore is given a slightly rough finish with a cylinder hone to help seat the new piston rings (6149). This finish is worn away as the piston rings and cylinder bore "mate" and the bore becomes glassy smooth. If the engine has been run enough for this to have happened, the cylinder will at least have to be honed to seat the new piston rings. New piston rings should be installed when the piston is removed and reinstalled because piston rings are given a special finish by the factory to help them wear in and seat. In seating, the special finish is worn off. Reusing piston rings will result in high oil consumption.

Cylinder Bore

Make sure cylinder bore is clean and dry before measuring.

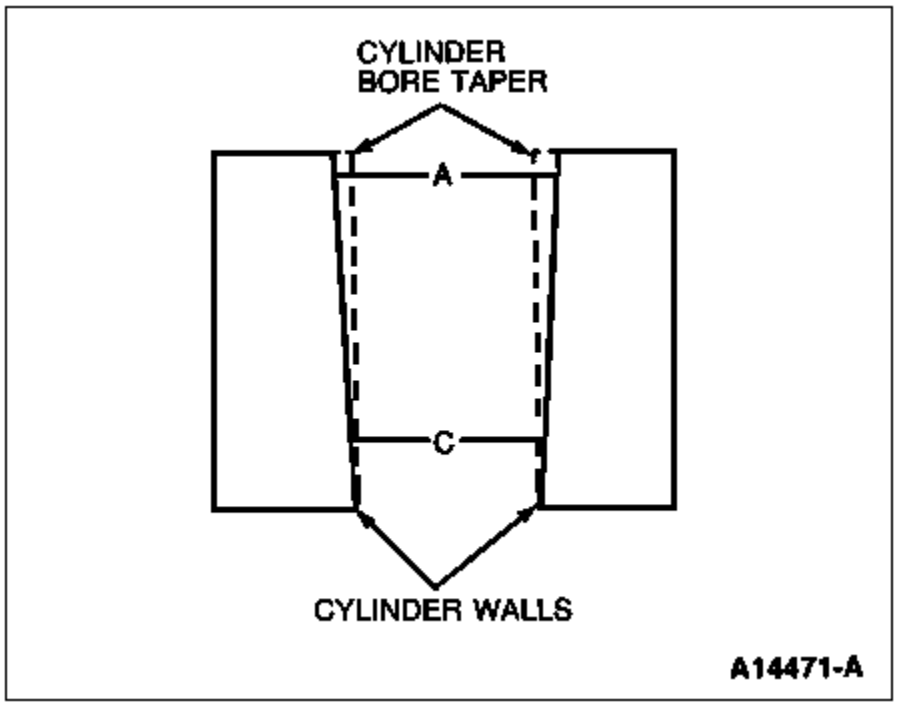
tomsn048@gmail.com

Using a suitable cylinder bore micrometer or gauge, measure the cylinder bore(s) in the X and Y directions (90 degrees apart) at points A, B, and C. The X direction is parallel to the piston pin. The Y direction is perpendicular to the piston pin and is the direction of piston thrust.



Cylinder Bore Taper

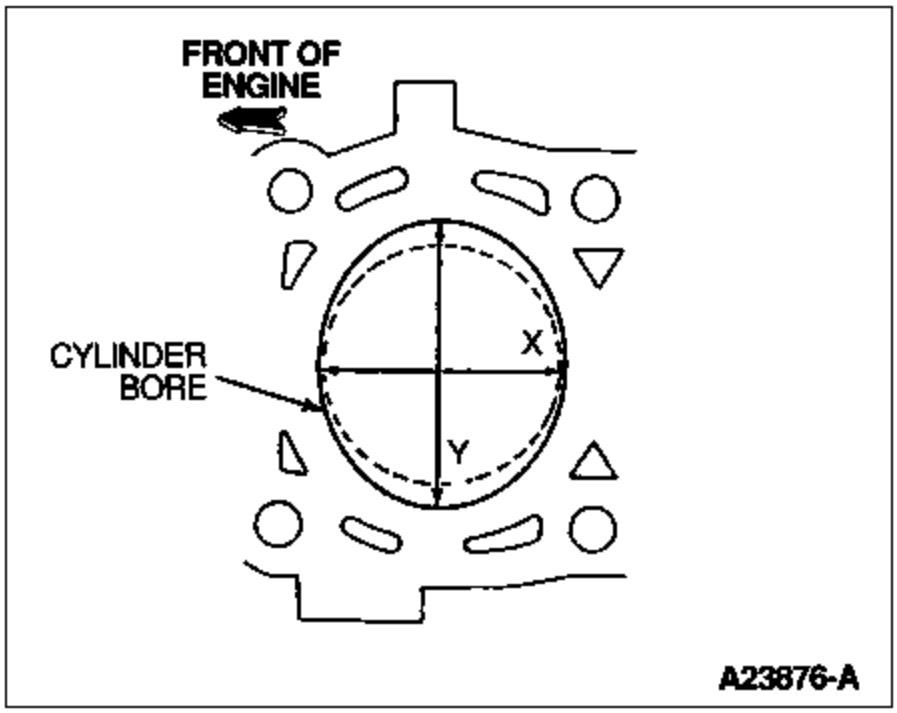
Subtract the micrometer or gauge reading from point C direction Y from point A direction Y. Also from point C direction X from point A direction X. Each difference should be less than 0.127mm (0.005 inch). If taper exceeds this specification, cylinder will have to be refinished.



Cylinder Out-of-Round

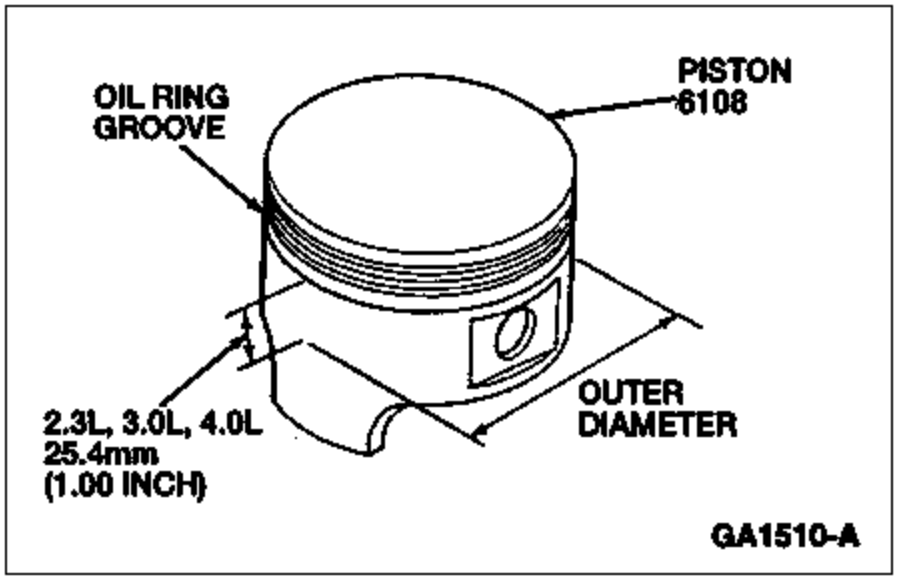
tomsn048@gmail.com

Subtract the reading of direction X (non-thrust) from direction Y (thrust side) at all points A, B, and C. All readings should be less than 0.127mm (0.005 inch). If out-of-round exceeds this specification, cylinder will have to be refinished.



Cylinder Bore Diameter

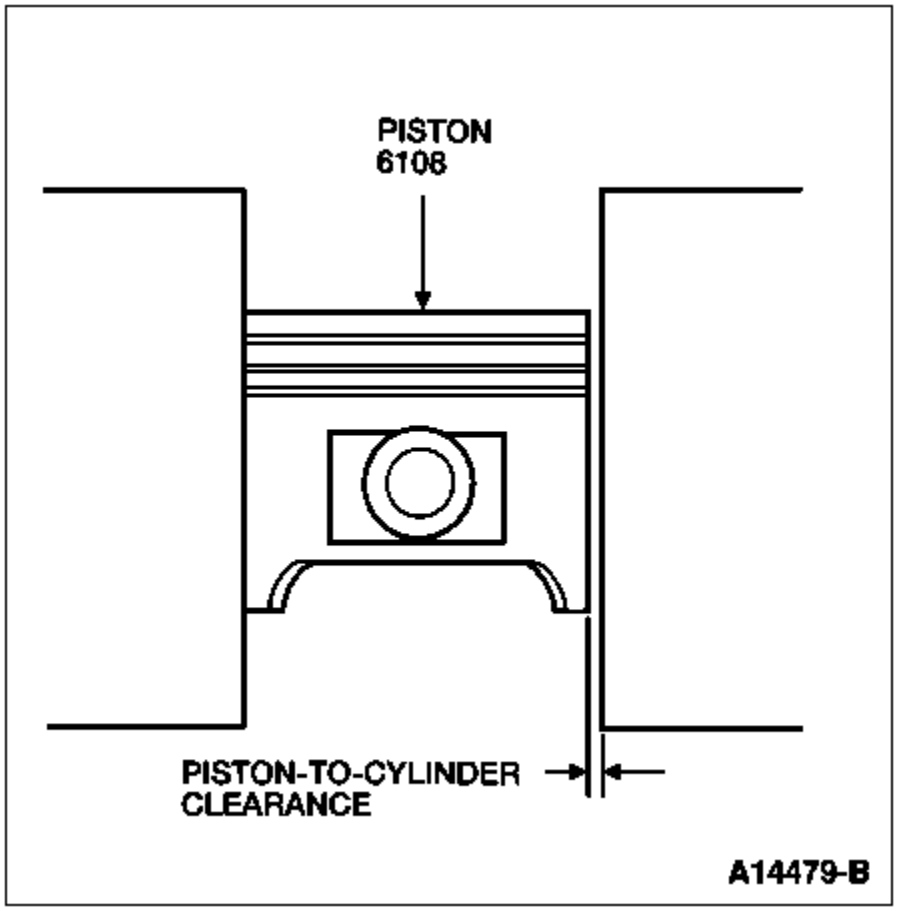
1. Measure the diameter of the piston on the thrust side — at right angles to the piston pin — 25.4mm (1.00 inch) below the oil ring groove on 2.3L, 3.0L, and 4.0L.



2. Measure the cylinder bore diameter at right angles to the piston pin at points A, B, and C as described under Cylinder Bore Taper.

tomsn048@gmail.com

3. Subtract the piston diameter from the cylinder bore diameters. The difference should not exceed the maximum clearance allowed in the specifications in Section 03-01A , Section 03-01B or Section 03-01C .



Cylinder Wall Honing

Hone the cylinder bore either when reinstalling a piston with new piston rings, or to size a rebored cylinder to the piston and prepare the bore surface.

1. Measure the diameter of the piston on the thrust side — at right angles to the piston pin — 25.4mm (1.00 inch) below the oil ring groove on 2.3L, 3.0L, and 4.0L.

2. Measure the cylinder bore diameter at right angles to the piston pin at points A, B, and C as described under Cylinder Bore Taper.

3. Subtract the piston diameter from the maximum cylinder bore diameter to determine the maximum amount of material that can be removed.

4. Hone the cylinder according to the hone manufacturer's instructions to obtain the proper bore surface finish of 18-38 RMS.

    - Keep the hone moving up and down to achieve the proper crosshatch pattern.
    - Measure frequently to make sure not to remove too much of the cylinder wall creating excess clearance.

tomsn048@gmail.com

tomsn048@gmail.com

Engine Block Plugs

SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
Impact Slide Hammer	T50T-100-A
Impact Slide Hammer	T59L-100-B

Removal and Installation

To remove a large core plug, drill a 12.70mm (0.50 inch) hole in the center of the plug and remove with an Impact Slide Hammer T59L-100-B or T50T-100-A or pry it out with a large drift punch. On a small core plug, drill a 6.35mm (0.25 inch) hole in the center of the plug and pry it out with a small pin punch. Clean and inspect the plug bore.

Prior to installing a core plug, the plug bore should be inspected for any damage that would interfere with the proper sealing of the plug. If the bore is damaged, it will be necessary to true the surface by boring for the next specified oversize plug.

Oversize plugs are identified by the OS stamped in the flat located on the cup side of the plug.

Coat the plug and/or bore lightly with an oil-resistant (oil galley) Stud and Bearing Mount E0AZ-19554-BA or equivalent meeting Ford specification WSK-M2G349-A1 or Threadlock 262 E2FZ-19554-B or equivalent meeting Ford specification WSK-M2G351-A6, and install it following the procedure for cup-type or expansion-type below:

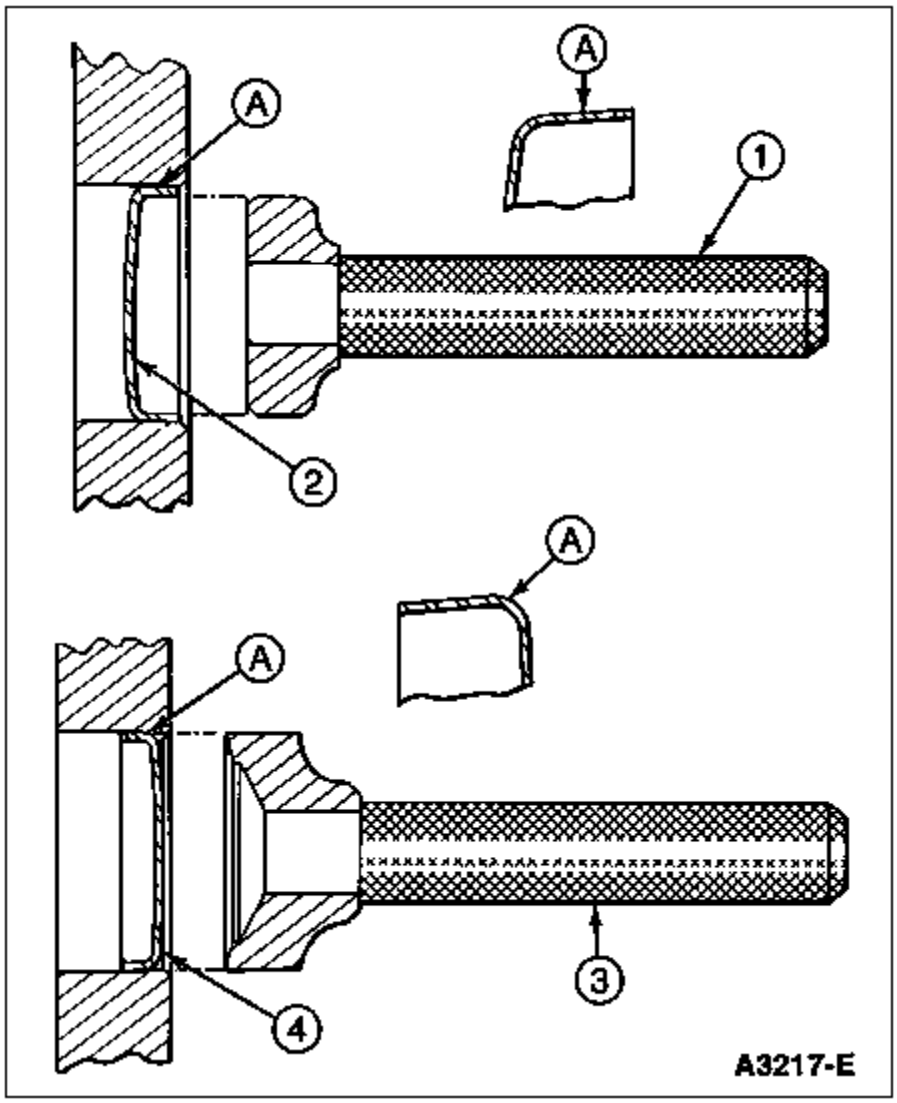
Cup-Type

Cup-type core plugs are installed with the flanged edge outward. The maximum diameter of this plug is located at the outer edge of the flange. The flange on a cup-type plug flares outward with the largest diameter of the outer (sealing) edge.

CAUTION: It is imperative to push the plug into the machined bore by using a properly designed tool. Under no circumstances is the plug to be driven into the bore using a tool that contacts the flange. This method will damage the sealing edge and will result in leakage and/or plug blowout.

The flanged (trailing) edge must be below the chamfered edge of the bore to effectively seal the plugged bore.

tomsn048@gmail.com



Item	Part Number	Description
1	—	Cup-Type Core Plug Replacer Tool — Typical
2	6026	Engine Block Plug — Cup-Type
3	—	Expansion-Type Core Plug Replacer Tool — Typical
4	6026	Engine Block Plug — Expansion-Type
A	—	Sealing Edge Before and After Installation

Expansion-Type

Expansion-type core plugs are installed with the flange edge inward. The maximum diameter of this plug is located at the base of the flange with the flange flaring inward.

CAUTION: It is imperative to push or drive the plug into the machined bore using a properly designed tool. Under no circumstances is the plug to be driven using a tool that contacts the crowned portion of the plug. This method will expand the plug prior to installation and may damage

tomsn048@gmail.com

the plug and/or plug bore.

When installed, the trailing (maximum) diameter must be below the chamfered edge of the bore to effectively seal the plugged bore.

If the core plug replacing tool has a depth seating surface, do not seat the tool against a non-machined (casting) surface.

---

tomsn048@gmail.com

Crankshaft Main and Connecting Rod Bearings

Cleaning

NOTE: Do not scrape gum or varnish deposits from the bearing shells.

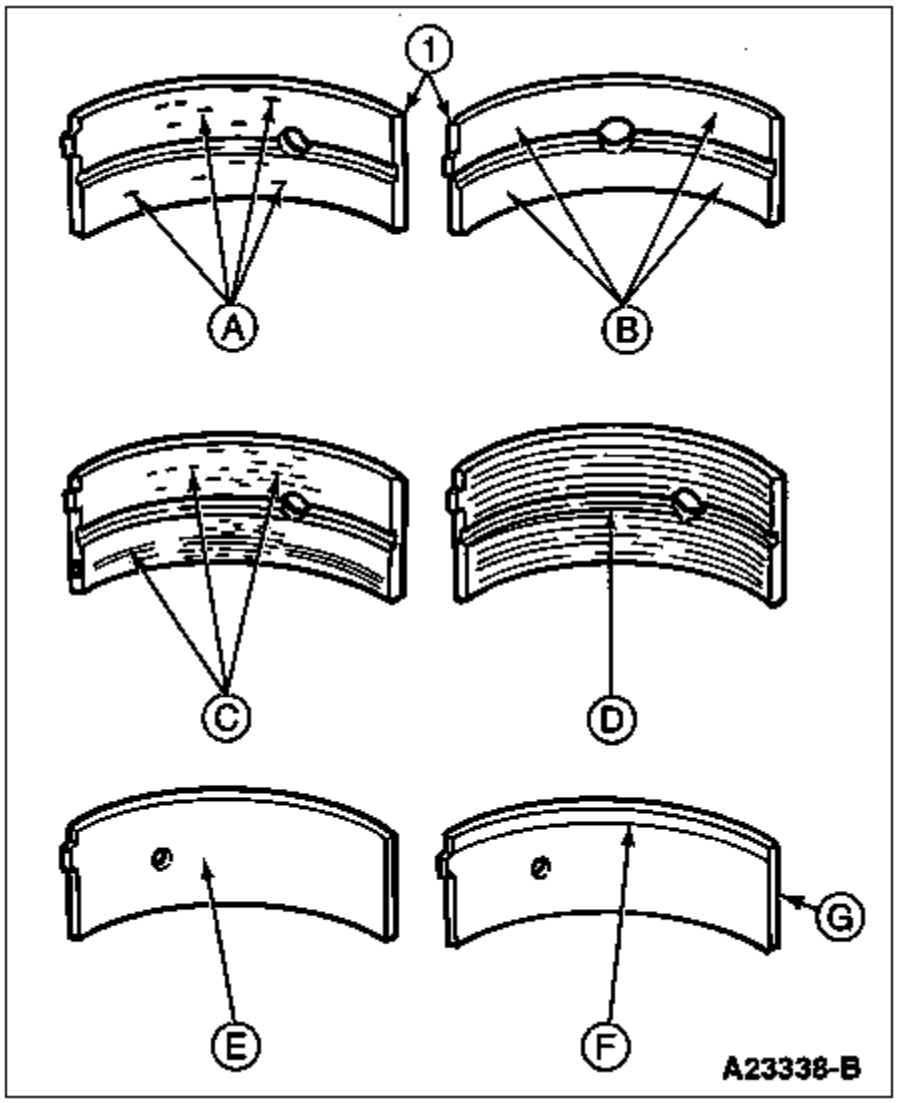
Bearings that are to be reused should be identified so they can be installed in their original locations.

Clean the bearing inserts and caps thoroughly in solvent, and dry them with compressed air.

Inspection

Inspect each bearing carefully. Bearings that have a scored, chipped or worn surface should be replaced. Typical examples of unsatisfactory bearings and their causes are shown in the illustration. The copper lead bearing base may be visible through the bearing overlay. If the base showing is less than 20 percent of the total area, the bearing is not excessively worn. It is not necessary to replace the bearing if the bearing clearance is within recommended limits. Check the clearance of bearings that appear to be satisfactory with Plastigage® as described in this section.

tomsn048@gmail.com



Item	Part Number	Description
1	6333	Connecting Rod Bearing
A	—	Fatigue Failure — Craters or Pockets
B	—	Improper Seating — Bright (Polished) Sections
C	—	Dirt Scratching, Imbedding
D	—	Overlay Wiped Out — Lack of Oil or Improper Clearance
E	—	Hourglass — Overlay Gone from Edges
F	—	Radius Ride
G	—	Overlay Gone from Mating Edge, One Side Only. Rod Cap Shift.

tomsn048@gmail.com

tomsn048@gmail.com

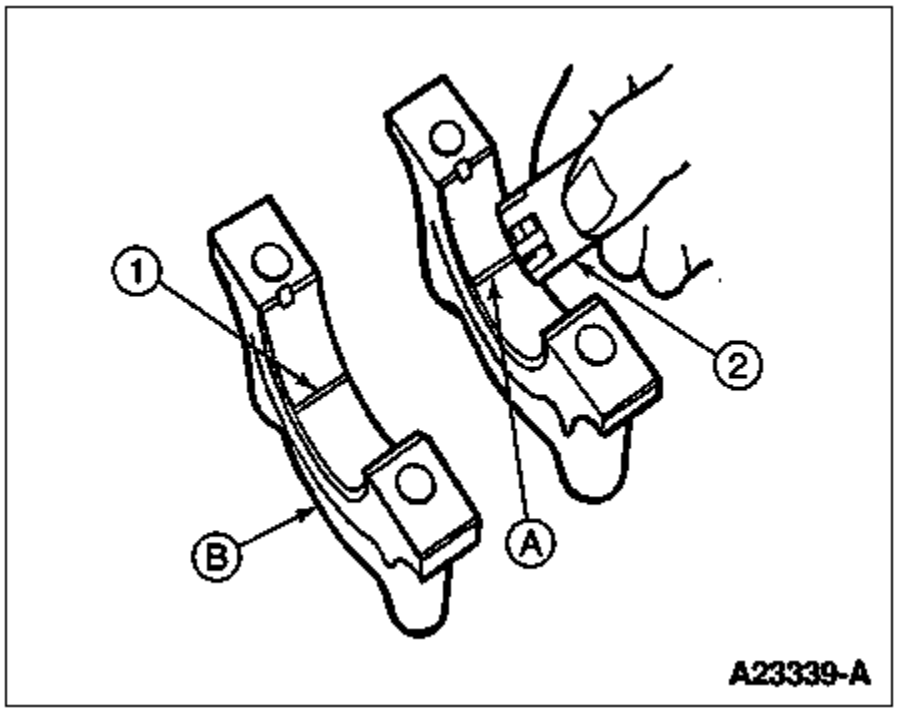
Crankshaft Main or Connecting Rod Bearings — Fitting Plastigage® Method

1. Clean crankshaft journals. Inspect journals and thrust faces for nicks, burrs or roughness that would cause premature bearing wear. **When replacing standard bearings with new bearings, it is good practice to fit bearing to minimum specified clearance.** If desired clearance cannot be obtained with a standard bearing, try a 0.050mm (0.002-inch) undersize bearing set to obtain proper clearance.

2. **CAUTION: Do not position jack under crankshaft pulley. Crankshaft post damage will result.**

   If fitting main bearing in-vehicle, position a jack under counterweight adjoining bearing which is being checked. Support crankshaft (6303) with jack so its weight will not compress Plastigage® and provide an erroneous reading.

3. Place a piece of Plastigage® D81L-6002-B or equivalent on bearing surface across full width of bearing cup and about 6.35mm (1/4 inch) off center.



Item	Part Number	Description
1	D81L-6002-B	Plastigage®
2	—	Plastigage® Scale (Part of D81L-6002-B)
A	—	Check Width of Plastigage®

tomsn048@gmail.com

B	—	Location of Plastigage® Prior to Tightening

4. Install main bearing cap and tighten bolts to specification. Refer to Section 03-01A , Section 03-01B or Section 03-01C . Do not turn crankshaft while Plastigage® is in place.

5. Remove cap. Using Plastigage® scale, check width of Plastigage® at widest point to get minimum clearance. Check at narrowest point to get maximum clearance. Difference between reading is taper of journals.

6. If bearing clearance exceeds the specified limits, try using one of the various combinations of undersize bearings as directed by the accompanying table. Use of any other bearing combination is not recommended. Bearing clearance must be within specified limits. Refer to Specifications in Section 03-01A , Section 03-01B or Section 03-01C for main and connecting rod bearing clearance limits. If use of these bearing combinations does not bring clearance to the desired limits, refinish the crank journal to a standard undersize, and use the appropriate undersize bearing.

7. After bearing has been fitted and cleaned, apply a light coat of engine oil to journal and bearings. Install main bearing cap. Tighten main bearing cap bolts to specification. Refer to Section 03-01A , Section 03-01B or Section 03-01C .

For This Amount of Bearing Clearance Excess		Use This Bearing Size			
		(Upper Bearing)		(Lower Bearing)	
mm	Inch	mm	Inch	mm	Inch
0.0-0.013	0.0-0.0005	0.025	0.001 U.S.	Standard	Standard
0.013-0.026	0.0005-0.0010	0.025	0.001 U.S.	0.025	0.001 U.S.
0.026-0.039	0.0010-0.0015	0.050	0.002 U.S.	0.025	0.001 U.S.
0.039-0.052	0.0015-0.0020	0.050	0.002 U.S.	0.050	0.002 U.S.

Bore Gauge Method

1. Install bearings in the cylinder blocks (6010) and main bearing caps.

2. Install and tighten main bearing cap bolts to specification. Refer to Section 03-01A , Section 03-01B or Section 03-01C .

3. Use a micrometer to measure main bearing journals. Refer to the procedure in this section.

4. Use a bore gauge to measure the inside diameter of each bearing assembly. It may be necessary to measure the outer bearings first, then remove the main bearing caps and measure the inner bearings.

5. Subtract the maximum measurement for each journal from the minimum measurement of each bearing to determine the minimum oil clearance.

   Allowable clearances are:

   2.3L: Number one main bearing 0.010-0.054mm (0.0004-0.0021 inch) Numbers two to five main

tomsn048@gmail.com

bearings 0.020-0.064mm (0.0008-0.0025 inch).

3.0L: 0.013-0.058mm (0.0005-0.0023 inch).

4.0L: 0.013-0.048mm (0.0005-0.0019 inch).

---

tomsn048@gmail.com

Crankshaft

Cleaning

CAUTION: Handle the crankshaft (6303) with care to avoid possible damage to the finished surfaces.

Clean the crankshaft with solvent, then blow out all oil passages with compressed air.

Inspection

Measure the diameter of each journal in at least four places to determine an out-of-round, taper or undersize condition. For specifications, refer to Section 03-01A , Section 03-01B or Section 03-01C .

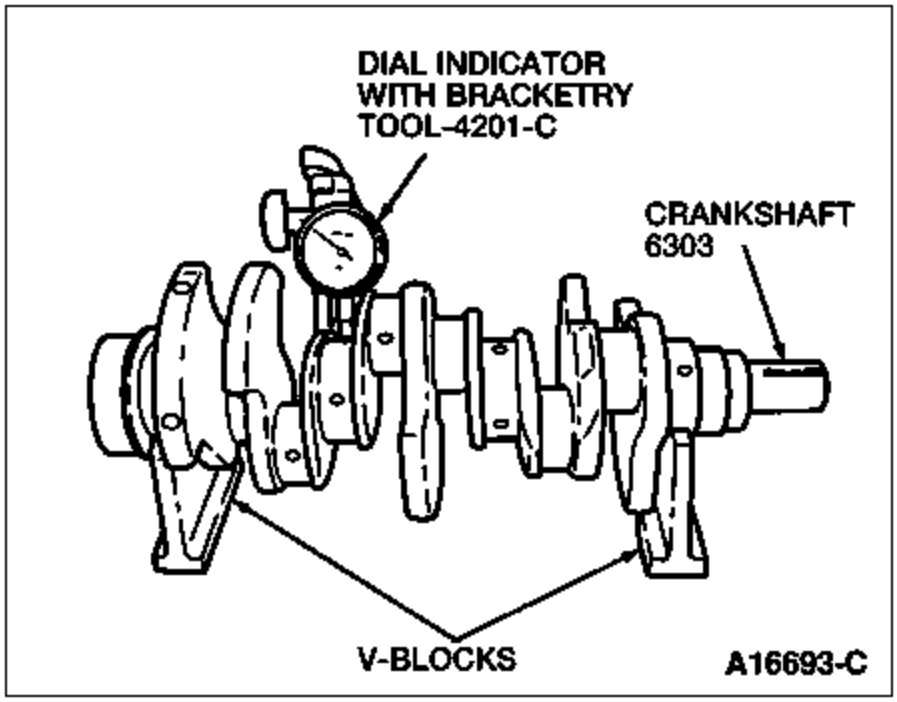
On vehicles equipped with a manual transmission, check the fit of the pilot bearing (7600) in the bore of the crankshaft. A needle roller bearing and adapter assembly is used as a pilot bearing. It is press fit directly into the crankshaft and should not be loose. Inspect the inner surface of the pilot bearing for wear or a bell-mouth condition. Check the inside diameter of the pilot bearing to see if it is worn or damaged. The bearing and adapter assembly cannot be serviced separately. The pilot bearing can only be installed with the seal end of the bearing facing the transmission. The bearing and seal are pregreased and do not require additional lubrication.

NOTE: A new pilot bearing must be installed whenever a pilot bearing is removed.

Inspect the pilot bearing, when used, for roughness, evidence of overheating or loss of lubricant. Replace if any of these conditions are found.

Crankshaft Runout

tomsn048@gmail.com



NOTE: Check crankshaft journals for out-of-round before checking for runout, or an out-of-round condition on the center journal could be confused for an excess runout condition.

1. Set V-blocks on surface plate and set crankshaft on V-blocks supported on the outer two main bearing journals.
2. Set up TOOL-4201-C or equivalent Dial Indicator with Bracketry to measure runout on center main bearing journal.
3. Zero dial indicator.
4. Slowly rotate crankshaft one revolution, recording highest and lowest readings.

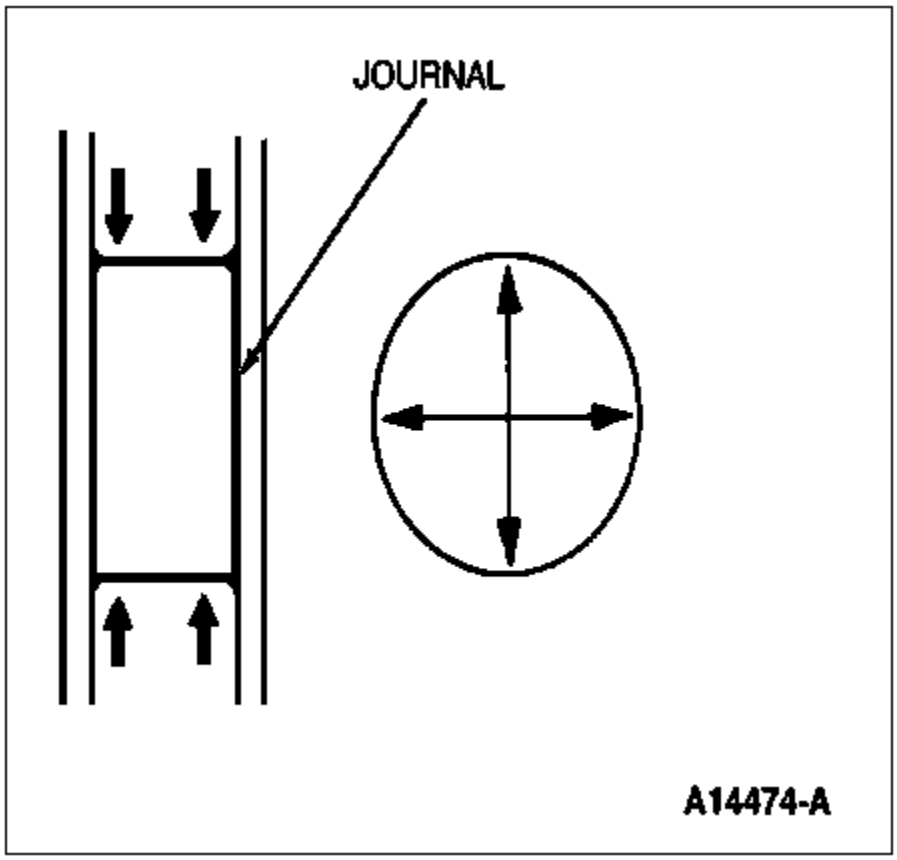
Crankshaft End Play

Refer to crankshaft end play elsewhere in this section. Crankshaft must be installed in block with the bearings that will be used, but without connecting rods (6200), pistons (6108), or flywheel (6375) installed to check end play.

Crankshaft Main Journal and Connecting Rod Journals

Inspect the main journal and crankpin journal diameters. Measure the diameter of each journal at two different points in the directions as shown.

tomsn048@gmail.com



Refer to Section 03-01A , Section 03-01B or Section 03-01C for crankshaft journal specifications.

Journals, Refinishing

NOTE: Polish direction is clockwise as viewed from the front of the crankshaft.

Dress minor imperfections such as scores, nicks or burrs with an oil stone.

If journals are severely marred or exceed service limits for wear, taper, or out of round, they should be refinished to size for the next undersize crankshaft main bearing.

Follow crankshaft lathe manufacturer's instructions for refinishing crankshaft.

If the journals will not clean up to less than the maximum undersize bearing available, replace the crankshaft.

Always reproduce the same journal shoulder radius that existed originally. Too small a radius will result in fatigue failure of the crankshaft. Too large a radius will result in bearing failure due to radius ride of the crankshaft bearing.

After refinishing the journals, chamfer the oil holes. Polish the journals with a No. 500 grit polishing cloth and engine oil (crocus cloth may also be used as a polishing agent) to obtain a smooth finish.

Crankshaft Sprocket

tomsn048@gmail.com

Inspect crankshaft sprocket (6306) for chipped, broken, or excessively worn teeth. Remove and replace as outlined in the appropriate Section 03-01A , Section 03-01B or Section 03-01C , depending on engine, if necessary.

tomsn048@gmail.com

Pistons, Piston Pins and Piston Rings

Cleaning

1. Clean piston (6108) using suitable solvent.
2. Using a putty knife or scraper clean carbon off of the top of the piston.
3. Do not use a power wire brush to clean the piston skirt, crown, or piston ring grooves as it will remove metal.
4. If using a ring groove scraper, be careful not to remove metal from the piston ring lands.

Inspection

1. Inspect for a hole or crack in top of piston caused by pre-ignition or foreign object damage.
2. Excess wear in ring lands indicated by visible steps worn in ring lands.
3. Scoring or gouges on piston skirt or crown.
4. Looseness between piston and piston pin.

Pistons — Fitting

SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
Engine Cylinder Hone Set	T73L-6011-A

NOTE: There are two procedures for piston fitting. One is used when the original standard-size bore shows little wear and can be cleaned up. The second is used after the cylinder has been rebored.

Original Bore

1. Measure cylinder bore as outlined in this section under Cylinder Bore Measuring . If cylinder bore is not damaged and wear, taper, and out-of-round are within specifications listed in the appropriate Section 03-01A , Section 03-01B , or Section 03-01C . Depending on engine, then the cylinder bore may be cleaned up and reboring is unnecessary.
2. Hone cylinder, if necessary, to restore a proper crosshatch pattern so new rings can seat. Remove as little of the cylinder wall as possible.
    - If clearance exceeds specifications, the piston will have to be replaced.
    - If clearance is within specifications, proceed to assemble and install the piston as outlined in Section 03-01A , Section 03-01B or Section 03-01C depending on which engine.

tomsn048@gmail.com

3. **NOTE: On 2.3L and 4.0L engines (6007) red select fit pistons are available for select fitting a standard size bore if only a slight cleanup was required. On 3.0L engines red and blue select fit pistons are available. On 3.0L engines a yellow 0.076mm (0.003 inch) oversize piston is available if greater cleanup was required. Refer to Master Parts Catalog.**

   Subtract from cylinder bore dimension determined earlier. If within specifications in Section 03-01A , Section 03-01B or Section 03-01C , install the piston as outlined in that section. If not, try the other color piston. If neither of the standard bore "color" pistons can be brought within the maximum clearance, fit the selected oversize piston.

After Reboring

NOTE: When reboring cylinder, leave bore 0.13mm (0.005 inch) undersize to allow for honing and fitting piston. Measure the diameter of the oversize piston on the thrust side at right angles to the piston pin (6135) 24.5mm (1.000 inch) below the oil ring groove for 2.3L, 3.0L, and 4.0L engines.

Oversize pistons are available in 0.51mm (0.020 inch), 0.76mm (0.030 inch) and 1.02mm (0.040 inch). Refer to Master Parts Catalog.

1. Remeasure the cylinder bore. Refer to the Cylinder Bore Measuring procedure in this section.

2. Subtract the piston diameter from the cylinder bore diameter to determine how much material must be removed during honing to establish correct piston-to-cylinder bore clearance. Refer to the specifications in Section 03-01A , Section 03-01B or Section 03-01C .

3. Use T73L-6011-A Engine Cylinder Hone Set to hone the cylinder bore to bring the piston-to-cylinder clearance within specifications.

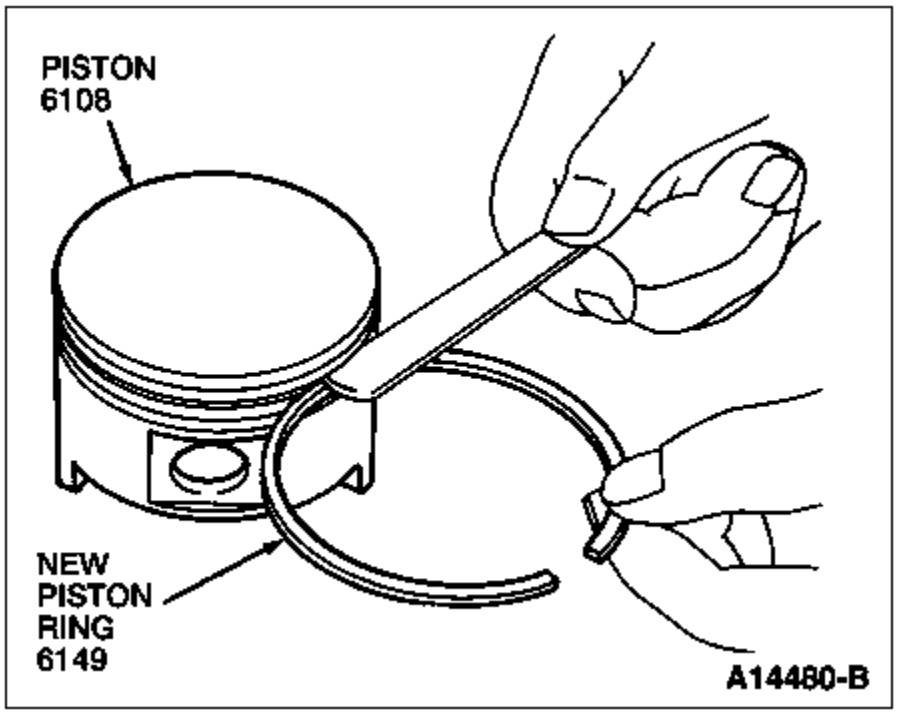
   - Take frequent measurements to assure you do not remove too much metal from the cylinder bore.
   - Move hone up and down to attain proper crosshatch pattern and prevent tapering or bell-mouthing the cylinder bore.

4. Once proper fit and crosshatch pattern is achieved, assemble and install piston. Refer to the procedure in Section 03-01A , Section 03-01B or Section 03-01C . If the entire engine is being rebuilt, make sure piston and rod assemblies are marked so each piston is installed in the bore to which it was fitted.

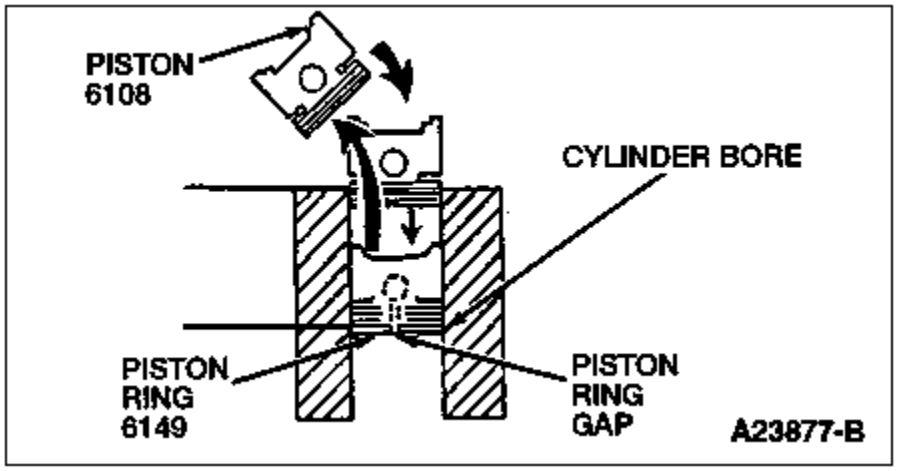
Piston Rings — Fitting

NOTE: Do not reinstall used piston rings (6149). A special break-in finish, and sometimes an anti-scuff coating, is given to new piston rings by the factory. The purpose of the special finish is to help the new piston rings and cylinder bore mate properly. The special finish, like the crosshatching on the cylinder bore, wears off during break-in. The special finish will be already worn off used piston rings so they probably will not seat properly. For this reason attempting to reuse piston rings could lead to excess oil consumption and possible cylinder scoring.

tomsn048@gmail.com



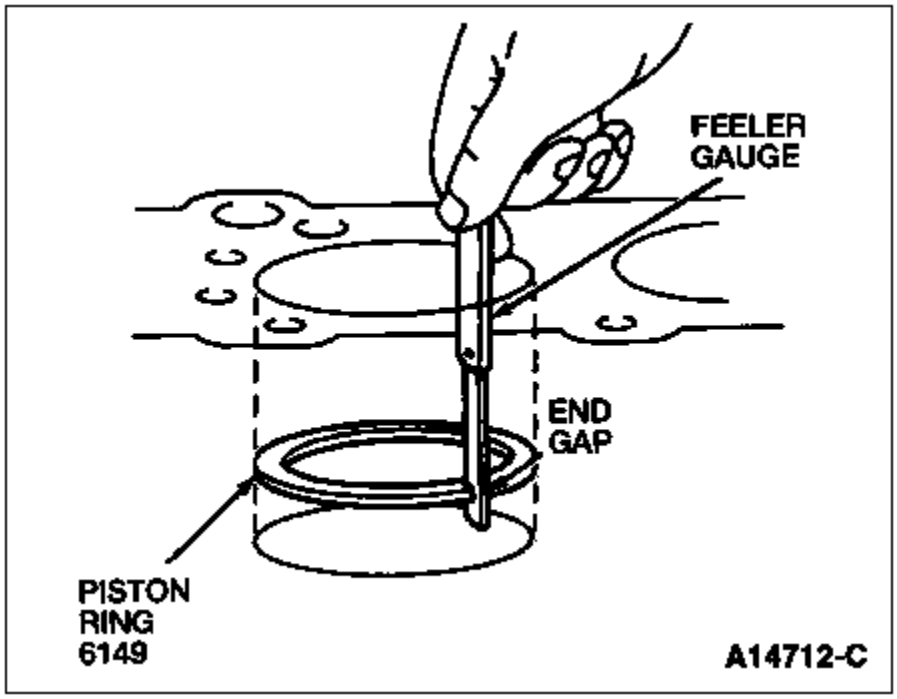
1. Insert each piston ring backwards in the appropriate piston ring groove.
2. Measure the clearance between the piston ring and groove (side clearance) with a feeler gauge and check against the side clearance specifications in Section 03-01A , Section 03-01B or Section 03-01C .
3. Insert the piston ring in the cylinder bore.
4. Using the piston, without piston rings, turned upside down, press the piston ring down to the center of the cylinder bore.



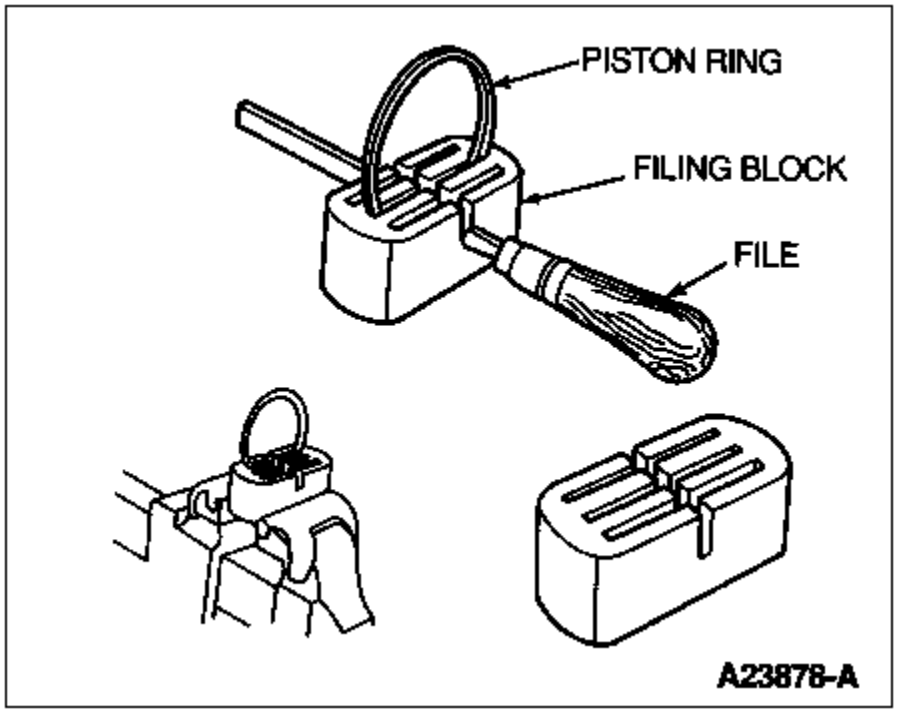
5. Make sure the piston ring is "square" in the cylinder bore.
6. Check the piston ring end gap specification in Section 03-01A , Section 03-01B or Section 03-01C .

tomsn048@gmail.com

Use a feeler gauge to check the piston ring end gap.



7. If the piston ring end gap is too small, the piston ring will have to be filed until the piston ring end gap is within specifications. The use of a ring filing block helps ensure that the piston ring ends are filed square.



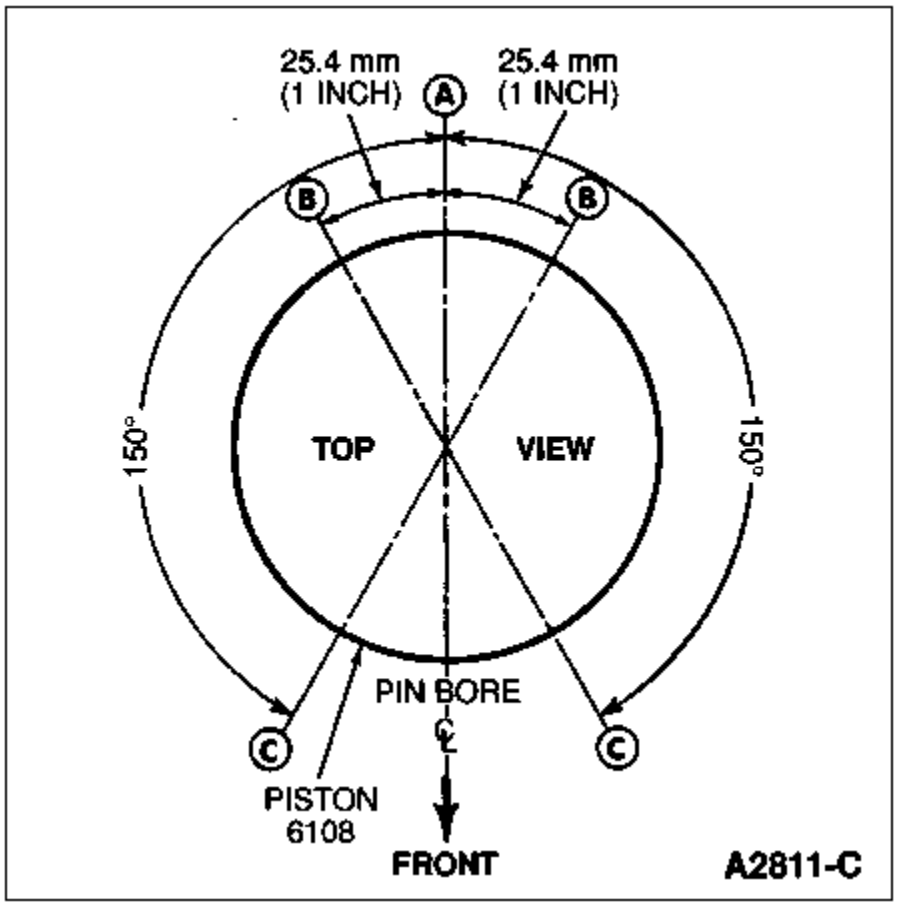
tomsn048@gmail.com

8. **CAUTION: Install the piston rings after the piston has been installed on the connecting rod. Since the piston may be supported by the crown during this operation, the piston rings could be damaged.**

   CAUTION: Use a piston ring expander to install the piston rings. Attempting to wind them on by hand may put a deep scratch in the piston or break the piston ring.

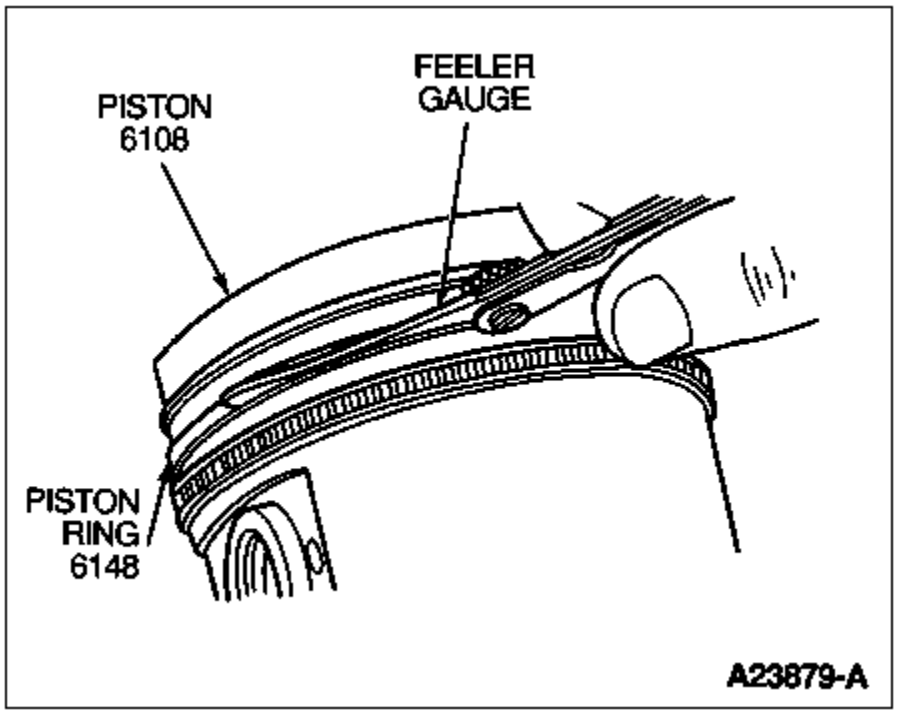
   Using a piston ring expander, install the piston rings starting with the oil control rings. Make sure piston rings are installed right side up. Refer to instructions with the piston ring set.

9. Rotate the piston rings so the piston ring end gaps are NOT lined up but are spaced properly as shown.



10. Use a feeler gauge to recheck piston ring side clearance.

tomsn048@gmail.com



Piston and Piston Pin Fit

NOTE: New pistons come with fitted piston pins and should not require refitting unless the connecting rod bore is oversize.

All 2.3L, 3.0L, 4.0L engines use piston pins which press into the connecting rod (6200). The piston pivots on the piston pin. There is no connecting rod bushing but rather an interference fit between the piston pin and the connecting rod.

Refer to Section 03-01A , Section 03-01B or Section 03-01C for specifications and assembly instructions.

1. Clean and inspect the connecting rod. Refer to the procedure in this section.
2. Clean and inspect the piston and piston pin. Refer to the procedure in this section.
3. Use a suitable micrometer to measure the piston pin both places where the piston pivots and in the center where it is pressed into the connecting rod.
4. Use a suitable set of plug gauges or bore gauge to measure the upper bore of the connecting rod. An interference fit is required. If the bore is oversize it will be necessary to install an oversize piston pin. It is not necessary to rebore or ream the connecting rod.
5. If the pin-to-rod fit is within specifications, measure the piston pin bores in the piston.
6. Subtract the piston pin size from the piston pin bore sizes. Pin-to-piston clearance is listed in the Specifications in Section 03-01A , Section 03-01B or Section 03-01C .

tomsn048@gmail.com

If clearance is excessive it will be necessary to fit an oversize piston pin.

7. To fit an oversize piston pin because either the pin-to-connecting rod or pin-to-piston clearance was excessive:

   - Obtain an appropriate oversize piston pin.
   - Hone or ream the piston pin bores in the piston to obtain the correct clearance.
   - It is not necessary to hone or ream the connecting rod piston pin bore oversize.

8. Once piston pin, connecting rod, and piston are correctly sized to each other, assemble as outlined in Section 03-01A , Section 03-01B or Section 03-01C .

tomsn048@gmail.com

Connecting Rods

Piston Pin Clearance

Refer to Piston and Piston Pin Fit in this section.

Cleaning

Remove the bearings from the connecting rod (6200) and connecting rod cap. Identify each bearing location if they are to be used again. Clean the connecting rod in solvent, including the connecting rod bore and the back of the bearings. Do not use a caustic cleaning solution. Blow out all oil passages with compressed air.

Inspection

The connecting rods and related parts should be carefully inspected and checked for conformance to specifications. For specifications, refer to Section 03-01A , Section 03-01B or Section 03-01C . Various forms of engine wear caused by these parts can be readily identified.

A shiny surface on either pin boss inside of the piston (6108) usually indicates that a connecting rod is bent.

Abnormal connecting rod bearing wear can be caused by either a bent connecting rod, worn or damaged piston pin (6135), or a tapered connecting rod bore.

Twisted connecting rods can create an identifiable piston skirt wear pattern, but badly twisted connecting rods will disturb the action of the entire piston, piston rings, and connecting rod assembly and may be the cause of excessive oil consumption.

Check the connecting rods for bend or twist on a suitable alignment fixture. Follow the instructions of the fixture manufacturer. If the bend or twist exceeds specification, the connecting rod must be replaced.

Inspect the connecting rods for signs of fractures and the connecting rod bearing bores for out-of-round and taper. If the bore exceeds the recommended limits or if the connecting rod is fractured, it should be replaced.

tomsn048@gmail.com

tomsn048@gmail.com

Camshaft/Cylinder Head Journals

Cleaning

1. Remove camshaft sprocket (6256) from camshaft (6250).
2. Clean the camshaft in an appropriate solvent and wipe it dry.
3. Remove light scuffs, scores, or nicks from the camshaft machined surfaces with an oil stone.

Inspection

Inspect the camshaft journals and lobes for scoring and signs of abnormal wear.

Lobe pitting, except in the general area of the lobe toe, is not detrimental to the operation of the camshaft. The camshaft should not be replaced unless cam lobe lift loss has exceeded the specifications or pitting has occurred in the cam lobe lift area.

Camshaft Bearings

1. If engine (6007) has not been disassembled and cleaned, wipe bearing bore clean with a clean rag and solvent. Dry with a clean rag.
2. Inspect for scoring and visible wear. Inspect if Babbitt has been worn away to base. If visibly worn or damaged, bearings will have to be replaced. If one of the center bearings is worn significantly more than the end bearings, check camshaft for excessive runout.
3. Using suitable bore gauge or inside micrometer, measure each bearing twice, 90 degrees apart, to determine bearing size and out-of-round.
4. Check results against specifications in appropriate Section 03-01A , Section 03-01B , or Section 03-01C , depending on which engine you are working on. If bearings are out of specifications, they will have to be replaced. Check camshaft journals before replacing bearings to determine if undersize bearings are required.
5. If necessary, replace bearings as outlined in Section 03-01A , Section 03-01B , or Section 03-01C , depending on which engine you are working on.

Camshaft Bearing Journals

1. Measure each journal twice, 90 degrees apart, to determine journal wear, size, and out-of-round.
2. Check measurements against specifications in Section 03-01A , Section 03-01B , or Section 03-01C , depending on which engine you are working on.
3. If journals are excessively out-of-round or worn, regrind to a standard undersize. Refer to Master

tomsn048@gmail.com

Parts Catalogue. If journals are too worn to be refinished to an available undersize, camshaft will have to be replaced.

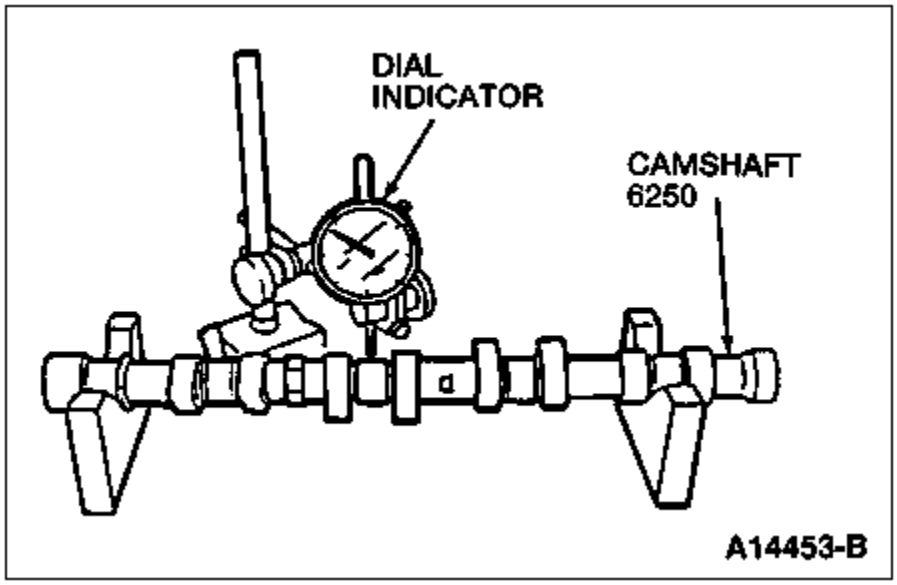
Camshaft Journals Oil Clearance

1. Measure camshaft bearings and camshaft bearing journals as outlined in this section.
2. Subtract size of journal from the size of its bearing.
3. Check clearance against specifications in Section 03-01A , Section 03-01B or Section 03-01C , depending on which engine you are working on.
4. If clearance is excessive, but camshaft journals are within specifications, simply install new bearings. If both bearings and journals are worn, turn camshaft journals to a standard undersize and install new undersize bearings.

Camshaft Runout

1. **NOTE: Check camshaft journals for out-of-round before checking for runout, or an out-of-round condition on the center journal could be confused for an excess runout condition.**

   Set suitable V-blocks on surface plate. Support outer camshaft journals on V-blocks.
2. Set up D78P-4201-B or equivalent Dial Indicator with Bracketry to check center bearing journal.
3. Zero dial indicator.
4. Slowly rotate camshaft to determine overall runout. If runout exceeds 0.03mm (0.0012 in.), replace camshaft.



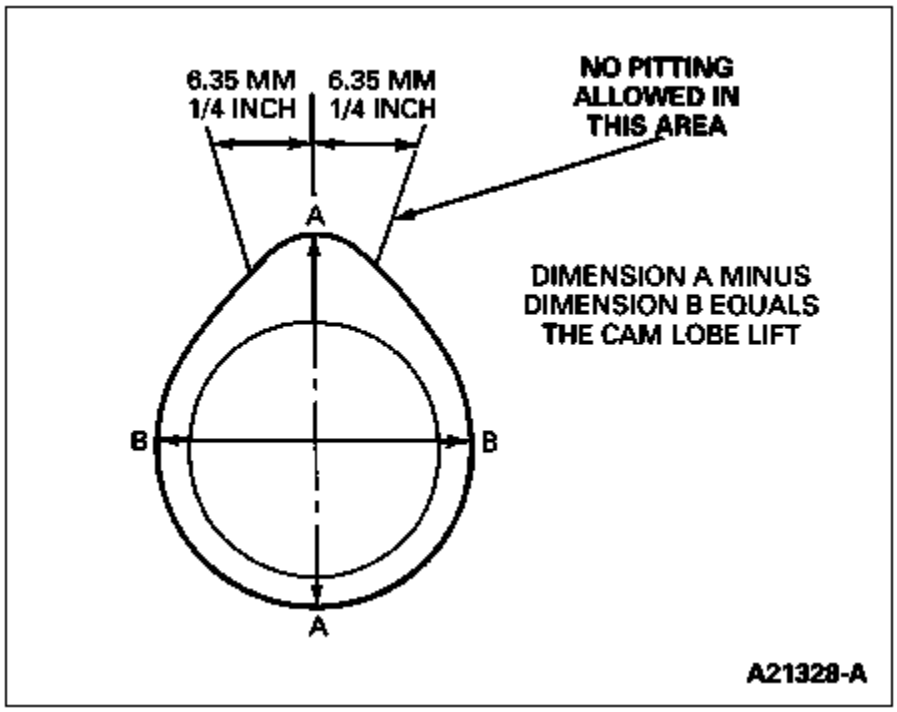
Cam Lobe Lift (Camshaft Removed)

tomsn048@gmail.com

There are two ways of measuring cam lobe lift with the camshaft bearing (6261) removed, with a vernier caliper camshaft bearing or on a lathe or cam grinder with a dial indicator. The second method is more accurate.

With Calipers

1. Inspect camshaft bearing as outlined in this section.
2. Measure the distance of each cam lobe at the major diameter.
3. Measure the distance of each cam lobe at the minor diameter.
4. For each cam lobe, subtract the minor diameter from the major diameter. The result for each lobe is the lobe lift.
5. Check the lobe lift for each cam lobe against the specifications in Section 03-01A , Section 03-01B or Section 03-01C depending on which engine you are working on.
6. If any cam lobe is worn excessively, the camshaft and tappets will have to be replaced.



On a Camshaft Grinder or Lathe

1. Clean and inspect the camshaft as outlined in this section.
2. Install the camshaft on the lathe or camshaft grinder centers.
3. Position the dial indicator which comes with the machine at the heel of the cam lobe which you are

tomsn048@gmail.com

going to check.

4. Zero the dial indicator.
5. Slowly turn the camshaft until the point of the dial indicator is on the tip of the cam lobe.
6. Read the dial indicator. This is your cam lobe lift.
7. Check the lobe lift against the specifications in Section 03-01A , Section 03-01B or Section 03-01C . If any cam is excessively worn, the camshaft and tappets will have to be replaced.

Camshaft Journal Oil Clearance

1. Use a suitable bore gauge or inside micrometer to measure camshaft bearings and camshaft bearing journals.
2. Subtract size of journal from the size of its bearing.
3. Check clearance against specifications in Section 03-01A , Section 03-01B or Section 03-01C .
4. If clearance is excessive, but camshaft journals are within specifications, install new bearings. If both bearings and journals are worn, turn camshaft journals to a standard undersize and install new oversize bearings.

Camshaft Sprocket

Inspect camshaft sprocket for worn or broken teeth. If necessary, remove as outlined in Section 03-01A , Section 03-01B or Section 03-01C .

tomsn048@gmail.com

Hydraulic Valve Tappets

Valve tappets (6500) should be kept in proper sequence so that they can be installed in their original position. Inspect and test each valve tappet separately so as not to intermix. If any part of the valve tappet assembly needs replacing, replace the entire assembly.

Cleaning

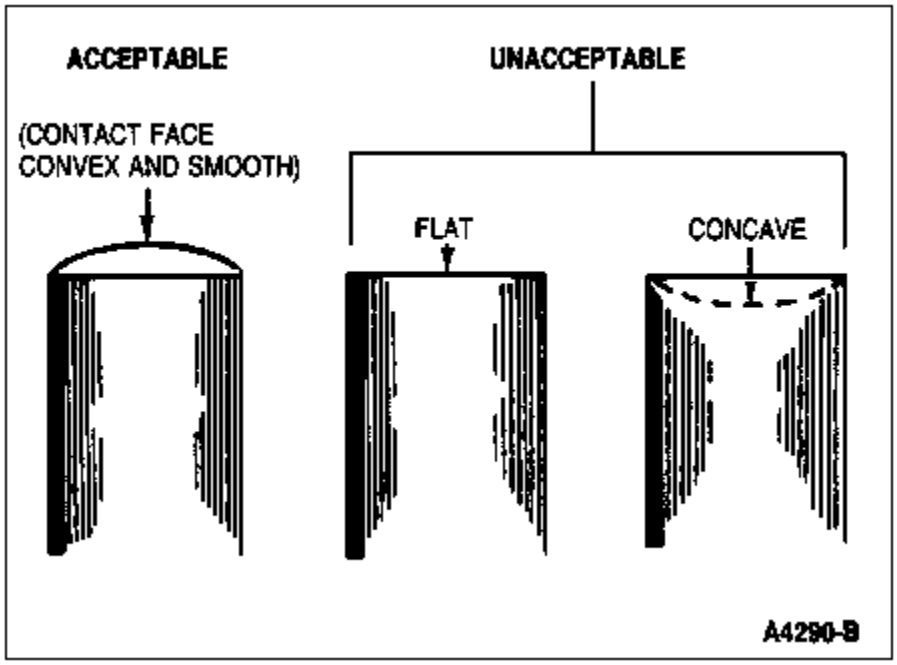
Thoroughly clean all the parts in clean solvent and wipe them with a clean, lint-free cloth.

Inspection

Inspect the parts and discard the entire valve tappet assembly if any part shows pitting, scoring or excessive wear. Replace the entire assembly if the plunger is not free in the body. The plunger should drop to the bottom of the body by its own weight when assembled dry and check ball assembly removed.

Assemble the valve tappet assembly and check for freedom of operation by pressing down on the plunger. The valve tappets can also be checked with a hydraulic tester to test the leak-down rate. Follow the instructions of the test unit manufacturer or refer to Valve Train Analysis — Dynamic in this section.

Valve, Flat — Tappet Wear

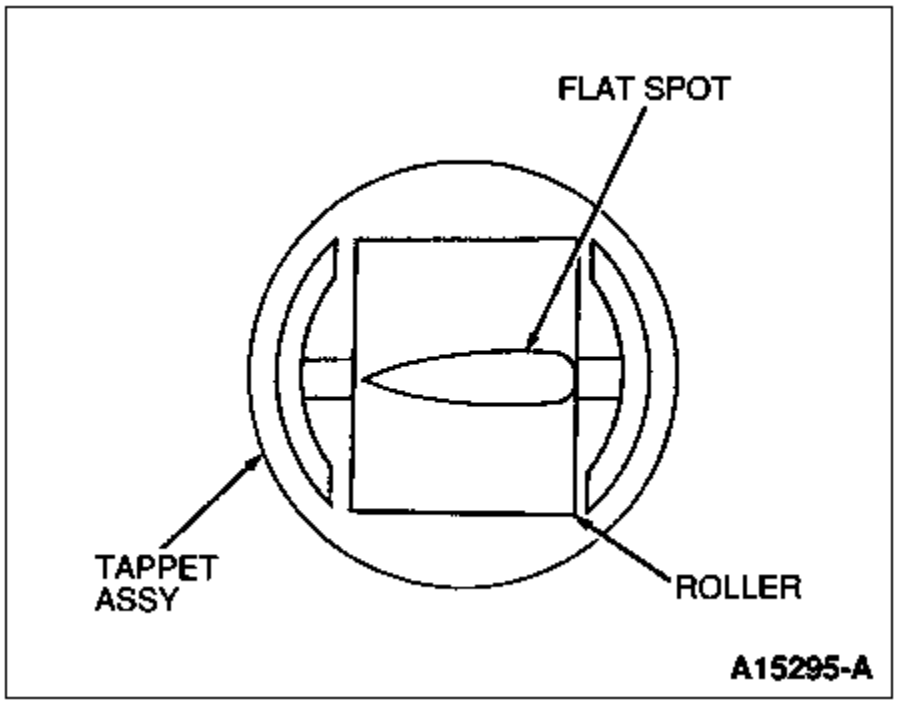


tomsn048@gmail.com

tomsn048@gmail.com

Valve Roller — Tappet Wear

Inspect roller tappet for flat spots or scoring. If flat spot is found, roller tappet must be replaced. Check camshaft lobes for proper height, or wear. Replace as required.



tomsn048@gmail.com

Oil Pump

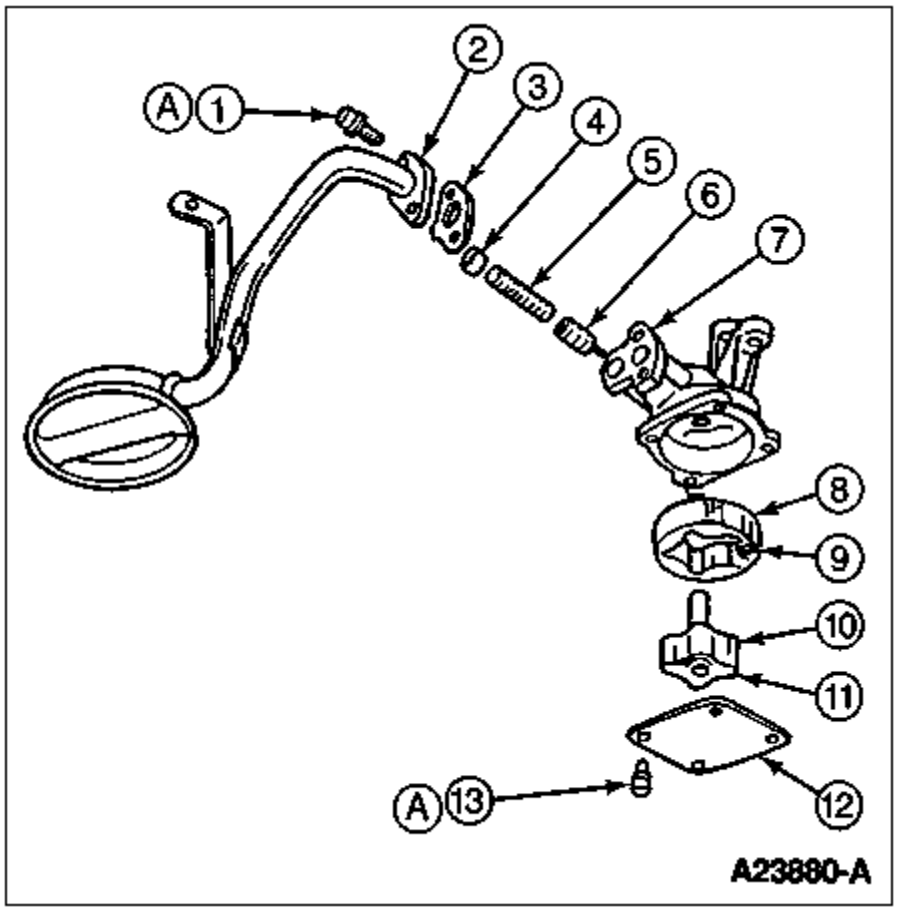
NOTE: On 2.3L engine, do not disassemble oil pump (6600) for inspection. If oil pump is questionable, replace it.

Cleaning

1. If not removed as part of engine disassembly, remove oil pump. Refer to Section 03-01B or Section 03-01C .
2. If not done already, lift out oil pump intermediate shaft (6A618).
3. Remove two oil pump screen cover and tube bolts and oil pump screen cover and tube (6622).
4. Remove the cover plate bolts and the cover plate.
5. Remove the inner rotor and shaft assembly, then remove the outer race.
6. Drill a small hole and insert a self-threading sheet metal screw of the proper diameter into the oil pressure relief valve chamber cap and pull the cap out of the chamber. Remove the spring and plunger.

Oil Pump — Typical (4.0L Shown)

tomsn048@gmail.com



Item	Part Number	Description
1	—	Oil Pump Screen Cover and Tube Bolt
2	6622	Oil Pump Screen Cover and Tube
3	6626	Gasket
4	—	Plug (Part of 6600)
5	—	Oil Relief Valve Spring (Part of 6600)
6	—	Oil Relief Valve Plunger (Part of 6600)
7	—	Oil Pump Body (Part of 6600)
8	—	Outer Rotor (Part of 6600)
9	—	Identification Mark (Part of 6600)
10	—	Inner Rotor (Part of 6600)
11	—	Identification Mark (Part of 6600)
12	—	Cover Plate (Part of 6600)
13	—	Cover Plate Bolt (Part of 6600)
A	—	Tighten to 14-20 Nm (11-14 Lb-Ft)

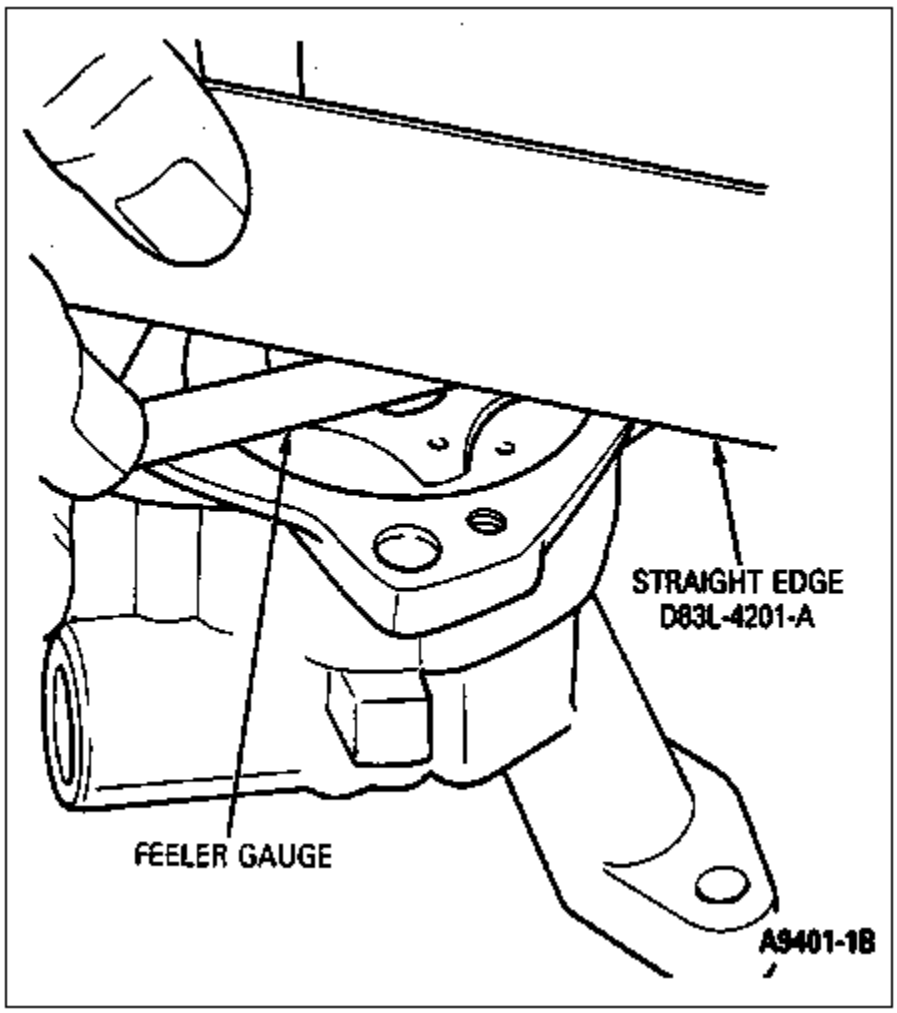
tomsn048@gmail.com

7. Clean all parts in solvent and dry them thoroughly with compressed air. Use a brush to clean the inside of the pump housing and pressure relief valve chamber. Make sure all dirt and metal particles are removed.

Inspection

1. Look for deep scoring in cover plate. Light concentric scratches only indicate that the pump has been used, and are acceptable. If cover plate is deeply scored, replace oil pump.
2. Look for scoring or wear on the shaft. If severely scored, replace shaft.
3. Inspect the rotor for burrs or score marks.
4. Remove minor imperfections from parts with an oil stone.

Rotor Clearance



tomsn048@gmail.com

1. Use a straightedge and feeler gauge to make sure inside of cover plate is flat. If a 0.038mm (0.0013 inch) feeler gauge can go under straightedge, replace oil pump.

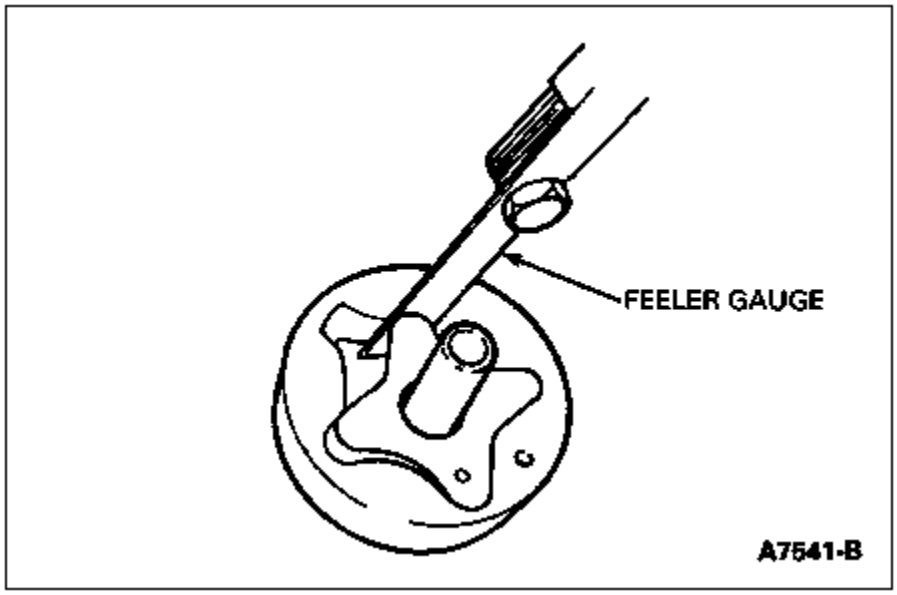
2. Insert the inner and outer rotor into the oil pump housing.

3. Place a straightedge over the rotor assembly and the oil pump housing.

4. Measure the clearance between the straightedge and the inner rotor, then the outer rotor. Clearance must not exceed 0.10mm (0.004 inch).

   If clearance is excessive, replace oil pump.

Tooth Tip Clearance



1. With inner and outer rotor installed, use feeler gauge to measure clearance between inner and outer rotor at tip of inner rotor furthest from outer rotor.

2. Check against specifications in Section 03-01B or Section 03-01C .

3. If clearance is excessive, replace oil pump.

Outer Rotor-to-Pump Body Clearance

1. Use feeler gauge to measure clearance between outer rotor (race) and housing.

2. Check against specifications in Section 03-01B or Section 03-01C .

tomsn048@gmail.com

3. If clearance is excessive, replace oil pump.

Pressure Regulator Valve Inspection

Inspect valve plunger for scoring and free operation. Light scratches may be removed with a crocus cloth.

Pressure Regulator Valve Spring Inspection

1. Inspect for breaks, cracks, tilting, and collapsed coils.

2. Use Valve/Clutch Spring Tester TOOL-6513-DD or equivalent to check valve spring tension. Check against specifications in Section 03-01B or Section 03-01C . A weak spring must be replaced.

Pressure Regulator Valve to Housing Clearance

1. Use plug gauge to measure regulator valve bore.

2. Use micrometer to measure outside of plunger.

3. Subtract plunger diameter from bore size and check against specifications in Section 03-01B or Section 03-01C . If clearance is excessive, replace oil pump.

---

tomsn048@gmail.com

Oil Pan

Cleaning

CAUTION: Do not damage the oil level sensor (if equipped) when cleaning the oil pan (6675).

Scrape any dirt or metal particles from the inside of the oil pan. Scrape all old gasket material from the gasket surface. Wash the pan in a solvent and dry it thoroughly. Make sure all foreign particles are removed.

Inspection

Check the oil pan for cracks, holes or damaged drain plug threads. Check the gasket surface for damage caused by overtightened bolts. Replace with a new oil pan if repairs cannot be made.

tomsn048@gmail.com

Cylinder Heads

NOTE: Do not plane or grind more than 0.254mm (0.010 inch) from original cylinder head gasket surface.

Replace the cylinder head (6049) if it is cracked. Remove all burrs or scratches with an oil stone.

Cleaning

With the valves installed to protect the valve seats, remove deposits from the combustion chambers and valve heads with a scraper and a wire brush. Be careful not to damage the cylinder head gasket surface. After the valves are removed, clean the valve guide bores. Use cleaning solvent to remove dirt, grease and other deposits from the valves with a fine wire brush or buffing wheel.

Inspection

Inspect the cylinder heads for cracks or excessively burned areas in the exhaust outlet ports.

Check the cylinder head for cracks and inspect the gasket surface for burrs and nicks. Small imperfections of this type can be dressed down using an oil stone. Replace the cylinder head if it is cracked.

The following inspection procedures are for a cylinder head that is to be completely overhauled. For individual repair operations, use only the pertinent inspection procedure.

Spark Plug Thread Service

NOTE: The use of power or air driven tools is not approved for the installation of tapersets.

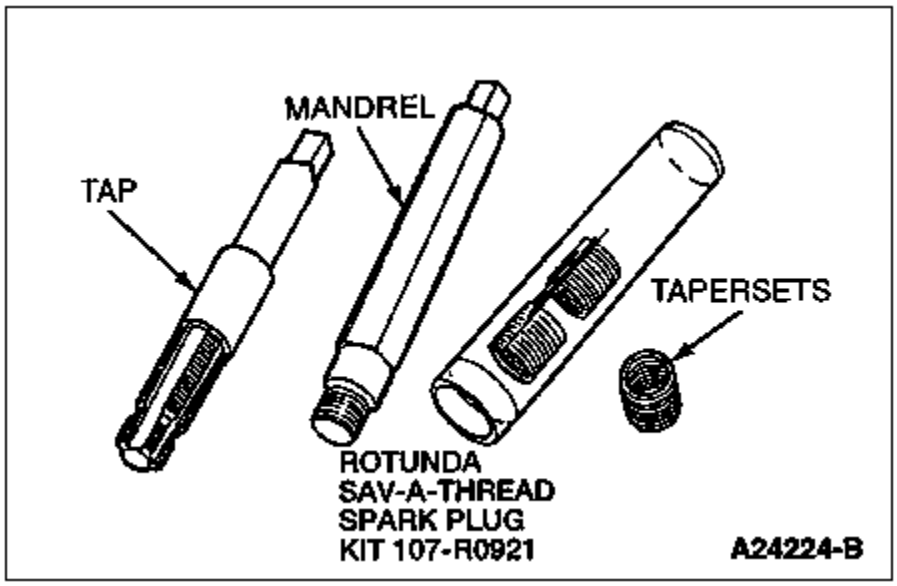
Damaged spark plug threads in the cylinder head can be serviced using Rotunda Sav-A-Thread Spark Plug Kit 107-R0921 or equivalent.

The procedure involves cutting new threads in the spark plug hole. After rethreading operation, a tapered sleeve will be installed in the cylinder head. The sleeve is threaded on the inside and outside. The outside threads into the cylinder head while the inside provides new threads for the spark plug (12405).

The service is permanent and will have no effect on cylinder head or spark plug life.

CAUTION: The cylinder head must be removed from engine (6007) before installing a taperset. The service procedure includes a thread cutting process which produces metal chips. Performing this procedure while the cylinder head is on the engine will cause metal chips to fall into the cylinder. Once in the cylinder, these chips can damage the cylinder wall when the engine is started.

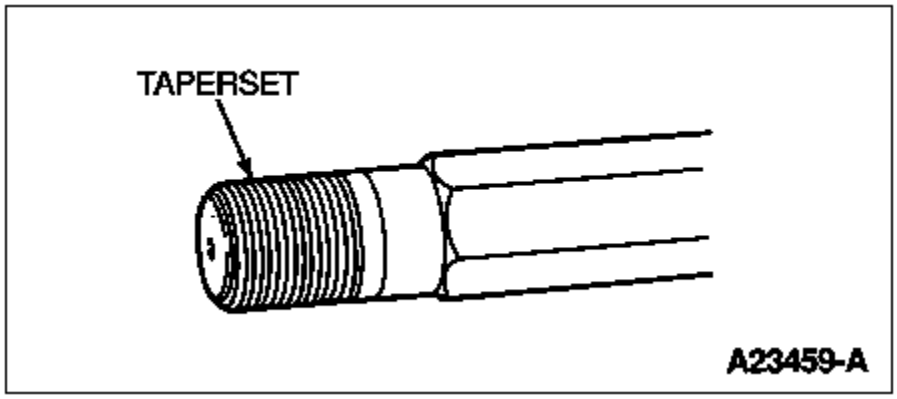
tomsn048@gmail.com



1. Thoroughly clean spark plug counter bore, seat and threads of all dirt or other foreign material.
2. Start tap into spark plug hole being careful to keep it properly aligned.

   As tap begins cutting new threads, apply aluminum cutting oil to tap, if aluminum.

   Continue cutting threads and applying oil until stop ring bottoms against spark plug seat.
3. Remove tap. Remove all metal chips using compressed air.
4. Coat threads of mandrel with cutting oil. Thread taperset onto mandrel until one thread of mandrel extends beyond taperset.

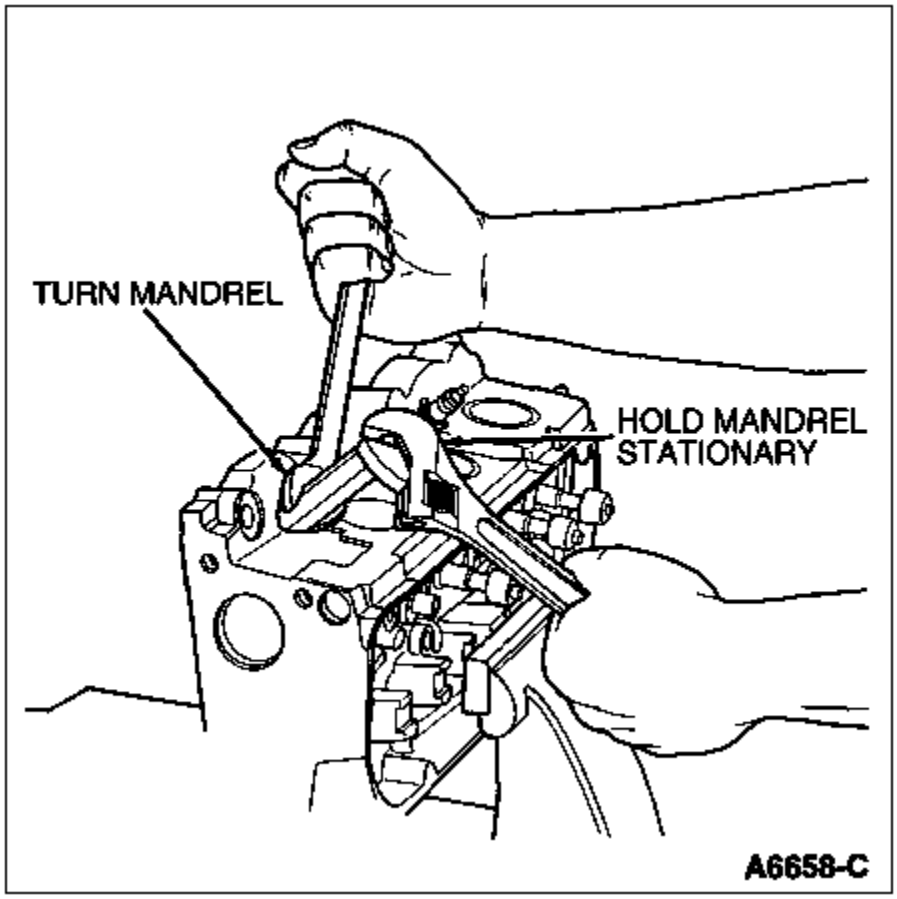


5. **NOTE: A properly installed taperset will be flush to one millimeter below spark plug gasket seat.**

   Thread taperset into tapped spark plug hole using a torque wrench. Continue tightening mandrel until torque wrench indicates 61 Nm (45 lb-ft).
6. To loosen mandrel for removal, hold mandrel stationary and turn mandrel body approximately one-

tomsn048@gmail.com

half turn. Remove mandrel.

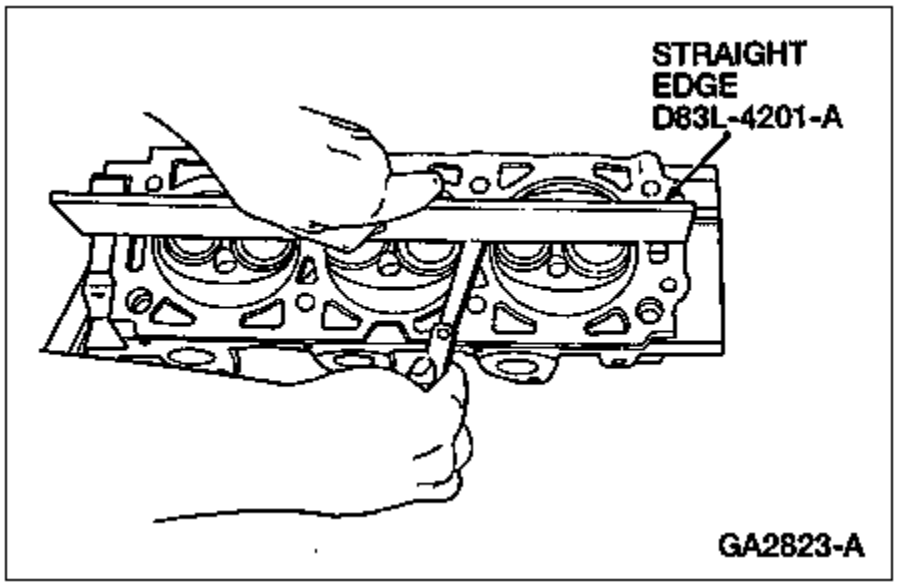


Cylinder Head Flatness

NOTE: Do not plane or grind off more than 0.254mm (0.010 inch).

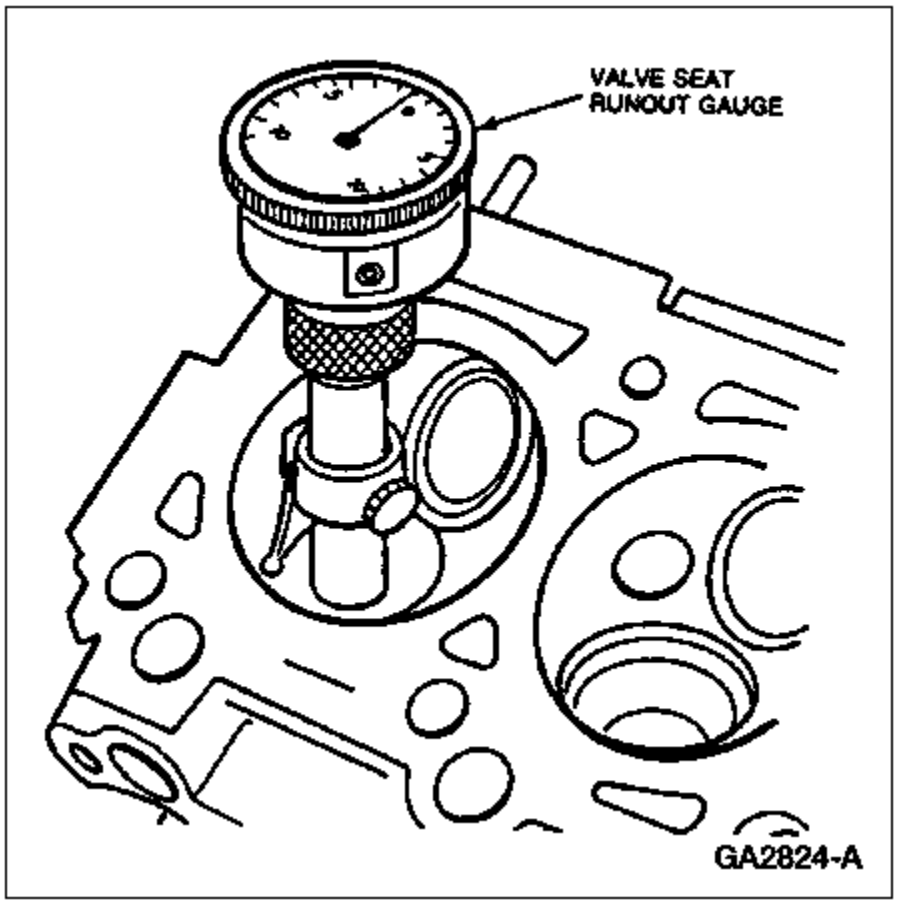
When a cylinder head is removed because of gasket leaks, check the flatness of the cylinder head gasket surface for conformance to specification. For specifications refer to General Specifications in this section. If necessary, refinish the cylinder head gasket surface.

tomsn048@gmail.com



Valve Seat Runout

Check the valve seat runout with Valve Seat Runout Gauge as illustrated below. Follow the instructions of the gauge manufacturer. If the runout exceeds the wear limit, reface the valve and valve seat. For specifications, refer to engine Section 03-01A , Section 03-01B or Section 03-01C depending on engine.

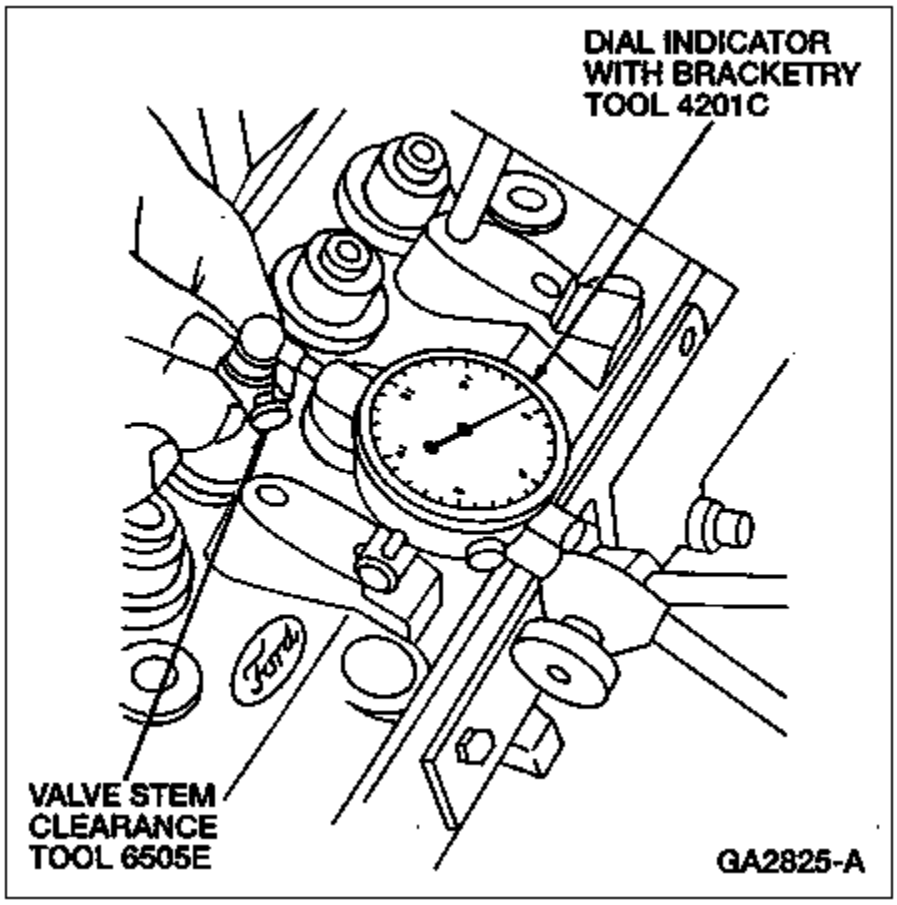


tomsn048@gmail.com

Valve Stem-to-Valve Guide Clearance

1. Check the valve stem-to-valve guide clearance of each valve in its respective valve guide (6510) with Valve Stem Clearance Tool TOOL-6505-E or equivalent and Dial Indicator With Bracketry TOOL-4201-C or equivalent. Use a flat-end indicator point.

2. Install Valve Stem Clearance Tool TOOL-6505-E or equivalent on the valve stem until it is fully seated, and tighten the knurled setscrew firmly. Permit the valve to drop away from its seat until the tool contacts the valve guide.



3. Install the Dial Indicator With Bracketry TOOL-4201-C, or equivalent, with its flat tip against the center portion of the spherical section of the Valve Stem Clearance Tool TOOL-6505-E, or equivalent, at approximately 90 degrees to the valve stem axis.

4. Move the valve stem back and forth in line with the dial indicator stem.

5. Take a reading on the dial indicator without removing the tool from the valve stem.

6. Divide the reading by two. This dimension is the valve stem-to-valve guide clearance.

7. If valve stem-to-valve guide clearance exceeds the wear limit, refer to Valve Guides, Reaming in this

tomsn048@gmail.com

section.

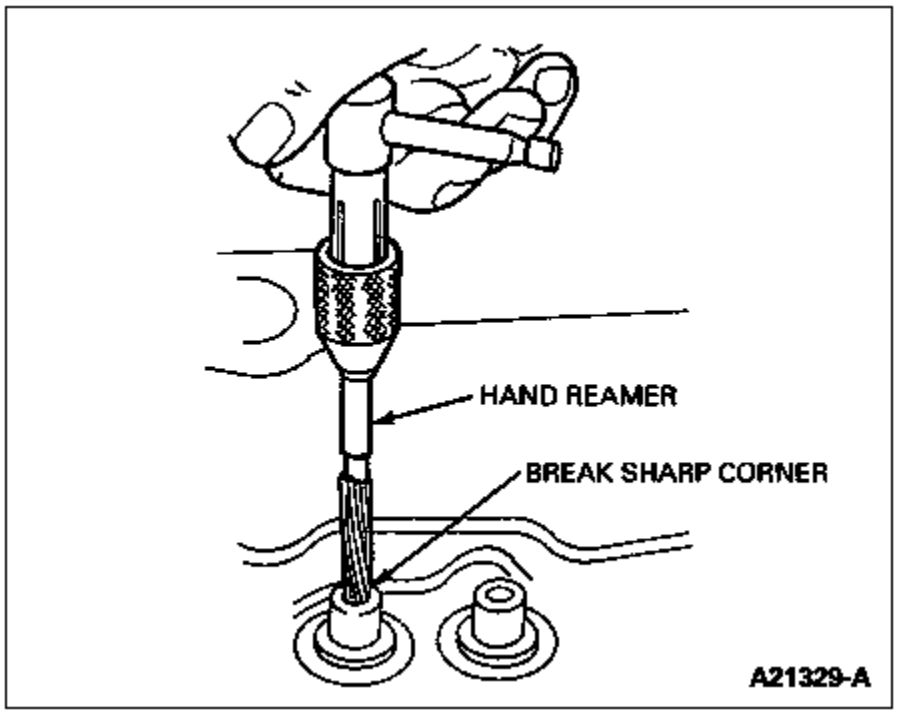
Valves, Select Fitting

If the valve stem-to-valve guide clearance exceeds the service clearance, ream the valve guide for the next oversize valve stem. Valves with oversize stem diameters are available for service. Refer to Master Parts Catalogue for available sizes. **Always reface the valve seat after the valve guide has been reamed.** Refer to Valve Guides, Reaming.

In the case of valve stem-to-valve guide clearance, the service clearance is intended as an aid to diagnosing engine noise only, and does not constitute a failure or indicate need for service. However, when overhauling or reconditioning a cylinder head, the service clearance should be regarded as a practical working value, and used as a determinant for installing the next oversize valve to make sure service life is extended.

Valve Guides, Reaming

If it becomes necessary to ream a valve guide to install a valve with an oversize stem, a hand reaming kit is available which contains the following reamer and pilot combinations: a 0.38mm (0.015-inch) OS reamer with a 0.076mm (0.003-inch) OS pilot, and a 0.76mm (0.030-inch) reamer with a 0.38mm (0.015-inch) OS pilot.



NOTE: If oversize valve stems and oversize stem seals are not available, bore out original valve guide and install service bushing. For 2.3L, push out original guide. Service bushing will be a regular production bushing. Ream inside diameter for specified clearance for standard size valve. Reface valve seat, as required. Install standard size valve stem oil seal.

When replacing a standard size valve with an oversize valve, always use the reamer in sequence (smallest oversize first, and then next smallest, etc.) so as not to overload the reamers. **Always reface the valve seat after the valve guide has been reamed, and use a suitable scraper to break the sharp corner (inside diameter) at the top of the valve guide.**

tomsn048@gmail.com

NOTE: The interference angle of the valve and seat should not be lapped out. Remove all grooves or score marks from the end of the valve stem, and chamfer it as necessary. Do not remove more than 0.254mm (0.010 inch) from the end of the valve stem.

If the valve face runout is excessive and/or to remove pits and grooves, reface the valves to a true 45 degree angle. Remove only enough stock to correct the runout or to clean up the pits and grooves. If the edge of the valve head is less then 0.794mm (1/32 inch) thick after grinding, replace the valve as the valve will run too hot in the engine.

If the valve and/or valve seat has been refaced, it will be necessary to check the clearance between the rocker arm pad and the valve stem with the valve train assembly installed in the engine.

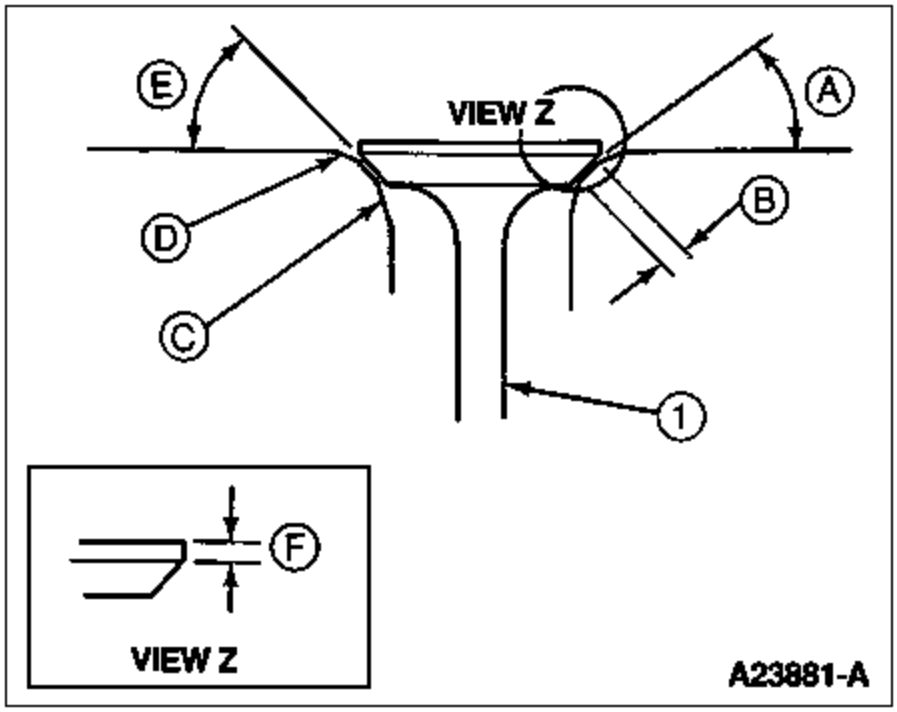
Valve Seats, Refacing

Measure the valve seat width. Reface the valve seat(s) if the width is not within specifications. Refer to Section 03-01A , Section 03-01B or Section 03-01C depending on engine.

Refer to Engine Service in the Rotunda Tool catalog for a description of the various types of valve seat grinders and cutters available.

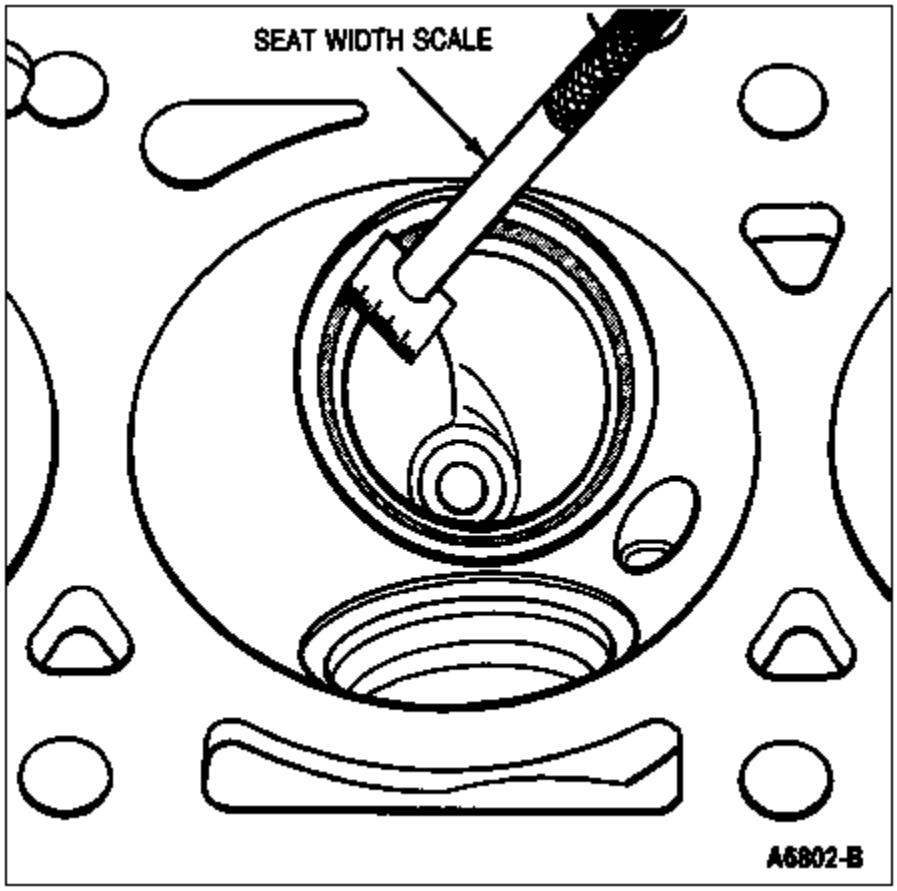
Refacing the valve seat should be closely coordinated with the refacing of the valve face so that the finished seat and valve face will be concentric and the specified interference angle will be maintained. This is important so that the valve and seat will have a compression-tight fit. Make sure refacer grinding wheels are properly dressed.

Grind the valve seats of all engines to a true 45-degree angle. Remove only enough stock to clean up pits and grooves or to correct the valve seat runout. After the seat has been refaced, use a seat width scale or a machinist scale to measure the seat width. Narrow the seat, if necessary, to bring it within specification. Refer to Section 03-01A , Section 03-01B or Section 03-01C depending on engine, for specifications.



tomsn048@gmail.com

Item	Part Number	Description
1	—	Valve
A	—	Valve Seat Angle
B	—	Seat Width and Proper Location on Valve
C	—	Bottom Narrowing Angle 75 Degrees
D	—	Top Narrowing Angle 30 Degrees
E	—	Valve Face Angle
F	—	Valve Margin



If the valve seat width exceeds the maximum limit, remove enough stock from the top edge and/or bottom edge of the seat to reduce the width to specification.

On the intake and exhaust seats, use a 60-degree angle grinding wheel to remove stock from the bottom of the seat (raise the seats). A 30-degree angle wheel is used to remove stock from the top of the seats (lower the seats).

The finished valve seat should contact the approximate center of the valve face. It is good practice to determine where the valve seat contacts the face.

To do this, coat the seat with Prussian Blue and set the valve in place. Rotate the valve with light pressure. If

tomsn048@gmail.com

the blue is transferred to the center of the valve face, the contact is satisfactory. If the blue is transferred to the top edge of the valve face, lower the valve seat. If the blue is transferred to the bottom edge of the valve face, raise the valve seat.

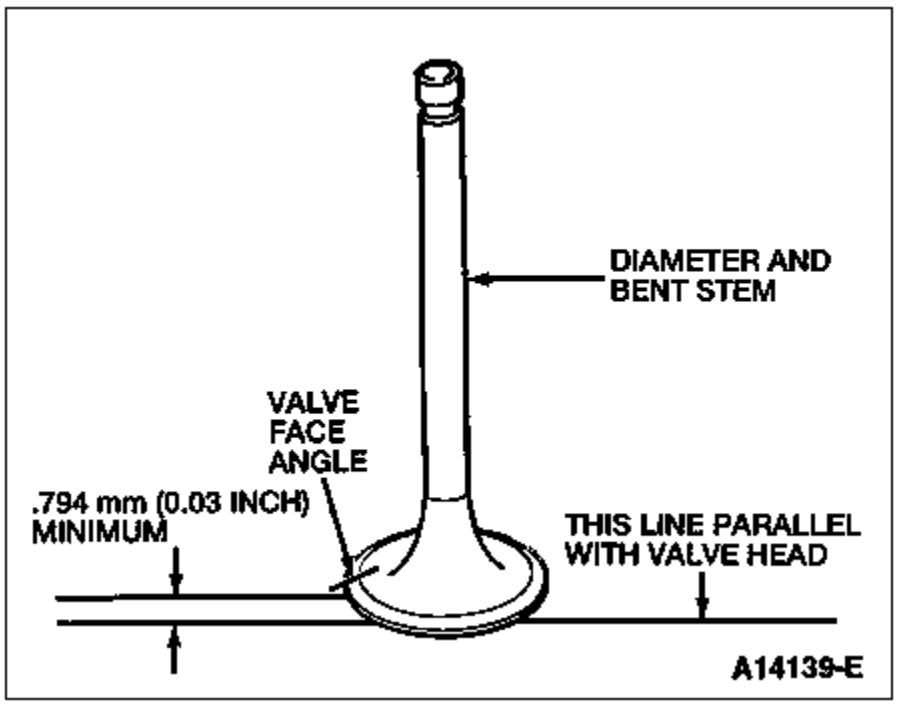
Valves, Inspection

The critical inspection points and tolerances of the valve are illustrated below. Refer to Specifications in Section 03-01A , Section 03-01B or Section 03-01C for service limits.

Inspect the valve stem for bends, and the end of the stem for grooves or scoring.

Inspect the valve face and the edge of the valve head for pits, grooves or scores. Inspect the stem for a bend condition and the end of the stem for grooves or scores. Check the valve head for signs of burning or erosion, warpage and cracking. Minor pits, grooves, etc., may be removed. Discard severely damaged valves.

Inspect the valve spring (6513), valve spring retainer (6514), valve spring retainer keys (6518) and discard any visually damaged parts.



Valves, Refacing

NOTE: Discard any excessively worn or damaged valve train parts.

Minor pits or grooves may be removed. Discard valves that are severely damaged if the face runout cannot be corrected by refinishing or if stem clearance exceeds specification. Refer to Section 03-01A , Section 03-01B or Section 03-01C for valve specifications.

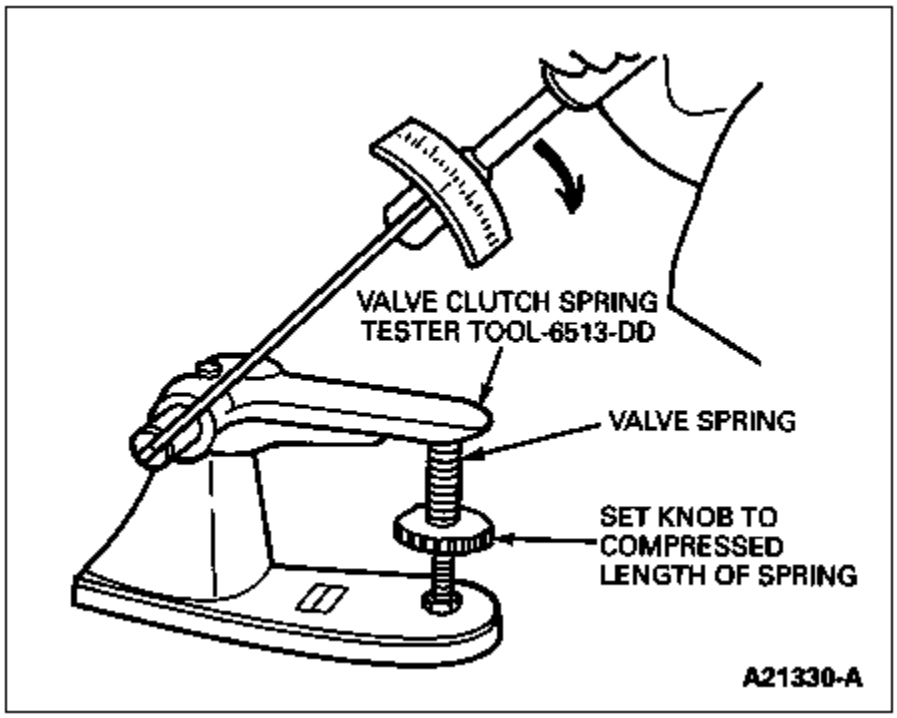
Refer to Engine Service in the Rotunda Tool catalog for a description of the various types of valve resurfacing equipment.

tomsn048@gmail.com

The valve refacing operation should be closely coordinated with the valve seat refacing operations so that the finished angles of the valve face and valve seat will be to specifications and provide a compression-tight fit.

Make sure refacer grinding wheels are properly dressed.

Valve Spring Tension



Inspect the valve springs, valve spring retainers, and valve spring retainer keys for wear or damage. Discard any damaged parts.

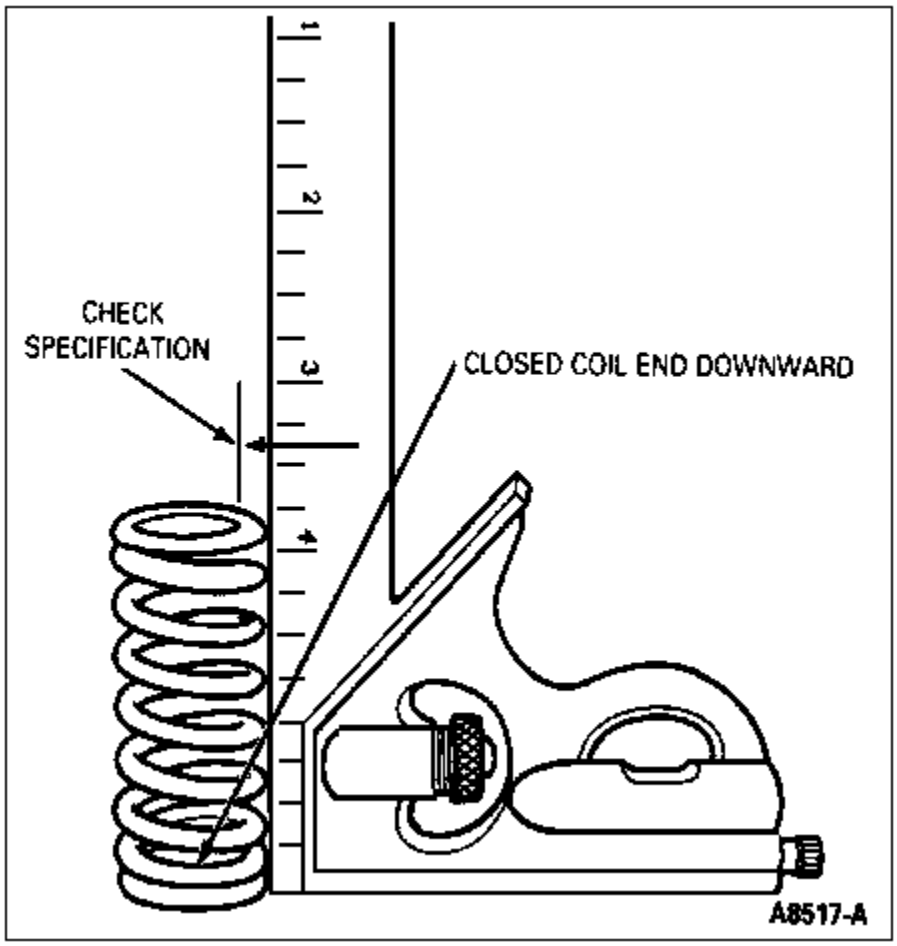
Check the valve springs for proper pressure at the specified spring lengths using Valve/Clutch Spring Tester TOOL-6513-DD or equivalent. Apply torque until click is heard; read torque wrench and multiply reading by two. Weak valve springs cause poor engine performance. Replace any valve spring not within specification. For specifications, refer to Section 03-01A , Section 03-01B or Section 03-01C . Manually rotating the valve spring assemblies while installed in the engine will not determine condition of valve springs.

CAUTION: Make sure the valve springs are reassembled to their own original dampers by pushing damper on the spring. Do not open damper with any kind of tool in order to reassemble.

Valve Spring Squareness

Check each valve spring for squareness using a steel square and a flat surface. Stand the valve spring and square on end. Slide the valve spring up to the square. Revolve the valve spring slowly and observe the space between the top coil of the valve spring and the square.

tomsn048@gmail.com



Refer to Specifications in Section 03-01A , Section 03-01B or Section 03-01C for out-of-square limits. Follow the same procedure for new valve springs before installation.

Make sure the proper valve spring (color-coded) is installed.

CAUTION: Make sure the valve springs are reassembled to their own original dampers by pushing damper on the valve spring. Do not open damper with any kind of tool in order to reassemble.

tomsn048@gmail.com

tomsn048@gmail.com

Rocker Arm

Cleaning

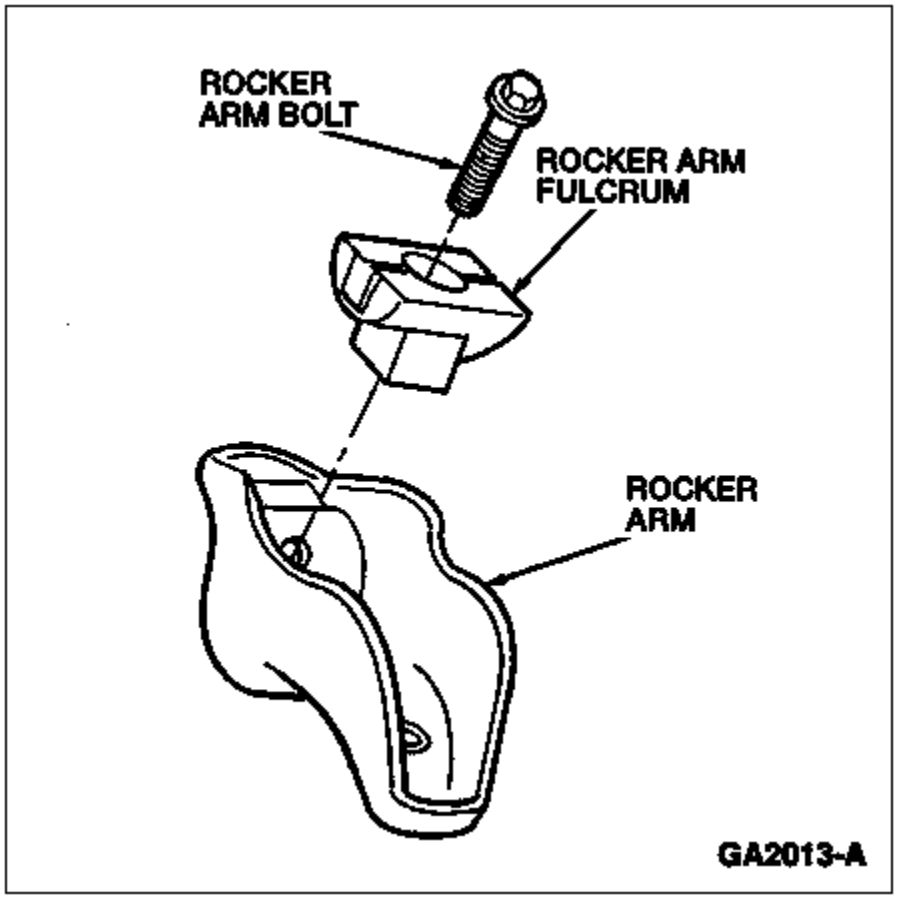
Clean all parts thoroughly. Make sure all oil passages are open.

Make sure oil passage in the push rod end of the rocker arm (6564) is open.

Inspection

Inspect the rocker arm for nicks, scratches, scores or scuffs. Replace any damaged parts.

Rocker Arm, 3.0L Shown



Inspect the pad at the valve end of the rocker arm for indications of scuffing or abnormal wear. If the pad is grooved, replace the rocker arm. Do not attempt to true this surface by grinding. On pedestal-mounted rocker arms, check the rocker arm pad, side rails, rocker arm fulcrum, and fulcrum seat for excessive wear, cracks, nicks or burrs. Check the rocker arm bolt for stripped or broken threads.

tomsn048@gmail.com

tomsn048@gmail.com

Rocker Arm (3.0L and 4.0L)/Camshaft Follower (2.3L)

Cleaning

Clean all parts thoroughly. Make sure all oil passages are open.

Make sure oil passage in the push rod end of the rocker arm (6564) is open.

Inspection

Inspect the shaft and the rocker arm bore for nicks, scratches, scores or scuffs. Replace any damaged parts.

tomsn048@gmail.com

Push Rods 3.0L and 4.0L

Cleaning

Clean the push rods in a suitable solvent. Blow out the oil passage in the push rod (6565) with compressed air.

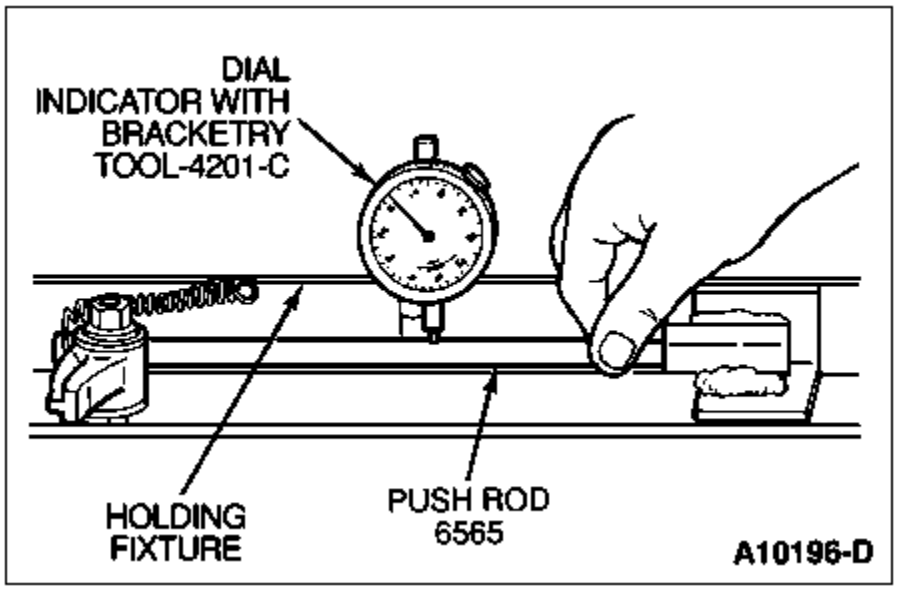
Inspection

NOTE: Do not attempt to straighten push rod.

Check the ends of the push rods for nicks, grooves, roughness or excessive wear. Replace damaged push rods.

The push rods can be visually checked for straightness while they are installed in the engine by rotating them with the valve closed. They also can be checked with a dial indicator.

If the push rod is bent beyond specifications, it should be replaced.



tomsn048@gmail.com

tomsn048@gmail.com

Intake Manifold

Cleaning

Remove all gasket material from the machined surfaces of the upper and lower intake manifolds. Clean the manifold in a suitable solvent and dry it with compressed air.

Inspection

NOTE: Remove all filings and foreign matter that may have entered the manifold as a result of service.

Inspect the manifold for cracks, damaged gasket surfaces, or other problems that would make it unfit for further service. Replace all studs that are stripped or otherwise damaged. Clean the EGR exhaust passages.

Check the baffle plate(s) on the underside of the manifold if so equipped. The baffle(s) should be securely fastened.

tomsn048@gmail.com

Exhaust Manifold

Cleaning

Remove all gasket or foreign material from all inlet and outlet sealing surfaces of the exhaust manifolds.

Inspection

Inspect the cylinder head joining flanges of the exhaust manifold (9430) for evidence of exhaust gas leaks.

Inspect the exhaust manifold for cracks, damaged gasket surfaces, or other damage that would make them unfit for further service. Warped or cracked exhaust manifolds must be replaced.

tomsn048@gmail.com

Flexplate Inspection — Automatic Transmission

NOTE: A visual inspection for damage is the only check required for flexplates. Do not use any specifications in flywheel inspections (i.e. run-out, flatness).

Inspect the flexplate and ring gear assembly for visual signs of damage (i.e. cracks, chipped or worn teeth). If damaged replace the flexplate and ring gear assembly.

tomsn048@gmail.com

Flywheel Inspection — Manual Transmission

With the flywheel installed on the crankshaft check the gear face run-out. Refer to flywheel specifications located in Section 08-00.

tomsn048@gmail.com

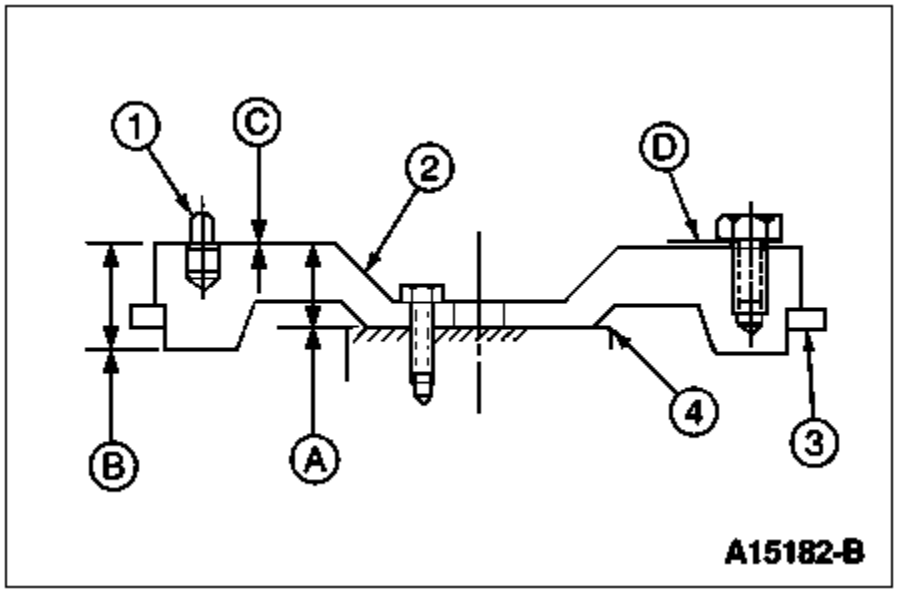
Flywheel Clutch Surface Machining

Inspect the flywheel (6375) for cracks, heat check, or other damage that would make it unfit for further use. Acceptable flywheels may be repaired by polishing with fine grade (400 grit) sandpaper. Flywheels may be resurfaced to remove scratches or grooves. After resurfacing, the flywheel thicknesses must not be less than the dimensions noted in the chart in Specifications portion of this section.

- Mount flywheel rigidly on crankshaft mounting flange.
- After machining:
  - Surface runout must not exceed 0.13mm (0.005 inch) TIR; surface finish must be in the range of 4.0/1.3 micrometer (160/52 microinch).
  - Major diameter of dowel pin (press-fit diameter) must not extend above the new surface.
  - The clutch pressure plate retaining bolts must screw into the flywheel under hand torque to within 1.50mm (0.06 inch) of new surface.
  - Flywheels with dimensions less than the charted dimensions must not be used; install new service flywheel.

Charts

Dimension "A" is the minimum acceptable dimension from the crankshaft mounting surface to the new resurfaced clutch face surface. Dimension "B" is a referenced minimum acceptable dimension for the overall width of the outer flange.



Item	Part Number	Description
1	—	Dowel Pin (Part of 6375)
2	6375	Flywheel
3	—	Ring Gear (Part of 6375)
4	6303	Crankshaft

tomsn048@gmail.com

A	—	Dimension A
B	—	Dimension B
C	—	Dowel Pin Height
D	—	Pressure Plate Bolt Height

tomsn048@gmail.com

SPECIFICATIONS

NOTE: For specific engine specifications, refer to Section 03-01A , Section 03-01B or Section 03-01C depending on which engine you are working on.

General Engine Specifications

Item	Dimension
Normal Engine Vacuum at Idle	-51 to -74 kPa (15-22 In-Hg)
Maximum Allowable Timing Chain Deflection (3.0L and 4.0L)	3.175mm (0.12 In.)
Cylinder Block Cylinder Head Deck Flatness — Maximum Variation	0.076mm (0.003 In.) over 152mm (6 In.) 0.152mm (0.006 In.) Overall
Cylinder Block Bearing Bore Alignment — Maximum Variation	0.076mm (0.003 In.) 0.051mm (0.002in) (5.0L)
Cylinder Block Flywheel Housing Flange Flatness Maximum Variation	0.076mm (0.003 In.)
Maximum Allowable Cylinder Bore Taper	0.127mm (0.005 In.)
Maximum Allowable Cylinder Bore Out-of-Round	0.127mm (0.005 In.)
Measuring Point for Piston Diameter — Below Oil Ring Groove	25.4mm (1.00 In.)
Required Oil Clearance — Crankshaft Journal to Main Bearing	Refer to Section 03-01A , Section 03-01B or Section 03-01C Depending on Engine.
Maximum Allowable Crankshaft Runout	0.05mm (0.002 In.)
Maximum Piston Clearance	0.076mm (0.003 In.) 0.0559mm (0.0022 In) (5.0L) 0.051mm (0.002 In) (2.3L)
Maximum Oil Pump Cover Flatness Variation	0.038mm (0.0015 In.)
Oil Pump Rotor Clearance	0.10mm (0.004 In.)
Minimum Engine Valve Margin	0.794mm (0.03 In)
Maximum Allowable Camshaft Runout	0.03mm (0.0012 In.)

Flywheel Dimensions

Flywheel Part Number	Dimension "A" mm (Inch)	Dimension "B" mm (Inch)
E3TZ-6375-A	25.95 (1.02)	28.45 (1.12)
E69Z-6375-B	28.18 (1.10)	28.85 (1.14)

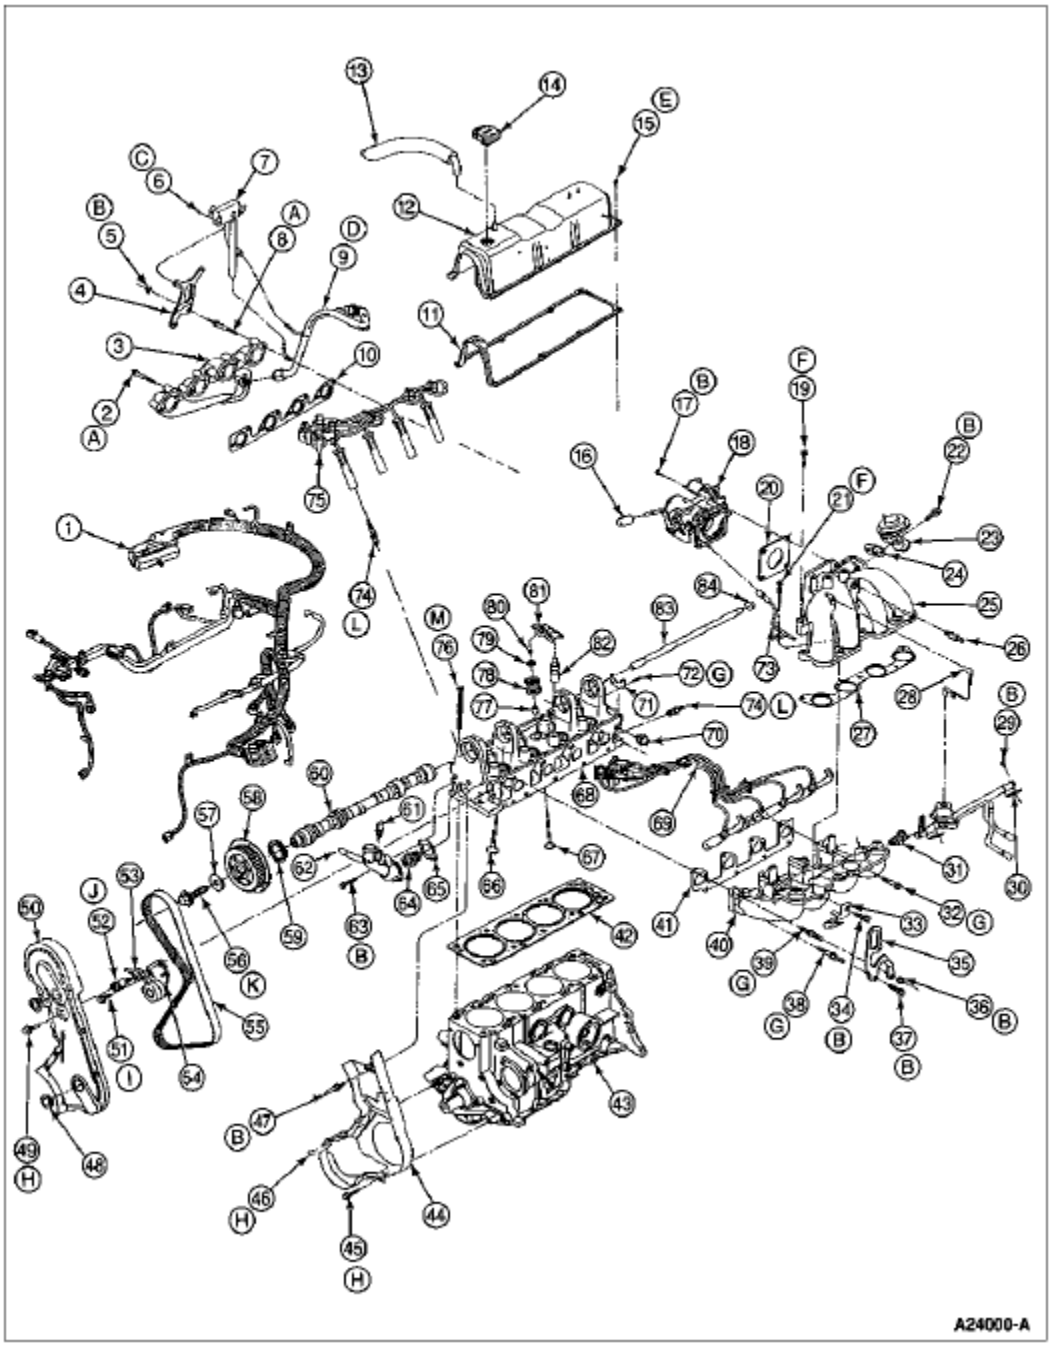
Engine Components

The views shown are typical and provide a reference for procedures. The numbers and part descriptions shown in the legends are basic part numbers corresponding with the Ford Master Parts Catalog.

2.3L OHC (Dual Plug) Engine Components, Top



tomsn048@gmail.com

Item	Part Number	Description
1	12A581	Engine Control Sensor Wiring
2	N806949-S100	Bolt, M10-1.5 x 59.1
3	9430	Exhaust Manifold
4	17A084	Engine Lifting Eye (Rear)
5	N620481-S2	Nut, M8-1.25
6	N807202-S36	Bolt, M5-0.8 x 16
7	9J433	EGR Transducer
8	N806948-S100	Stud, M10-1.5 x M8-1.25 x 89.6
9	9D477	EGR Valve to Exhaust Manifold Tube
10	9448	Exhaust Manifold Gasket
11	6584	Valve Cover Gasket
12	6582	Valve Cover
13	6853	Crankcase Ventilation Hose
14	6766	Oil Filler Cap
15	N805087-S2	Screw, M6-1 x 15
16	386800-S	Cap
17	N605788-S36	Bolt, M8-30
18	9E926	Throttle Body
19	N807462-S101	Bolt, M8-1.25 x 67.2
20	9E936	Throttle Body Gasket
21	N807461-S2	Bolt, M8-1.25 x 45 (5 Places)
22	N806781-S2	Bolt (Part of 9D475)
23	9D475	EGR Valve
24	9D476	EGR Valve Gasket
25	9425	Intake Manifold, Upper
26	9A474	Intake Manifold Vacuum Outlet Fitting and Cap
27	9H486	Intake Manifold Upper Gasket
28	9E498	Fuel Pressure Regulator Vacuum Tube
29	N807897-S100	Bolt, M8-1.25 x 31
30	9S441	Fuel Injection Supply Manifold

tomsn048@gmail.com

31	9F593	Fuel Injector
32	N807462-S101	Bolt, M8-1.25 x 67.2 (4 Places)
33	14A004	42-Pin Connector Bracket
34	N605904-S36	Bolt, M8-1.25 x 16.6
35	17A084	Engine Lifting Eye (Front)
36	N620481-S2	Nut, M8-1.25
37	N808162-S2	Bolt, M8-1.25 x 33
38	N807458-S101	Stud, M8-1.25 x 1.25 x 96.2
39	N808163-S100	Stud, M8-1.25 x 1.25 x 63.7
40	9424	Intake Manifold, Lower
41	9439	Intake Manifold Gasket
42	6051	Head Gasket
43	6010	Cylinder Blocks
44	6E005	Inner Timing Belt Cover
45	N804958-S8	Screw, M6-1 x 22.5
46	N621906-S2	Nut, M6-1
47	N808049-S102	Stud, M8-1.25 x 51
48	352284-S	Plug, Rubber 1-1/4 x 7/16 Inch
49	N808534-S2	Bolt, M6-1 x 17
50	6E011	Outer Timing Belt Cover
51	N800112-S100	Bolt, M8-1.25 x 20
52	6K282	Timing Belt Spring Bolt
53	6L273	Timing Belt Tension Spring
54	6K254	Belt Tensioner Assembly
55	6268	Timing Belt
56	N600414-S	Bolt, M12-1.75 x 45
57	6278	Camshaft Sprocket Washer
58	6256	Camshaft Sprocket
59	6700	Crankshaft Front Seal
60	6250	Camshaft
61	12A648	Engine Coolant Temperature Sensor

tomsn048@gmail.com

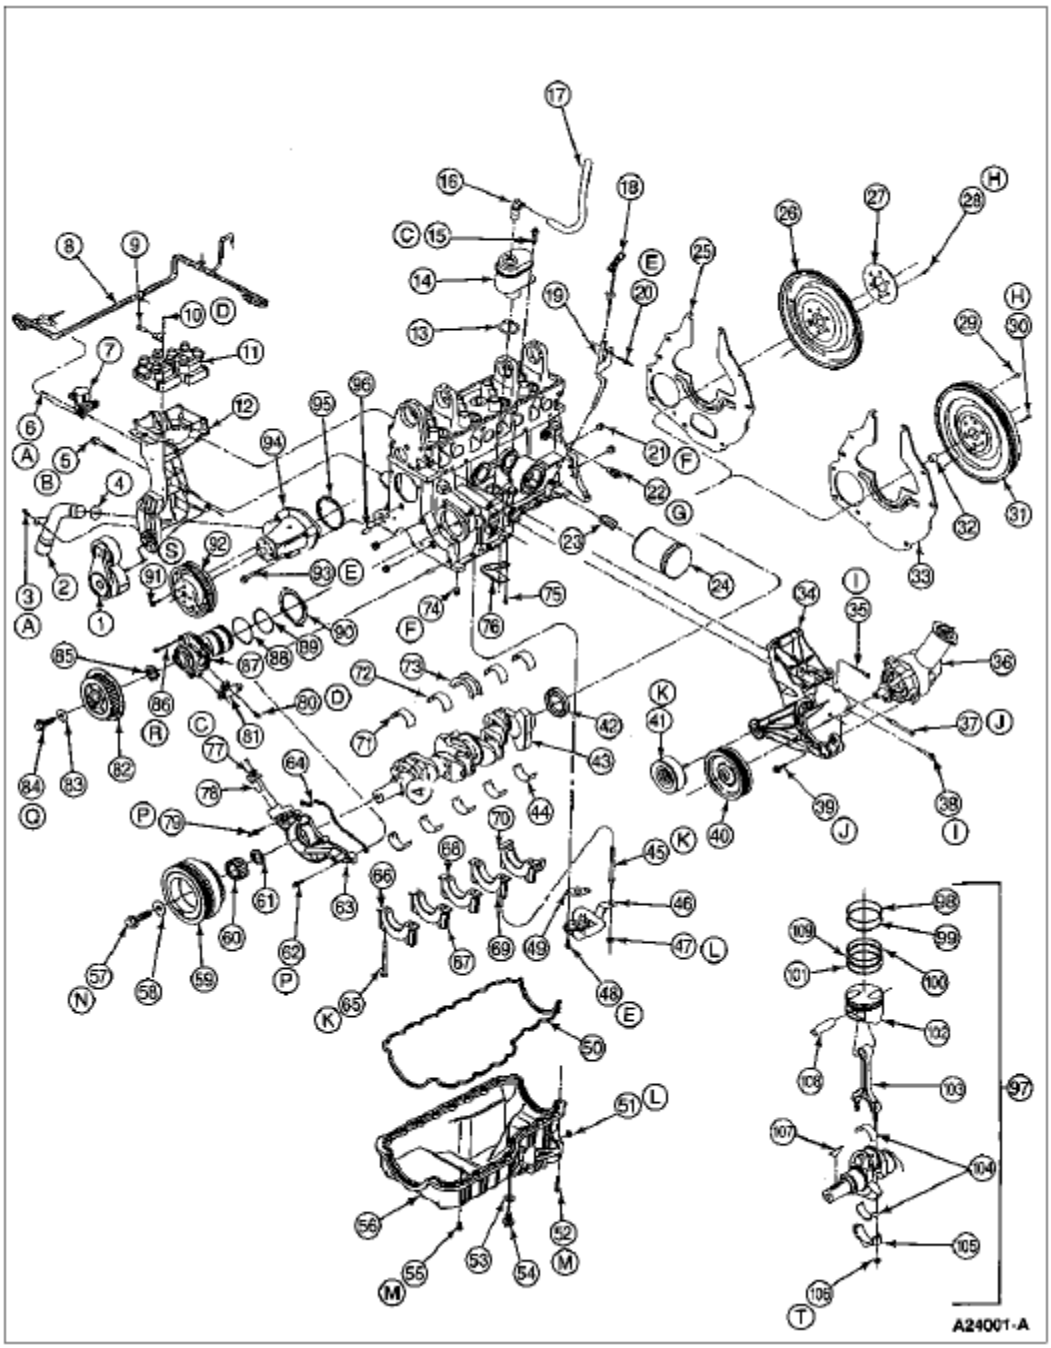
62	8594	Water Outlet Connection
63	N800025-S100	M8-1.25 x 18
64	8575	Water Thermostat
65	8255	Thermostat Gasket
66	6507	Intake Valve
67	6505	Exhaust Valve
68	6049	Cylinder Head
69	12281	Spark Plug Wire and Bracket Assembly (LH)
70	9278	Engine Oil Pressure Sender
71	6A222	Camshaft Retaining Plate
72	N604465-S	Screw, M6-1 x 16
73	9G271	Evaporative Emission Return Tube Assembly
74	12405	Spark Plug
75	12280	Spark Plug Wire and Bracket Assembly (RH)
76	N807013-S	Bolt, M12-1.75 x 100.7
77	6571	Valve Stem Seal
78	6513	Valve Spring
79	6514	Valve Spring Retainer
80	6518	Valve Spring Retainer Key
81	6529	Roller Finger Follower
82	6C501	Hydraulic Lash Adjuster
83	6B273	Camshaft Oil Flow Control Rod
84	376049-S36	Expansion Plug
A	—	Refer to Exhaust Manifold Installation in This Section for Tightening Instructions
B	—	Tighten to 20-30 Nm (15-22 Lb-Ft)
C	—	Tighten to 2.7-3.7 Nm (24-32 Lb-In)
D	—	Tighten Nut Both Ends to 34-47 Nm (25-35 Lb-Ft)
E	—	Tighten to 9-13 Nm (80-115 Lb-In)
F	—	Refer to Upper Intake Manifold Installation in This Section for Tightening Instructions
G	—	Refer to Lower Intake Manifold Installation in This Section for Tightening Instructions
H	—	Tighten to 8-12 Nm (70-106 Lb-In)
I	—	Tighten to 35-45 Nm (26-33 Lb-Ft)

tomsn048@gmail.com

		Refer to Timing Belt Installation in This Section
J	—	Tighten to 40-55 Nm (30-40 Lb-Ft) Refer to Timing Belt Installation in This Section
K	—	Tighten to 70-95 Nm (52-70 Lb-Ft)
L	—	Tighten to 9-20 Nm (79-177 Lb-In) Color Code: No. 1 and No. 2 Right-Hand and Left-Hand Green, No. 3 and No. 4 Right-Hand and Left-Hand White
M	—	Refer to Cylinder Head Installation in This Section for Tightening Instructions

2.3L OHC (Dual Plug) Engine Components, Bottom

tomsn048@gmail.com



Item	Part Number	Description
1	6B209	Drive Belt Tensioner
2	8290	Water Pump Inlet Tube
3	N606676-S2	Screw, M6-1 x 22.5
4	87056-S100	O-Ring
5	N606064-S309	Bolt, M10-1.5 x 60
6	N606676-S2	Screw, M6-1 x 20

tomsn048@gmail.com

7	9J459	EGR Vacuum Regulator Solenoid
8	9E498	Main Emission Vacuum Control Connector
9	18801	Radio Ignition Interference Capacitor
10	N606502-S36	Bolt, M5-0.8 x 37
11	12029	Ignition Coil
12	10153	Generator Mounting Bracket
13	87057-S94	O-Ring
14	6A785	Crankcase Vent Oil Separator
15	N805087-S2	Screw, M6-1 x 15
16	6A666	Positive Crankcase Ventilation Valve and Hose Assembly
17	6853	Crankcase Ventilation Hose
18	6750	Oil Level Dipstick
19	6754	Oil Level Indicator Tube
20	N807689-S2	Stud, M8-1.25 x M5-0.80 x 42.3
21	87838-S105	Pipe Plug, 3/8-18 x 3/8
22	10884	Water Temperature Indicator Sender Unit
23	6890	Oil Filter Mounting Insert
24	6714	Oil Filter
25	7007	Engine Rear Plate
26	6375	Flywheel
27	6A366	Flywheel Reinforcing Plate (Automatic Transmission)
28	N802741-S	Bolt, M10-1 x 20
29	7K578	Flywheel-to-Pressure Plate Dowel
30	N800028-S	Bolt, M10-1 x 30
31	6375	Flywheel (Manual Transmission)
32	7120	Pilot Bearing
33	7007	Engine Rear Plate (Manual Transmission)
34	2882	A/C Compressor Mounting Bracket
35	N606572-S309	Bolt, M10-1.5 x 123
36	3A674	Power Steering Pump
37	N606051-S309	Bolt, M8-1.25 x 100
38	N606068-S309	Bolt, M10-1.5 x 80
39	N800199-S309	Bolt, M10-1.5 x 33
40	3A733	Power Steering Pump Pulley
41	3F671	Power Steering Belt Idler Support

tomsn048@gmail.com

42	6701	Crankshaft Rear Oil Seal
43	6303	Crankshaft
44	6333	Crankshaft Main Bearing (Lower)
45	N803729-S	Stud, M10-1.5 x M12-1.75 x 108.5
46	6622	Oil Pump Cover Screen and Tube
47	N620482-S	Nut, M10-1.5
48	N605786-S2	Bolt, M8-1.25 x 20
49	6626	Oil Pump Inlet Tube Gasket
50	6710	Oil Pan Gasket
51	6C629	Oil Pan Spacer
52	N806379-S36	Bolt, M6-1 x 57.5
53	6734	Oil Pan Drain Plug Gasket
54	6730	Oil Pan Drain Plug
55	N806378-S36	M6-1 x 27.5
56	6675	Oil Pan
57	N805044-S2	Bolt, M14-1.5 x 55
58	6378	Crankshaft Pulley Retaining Washer
59	6312	Crankshaft Pulley
60	6306	Crankshaft Sprocket
61	6700	Crankshaft Front Seal
62	N807497-S2	Bolt, M6-1 x 37.5
63	6019	Engine Front Cover
64	6020	Engine Front Cover Gasket
65	N806835-S	M12-1.75 x 80
66	—	Front Main Bearing Cap (Part of 6010)
67	—	Front Intermediate Main Bearing Cap (Part of 6010)
68	—	Center Main Bearing Cap (Part of 6010)
69	—	Rear Intermediate Main Bearing Cup (Part of 6010)
70	—	Rear Main Bearing Cap (Part of 6010)
71	6333	Crankshaft Main Bearing (Upper No. 1, Color Code Blue)
72	6333	Crankshaft Main Bearing (Upper, 3 Places)
73	6337	Crankshaft Thrust Main Bearing
74	87338-S8	Pipe Plug, 3/8-18
75	N605890-S2	Bolt, M6-1 x 14
76	6A630	Cylinder Block Ventilation Baffle
77	N605892-S2	Bolt, M6-1 x 20
78	6C315	Crankshaft Position Sensor

tomsn048@gmail.com

79	N807288-S2	Stud, M6-1 x 1 x 61.9
80	N605880-S309B	Bolt, M5-0.8 x 20
81	6B288	Camshaft Position Sensor
82	6256	Oil Pump Sprocket
83	6278	Oil Pump Sprocket Washer
84	N600313-S2	Bolt, M10-1.5-40
85	6700	Oil Pump Front Seal
86	N606523-S2	Bolt, M6-1 x 47.5
87	6621	Oil Pump Assembly
88	87072-S100	O-Ring, Oil Pump Outlet/Vent
89	87071-S100	O-Ring, Oil Pump Inlet/Outlet
90	6659	Oil Pump to Cylinder Block Gasket
91	N806863-S2	Screw, M8-1.25 x 25
92	8509	Water Pump Pulley
93	N808517-S100	Bolt, M8-1.25 x 53
94	8501	Water Pump
95	8507	Water Pump Housing Gasket
96	N807419-S	Dowel
97	6100	Piston and Connecting Rod Assembly
98	6150	Upper Compression Ring
99	6152	Second Compression Piston Ring

101	6159	Oil Control Piston Ring
102	6110	Piston and Rod Assembly
103	6205	Connecting Rod
104	6211	Connecting Rod Bearings
105	6210	Connecting Rod Cap
106	N800113-S	Nut, M9-1
107	N806700-S	Woodruff Key
108	6135	Piston Pin
109	6161	Oil Control Ring Segment
A	—	Tighten to 8-12 Nm (70-106 Lb-In)
B	—	Refer to Generator Bracket Installation in Section 03-05
C	—	Tighten to 8-12 Nm (70-106 Lb-In)
D	—	Tighten to 5-7 Nm (45-61 Lb-In)

tomsn048@gmail.com

E	—	Tighten to 20-30 Nm (14-22 Lb-Ft)
F	—	Tighten to 31-38 Nm (23-28 Lb-Ft)
G	—	Tighten to 11-24 Nm (8-18 Lb-Ft)
H	—	Tighten to 73-87 Nm (54-64 Lb-Ft)
I	—	Tighten to 41-54 Nm (29-40 Lb-Ft)
J	—	Tighten to 22-28 Nm (16-20 Lb-Ft)
K	—	Refer to Crankshaft Installation in This Section
L	—	Select to Fit As Outlined Under Oil Pan Installation in This Section
M	—	Tighten to 13.5-18.5 Nm (120-163 Lb-In)
N	—	Tighten to 125-165 Nm (93-121 Lb-Ft)
P	—	Tighten to 13-16 Nm (115-144 Lb-In)
Q	—	Tighten to 40-55 Nm (29-40 Lb-Ft)
R	—	Tighten to 10-14 Nm (89-123 Lb-In)
S	—	Tighten to 20-55 Nm (15-18 Lb-Ft)
T	—	Tighten to 41-49 Nm (30-36 Lb-Ft)

tomsn048@gmail.com

Valve Cover and Gasket

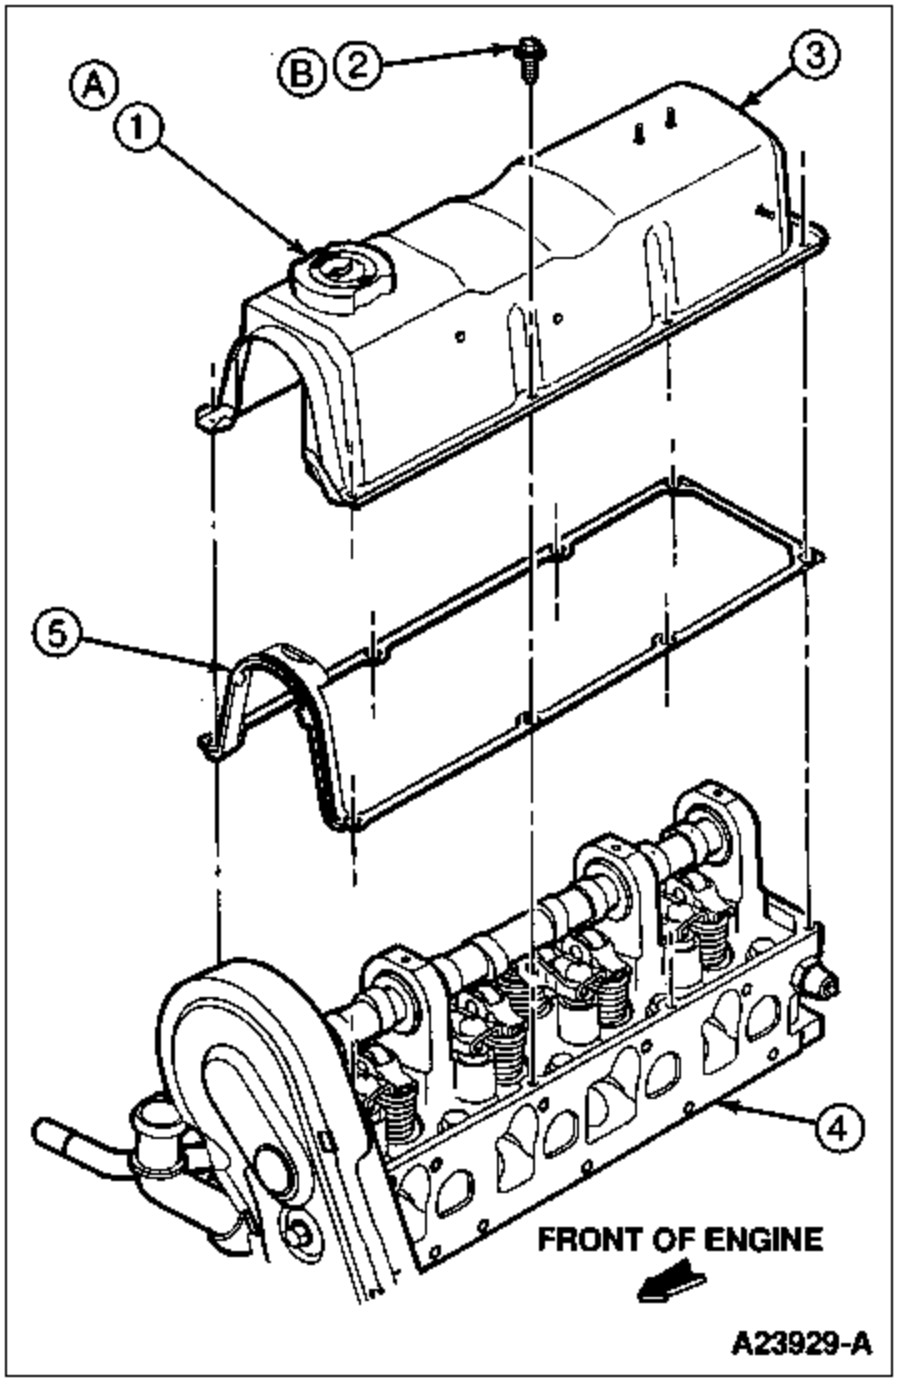
Removal

1. Disconnect intake air temperature sensor (IAT sensor) (12A697) and remove air cleaner outlet tube (9B659).
2. Remove accelerator control splash shield (9E766).
3. Remove throttle body. Refer to Section 03-04A for procedure.
4. Snap ignition cables out of ignition coil and place to the side.
5. Snap main emission vacuum control connector (9E498) and engine control sensor wiring (12A581) out of valve cover brackets.
6. Remove bolts and valve cover (6582).
7. Remove valve cover gasket (6584) from valve cover. If necessary, remove oil filler cap (6766).

Installation

1. Clean valve cover. Clean valve cover gasket surface on cylinder head (6049).
2. Put valve cover gasket in place on cylinder head.
3. Install valve cover. Alternately tighten bolts to 9-13 Nm (80-115 lb-in).
4. Snap engine wiring harness, vacuum harness and ignition cables back into place in brackets attached to valve cover.
5. Install throttle body as outlined in Section 03-04A .
6. Install accelerator control splash shield.
7. If removed, install oil filler cap.
8. Install air cleaner outlet tube and connect intake air temperature sensor.
9. Start engine (6007) and check for leaks.

tomsn048@gmail.com



Item	Part Number	Description
1	6766	Oil Filler Cap
2	N805087-S2	Screw, M6-1x15
3	6582	Valve Cover
4	6049	Cylinder Head
5	6584	Valve Cover Gasket
A	—	Tighten Until Ratchet Click Is Heard or Felt

tomsn048@gmail.com

B	—	Tighten to 9-13 Nm (80-115 Lb-In)

tomsn048@gmail.com

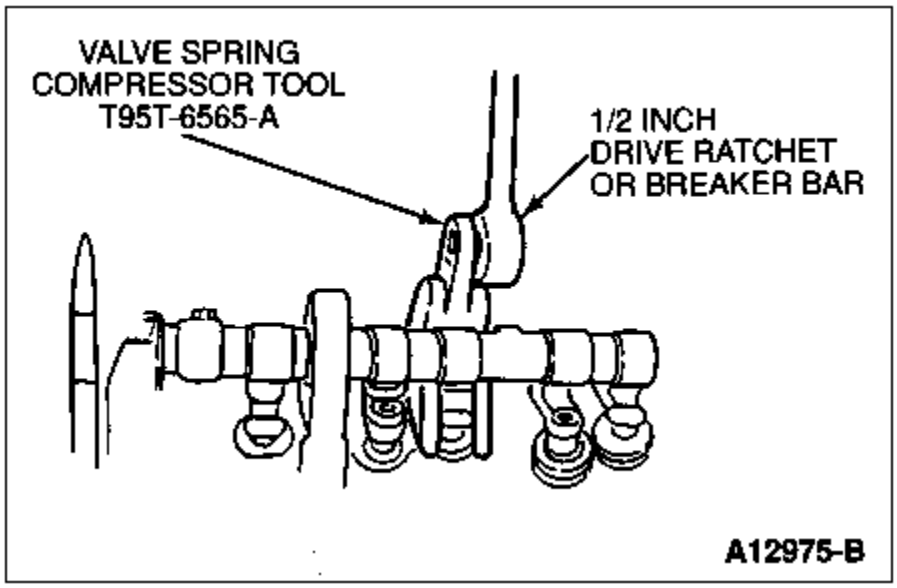
Camshaft Follower and Hydraulic Lash Adjuster

SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
Valve Spring Compressor	T95T-6565-A

Removal

1. Remove the valve cover as outlined in this section.
2. Rotate the camshaft (6250) so the rocker arm (6564) to be removed is on the heel of its cam.
3. Using Valve Spring Compressor T95T-6565-A, compress and hold down the valve and valve spring (6513). Slide out the roller finger follower over the lash adjuster.



4. Lift out the hydraulic lash adjuster.

Installation

1. Rotate camshaft so roller finger follower can be slid under heel of cam.
2. Lubricate contact points of roller finger follower with Ford Multi-Purpose Grease D0AZ-19584-AA or equivalent meeting Ford specification ESR-M1C159-AA.
3. If removed, place the lash adjuster in position in the bore.
4. Compress the valve spring using Valve Spring Compressor T95T-6565-A. Position the roller finger

tomsn048@gmail.com

follower over the hydraulic lash adjuster and the valve stem. Release valve spring.

5. **CAUTION: Make sure the hydraulic lash adjuster has been collapsed and released before rotating camshaft.**

   Using Valve Spring Compressor T88T-6565-BH, compress and release hydraulic lash adjuster.

6. Install valve cover (6582) as outlined in this section.

---

tomsn048@gmail.com

Valve Spring, Retainer and Valve Stem Seal

SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
Valve Spring Compressor	T95T-6565-A
Valve Stem Seal Replacer	T95T-6510-B

If the valve or valve seat has not been damaged, the valve spring (6513), valve stem seal (6571), valve spring retainer (6514) or valve spring retainer keys (6518) may be replaced by holding the affected valve against its seat using compressed air. Use an appropriate air line tool installed in the spark plug hole. A minimum of 965 kPa (140 psi) line pressure is required. If air pressure does not hold the valve shut, the valve is damaged or burned and the cylinder head (6049) must be removed and serviced. Refer to Section 03-00 .

Removal

1. Remove the valve cover (6582) as outlined in this section.
2. Rotate the camshaft (6250) so the roller finger follower for the valve to be serviced is on the heel of the cam.
3. Using Valve Spring Compressor T95T-6565-A, compress and hold down the valve spring. Slide out the roller finger follower over the lash adjuster.
4. Replace spark plug (12405) for cylinder being serviced with an air line adapter. Mark location so spark plug is returned to the same cylinder.
5. **CAUTION: The crankshaft may rotate when air pressure is applied. Remove all objects from fan area (lights, extension cords, etc).**

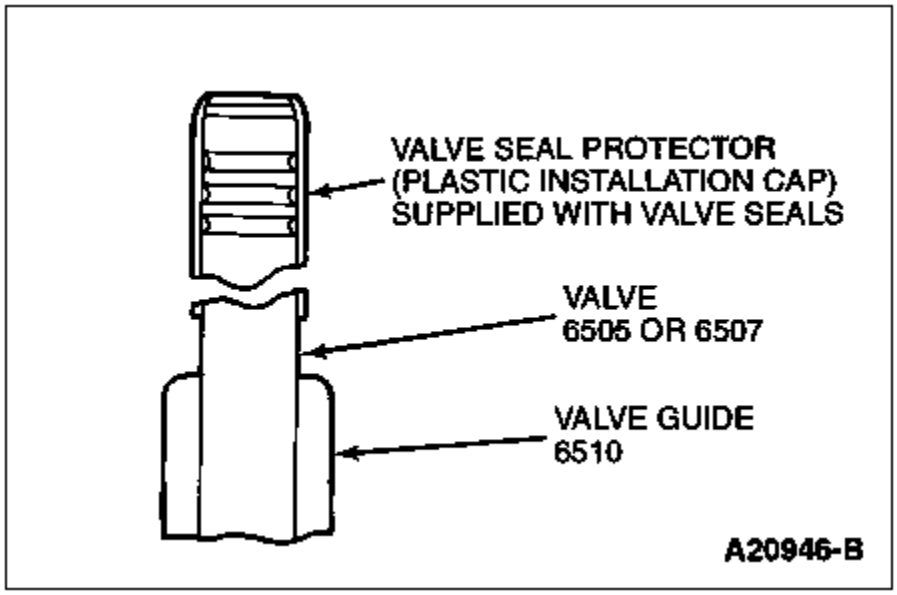
   Turn on air supply and pressurize cylinder. Air pressure may rotate the crankshaft until the piston (6108) reaches the bottom of the stroke.
6. Using Valve Spring Compressor T95T-6565-A compress the valve spring and remove the valve spring retainer keys, valve spring retainer. Remove and discard the stem seal.
7. If air pressure has forced the piston to the bottom of the cylinder, any removal of air pressure will allow the valve(s) to drop into the cylinder. Wrap a rubber band, tape or string around the end of the valve stem to prevent valve falling in and still allow enough travel to check the valve for binds.
8. Inspect the valve stem for damage. Rotate the valve and check the stem tip for eccentric movement. Move the valve up and down through normal travel in the valve guide (6510) and check the stem for any binding. If the valve has been damaged, it will be necessary to remove the cylinder head as outlined in this section and service. Refer to Section 03-00 .

Installation

tomsn048@gmail.com

1. **CAUTION: Install valve seal protector (plastic installation cap) included with valve seal kit over end of valve before installing valve stem seal or valve stem seal will be cut by valve retainer key grooves in valve. If valve stem seal is cut it will leak causing oil burning and valve fouling.**

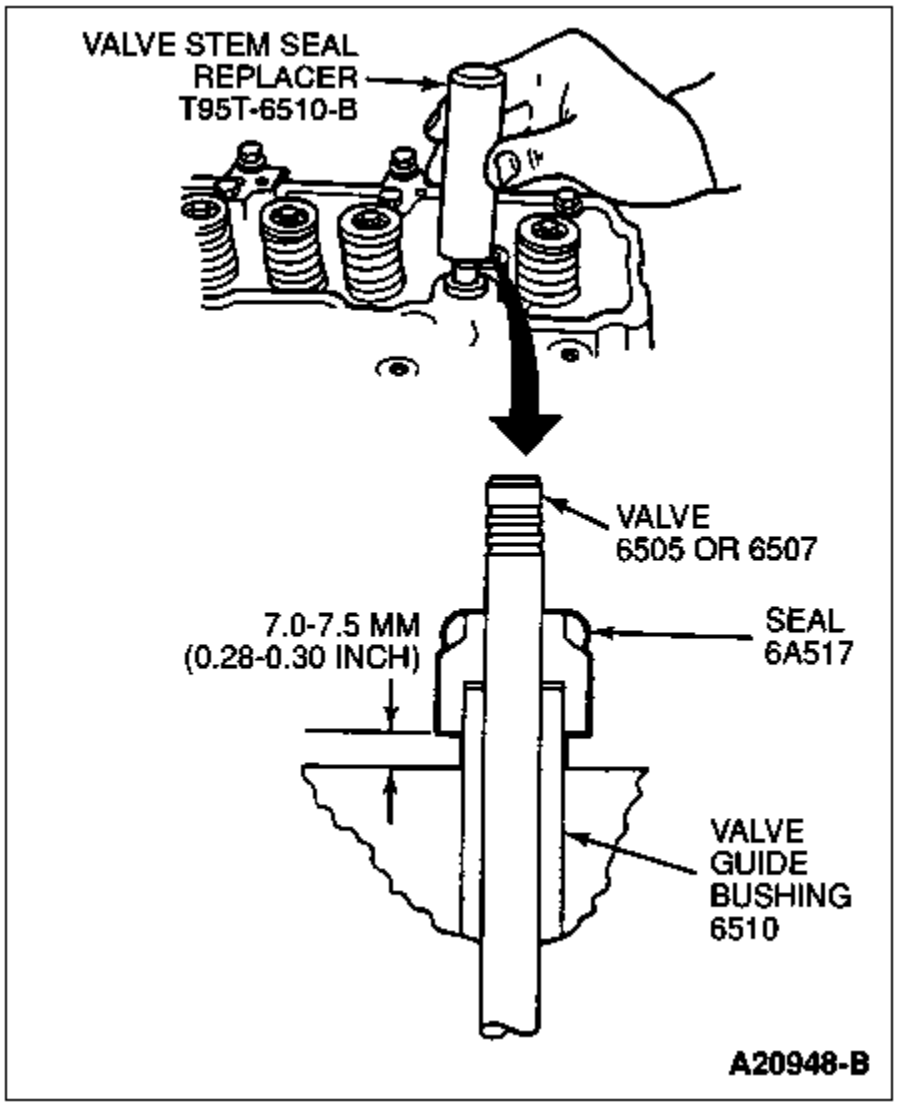
   Put valve seal protector (plastic installation cap) over end of valve as illustrated.



2. Start valve stem seal carefully over cap. Push valve stem seal down until jacket touches top of valve guide.

3. Remove seal protector (plastic cap). Use Valve Stem Seal Replacer T95T-6510-B to install valve stem seal on valve guide.

tomsn048@gmail.com



4. Apply a small amount of Ford Multi-Purpose Grease D0A2-19584-AA or equivalent meeting Ford specification ESR-M1C159-A to valve spring retainer key to hold in place during installation.

5. With cylinder pressurized, place valve spring and valve spring retainer into position.

6. Compress valve spring with Valve Spring Compressor T95T-6565-A and install valve spring retainer keys. Release spring to seat valve spring retainer keys in proper cylinder.

7. Release air pressure and remove air adapter. Install spark plug in proper cylinder.

8. Grease contact surfaces of roller finger follower with Ford Multi-Purpose Grease D0AZ-19584-AA or equivalent meeting Ford specification ESR-M1C159-A.

9. Using Valve Spring Compressor T95T-6565-A, compress and hold down the valve and spring. Slide the roller finger follower into place over valve and lash adjuster. Release spring.

10. Using Valve Spring Compressor T95T-6565-A, compress and release lash adjuster.

11. Install valve cover as outlined in this section.

tomsn048@gmail.com

tomsn048@gmail.com

Crankshaft Pulley and Damper

Removal

1. With vehicle in park if it has an automatic transmission, or reverse if it has a manual transmission, loosen crankshaft damper bolt.
2. Using flex handle, rotate drive belt tensioner (6B209) and remove drive belt (8620).
3. Remove crankshaft damper from crankshaft (6303).

Installation

1. Align keyway with key, install crankshaft damper on crankshaft, and snug crankshaft damper bolt.
2. Position drive belt and rotate drive belt tensioner away from drive belt.
3. Position drive belt under drive belt tensioner and release drive belt tensioner, tensioning drive belt.
4. Tighten crankshaft damper retaining bolt to 125-165 Nm (93-121 lb-in).

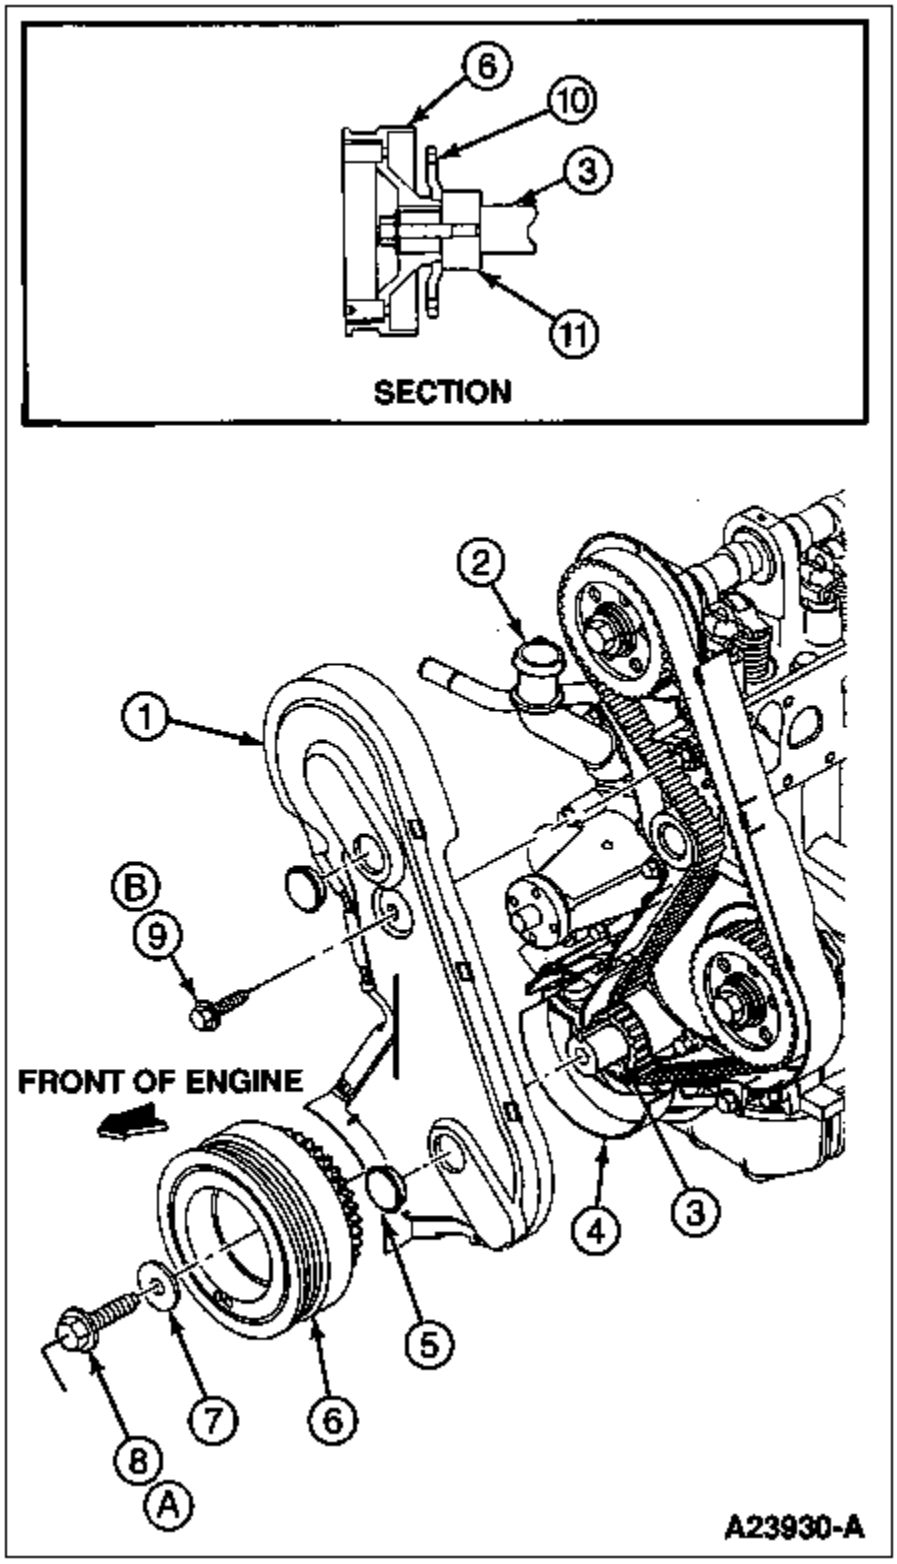
tomsn048@gmail.com

Camshaft Timing Belt Outer Cover

Removal

1. Remove two screws and fan guard (8A611). Remove two screws and fan shroud (8146) and set on fan blade (8600).
2. Remove four screws and fan. Take out fan shroud at the same time.
3. Loosen four fan clutch (8A616) and water pump pulley (8509)-to-water pump bolts.
4. Rotate drive belt tensioner (6B209) and remove drive belt (8620).
5. Remove four bolts, fan clutch, and water pump pulley.
6. Recover refrigerant from air conditioning system. Refer to Section 12-00 .
7. Remove four bolts and A/C compressor (19703) from A/C compressor mounting bracket (2882) and set aside with hoses attached.
8. Remove bolts and A/C compressor mounting bracket with attached power steering pump (3A674) and set aside with hoses attached.
9. Remove timing belt outer cover retaining screw.
10. Release seven cover interlocking tabs and remove outer timing belt cover.

tomsn048@gmail.com



Item	Part Number	Description
1	6E011	Outer Timing Belt Cover Assembly
2	8594	Water Outlet Connection

tomsn048@gmail.com

3	6303	Crankshaft
4	6E005	Inner Timing Belt Cover
5	N807419-S	Plug (Part of 6E011)
6	6312	Crankshaft Pulley
7	6378	Crankshaft Pulley Retaining Washer
8	N805044-S2	Bolt, M14-1.5 x 55
9	N808534-S2	Bolt, M6-1 x 17
10	—	Pulse Wheel (Part of 6312)
11	6306	Crankshaft Sprocket
A	—	Tighten to 125-165 Nm (93-121 Lb-Ft)
B	—	Tighten to 8-12 Nm (70-106 Lb-In)

Installation

1. Position outer timing belt cover and secure by snapping the seven interlocking tabs into place.
2. Install timing belt cover retaining screw and tighten to 8-12 Nm (70-106 lb-in).
3. Install A/C compressor mounting bracket with attached power steering pump. Tighten bolts to 21-28 Nm (16-20 lb-ft).
4. Install A/C compressor and tighten bolts to 21-28 Nm (16-20 lb-ft).
5. Install water pump pulley and fan clutch and tighten snug but not tight.
6. Install drive belt.
7. Using flex handle, rotate drive belt tensioner, position drive belt, and rest tensioner pulley on belt.
8. Tighten four fan clutch and pulley-to-water pump bolts to 17-23 Nm (13-16 lb-ft).
9. Position fan shroud over fan clutch shaft.
10. Install fan shroud and fan guard.

tomsn048@gmail.com

tomsn048@gmail.com

Camshaft Timing Belt Inner Cover

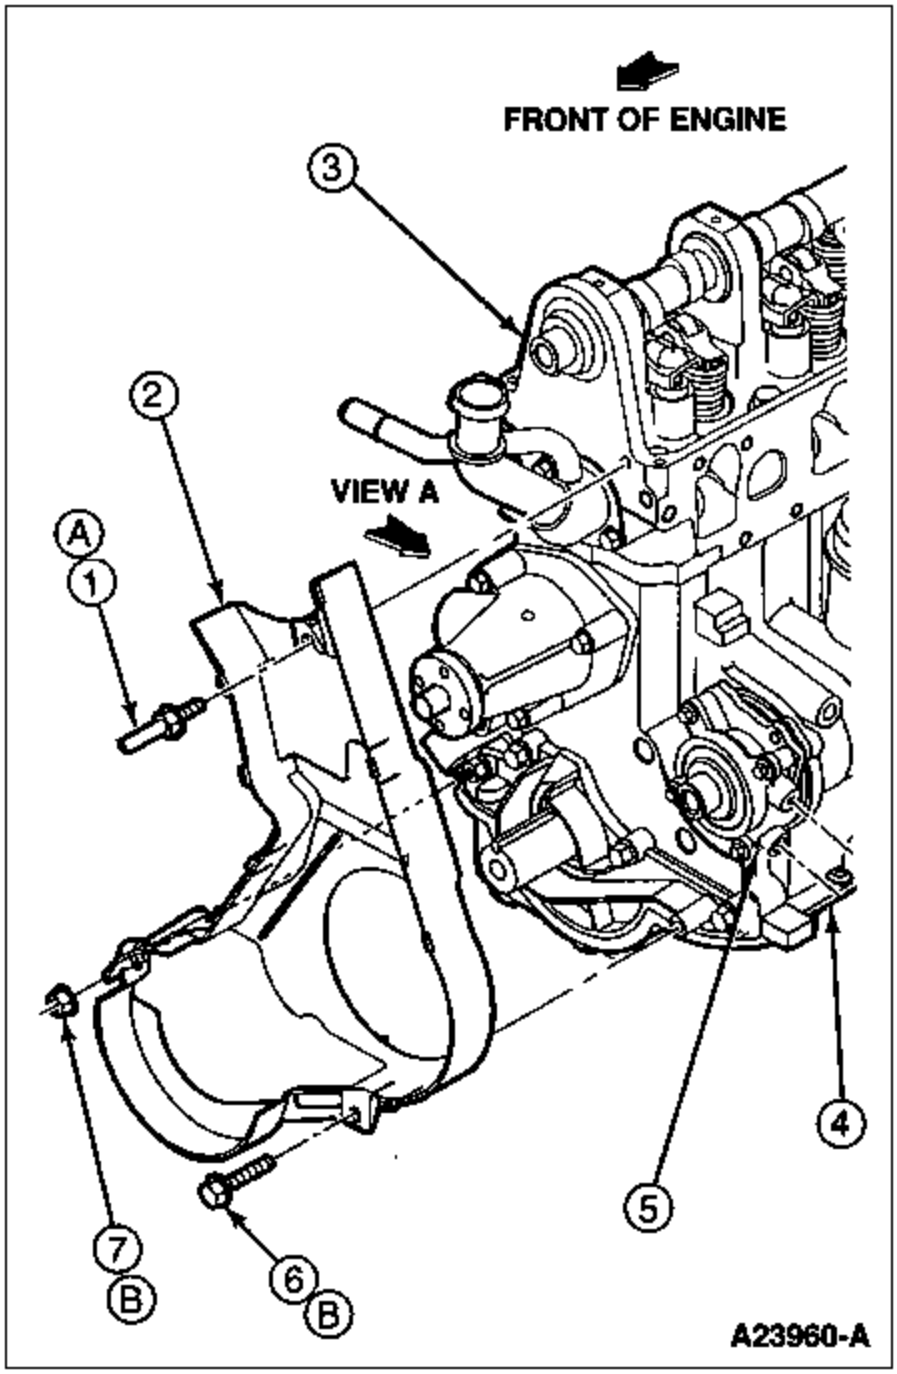
Removal

1. Remove timing belt as outlined in this section.
2. Remove timing belt tensioner as outlined in this section.
3. Remove oil pump sprocket as outlined in this section.
4. Remove screw and nut securing inner timing belt cover to cylinder block.
5. Loosen stud two or three turns.
6. Remove inner timing belt cover.

Installation

1. Position inner timing belt cover on front of engine (6007) and stud.
2. Install nut and bolt and tighten to 8-12 Nm (70-106 lb-in).
3. Tighten stud to 20-30 Nm (14-22 lb-ft).
4. Install oil pump sprocket as outlined in this section.
5. Install timing belt tensioner as outlined in this section. Tighten M8 bolt to 21-28 Nm (16-20 lb-ft) and M10 bolts (3) to 40-55 Nm (30-40 lb-ft).
6. Install timing belt as outlined in this section.

tomsn048@gmail.com



Item	Part Number	Description
1	N808049-S102	Stud, M8-1.25 x 51
2	6E005	Inner Timing Belt Cover

Camshaft Timing Belt

SPECIAL SERVICE TOOL(S) REQUIRED

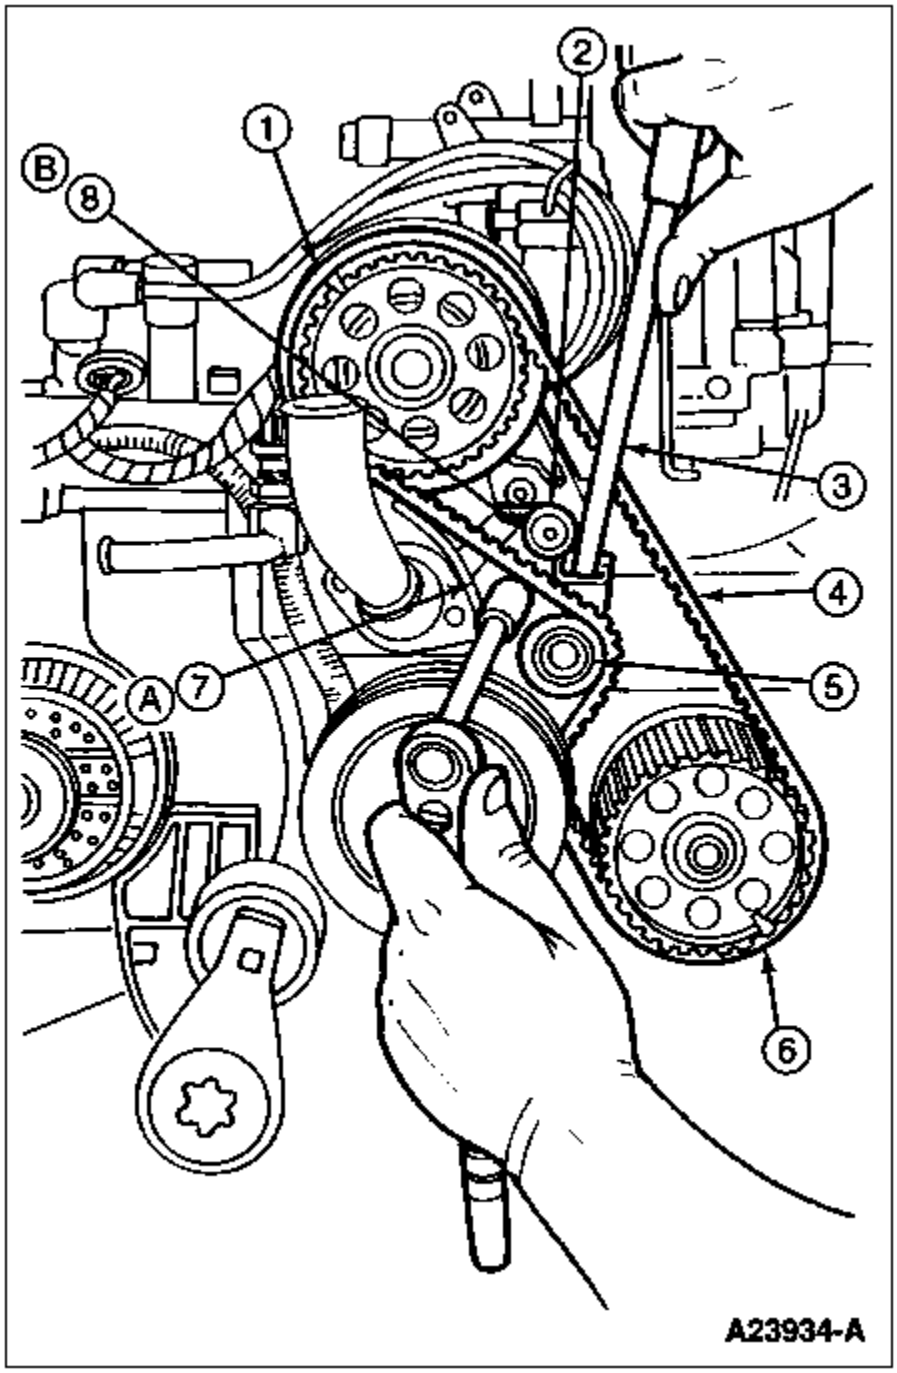
Description	Tool Number
Camshaft Belt Tension Adjusting Tool	T74P-6254-A

Removal

1. Remove spark plugs (12405).
2. Align crankshaft (6303) so number one piston is at TDC (top dead center) as indicated by timing marks. Refer to illustration.
3. Remove outer timing belt cover as outlined in this section.
4. **CAUTION: If you attempt to remove timing belt or adjust tension without loosening both timing belt tensioner adjusting bolt and spring pivot bolt, you will break Camshaft Belt Tension Adjusting Tool T74P-6254-A when you attempt to relieve tension on belt.**

   Loosen timing belt spring pivot bolt. Do not remove.
5. Hold tensioner with Camshaft Belt Tension Adjusting Tool T74P-6254-A.

tomsn048@gmail.com



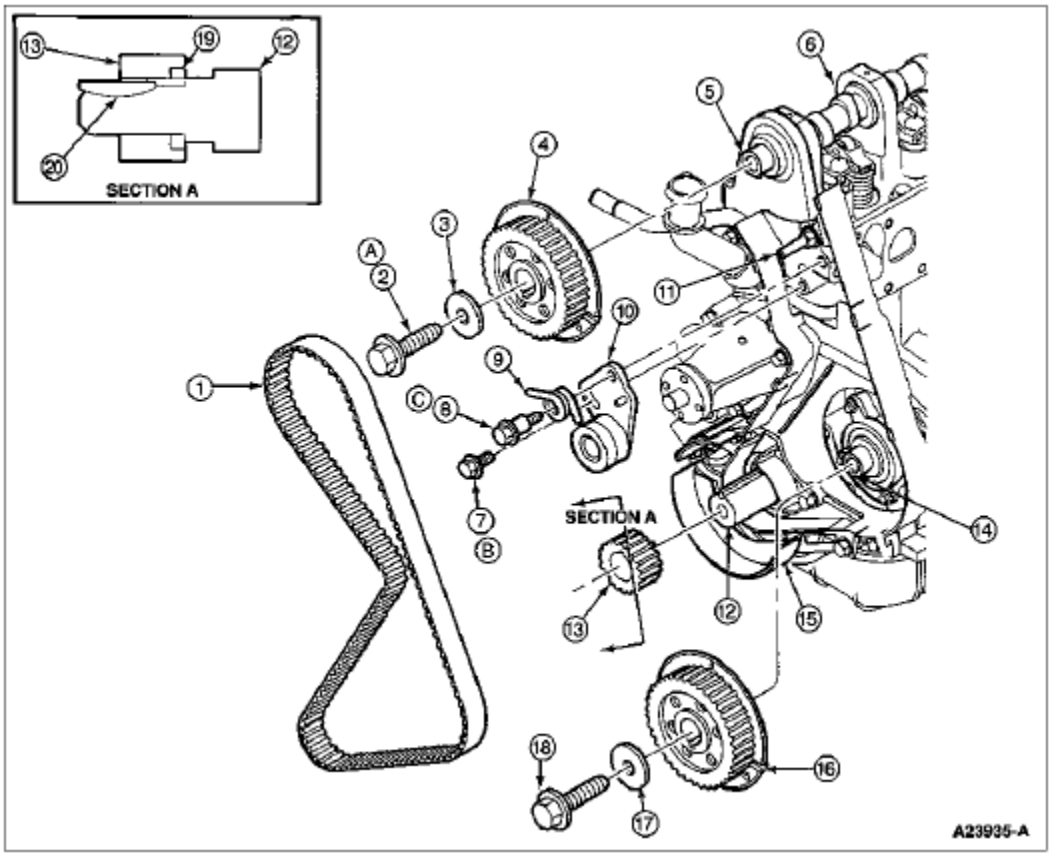
Item	Part Number	Description
1	6256	Camshaft Sprocket (Timing Mark)
2	6L273	Timing Belt Tensioner Spring
3	T74P-6254-A	Camshaft Belt Tension Adjusting Tool
4	6268	Timing Belt
5	6K254	Timing Belt Tensioner
6	6256	Oil Pump Sprocket

tomsn048@gmail.com

		(Timing Mark)
7	N800112-S100	Tensioner Adjusting Bolt, M8-1.25 x 20 (Under Wrench)
8	6K282	Timing Belt Tensioner (Spring Pivot) Bolt
A	—	Tighten to 35-45 Nm (26-33 Lb-Ft)
B	—	Tighten to 40-55 Nm (30-40 Lb-Ft)

6. While holding tensioner, loosen adjusting bolt and gradually release spring tension.
7. Using adjusting tool, rotate tensioner, against spring pressure, as far clockwise as possible. While holding, tighten adjusting bolt to hold tensioner away from belt.
8. Remove timing belt.

Camshaft Timing Belt, 2.3L I-4



Item	Part Number	Description
1	6268	Timing Belt

tomsn048@gmail.com

13	6306	Crankshaft Sprocket
14	6600	Oil Pump
15	6E005	Inner Timing Belt Cover
16	6256	Oil Pump Sprocket
17	—	Washer (Part of N600313-S2)
18	N600313-S2	Bolt, M10-1.5 x 40
19	—	Recess (Part of 6306)
20	—	Crankshaft Keyway
A	—	Tighten to 70-95 Nm (51-70 Lb-Ft) (See Text)
B	—	Tighten to 35-45 Nm (25-33 Lb-Ft) (See Text)
C	—	Tighten to 40-55 Nm (30-40 Lb-Ft) (See Text)

Installation

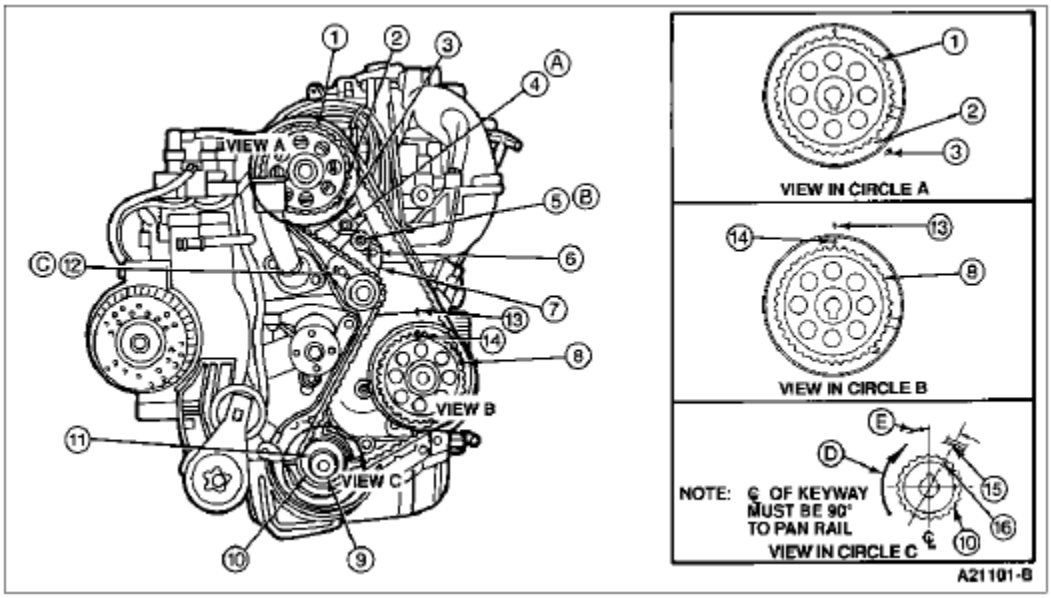
NOTE: Care must be taken during timing belt installation to prevent damage to the inner timing cover.

1. If not done:
    a. Loosen tensioner adjusting bolt.
    b. Using Camshaft Belt Tension Adjusting Tool T74P-6254-A, pry tensioner clockwise against spring tension as far as possible.
    c. Tighten adjusting bolt to hold tensioner in released position.
2. Align crankshaft so number one piston is at TDC (top dead center) with crankshaft key pointing straight up and circle on crankshaft sprocket (6306) aligned with notch in engine front cover (6019).
3. Align triangle on camshaft sprocket with triangle on inner timing belt cover.

tomsn048@gmail.com

4. Align diamond on oil pump sprocket with diamond on inner timing belt cover.

Timing Mark Alignment



Item	Part Number	Description
1	6256	Camshaft Sprocket
2	—	Pointer Triangle (Part of Camshaft Sprocket)
3	—	Pointer Triangle (on Inner Timing Belt Cover)
4	N801658-S	Stud, M8 x 1.25
5	6K282	Spring Pivot Bolt
6	—	Stud (Part of 6K254)
7	6K254	Timing Belt Tensioner
8	6256	Oil Pump Sprocket
9	6303	Crankshaft
10	6306	Crankshaft Sprocket
11	N806700-S	Key
12	N800112-S2	Adjusting Bolt, M8-1.25 x 20
13	—	Pointer Diamond (on Inner Timing Belt Cover)
14	—	Pointer Diamond (on Oil Pump Sprocket)
15	—	Pointer Line (Part of 6019)

tomsn048@gmail.com

16	—	Pointer Circle (on 6306)
A	—	Tighten to 20-30 Nm (15-22 Lb-Ft) (See Text)
B	—	Tighten to 40-55 Nm (30-40 Lb-Ft) (See Text)
C	—	Tighten to 35-45 Nm (26-33 Lb-Ft) (See Text)
D	—	Direction of Rotation
E	—	29°

5. Install timing belt over crankshaft sprocket. Then, proceeding counterclockwise, over oil pump sprocket and camshaft sprocket.

6. Loosen tensioner adjusting bolt allowing tensioner pulley to press against timing belt.

7. **NOTE: When performing the following step, do not rotate crankshaft counterclockwise as timing belt may jump a cog, putting camshaft or camshaft position sensor on oil pump out of time.**

   Rotate crankshaft two revolutions clockwise.

8. Bring crankshaft slowly, without stopping, to number one cylinder firing position (keyway directly up).

9. Recheck timing mark alignment. Repeat steps if timing marks are not properly aligned.

10. Rotate tensioner assembly against belt with torque wrench up to 41-45 Nm (30-33 lb-ft) and tighten adjusting bolt.

11. Tighten adjusting bolt to 35-45 Nm (26-33 lb-ft).

12. Tighten spring pivot bolt to 40-55 Nm (30-40 lb-ft).

13. Install outer timing belt cover as outlined in this section.

---

tomsn048@gmail.com

tomsn048@gmail.com

Camshaft and Oil Pump Sprocket

NOTE: Removal and installation steps are the same for both camshaft and oil pump (6600) sprockets.

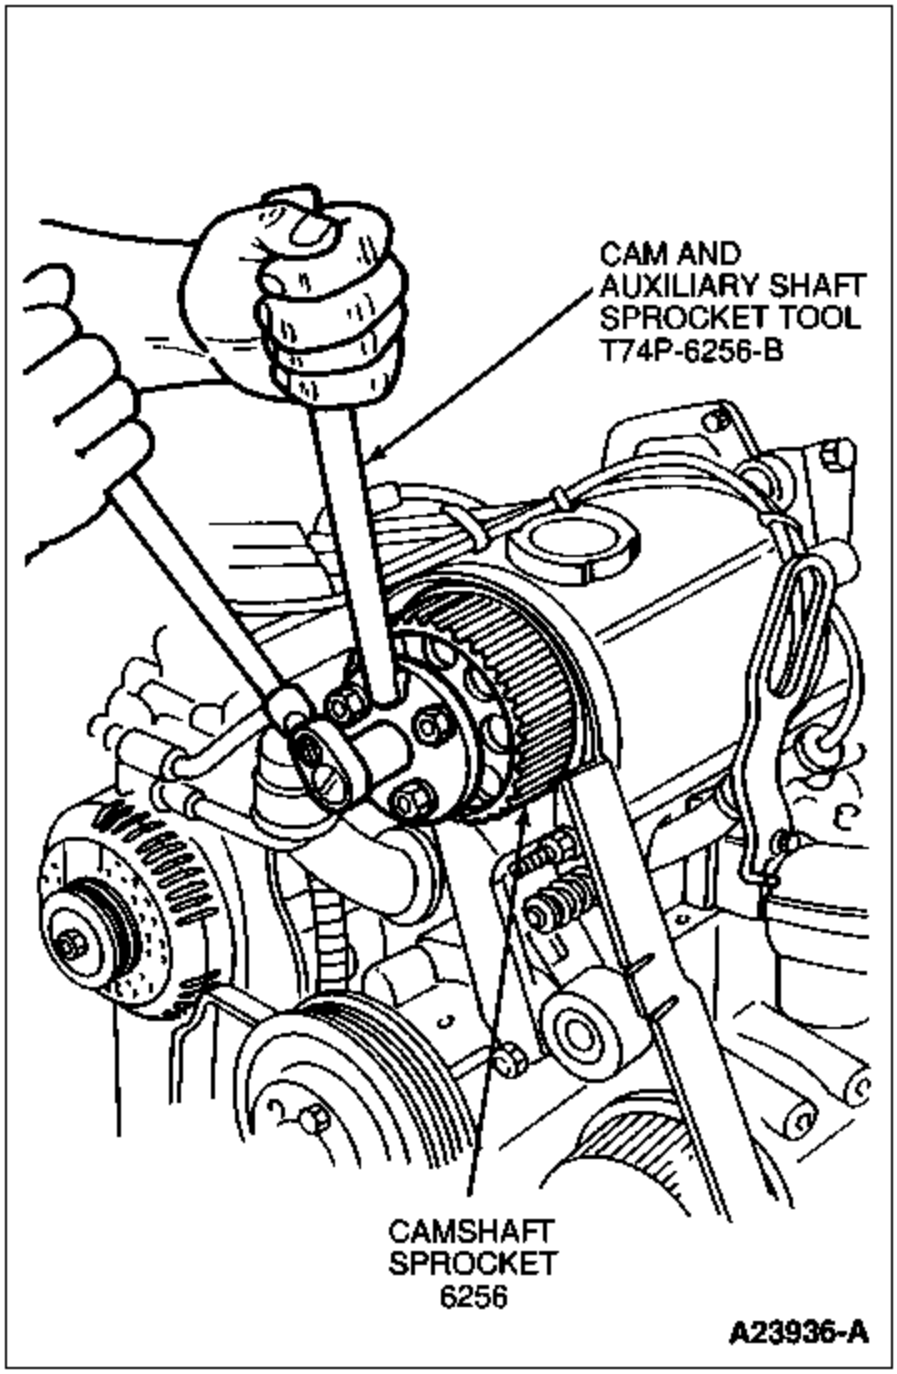
SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
Cam Sprocket Holding/Removing Tool	T74P-6256-B

Removal

1. Remove outer timing belt cover as outlined in this section.
2. Remove timing belt as outlined in this section.
3. Install Cam Sprocket Holding/Removing Tool T74P-6256-B on sprocket. Use tool to hold sprocket and remove bolt and washer.

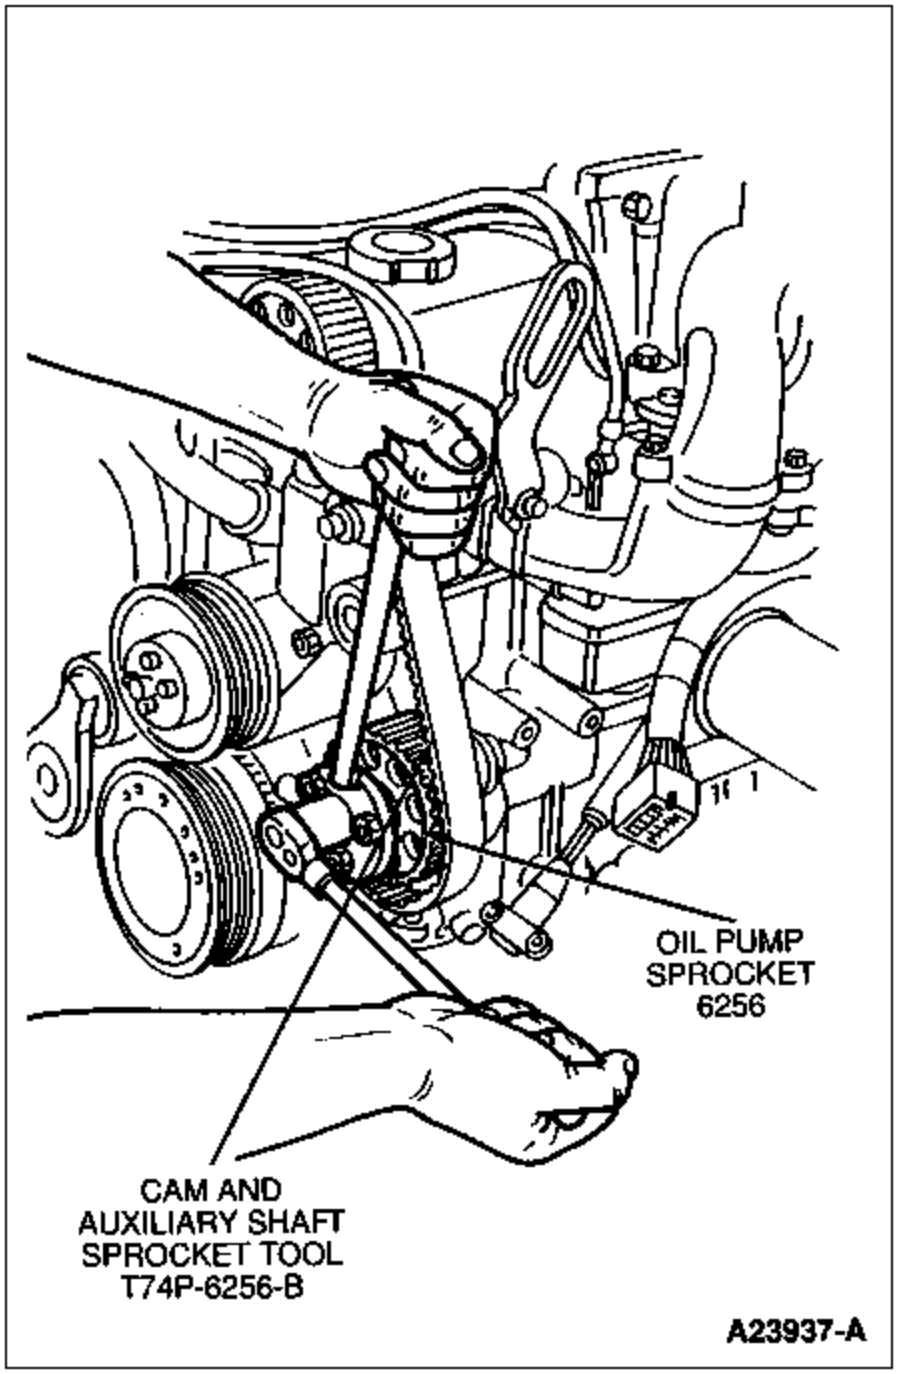
tomsn048@gmail.com



4. Install threaded puller insert in Cam Sprocket Holding/Removing Tool T74P-6256-B and remove sprocket.

5. Remove tool from sprocket.

tomsn048@gmail.com



Installation

1. Position key and sprocket on shaft.
2. Install Cam Sprocket Holding/Removing Tool T74P-6256-B, without threaded puller insert, on sprocket.
3. Install sprocket bolt and washer and tighten to 70-95 Nm (52-70 lb-ft).
4. Remove tool.

tomsn048@gmail.com

5. Install timing belt as outlined in this section.
6. Install outer timing belt cover as outlined in this section.

---

tomsn048@gmail.com

Crankshaft Sprocket

Removal

1. Remove outer timing belt cover as outlined in this section.
2. Remove crankshaft damper and crankshaft pulley retaining washer (6378).
3. Remove crankshaft damper.
4. Remove timing belt as outlined in this section.
5. Remove crankshaft sprocket (6306).

Installation

1. Install crankshaft sprocket.
2. Install timing belt as outlined in this section.
3. Install outer timing belt cover as outlined in this section.
4. Install crankshaft pulley (6312), washer, and bolt. Tighten bolt to 125-165 Nm (92-121 lb-ft).

tomsn048@gmail.com

Timing Belt Tensioner

SPECIAL SERVICE TOOL(S) REQUIRED

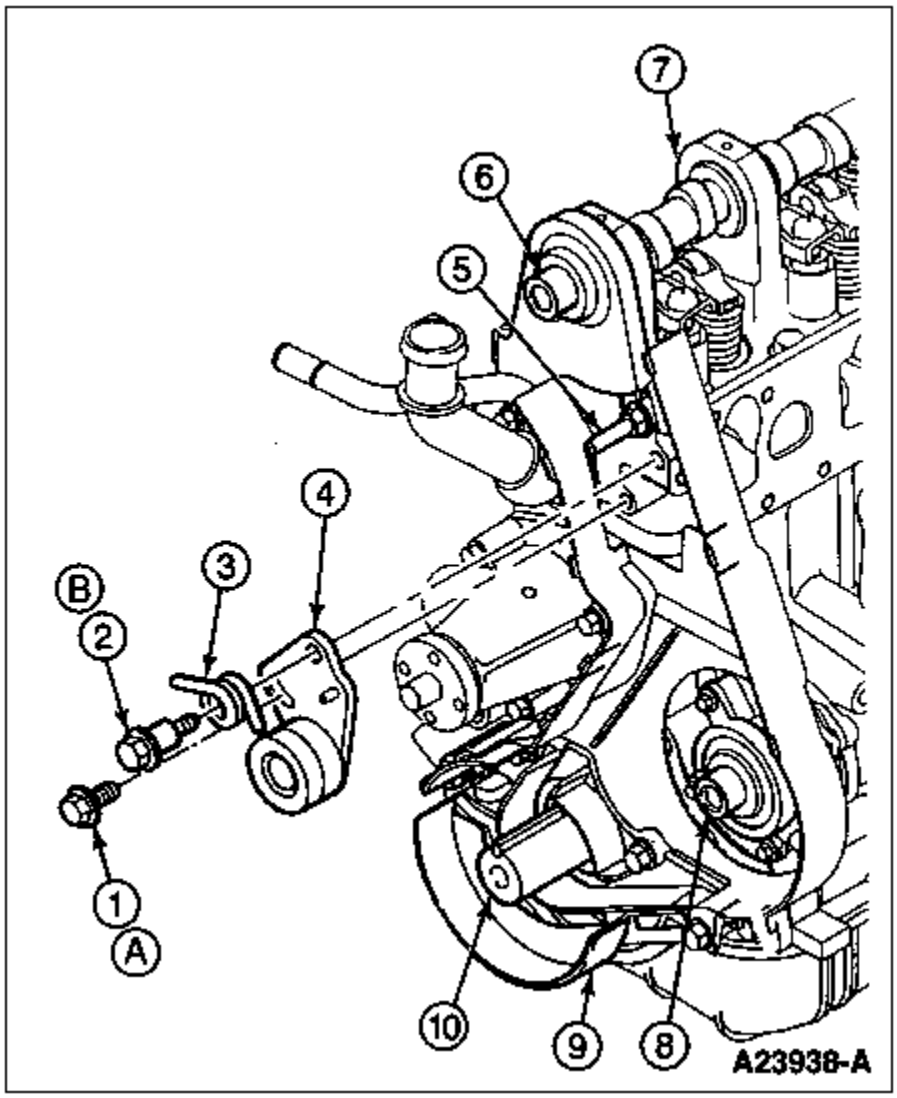
Description	Tool Number
Belt Tension Adjusting Tool	T74P-6254-A
Camshaft Belt Tensioner Tool	T74P-6256-B

Removal

1. Remove outer timing belt cover as outlined in this section.
2. Remove timing belt as outlined in this section.
3. **NOTE: Belt tensioner assembly is under spring tension.**

   Hold tensioner by prying against spring pressure with Belt Tensioner Adjusting Tool T74P-6254-A. Remove adjustment bolt (which goes through slot in base of tensioner).
4. Release pressure.
5. Remove spring pivot bolt, spring, and tensioner assembly.

tomsn048@gmail.com



Item	Part Number	Description
1	N80012-S100	Bolt, M8-1.25 x 20
2	6K282	Timing Belt Tensioner Bolt
3	6L273	Timing Belt Tensioner Spring
4	6K254	Belt Tensioner Assembly
5	—	Stud (Part of 6049)
6	6250	Camshaft
7	6049	Cylinder Head
8	6600	Oil Pump
9	6E005	Inner Timing Belt Cover
10	6303	Crankshaft
A	—	Tighten to 35-45 Nm (26-33 Lb-Ft) (See Text)
B	—	Tighten to 40-55 Nm

tomsn048@gmail.com

		(30-40 Lb-Ft) (See Text)

Installation

1. Install belt tensioner and timing belt tensioner spring on cylinder head placing one leg of spring under stud on cylinder head (6049) and other leg against pin on tensioner and install spring pivot bolt loosely.

2. Using Camshaft Belt Tensioner Tool T74P-6256-B, rotate tensioner clockwise against spring tension as far as possible and install adjustment bolt and tighten to restrain tensioner.

3. **NOTE: Spring pivot bolt is to be tightened after timing belt is installed. Adjusting bolt is tightened as part of timing belt installation.**

   Install timing belt as outlined in this section.

4. After installing timing belt, tighten spring pivot bolt to 40-55 Nm (30-40 lb-ft).

5. Install outer timing belt cover as outlined in this section.

tomsn048@gmail.com

Camshaft

SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
Valve Spring Compressor	T95T-6565-A
Cam Sprocket Holding/Removing Tool	T74P-6256-B
Front Seals Replacer	T74P-6150-A
Front Cover Seal Remover	T74P-6700-B

NOTE: Front of engine must be raised for this operation.

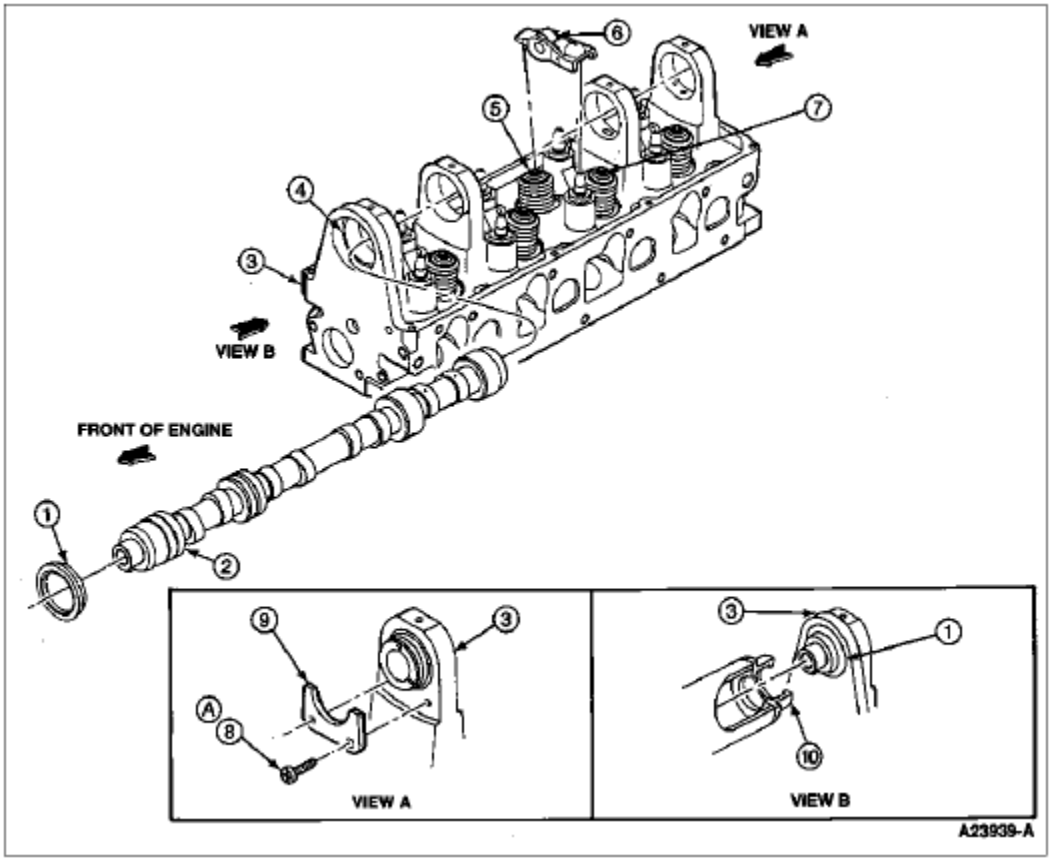
Removal

1. Remove outer timing belt cover as outlined in this section.
2. Remove valve cover (6582) as outlined in this section.
3. Rotate the camshaft (6250) so the rocker arm (6564) is on the heel of its cam.
4. Using Valve Spring Compressor T95T-6565-A compress valve springs (6513) and remove all roller finger followers.
5. Remove camshaft sprocket using Cam Sprocket Holding/Removing Tool T74P-6256-B.
6. Remove camshaft seal using Front Cover Seal Remover T74P-6700-B.
7. Remove camshaft retainer plate (two screws).
8. **CAUTION: Be careful to avoid damaging journals and lobes.**

   Remove camshaft.

Camshaft Installation, 2.3L

tomsn048@gmail.com



Item	Part Number	Description
1	6700	Camshaft Front Seal
2	6250	Camshaft
3	6049	Cylinder Head
4	6261	Camshaft Bearing
5	6505	Exhaust Valve
6	6564	Rocker Arm
7	6507	Intake Valve
8	N604465-S	Pan Head Screw, M6-1 x 16
9	6A222	Camshaft Retaining Plate
10	T74P-6150-A	Cam and Auxiliary Shaft Seal Replacer
A	—	Tighten to 8-12 Nm (71-106 Lb-In)

Installation

1. Coat the camshaft lobes with Ford Multi-Purpose Grease D0AZ-19584-AA or equivalent meeting Ford specification ESR-M1C159-A and lubricate the journals with heavy oil SF before installation. Carefully slide the camshaft through the camshaft bearings (6261).

tomsn048@gmail.com

2. Install camshaft retaining plate. Tighten screws to 8-12 Nm (6-9 lb-ft).
3. Install camshaft front seal using Front Seals Replacer T74P-6150-A.
4. Install camshaft sprocket to camshaft.
5. Install retaining bolt using Cam Sprocket Holding/Removing Tool T74P-6256-B to hold sprocket. Tighten to 70-95 Nm (52-70 lb-ft).
6. Install timing belt as outlined in this section.
7. Install outer timing belt cover as outlined in this section.
8. Using Valve Spring Compressor T95T-6565-A compress valve spring and install followers.
9. Using Valve Spring Compressor T95T-6565-A, compress and release valve tappet.
10. Install valve cover as outlined in this section.
11. Start engine (6007) and check for leaks.

---

tomsn048@gmail.com

Camshaft and Oil Pump Oil Seal

NOTE: The camshaft and oil pump shaft seals are each replaced in the same manner with the same tools after the respective sprocket has been removed.

NOTE: Always use a new attaching bolt when replacing the camshaft sprocket or use Teflon® or equivalent sealing tape on the threads of the old bolt.

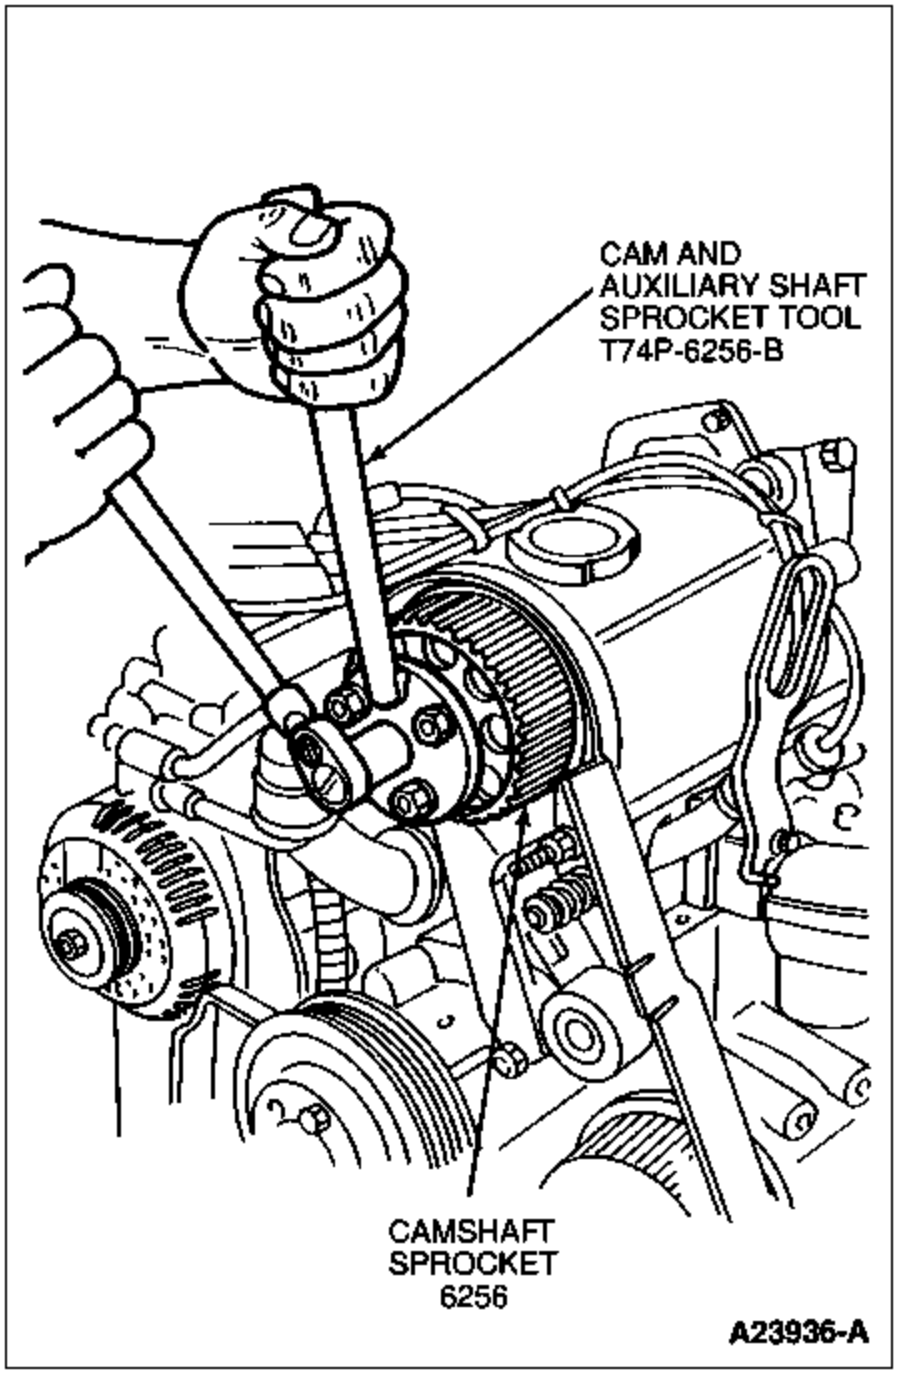
SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
Cam Sprocket Holding/Removing Tool	T74P-6256-B
Front Cover Seal Remover	T74P-6700-B
Front Seals Replacer	T74P-6850-A

Removal

1. Remove outer timing belt cover as outlined in this section.
2. Remove timing belt as outlined in this section.
3. Install Cam Sprocket Holding/Removing Tool T74P-6256-B on sprocket and use tool to hold sprocket and remove bolt and washer.

tomsn048@gmail.com



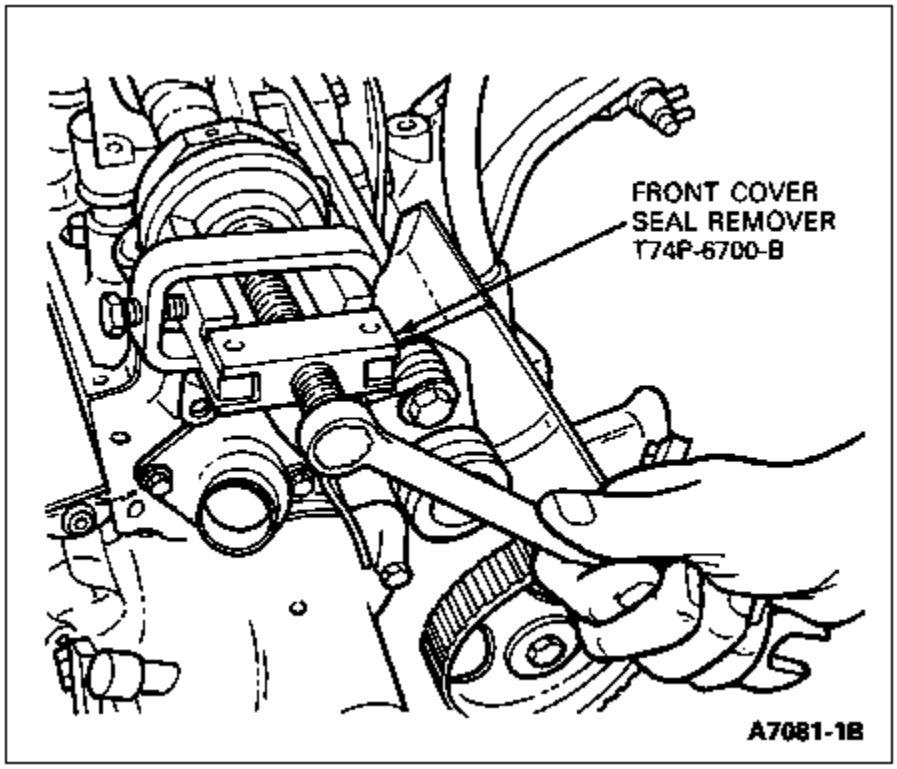
4. Install threaded puller insert in Cam Sprocket Holding/Removing Tool T74P-6256-B and pull sprocket.

5. **NOTE: When positioning Front Cover Seal Remover T74P-6700-B, make sure the jaws are gripping the thin edge of the seal very tightly before operating the jack screw portion of the tool.**

   Install Front Cover Seal Remover T74P-6700-B, making sure jaws are tightly gripping the thin edge of the seal. Clean journal of debris.

6. Remove seal.

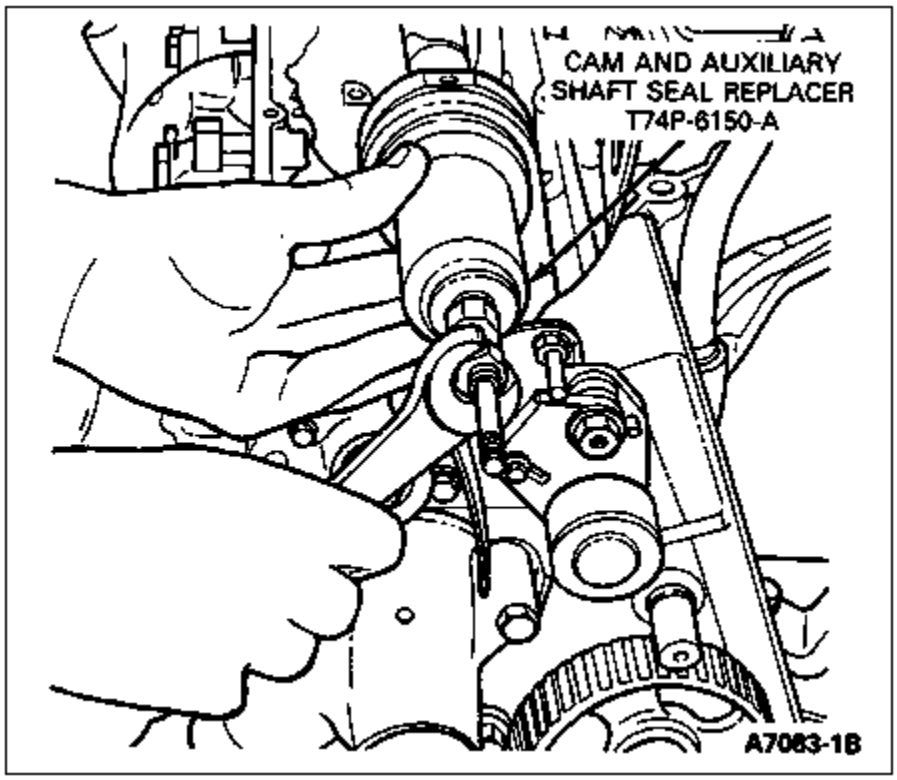
tomsn048@gmail.com



Installation

1. Position camshaft or oil pump shaft seal on Front Seals Replacer T74P-6850-A and press into place.

tomsn048@gmail.com



2. Remove tool.
3. Position sprocket on shaft.
4. Install Cam Sprocket Holding/Removing Tool T74P-6256-B, without threaded puller insert, on sprocket.
5. Install sprocket bolt and washer and tighten to 70-95 Nm (52-70 lb-ft).
6. Remove tool.
7. Install timing belt as outlined in this section.
8. Install outer timing belt cover as outlined in this section.

Cylinder Block Front Cover Seal

SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
Front Cover Seal Remover	T74P-6700-B
Cam Bearing Adapter Tube	T72C-6250

Removal

1. Remove outer timing belt cover as outlined in this section.
2. Remove timing belt as outlined in this section.
3. Remove crankshaft pulley hub bolt.
4. Slide crankshaft pulley (6312) off crankshaft (6303).
5. Slide crankshaft sprocket off of crankshaft.
6. Remove key from crankshaft.
7. **NOTE: When positioning Front Cover Seal Remover T74P-6700-B, make sure jaws are gripping the thin edge of the seal tightly before operating the jack screw portion of the tool.**

   Install Front Cover Seal Remover T74P-6700-B, making sure jaws are gripping the thin edge of the seal.
8. Remove seal.
9. Clean journal of debris.

Installation

1. Using Cam Bearing Adapter Tube T72C-6250 and crankshaft pulley hub bolt, press engine front cover seal into engine front cover (6019).
2. Remove tool.
3. Install key.
4. Install crankshaft sprocket (6306), crankshaft pulley, washer, and bolt. Tighten bolt to 125-165 Nm (92-121 lb-ft).
5. Install timing belt as outlined in this section.
6. Install outer timing belt cover as outlined in this section.

tomsn048@gmail.com

tomsn048@gmail.com

Cylinder Head

SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
Camshaft Belt Tensioner Tool	T74P-6254-A

Removal

WARNING: RESIDUAL PRESSURE REMAINS IN FUEL SYSTEM AFTER ENGINE IS SHUT OFF. THIS COULD RESULT IN INJURY OR FIRE WHEN FUEL LINES ARE DISCONNECTED. DISCONNECT INERTIA FUEL SHUTOFF SWITCH AND CRANK ENGINE A MINIMUM OF 15 SECONDS TO DEPRESSURIZE SYSTEM. REFER TO SECTION 10-01.

1. Disconnect battery ground cable (14301).
2. Drain cooling system.
3. Disconnect intake air temperature sensor (IAT sensor) (12A697) and mass air flow sensor (MAF sensor) (12B579).
4. Remove air cleaner outlet tube (9B659).
5. Remove upper intake manifold and assembled throttle body as outlined in this section.
6. Remove engine control sensor wiring (12A581).
7. Remove ignition wire and brackets (12280)/spark plug wire sets (12281) from spark plugs (12405) and valve cover attachments.
8. **NOTE: Unique platinum spark plugs are used. If all eight spark plugs are not "PP" series, they will need to be marked for replacement in the same cylinder. Refer to Section 03-07B .**

   Remove spark plugs.
9. Disconnect required vacuum hoses.
10. Remove engine oil level indicator tube (6754).
11. Apply penetrating lubricant E8AZ-19A501-B to EGR tube nuts. Unscrew nuts and remove EGR valve to exhaust manifold tube (9D477).
12. Remove valve cover (6582) retaining bolts and remove cover.
13. Using flex handle, rotate drive belt tensioner (6B209) counterclockwise and remove drive belt (8620).
14. Recover refrigerant from air conditioning system. Refer to Section 12-00 .

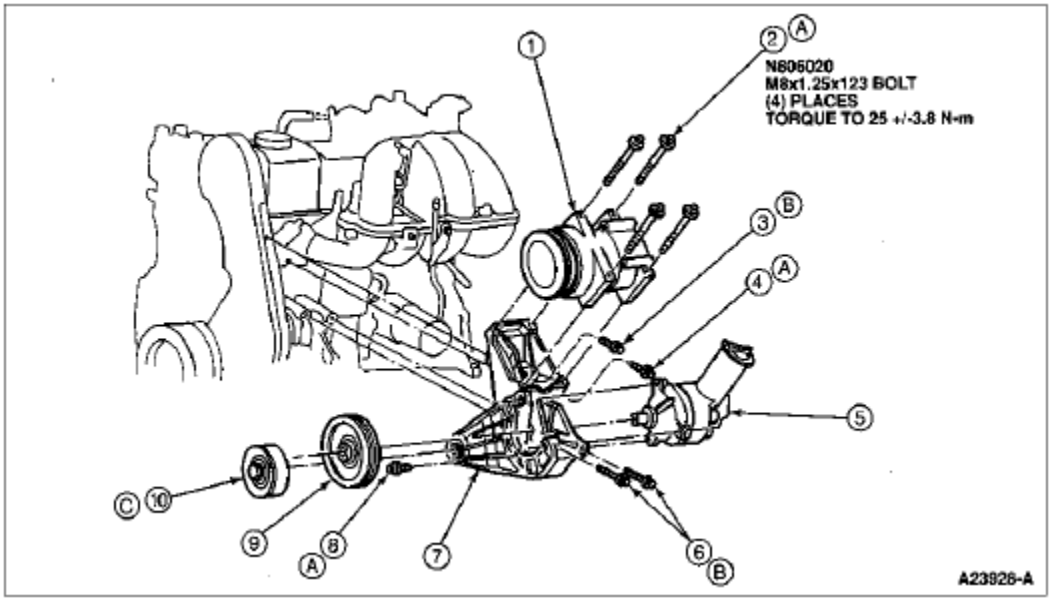
tomsn048@gmail.com

15. Disconnect air conditioning compressor electrical connections.

16. Remove four bolts and A/C compressor (19703) and set to one side without disconnecting hoses. Do not let compressor hang by hoses.

17. Remove bolts and A/C compressor mounting bracket (2882) with assembled power steering pump (3A674), and set to one side without disconnecting hoses.

A/C Compressor Mounting Bracket, 2.3L



Item	Part Number	Description
1	19703	A/C Compressor
2	N806020	Bolt, M8-1.25 x 123
3	N606572	Bolt, M10-1.5 x 123
4	N606051	Bolt, M8-1.25 x 100
5	3A674	Power Steering Pump
6	N606068	Bolt, M10-1.5 x 80
7	10153	A/C Compressor Mounting Bracket
8	N800199	Bolt, M10-1.5 x 33
9	3A733	Power Steering Pump Pulley
10	3F671	Power Steering Belt Idler Support
A	—	Tighten to 22-28 Nm (16-21 Lb-Ft)
B	—	Tighten to 41-54 Nm (29-40 Lb-Ft)
C	—	Tighten to 53-71 Nm

tomsn048@gmail.com

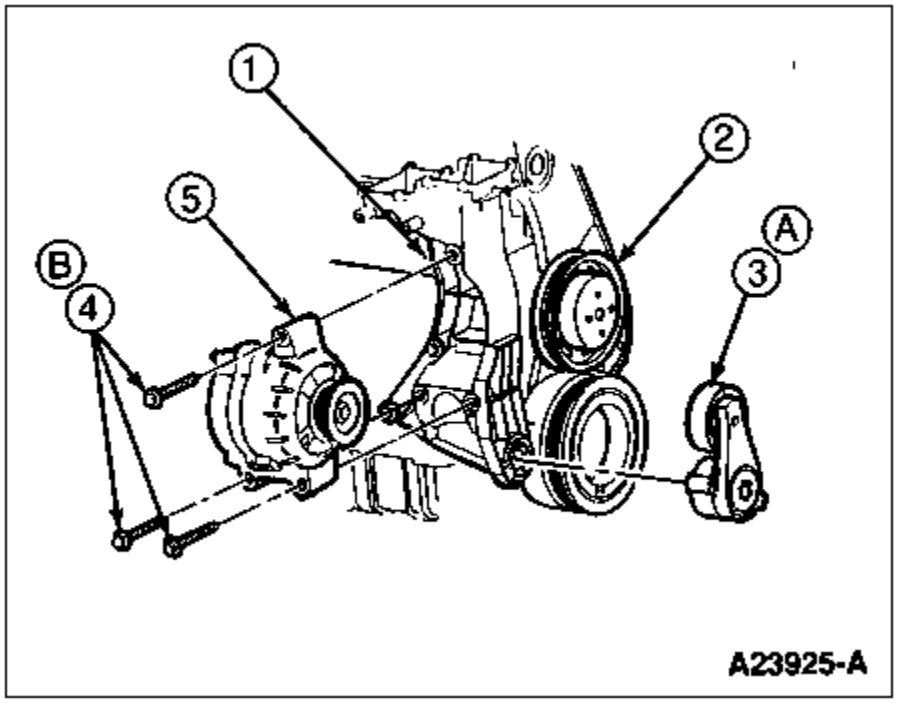
		(39-53 Lb-Ft)

18. Disconnect generator (GEN) (10346) electrical connections.

19. Remove lower radiator hose (8286) and heater water hose (18472) from water pump inlet tube (8290) and thermostat housing.

20. Remove bolts securing water pump inlet tube to generator mounting bracket (10153) and remove water pump inlet tube.

21. Remove three bolts from generator. Remove generator. Remove 3 bolts from generator mounting bracket. Remove bracket with ignition coils (12029) and ignition wire and brackets attached.



Item	Part Number	Description
1	10153	Generator Mounting Bracket
2	8509	Water Pump Pulley
3	6B209	Drive Belt Tensioner
4	N606068	Bolt, M10-1.5 x 80
5	10300	Generator
A	—	Tighten to 40-55 Nm (30-40 Lb-Ft)
B	—	Tighten to 41-54 Nm (30-40 Lb-Ft)

22. Disconnect upper radiator hose (8260) at both ends and remove from vehicle.

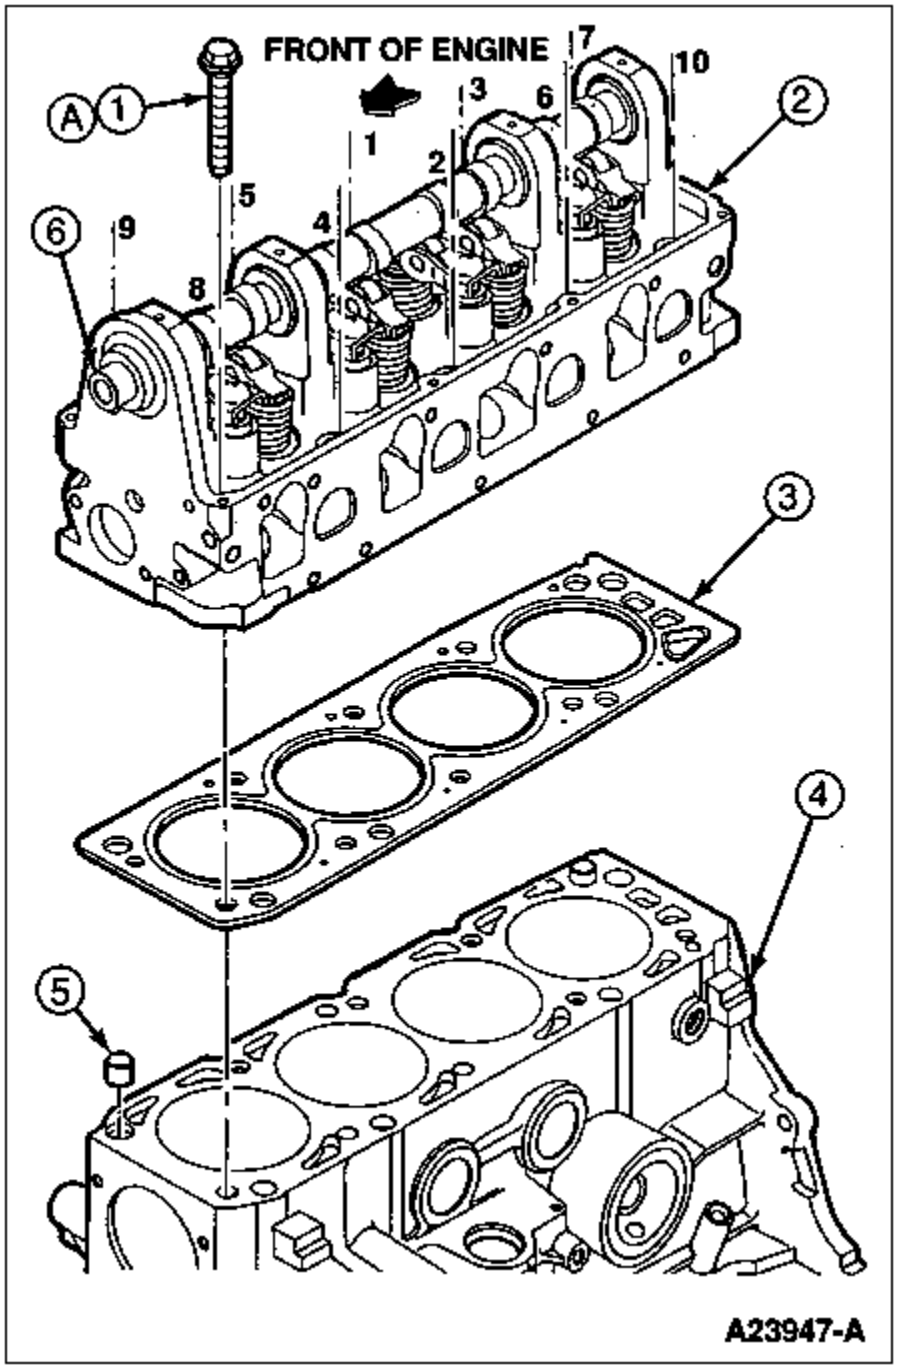
tomsn048@gmail.com

23. Remove fan clutch (8A616) and water pump pulley (8509).
24. Remove timing belt outer cover as outlined in this section.
25. Remove timing belt as outlined in this section.
26. Remove timing belt tensioner adjuster bolt, spring pivot bolt, timing belt tensioner spring, and tensioner.
27. Remove front engine lifting eye (17A084).
28. Remove retaining bolts and lower intake manifold.
29. Remove rear engine lifting eye.
30. Remove the eight exhaust manifold (9430) retaining bolts and studs (6 bolts, 2 studs).
31. Remove cylinder head retaining bolts (10).
32. Remove the cylinder head (6049).
33. Clean cylinder head gasket surface at the block.
34. Clean lower and upper intake manifold gasket surfaces.
35. Clean exhaust manifold gasket surface.
36. Clean exhaust manifold gasket surface at the cylinder head.
37. Clean cylinder head gasket surface at the cylinder head.
38. Clean intake manifold gasket surface at the cylinder head.
39. Blow oil out of the cylinder block bolt holes.
40. Clean valve cover gasket surface on the cylinder head.
41. Check cylinder head for flatness as outlined in Section 03-00 . Cylinder head and cylinder blocks (6010) cylinder head gasket surface should be flat to 0.08mm (0.003 inch) over any 152mm (6 inches) and flat within 0.16mm (0.006 inch) overall.

Installation

1. Position head gasket (6051) on the block.
2. Position cylinder head to cylinder blocks.
3. Install 10 cylinder head bolts in numerical sequence. Tighten to 70 Nm (51 lb-ft) in illustrated sequence. Retighten to 70 Nm (51 lb-ft) in sequence. Then turn all head bolts an additional 90-100 degrees in sequence.

tomsn048@gmail.com

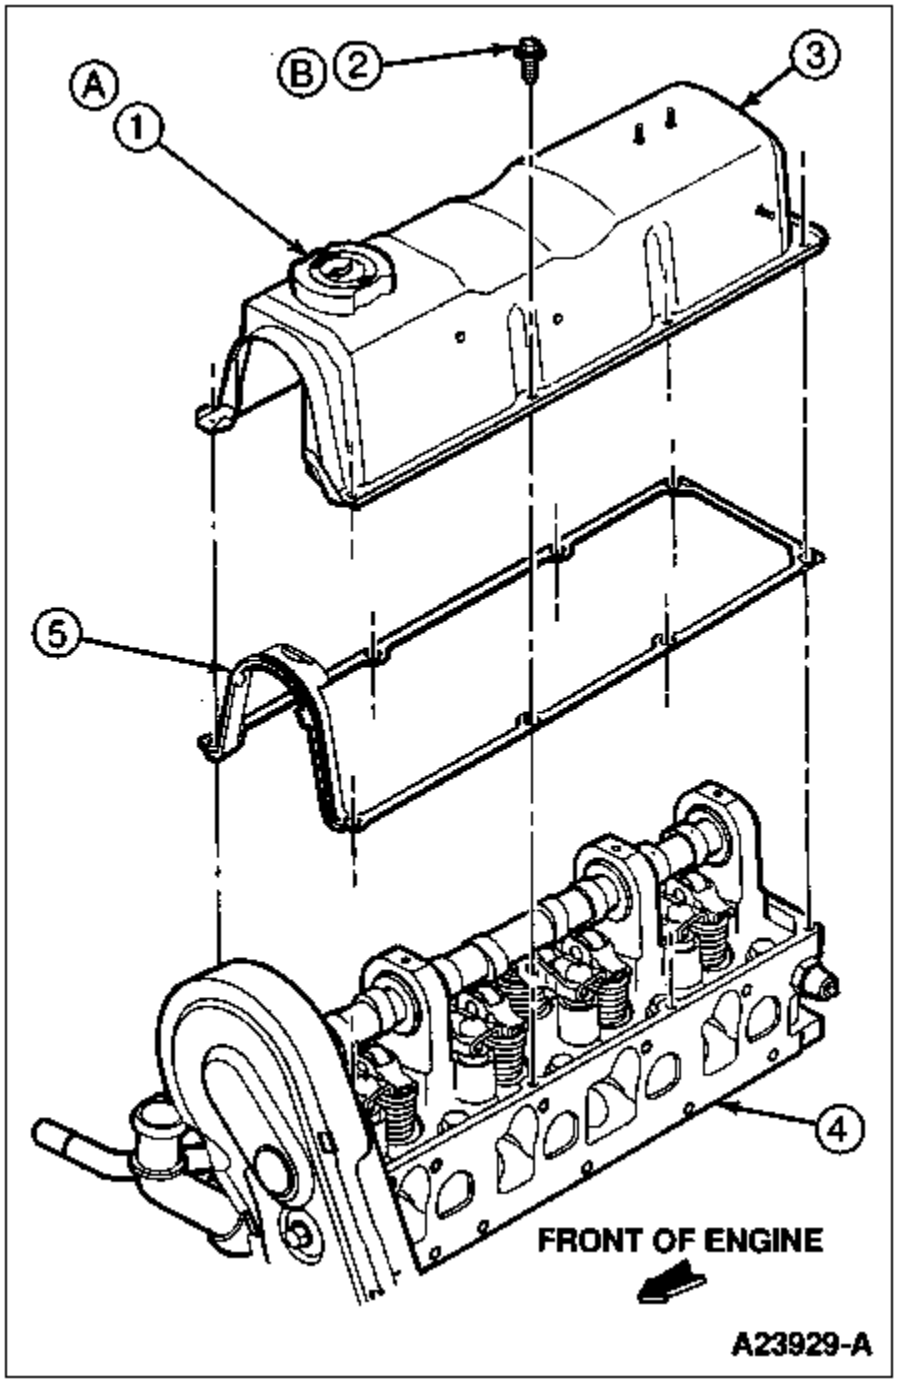


Item	Part Number	Description
1	N807013-S	Bolt, M12-1.75 x 100.7
2	6049	Cylinder Head
3	6051	Head Gasket
4	6010	Cylinder Blocks
5	—	Dowel (Part of 6010)

tomsn048@gmail.com

6	6251	Camshaft
A	—	Tighten in Illustrated Sequence According to Procedure in Text

4. Install valve cover and valve cover gasket (6584). Tighten retaining bolts to 9-13 Nm (80-115 lb-in).



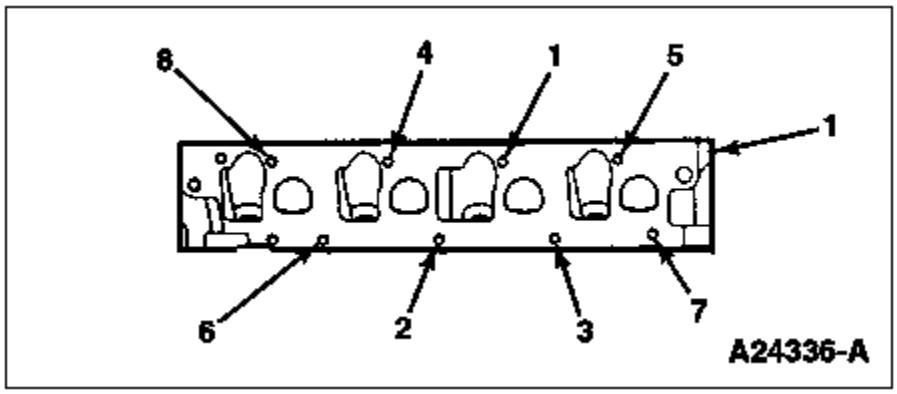
Item	Part Number	Description

tomsn048@gmail.com

1	6766	Oil Filler Cap
2	—	Screw, M6-1 x 15
3	6582	Valve Cover
4	6049	Cylinder Head
5	6584	Valve Cover Gasket
A	—	Tighten Until Ratchet Click Is Heard or Felt
B	—	Tighten to 9-13 Nm (80-115 Lb-In)

5. Install lower intake manifold and gasket. Tighten retaining nuts/bolts in sequence to 26-38 Nm (19-28 lb-ft).

Lower Intake Torque Sequence

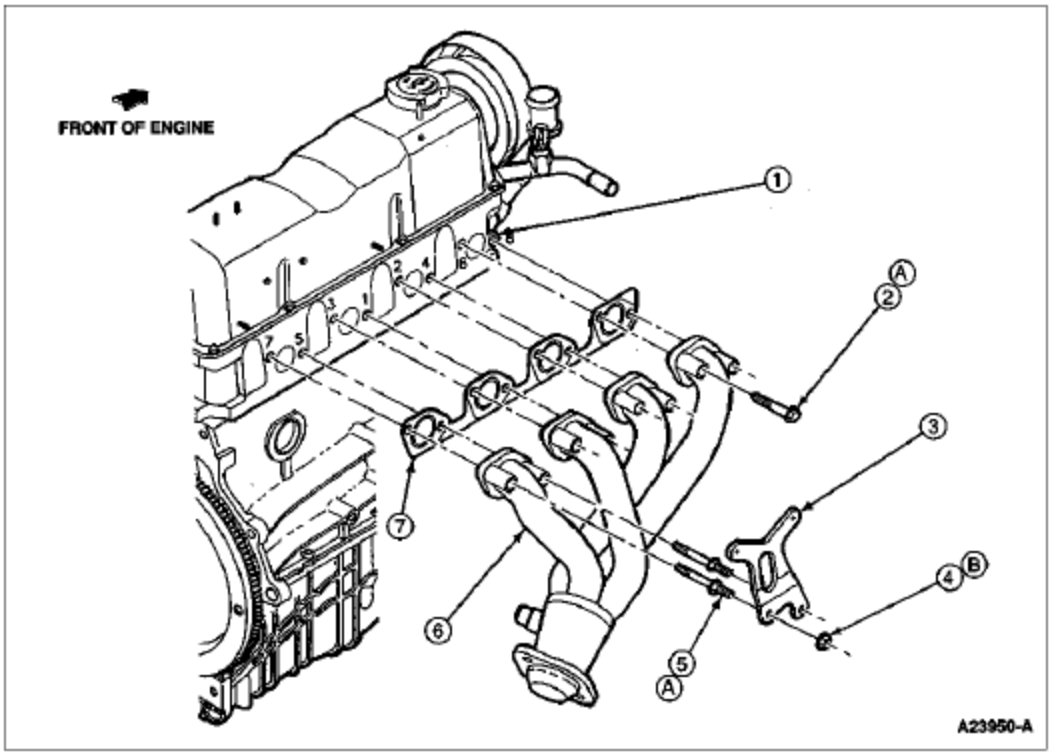


6. Install front lifting eye and tighten nut and bolt to 20-30 Nm (15-22 lb-ft).

7. Install exhaust manifold, gasket, and eight exhaust manifold retaining bolts and/or stud bolts. Tighten the bolts in sequence in two steps: 20-30 Nm (178-204 lb-in), then 60-80 Nm (20-30 lb-ft).

Exhaust Manifold

tomsn048@gmail.com



Item	Part Number	Description
1	6049	Cylinder Head
2	N806949-S100	Bolt, M10-1.5 x 59.1 (6 Places)
3	17A084	Engine Lifting Eye

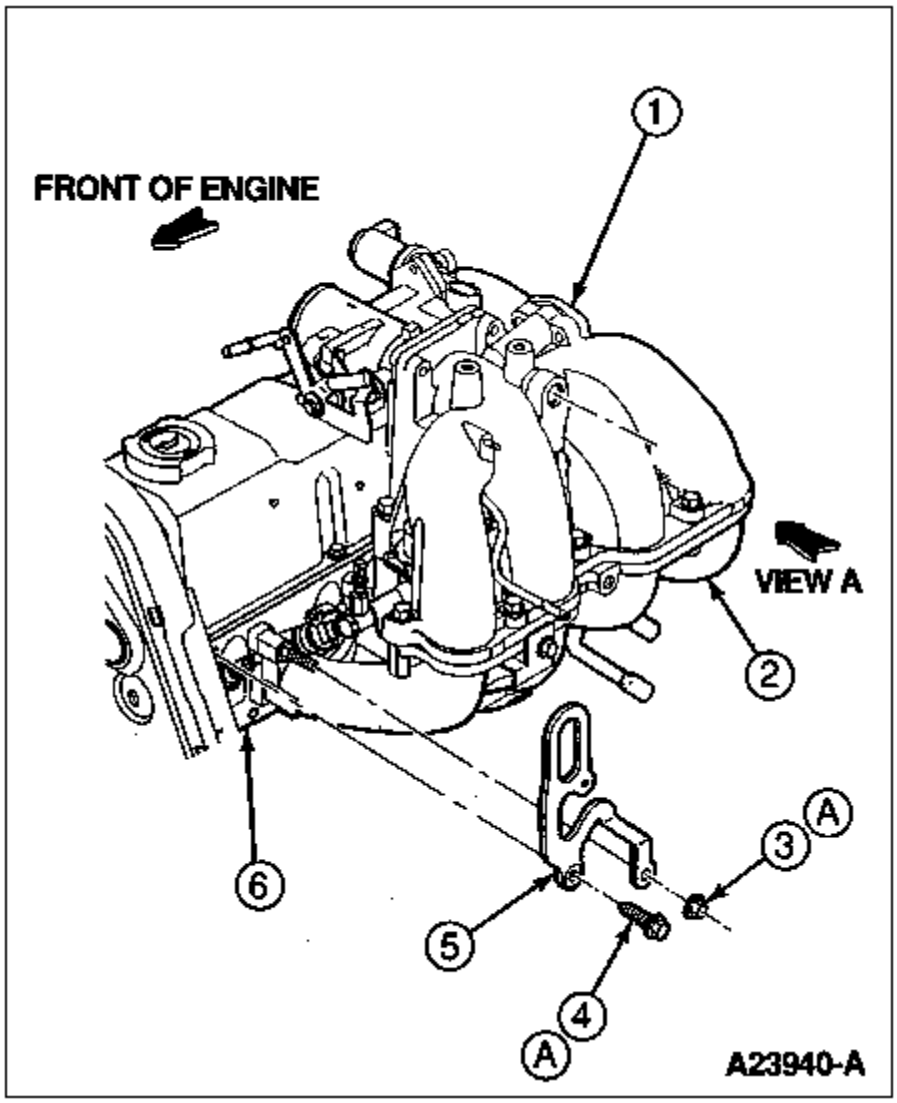
5	N806948-S100	Stud, M10-1.5 x M8-1.25 x 89.6 (2 Places)
6	9430	Exhaust Manifold
7	9448	Exhaust Manifold Gasket
A	—	Tighten in Two Stages According to Instructions in Text
B	—	Tighten to 20-30 Nm (15-22 Lb-Ft)

tomsn048@gmail.com



Item	Part Number	Description
1	9425	Upper Intake Manifold
2	9K461	Lower Intake Manifold
3	N620481-S2	Nut, M8-1.25
4	N808162-S2	Bolt, M8-1.25 x 33
5	17A084	Engine Lifting Eye (Front)
6	6049	Cylinder Head
A	—	Tighten to 20-30 Nm (14-22 Lb-Ft)

8. Install timing belt tensioner and timing belt tensioner spring on cylinder head placing one leg of timing belt tensioner spring under stud on cylinder head and other leg against pin on timing belt tensioner and install spring pivot bolt.

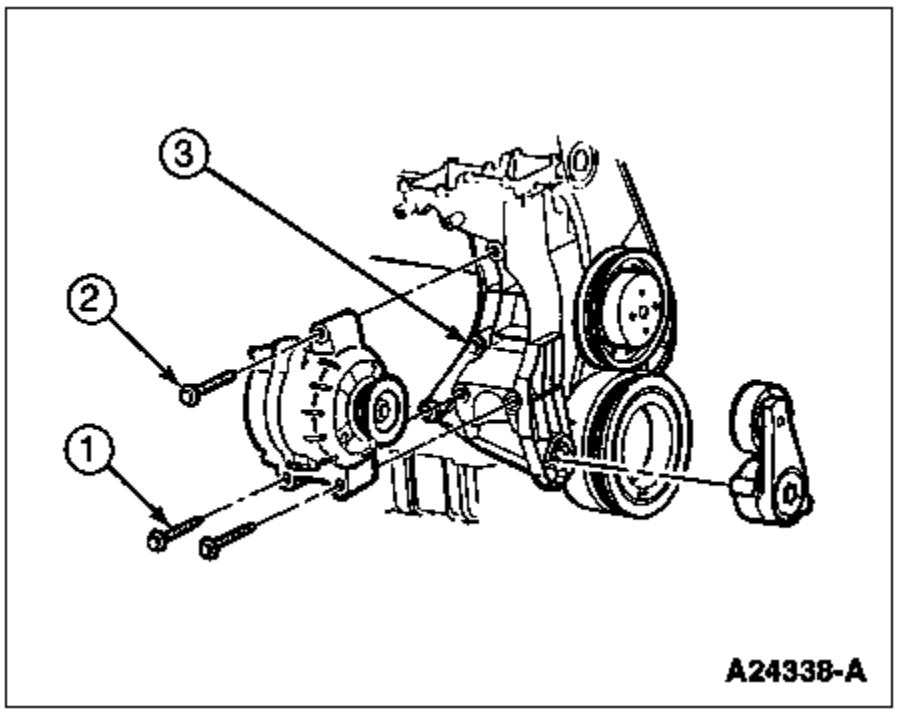
9. Install timing belt as outlined in this section.

tomsn048@gmail.com

10. Install outer timing belt cover as outlined in this section.

11. Install generator mounting bracket with assembled ignition coils and ignition wire and brackets. Refer to the following installation drawing for correct torque sequence. Tighten in order illustrated.

Generator and Bracket Torque Sequence



Item	Part Number	Description
1	—	Tighten to 40-55 Nm (30-41 Lb-Ft)
2	—	Tighten to 40-55 Nm (30-41 Lb-Ft)
3	—	Tighten to 40-55 Nm (30-41 Lb-Ft)

12. Replace O-ring lubricated with silicone grease on water pump inlet tube.

13. Install water pump inlet tube into water pump (8501). Tighten inlet tube-to-generator bracket bolts to 9-12 Nm (80-106 lb-in).

14. Install lower radiator hose.

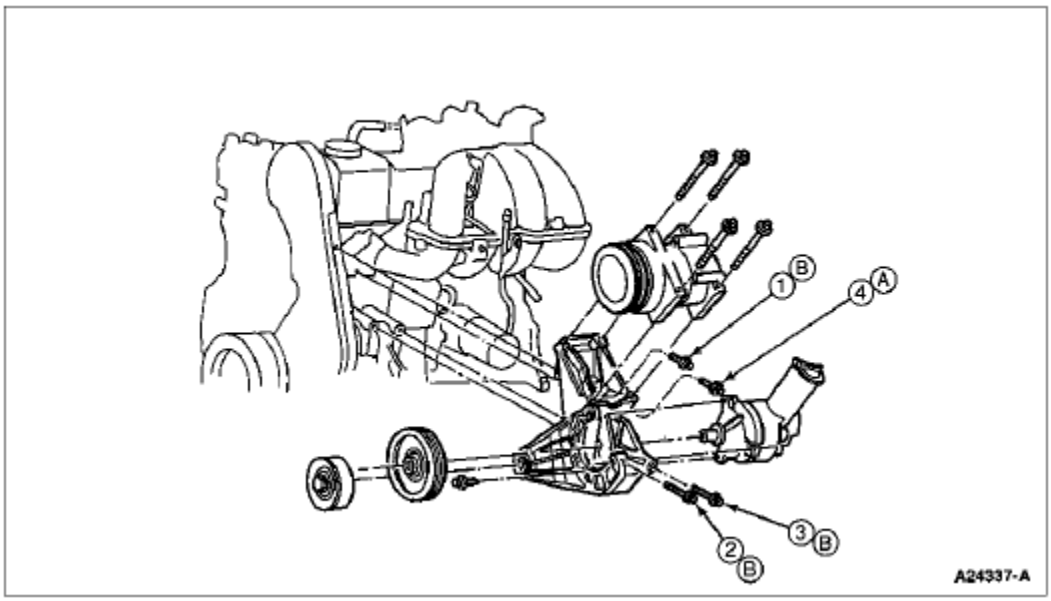
15. Install generator. Tighten generator-to-bracket bolts to 40-54 Nm (30-40 lb-ft).

16. Connect upper radiator hose hose and heater water hose and tighten hose clamps (8287).

tomsn048@gmail.com

17. Install A/C compressor mounting bracket with attached power steering pump. Refer to the following installation drawing for correct bolt torque sequence. Tighten in order illustrated. Torque bolts 1 and 2 to 40-55 Nm (30-41 lb-ft), bolt 3 to 21-28 Nm (15-21 lb-ft).

A/C Compressor Bracket Torque Sequence



Item	Part Number	Description
1	N606572	Bolt, M10-1.5 x 123
2	N606068	Bolt, M10-1.5 x 80
3	N606068	Bolt, M10-1.5 x 80
4	N606051	Bolt, M8-1.25 x 100
A	—	Tighten to 22-28 Nm (15-21 Lb-Ft)
B	—	Tighten to 41-54 Nm (29-40 Lb-Ft)

18. Install A/C compressor with attached hoses and tighten bolts to 21-28 Nm (16-20 lb-ft).

19. Install water pump pulley and fan clutch. Tighten bolts snug.

20. Position drive belt.

21. Using flex handle, rotate drive belt tensioner, position drive belt, and rest tensioner pulley on drive belt.

22. Tighten four fan clutch and pulley-to-water pump bolts to 17-23 Nm (13-16 lb-ft).

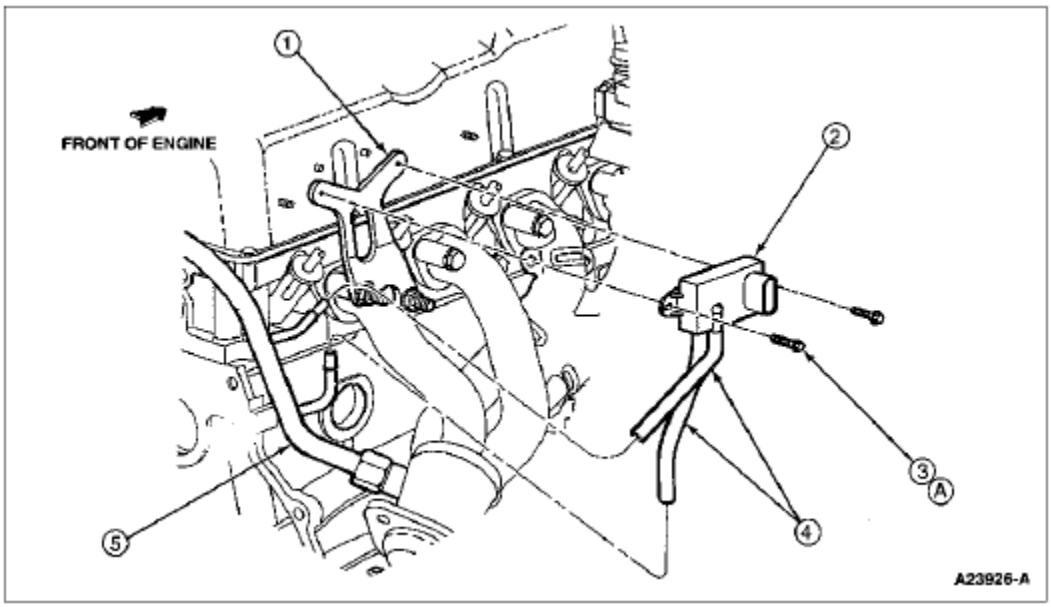
23. Position fan shroud (8146) over fan clutch shaft.

tomsn048@gmail.com

24. Install fan shroud and fan guard (8A611).
25. **NOTE: Spark plug gap is 1.07-1.17mm (0.042-0.046 inch).**

    Install spark plugs in proper locations.
26. Install engine oil level indicator tube.
27. Position and connect engine control sensor wiring. Install ignition wires.
28. Install upper intake manifold as outlined in this section.
29. Install EGR valve to exhaust manifold tube and tighten nuts to 34-47 Nm (25-34 lb-ft).
30. Install EGR transducer (9J433) to rear engine lifting eye. Tighten bolts to 2.7-3.7 Nm (24-32 lb-ft).

EGR Transducer



Item	Part Number	Description
1	17A084	Engine Lifting Eye
2	9J433	EGR Transducer
3	N807202-S36	Bolt, M5-0.8 x 16
4	—	Hoses (Part of 9J433)
5	9D477	EGR Valve to Exhaust Manifold Tube
A	—	Tighten to 2.7-3.7 Nm (24-32 Lb-Ft)

31. Fill cooling system. Refer to Section 03-03 .

tomsn048@gmail.com

32. Install air cleaner outlet tube to throttle body (9E926) and engine air cleaner (ACL) (9600).

33. Connect intake air temperature sensor and mass air flow sensor.

34. **NOTE: When the battery (10655) has been disconnected and reconnected, some abnormal drive symptoms may occur while the powertrain control module (PCM) (12A650) relearns its adaptive strategy. The vehicle may need to be driven to relearn the strategy.**

    Connect battery ground cable.

35. Recharge air conditioner system. Refer to appropriate section in Group 12.

36. Start engine (6007) and check for leaks.

---

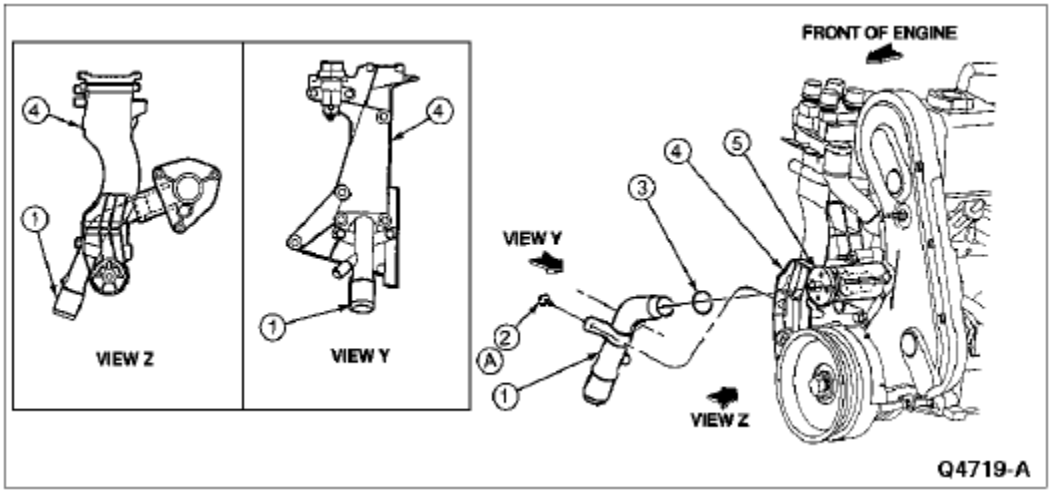
tomsn048@gmail.com

Water Pump

Removal

1. Drain cooling system.
2. Using 1/2-inch drive handle, rotate drive belt tensioner (6B209) and remove drive belt (8620).
3. Remove fan clutch and shroud.
4. Remove water pump pulley (8509).
5. Remove heater water hose (18472) to water pump inlet tube (8290).
6. Remove lower radiator hose (8286) from the water pump inlet tube.
7. Remove water inlet tube-to-generator bracket bolts and water pump inlet tube.

Water Pump Inlet Tube



Item	Part Number	Description
1	8274	Water Pump Inlet Tube
2	N606676-S2	Screw and Washer Assembly, M6-1 x 22.5
3	87056-S100	O-Ring
4	10153	Generator Mounting Bracket
5	8501	Water Pump

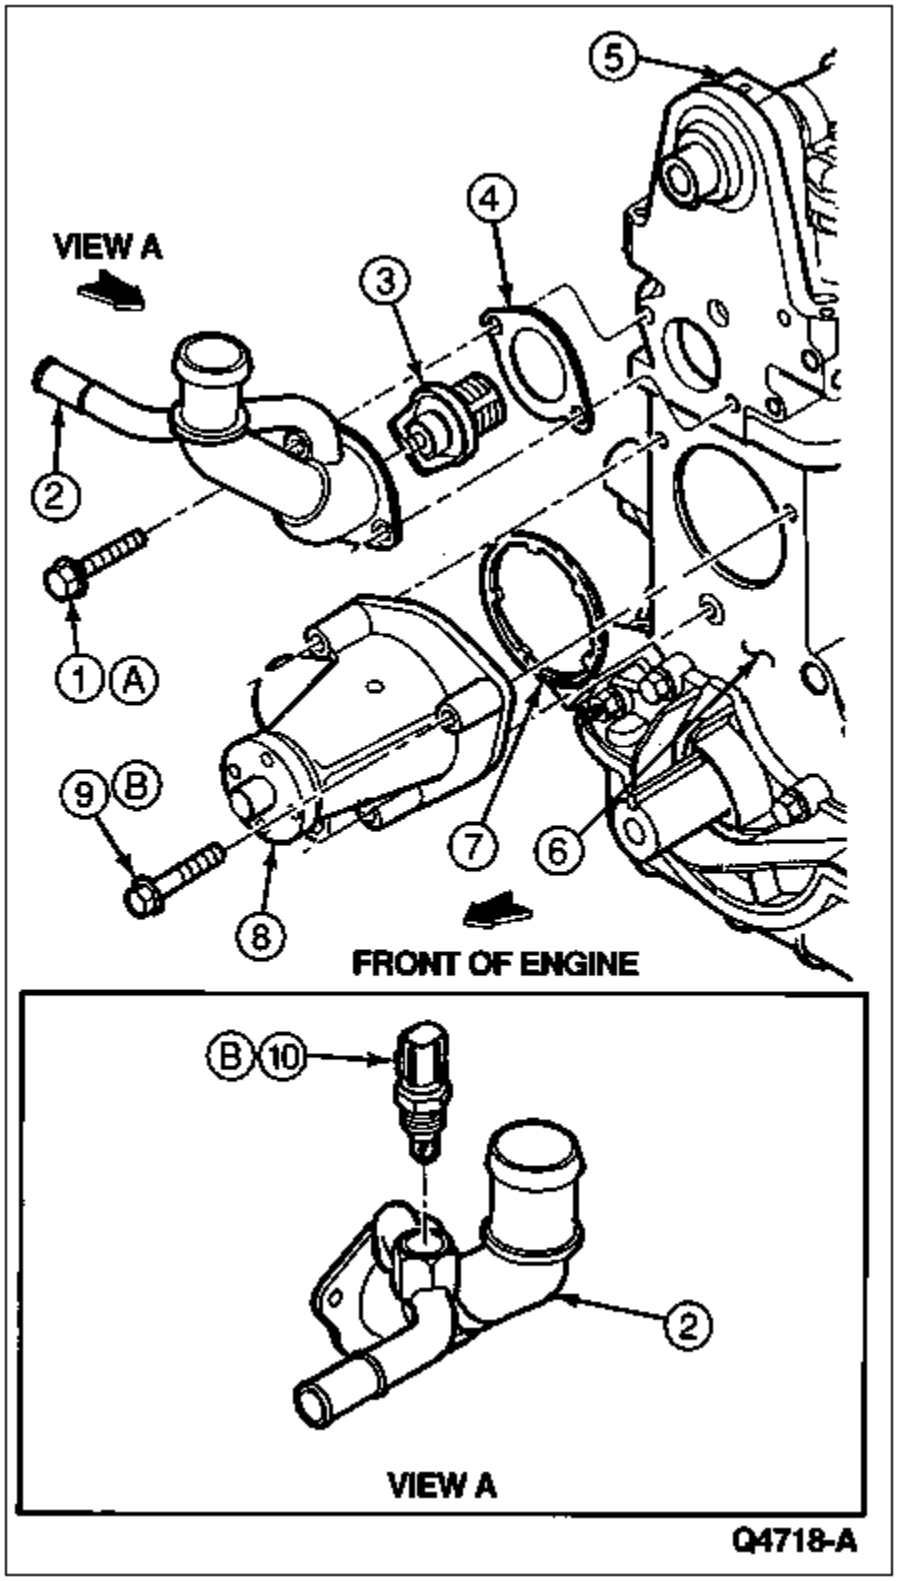
tomsn048@gmail.com

A	—	Tighten to 9-12 Nm (78-107 Lb-In)

8. Remove water pump (8501) retaining bolts and remove water pump.

9. Clean water pump gasket surface of cylinder block.

tomsn048@gmail.com



Item	Part Number	Description
1	800025-S100	Screw, M8-1.25 x 18
2	8594	Water Outlet Connection

tomsn048@gmail.com

3	8575	Water Thermostat
4	8255	Gasket
5	6049	Cylinder Head
6	6010	Cylinder Blocks
7	8507	Water Pump Housing Gasket
8	8501	Water Pump
9	N808517-S100	Bolt, M8-1.25 x 53
10	12A648	Engine Coolant Temperature Sensor
A	—	Tighten to 20-30 Nm (14-21 Lb-Ft)
B	—	Tighten to 16-24 Nm (12-17 Lb-Ft)

Installation

1. Apply Pipe Sealant with Teflon® D8AZ-19554-A or equivalent meeting Ford specification ESG-M4G194-A to water pump bolts prior to installation.
2. Position gasket and water pump on cylinder blocks (6010) and install screws. Alternately tighten to 20-30 Nm (15-20 lb-ft).
3. Replace water inlet tube O-ring (lubricated with silicone grease).
4. Install water pump inlet tube in water pump. Tighten water inlet tube-to-generator bracket bolts to 9-12 Nm (80-106 lb-in).
5. Install lower radiator hose to water pump.
6. Install heater water hose to the water pump inlet tube.
7. Install water pump pulley and fan clutch (8A616) and tighten bolts finger-tight.
8. Using half-inch drive handle, rotate drive belt tensioner and install drive belt.
9. Tighten fan clutch and water pump pulley bolts to 20-25 Nm (14-19 lb-ft).
10. Install fan blade (8600) and tighten screws to 6-8 Nm (52-71 lb-in).
11. Install fan and shroud.
12. Fill cooling system. Refer to Section 03-03 .
13. Start engine (6007) and check for leaks.

tomsn048@gmail.com

tomsn048@gmail.com

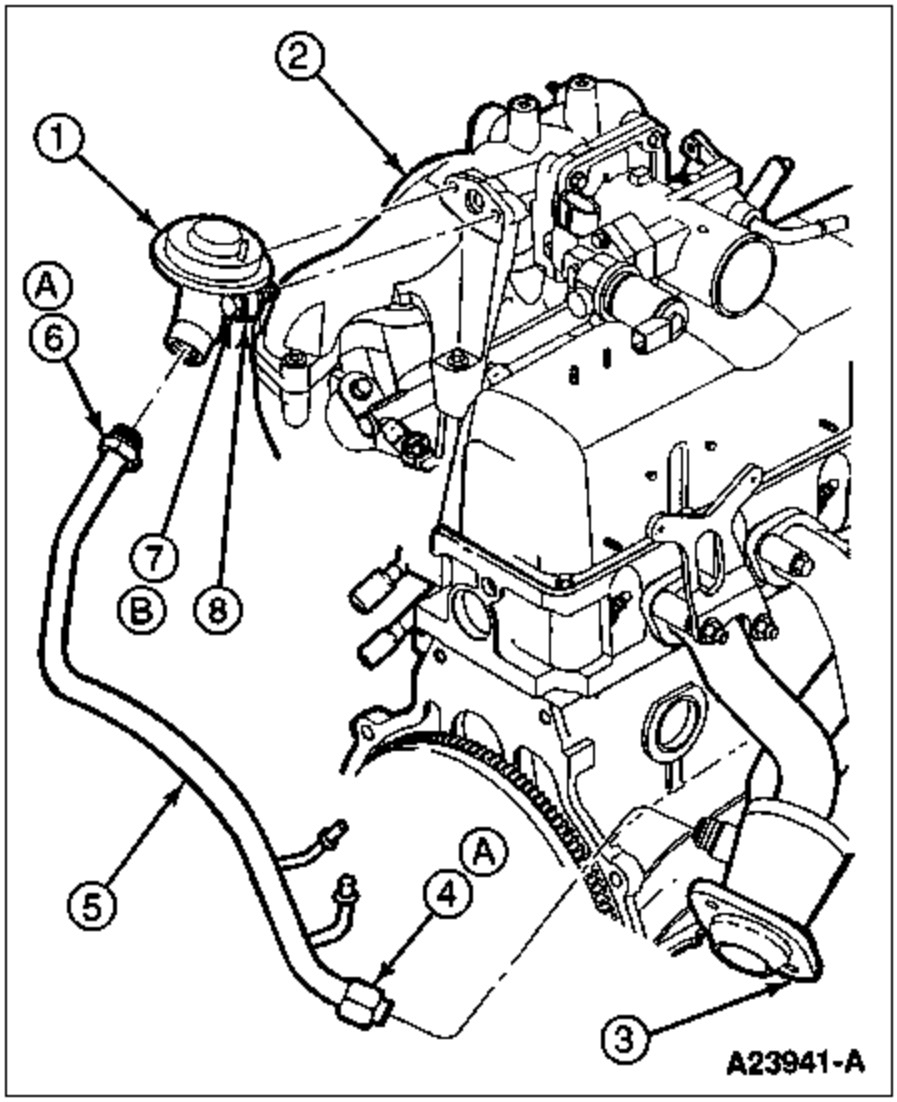
Upper Intake Manifold

Removal

NOTE: If removing upper intake manifold for access to other components only, throttle body may remain attached.

1. Disconnect intake air temperature sensor (IAT sensor) (12A697).
2. Remove air cleaner outlet tube (9B659).
3. Remove accelerator control splash shield (9E766).
4. Disconnect electrical connections to:
    a. Throttle position sensor (TP sensor) (9B989)
    b. Idle air control valve (IAC valve) (9F715)
5. Disconnect accelerator cable (9A758).
6. Remove accelerator cable bracket bolts and tie bracket and cables out of the way.
7. Disconnect PCV valve from oil separator.
8. Tag and disconnect vacuum hoses from manifold vacuum tee:
    a. Power brakes
    b. EGR
    c. Speed control
9. Disconnect fuel pressure regulator vacuum line at fitting located on underside of intake manifold.
10. Remove two bolts and EGR valve (EGR valve) (9D475) and EGR valve gasket (9D476).

tomsn048@gmail.com



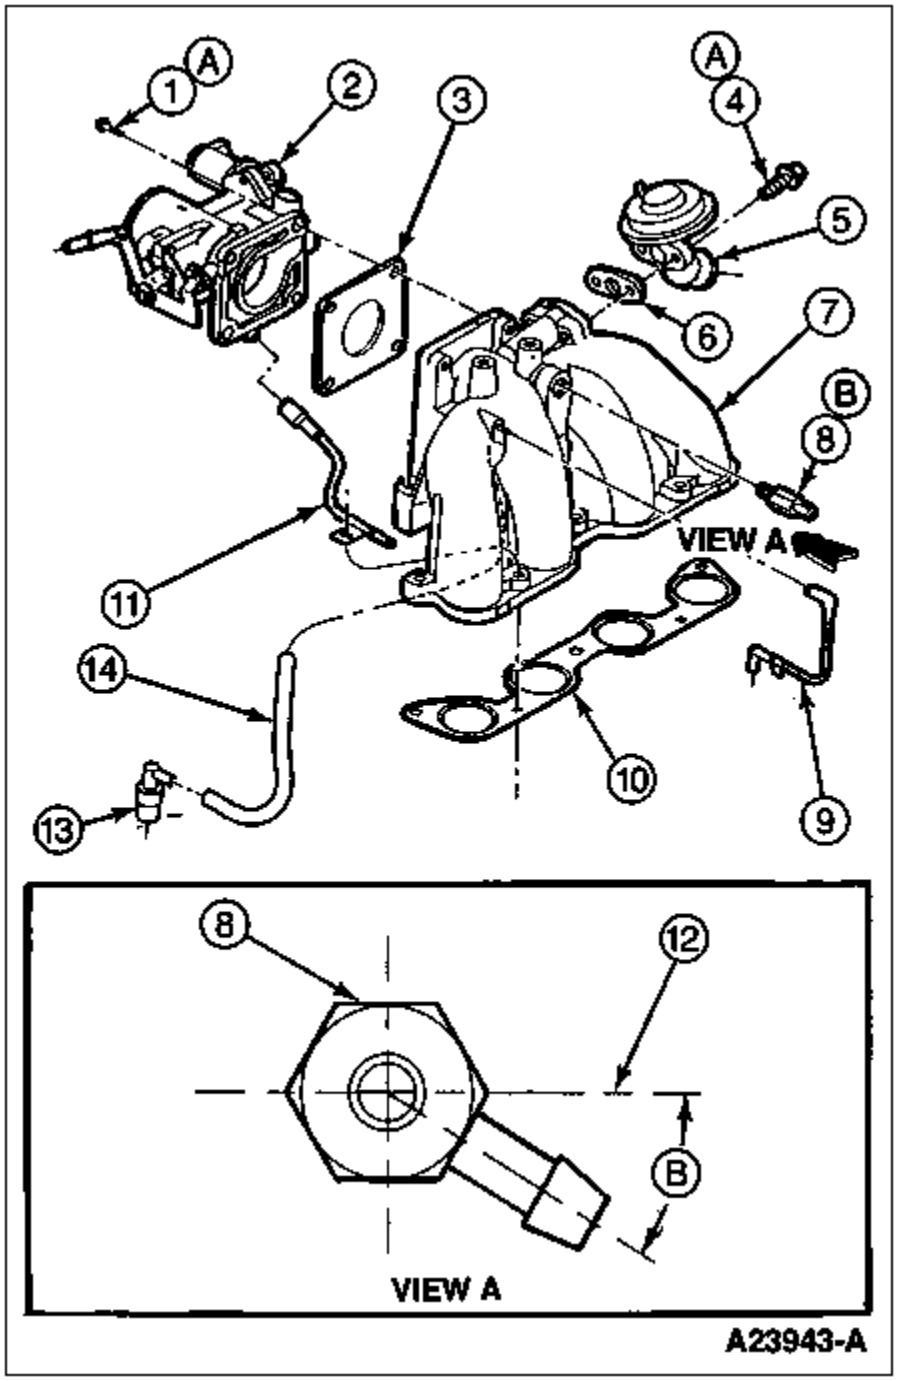
Item	Part Number	Description
1	9D460	EGR Valve
2	9424	Upper Intake Manifold
3	9430	Exhaust Manifold
4	—	Nut (Part of 9D477)
5	9D477	EGR Valve to Exhaust Manifold Tube
6	—	Nut (Part of 9D477)
7	N806781-S2	Screw, M8-1.25 x 35
8	9D476	EGR Valve Gasket
A	—	Tighten to 34-47 Nm (25-35 Lb-Ft)
B	—	Tighten to 20-30 Nm (15-22 Lb-Ft)

tomsn048@gmail.com

11. Remove seven bolts and upper intake manifold and intake manifold upper gasket (9H486) from lower intake manifold.

12. Remove evaporative emission return tube (9G271) from throttle body (9E926) and upper intake manifold.

13. Remove four bolts, throttle body and throttle body gasket (TB gasket) (9E936) from upper intake manifold.



tomsn048@gmail.com

Item	Part Number	Description
1	N605788-S36	Bolt, M8x30
2	9E926	Throttle Body
3	9E936	Throttle Body Gasket
4	N806781-S2	Bolt
5	9D475	EGR Valve
6	9D476	EGR Valve Gasket
7	9425	Upper Intake Manifold
8	9A474	Intake Manifold Vacuum Outlet Fitting and Cap
9	9E498	Fuel Pressure Regulator Vacuum Tube
10	9H486	Intake Manifold Upper Gasket
11	9G271	Evaporative Emission Return Tube
12	—	Centerline of Fitting 9A474 Parallel to Engine Crankshaft
13	6B690	PCV Valve
14	6K817	PCV Hose
A	—	Tighten to 20-30 Nm (15-22 Lb-Ft)
B	—	Tighten to 16-24 Nm (12-17 Lb-Ft) Then Rotate So Side Nipple Is 30 Degrees Below Centerline of Nipple Parallel with Engine Crankshaft

14. If necessary, remove intake manifold vacuum outlet fitting from upper intake manifold.

Installation

1. If removed, install intake manifold vacuum outlet fitting. Tighten to 16-24 Nm (12-17 lb-ft). Rotate clockwise so side nipple is 30 degrees below centerline of nipple parallel with engine crankshaft (6303) (bottom of upper intake manifold).

2. Install throttle body gasket, throttle body, and four bolts to upper intake manifold. Alternately tighten to 20-30 Nm (15-22 lb-ft).

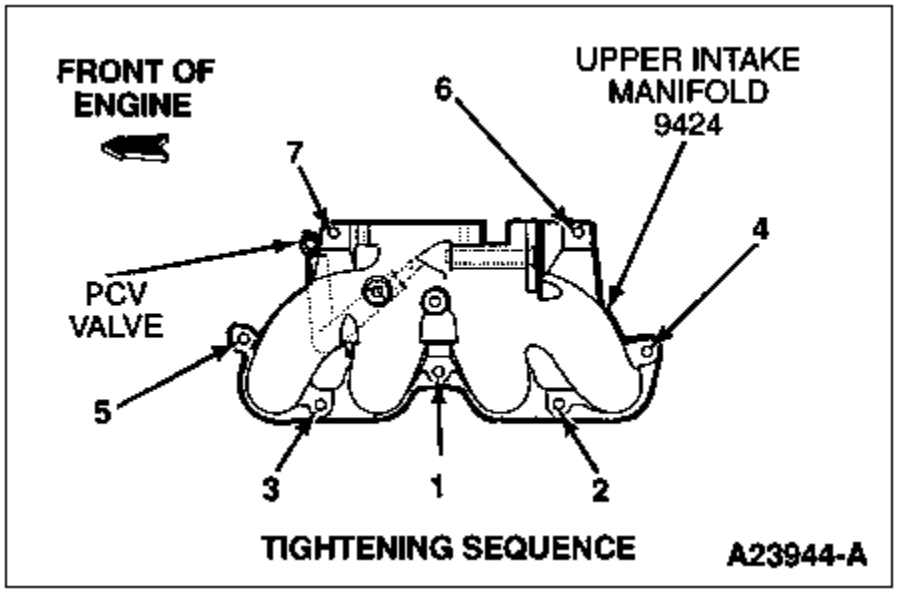
3. Install evaporative emission return tube on throttle body tube and position on upper intake manifold.

4. Position intake manifold upper gasket and upper intake manifold.

5. Start bolts. Tighten in sequence to 7-10 Nm (61-88 lb-in). Tighten in sequence to 26-38 Nm (19-28 lb-ft).

6. Install PCV valve into crankcase vent oil separator (6A785).

tomsn048@gmail.com



7. Install EGR valve and EGR valve gasket and tighten bolts to 20-30 Nm (15-22 lb-ft).
8. Install EGR valve to exhaust manifold tube (9D477) and tighten nuts to 34-47 Nm (25-34 lb-ft).
9. Connect vacuum hoses to intake manifold vacuum tee:
    a. Fuel pressure regulator
    b. Speed control
    c. EGR
    d. Power brakes
10. Connect fuel pressure regulator vacuum line to fitting on upper intake manifold.
11. Connect crankcase ventilation hose (6853) to PCV valve to oil separator.
12. Install accelerator cable bracket (9723) to throttle body and tighten bolts to 21-28 Nm (16-20 lb-ft).
13. Connect accelerator cable.
14. Connect throttle body and upper intake manifold electrical connections:
    a. Idle air control valve
    b. Throttle position sensor
15. Install air cleaner outlet tube.
16. Connect intake air temperature sensor and mass air flow sensor (MAF sensor) (12B579).
17. Install accelerator control splash shield.
18. Connect EVAP hose to metal tube.
19. Start engine (6007) and check for leaks.

tomsn048@gmail.com

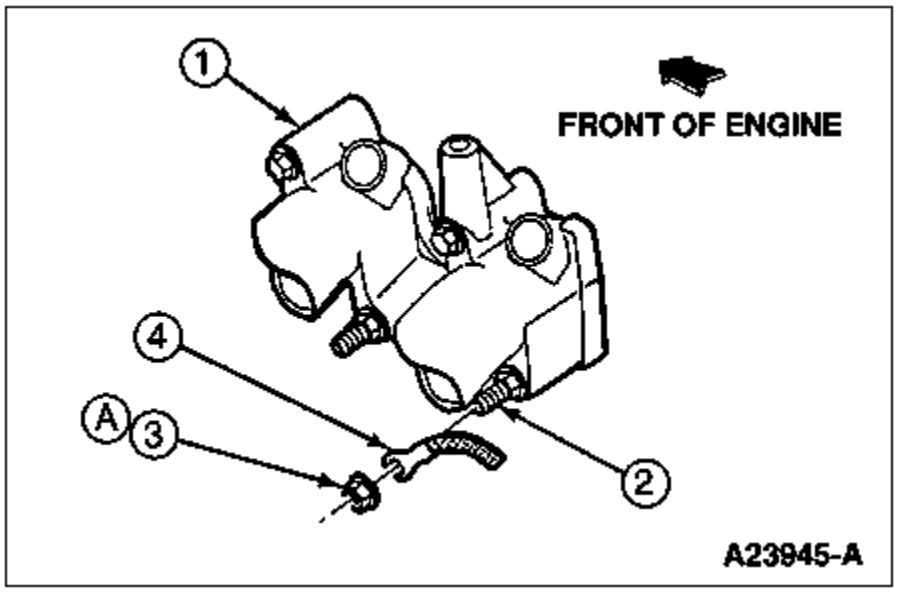
tomsn048@gmail.com

Lower Intake Manifold

Removal

WARNING: RESIDUE FUEL PRESSURE REMAINS IN FUEL SYSTEM AFTER ENGINE IS SHUT OFF. THIS COULD RESULT IN INJURY OR FIRE WHEN FUEL LINES ARE DISCONNECTED. DISCONNECT INERTIA FUEL SHUTOFF SWITCH AND CRANK ENGINE A MINIMUM OF 15 SECONDS TO DEPRESSURIZE SYSTEM. REFER TO SECTION 10-01.

1. Disconnect battery ground cable (14301).
2. Remove engine oil dipstick bracket retaining bolt.
3. Remove upper intake manifold as outlined in this section.
4. Remove nut and dash panel ground cable (14303) from No. 7 stud.

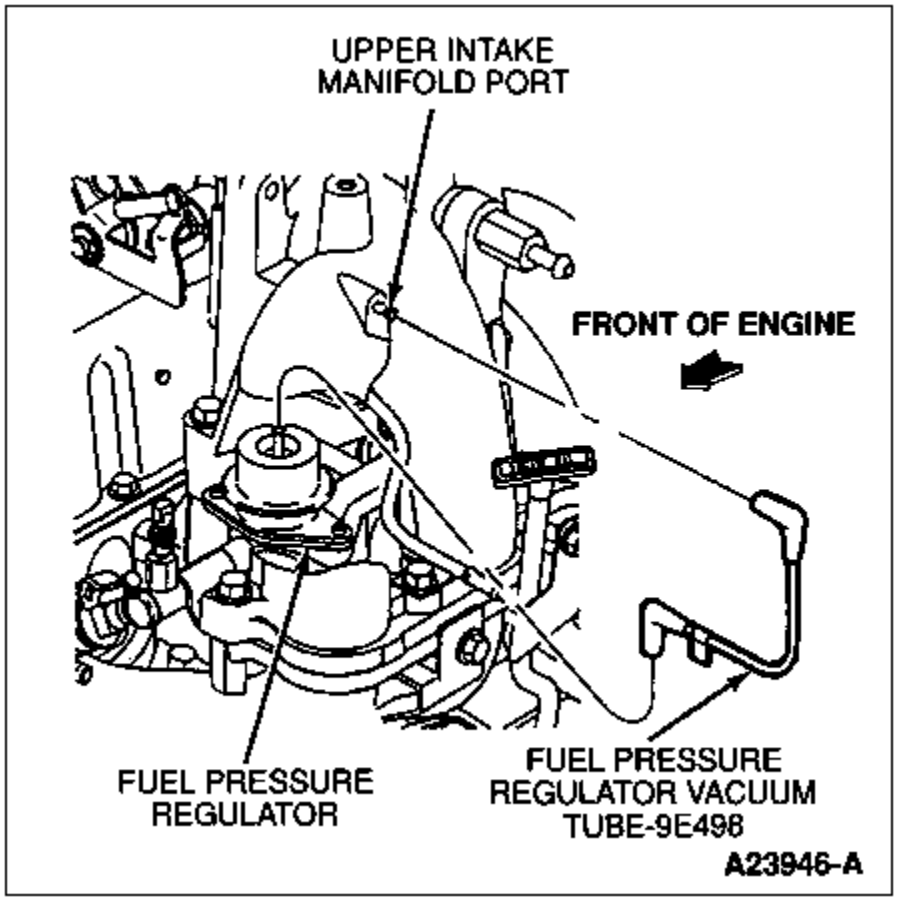


Item	Part Number	Description
1	9424	Intake Manifold, Lower
2	N807458-S101	Stud, M8-1.25 x 1.25 x 96.2
3	N620481-S2	Nut, M8 x 1
4	14303	Dash Panel Ground Cable
A	—	Tighten to 9-12 Nm

tomsn048@gmail.com

		(80-106 Lb-In)

5. Remove wiring harness clip from No. 3 and 6 studs.

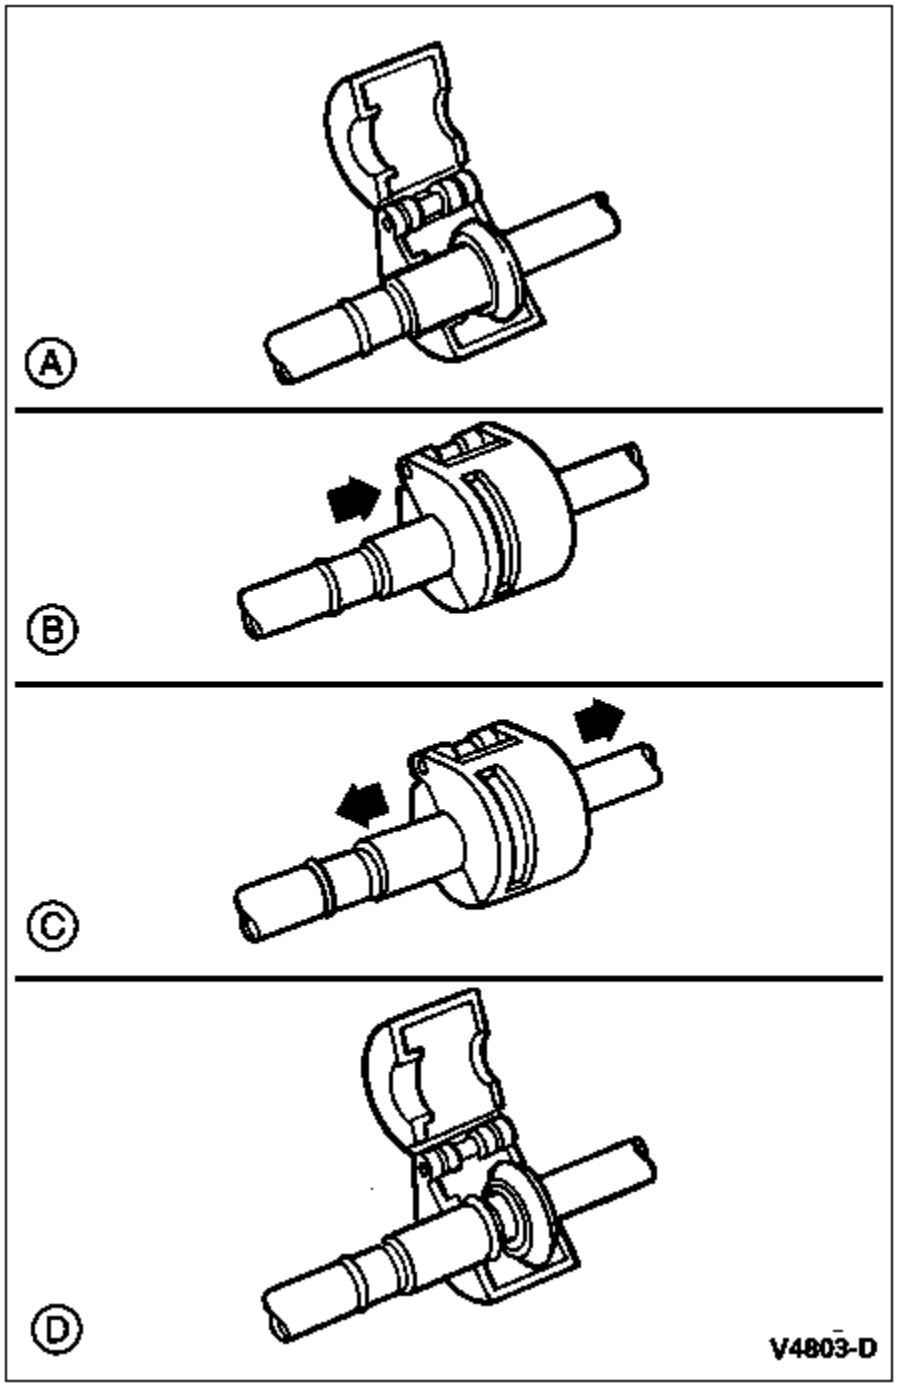


6. Remove fuel tube clip (9A317) from fuel inlet and return fittings.

7. Using Spring Lock Coupling Disconnect Tool, disconnect fuel hoses at the fuel rail supply tube and fuel rail return tube.

   a. Fit tool to coupling so tool can enter cage to release garter spring.
   b. Push the tool into the cage opening to release female fitting from garter spring.
   c. Pull the coupling male and female fittings apart.
   d. Remove the tool from the disconnected coupling.

tomsn048@gmail.com



8. Disconnect the electrical connectors from all four fuel injector nozzle tips (9E527) and move fuel charging wiring (9D930) aside.

9. Remove engine lifting eye.

10. Remove four bottom retaining bolts from lower manifold.

11. Remove four upper retaining bolts/studs from lower manifold. Remove lower intake manifold assembly.

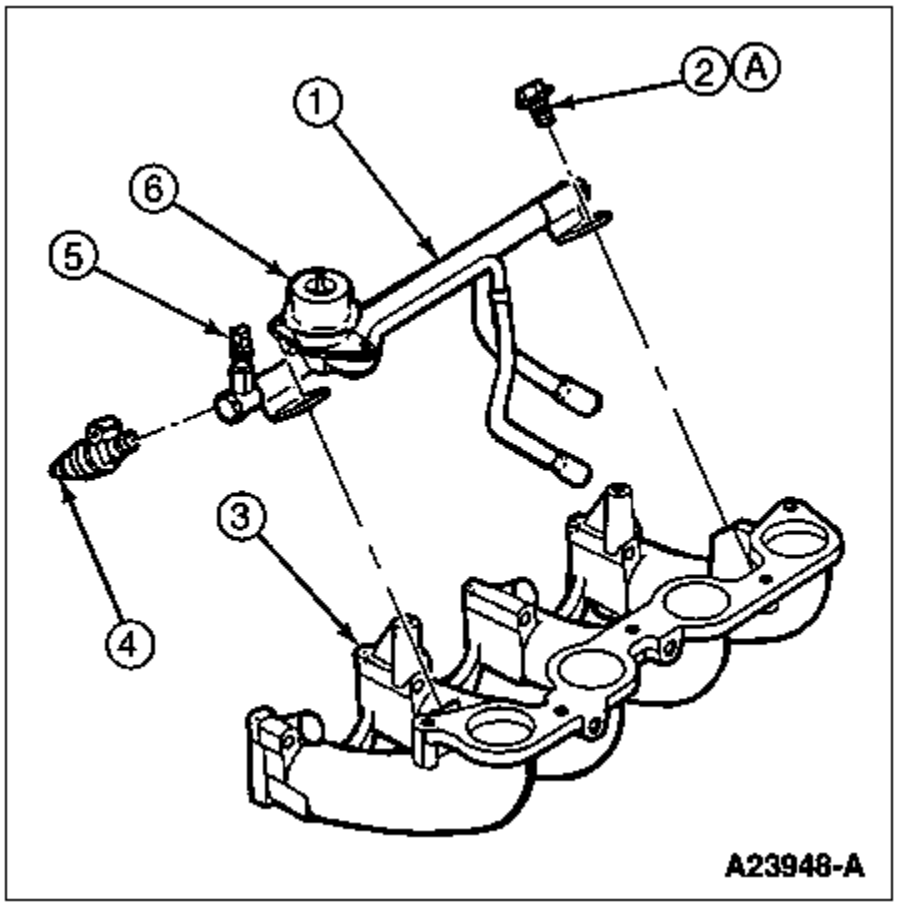
12. Remove two screws and fuel injection supply manifold (9D280) from lower intake manifold, if

tomsn048@gmail.com

necessary.

13. Remove fuel injector nozzle tips from lower intake manifold, if necessary. Grasping injector body, pull up while gently rocking injector from side to side.

14. If necessary, remove bolt and 42-pin connector bracket.



Item	Part Number	Description
1	9D280	Fuel Injection Supply Manifold
2	N807897-S100	Bolt, M8-1.25 x 31
3	9424	Intake Manifold, Lower
4	9F593	Fuel Injector
5	9H321	Fuel Pressure Relief Valve
6	9C968	Fuel Pressure Regulator
A	—	Tighten to 20-30 Nm (15-22 Lb-Ft)

Installation

tomsn048@gmail.com

1. Clean and inspect the mounting faces of the intake manifold assembly and the cylinder head (6049). Both surfaces must be clean and flat.

2. If fuel injector nozzle tips were removed:

    a. Inspect injector O-rings (two per injector) for signs of deterioration.
    b. If replacing, lubricate new O-rings with 10W-30 motor oil such as XO-10W30-ASP or equivalent meeting Ford specification ESE-M2C153-E and install two on each injector.
    c. Install fuel injectors into lower intake manifold.

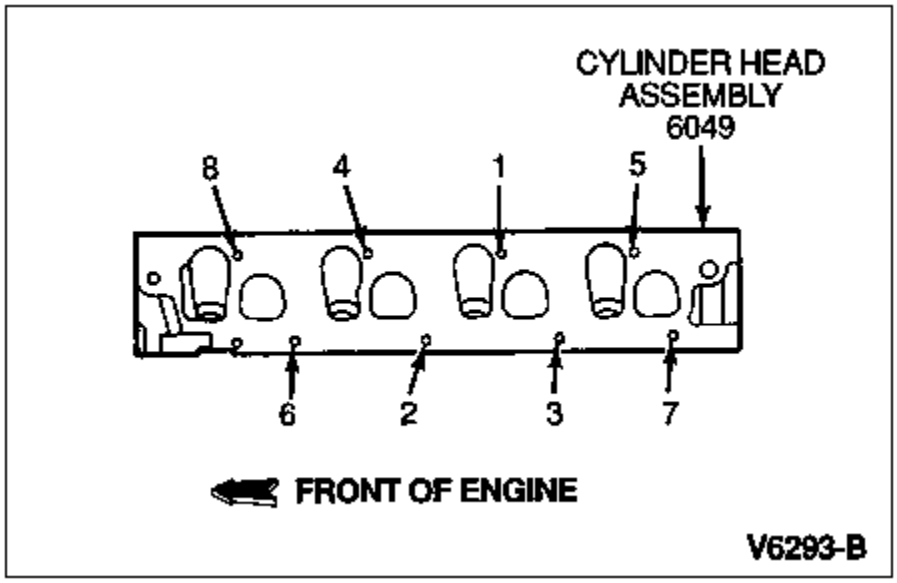
3. If removed, install fuel injection supply manifold. Tighten bolts to 20-30 Nm (15-22 lb-ft).

4. Clean and lightly oil manifold bolt threads.

5. Install a new intake manifold gasket (9439).

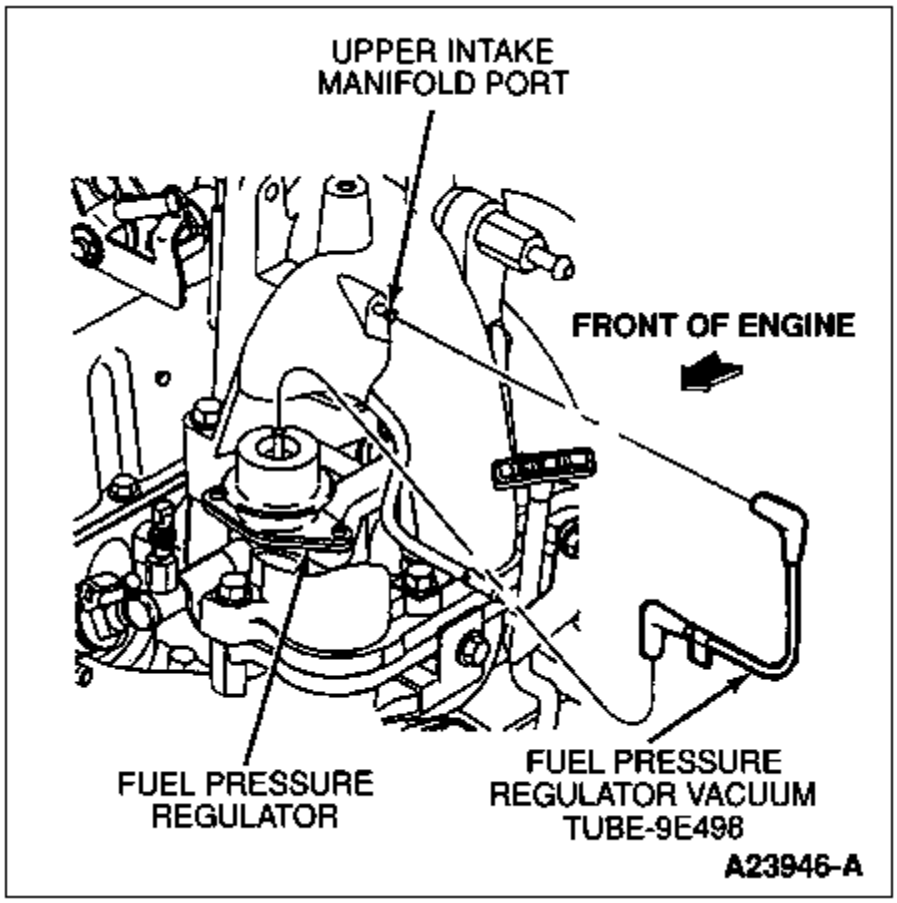
6. Position the lower manifold assembly to cylinder head. Install four upper manifold retaining bolts/studs finger-tight.

7. Install four remaining manifold bolts/studs. Tighten all bolts to 26-38 Nm (19-28 lb-ft) following the tightening sequence.



8. Connect electrical connectors to fuel injector nozzle tips.

tomsn048@gmail.com



9. Push wiring harness clip onto front bottom intake manifold stud.

10. Install dash panel ground cable on rear bottom intake manifold stud and tighten nut to 9-12 Nm (80-106 lb-in).

11. Install upper intake manifold as outlined in this section.

12. **NOTE: When the battery has been disconnected and reconnected, some abnormal drive symptoms may occur while the powertrain control module relearns its adaptive strategy. The vehicle may need to be driven to relearn the strategy.**

    Connect battery ground cable.

13. Start engine (6007) and check for leaks.

Lower Intake Manifold Installation, 2.3L

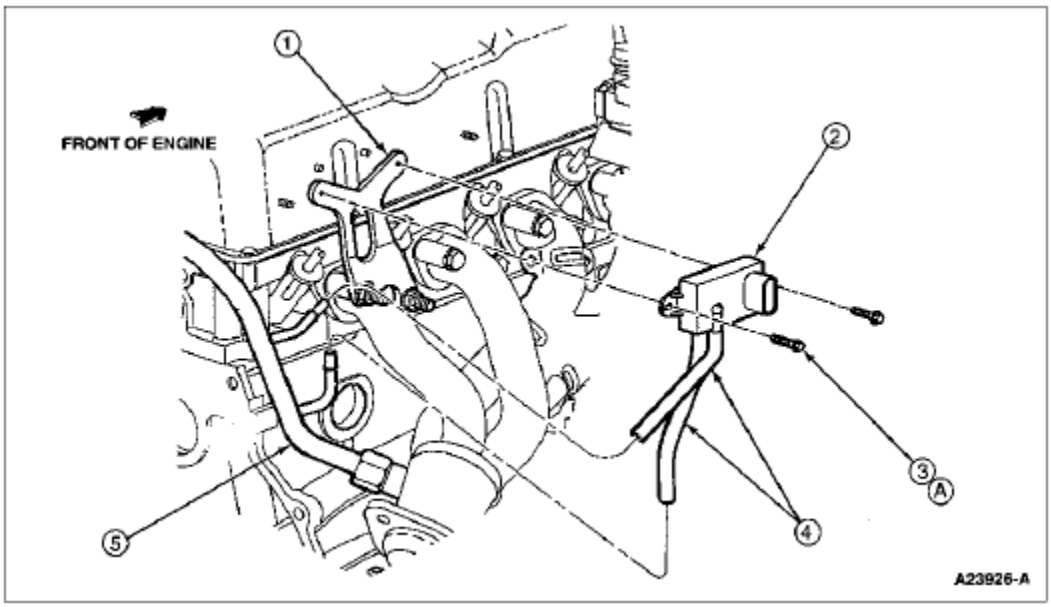
Exhaust Manifold

Removal

1. Install protective covers.
2. Disconnect intake air temperature sensor (IAT sensor) (12A697).
3. Remove air cleaner outlet tube (9B659).
4. Disconnect EGR transducer (9J433) tubes from EGR valve to exhaust manifold tube (9D477).

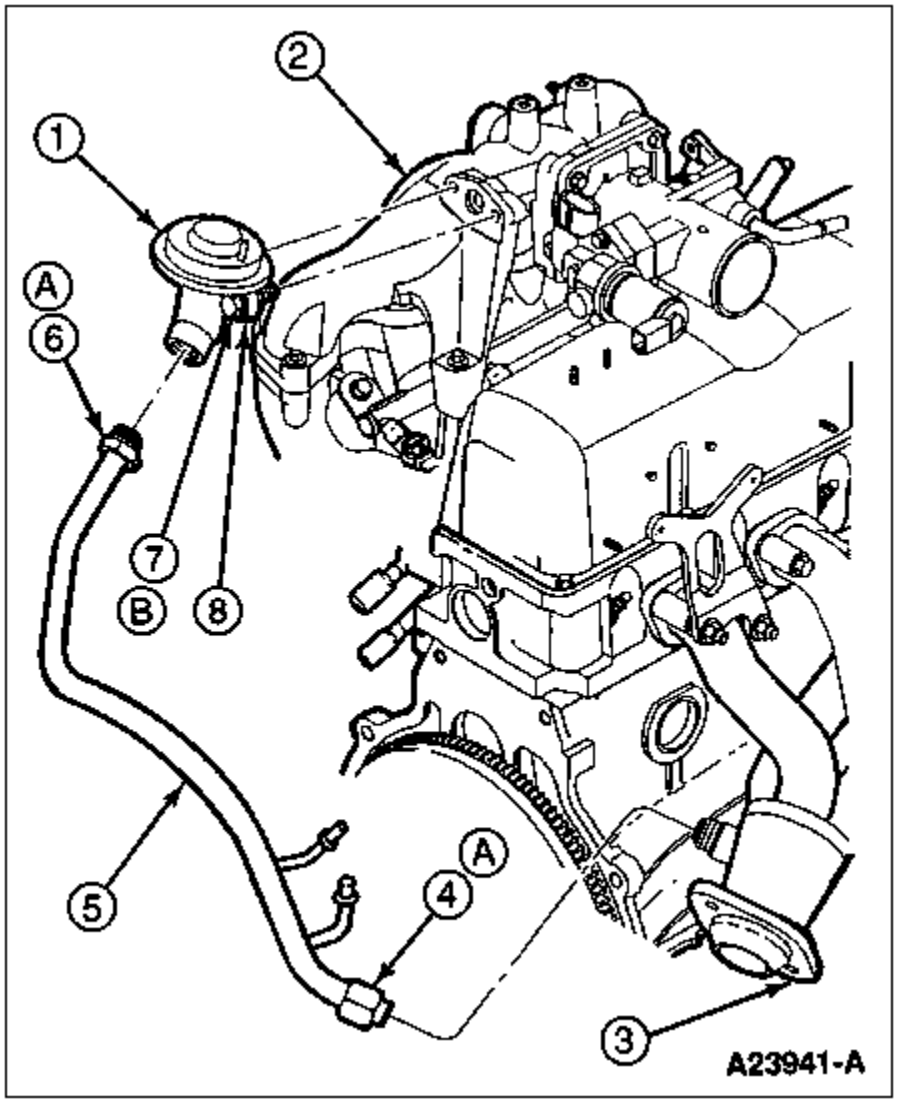
EGR Transducer



Item	Part Number	Description
1	17A084	Engine Lifting Eye
2	9J433	EGR Transducer
3	N807202-S36	Bolt, M5-0.8 x 16
4	—	Hoses (Part of 9J433)
5	9D477	EGR Valve to Exhaust Manifold Tube
A	—	Tighten to 2.7-3.7 Nm (24-32 Lb-In)

tomsn048@gmail.com

5. Remove EGR valve to exhaust manifold tube at the exhaust manifold (9430) and at the EGR external pressure valve (9F483).



Item	Part Number	Description
1	9D475	EGR Valve
2	9424	Upper Intake Manifold
3	9430	Exhaust Manifold
4	—	Nut (Part of 9D477)
5	9D477	EGR Valve to Exhaust Manifold Tube
6	—	Nut (Part of 9D477)
7	N806781-S2	Screw, M8-1.25 x 35
8	9D476	EGR Valve Gasket
A	—	Tighten to 34-47 Nm

tomsn048@gmail.com

		(25-35 Lb-Ft)
B	—	Tighten to 20-30 Nm (15-22 Lb-Ft)

6. Disconnect three way catalytic converter (TWC) (5E212) from exhaust manifold.
7. Remove two nuts and remove rear engine lifting eye from exhaust manifold studs with DPFE sensor and hoses attached.
8. Remove two studs and six bolts and remove exhaust manifold and exhaust manifold gasket (9448) from engine (6007).

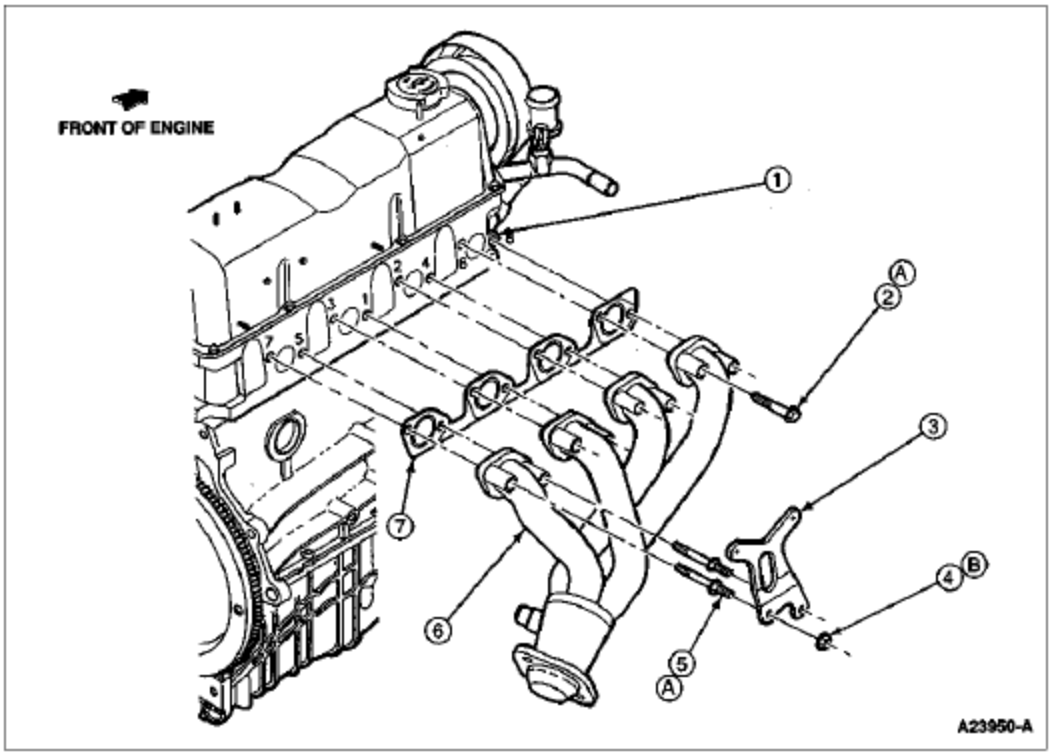
Installation

1. If necessary, clean gasket surfaces on exhaust manifold and cylinder head.
2. Install exhaust manifold and exhaust manifold gasket.
3. Install fasteners.
4. **NOTE: Exhaust manifold fasteners must be tightened in two stages.**

   Tighten fasteners to 20-30 Nm (15-22 lb-ft) in the sequence shown in the illustration.
5. Retighten fasteners to 60-80 Nm (45-59 lb-ft) in the sequence shown in the illustration.
6. Position engine rear lifting eye on studs as shown in the illustration. Install retaining nuts and tighten to 20-30 Nm (15-25 lb-ft).
7. Install EGR valve to exhaust manifold tube. Tighten nuts to 34-47 Nm (25-35 lb-ft).
8. Connect EGR transducer hoses to EGR valve to exhaust manifold tube in correct order.
9. Connect three way catalytic converter to exhaust manifold. Refer to Section 09-00 .
10. Install the air cleaner outlet tube.
11. Connect intake air temperature sensor and mass air flow sensor (MAF sensor) (12B579).

Exhaust Manifold

tomsn048@gmail.com



Item	Part Number	Description

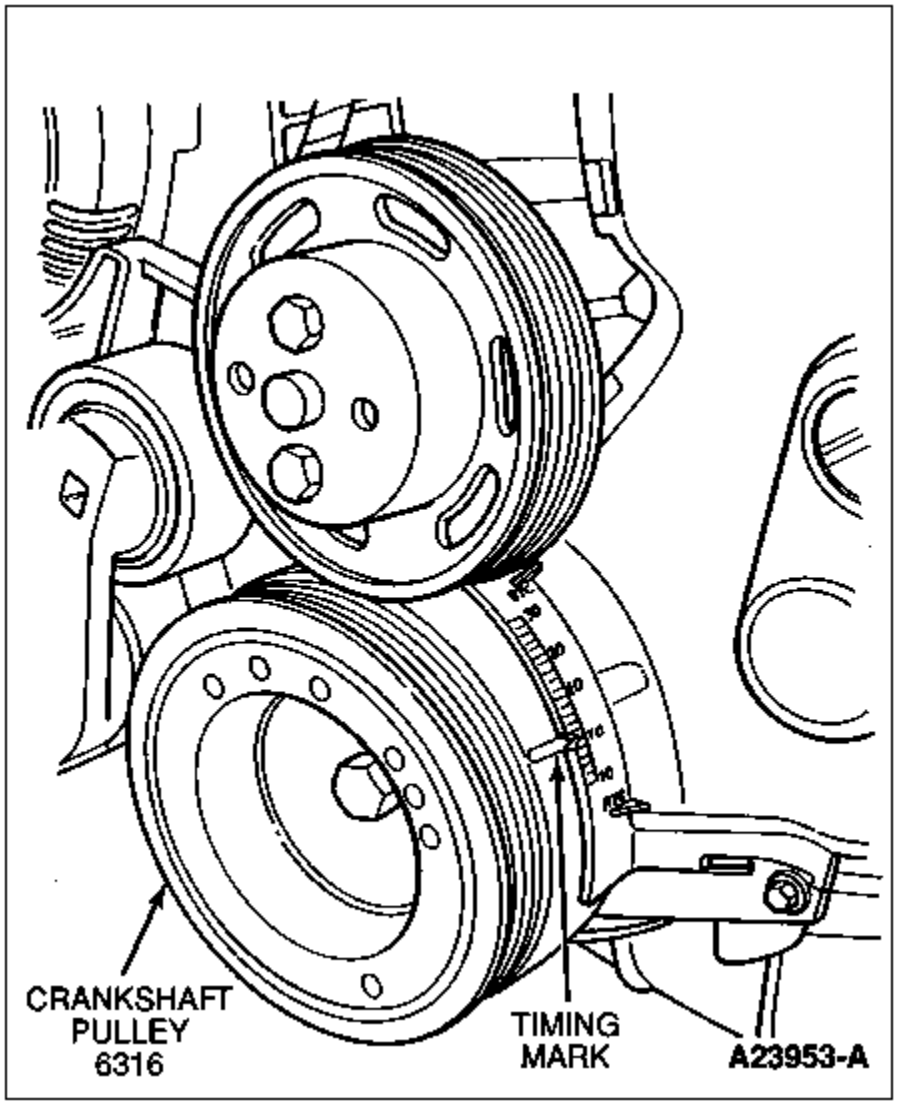
Oil Pump

Removal

1. Rotate crankshaft (6303) so number one piston (6108) is at TDC (Top Dead Center) of its compression stroke.

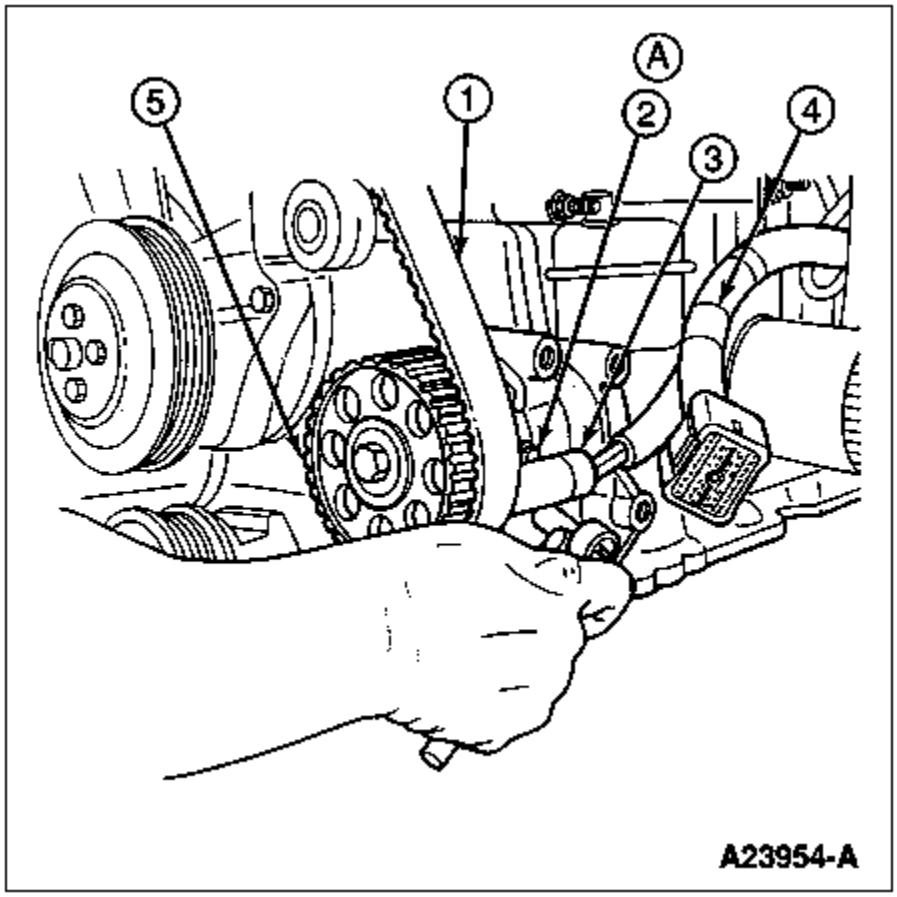


2. Remove outer timing belt cover as outlined in this section.

3. Remove timing belt as outlined in this section.

tomsn048@gmail.com

4. Remove oil pump timing belt sprocket as outlined in this section.
5. Disconnect the camshaft position (CMP) sensor wiring connector.
6. Remove two screws and camshaft position sensor (CMP sensor) (6B288).

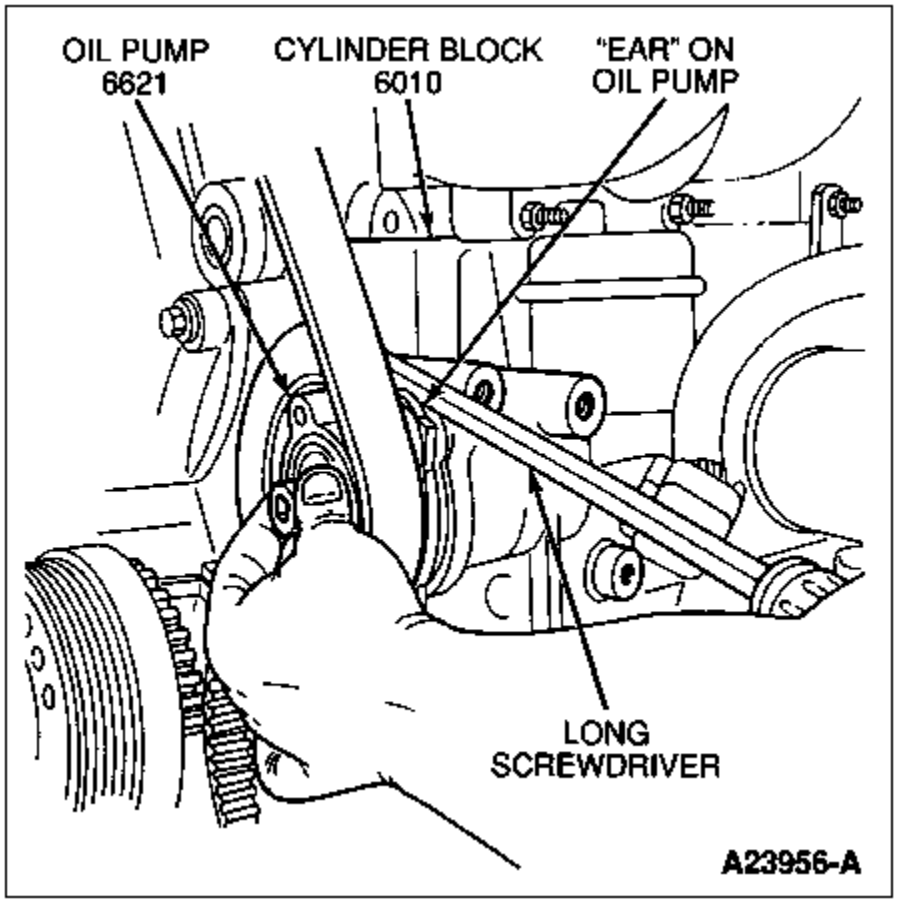


Item	Part Number	Description
1	6E005	Inner Timing Belt Cover
2	N605880-S3098	Bolt, M5-0.8 x 20 (Part of 6007)
3	6B288	Camshaft Position Sensor
4	12A581	Engine Control Sensor Wiring
5	6256	Camshaft Sprocket
A	—	Tighten to 5-7 Nm (45-61 Lb-In)

7. Remove four oil pump screws.
8. **CAUTION: Do not pry on sealing surfaces.**

tomsn048@gmail.com

Pry between cylinder blocks (6010) and ear on oil pump (6600) as shown to loosen oil pump.



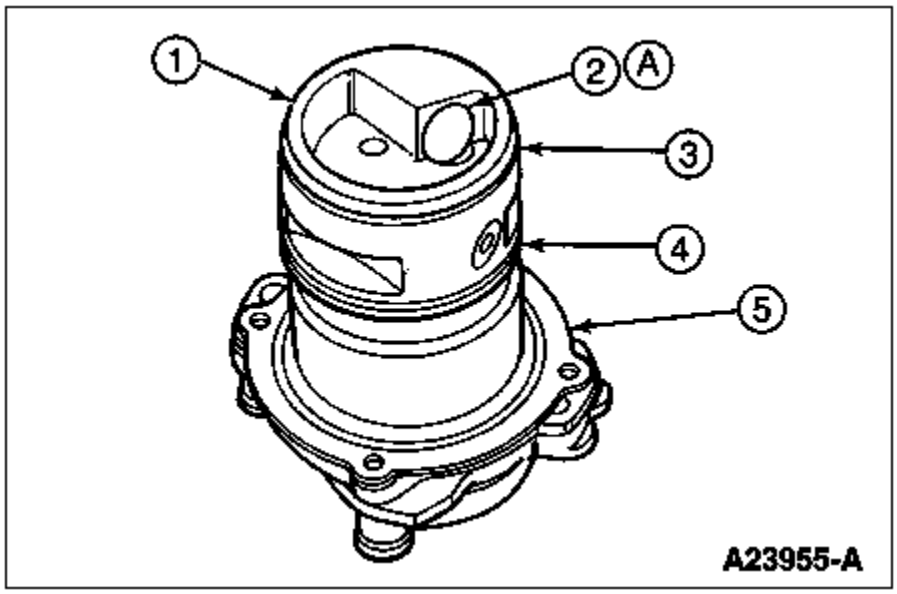
9. Remove oil pump and oil pump to cylinder block gasket (6659).
10. Clean surfaces of oil pump and cylinder blocks.

Installation

NOTE: Inspect and clean oil pump hole in the cylinder block before installing the oil pump.

1. If original oil pump is to be reused, install new oil pump O-ring seals on oil pump.
2. Prime back of oil pump and O-rings with 236 ml (eight ounces) of fresh motor oil.
3. Add oil to cylinder block hole.

tomsn048@gmail.com

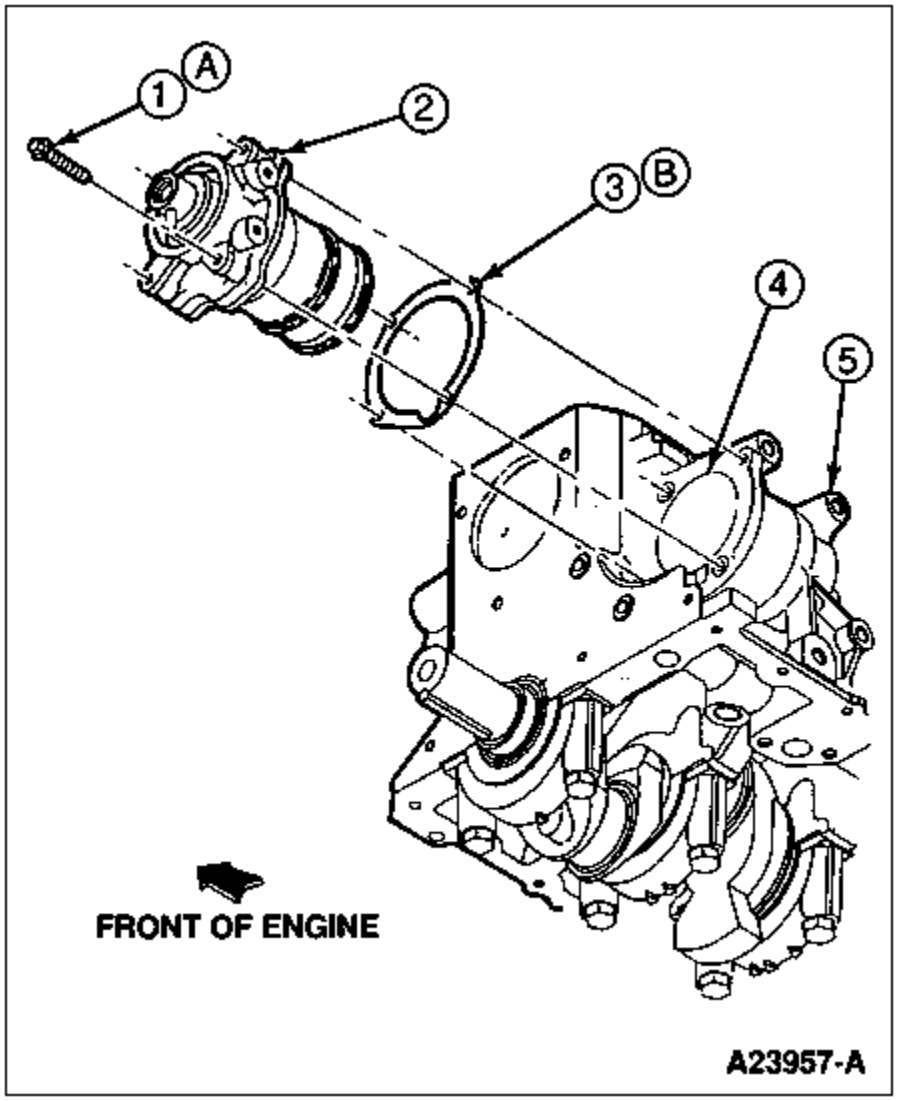


Item	Part Number	Description
1	6600	Oil Pump
2	—	Inlet Passage (Part of 6621)
3	87071-S100	O-Ring
4	87072-S100	O-Ring
5	6659	Oil Pump to Cylinder Block Gasket
A	—	Tilt Oil Pump and Pour In 236 ml (8 Oz.) of Motor Oil to Prime Pump

4. Install oil pump and oil pump to cylinder block gasket being careful to retain the oil in the back of the pump.
5. Install four oil pump screws and tighten to 10-14 Nm (89-123 lb-in).
6. Install oil pump sprocket as outlined in this section.
7. Check to make sure crankcase is filled to proper level with motor oil.
8. Prime oil pump with a drill motor, by rotating oil pump sprocket approximately 10 revolutions or until resistance is felt.
9. Install camshaft position sensor and screws. Tighten screws to 5-7 Nm (45-70 lb-in).
10. Connect the camshaft position sensor electrical connector.
11. Align timing marks and install timing belt as outlined in this section.
12. Install outer timing belt cover as outlined in this section.

tomsn048@gmail.com

13. Install oil filler cap (6766) and tighten until it ratchets.



Item	Part Number	Description

2	6600	Oil Pump
3	6659	Oil Pump to Cylinder Block Gasket
4	—	Oil Pump Cavity (Part of 6010)
5	6010	Cylinder Blocks
A	—	Tighten to 10-14 Nm (88-123 Lb-In)
B	—	Side Marked "Block" Goes Toward Cylinder Block

tomsn048@gmail.com

tomsn048@gmail.com

Flywheel

Removal

1. Remove transmission (7003). Refer to Section 07-01A , Section 07-01B or Section 07-03 depending on transmission type.
2. Remove clutch, if equipped, as outlined in Section 08-01 .
3. Remove attaching bolts and flywheel, or flexplate and flywheel reinforcing plate (6A366).

Installation

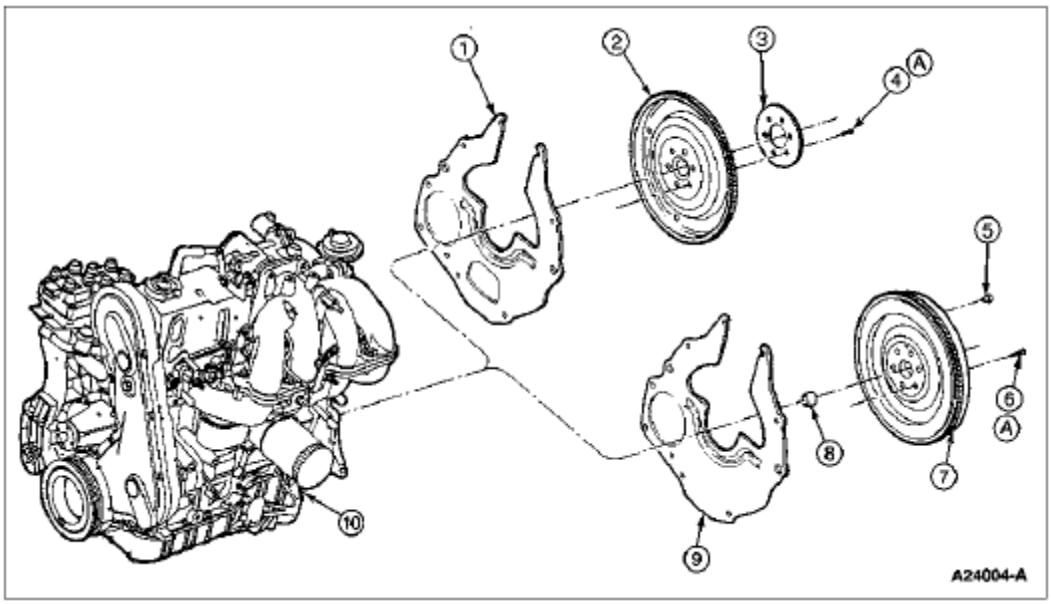
NOTE: All major rotating components including flex plate/flywheel are individually balanced to zero. Engine assembly balancing is not required. Balance weights should NOT be installed on new flywheels.

NOTE: Special bolts are used for flywheel/flexplate installation. Do not use standard bolts.

1. If vehicle has manual transmission, inspect pilot bearing. If necessary, replace as outlined in Section 08-01 .
2. Install engine rear plate (7007), if removed.
3. Position flywheel or flexplate and flywheel reinforcing plate on the crankshaft and install attaching bolts. Tighten in standard cross-tightening sequence to 73-87 Nm (54-64 lb-ft).
4. If equipped, install clutch as outlined in Section 08-01 .
5. Install transmission as outlined in Section 07-01A , Section 07-01B or Section 07-03 , depending on transmission type.

Flywheel Installation, Automatic and Manual Transmission

tomsn048@gmail.com



Item	Part Number	Description
1	7007	Engine Rear Plate (Automatic Transmission)
2	6375	Flywheel (Automatic Transmission — Also Called Flexplate)
3	6A366	Flywheel Reinforcing Plate (Automatic Transmission)
4	N802741-S	Bolt, M10-1 x 20
5	6397	Flywheel Dowel — Manual Transmission Only (3 Places)
6	N800028-S	Bolt, M10-1 x 30
7	6375	Flywheel (Manual Transmission)
8	7120	Pilot Bearing
9	7007	Engine Rear Plate (Manual Transmission)
10	6007	Engine (2.3L)
A	—	Tighten to 73-87 Nm (54-64 Lb-Ft)

Crankshaft Rear Oil Seal

SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
Jet Plug Remover	T77L-9533-B
Rear Main Seal Replacer	T82L-6701-A

Removal

1. Remove transmission (7003) as outlined in Section 07-01A , Section 07-01B , or Section 07-03 , depending on transmission type.

2. Remove flywheel or flex plate as outlined in this section.

3. **NOTE: Clean exterior surface of crankshaft rear oil seal (6701) and cylinder blocks (6010) before removing crankshaft rear oil seal.**

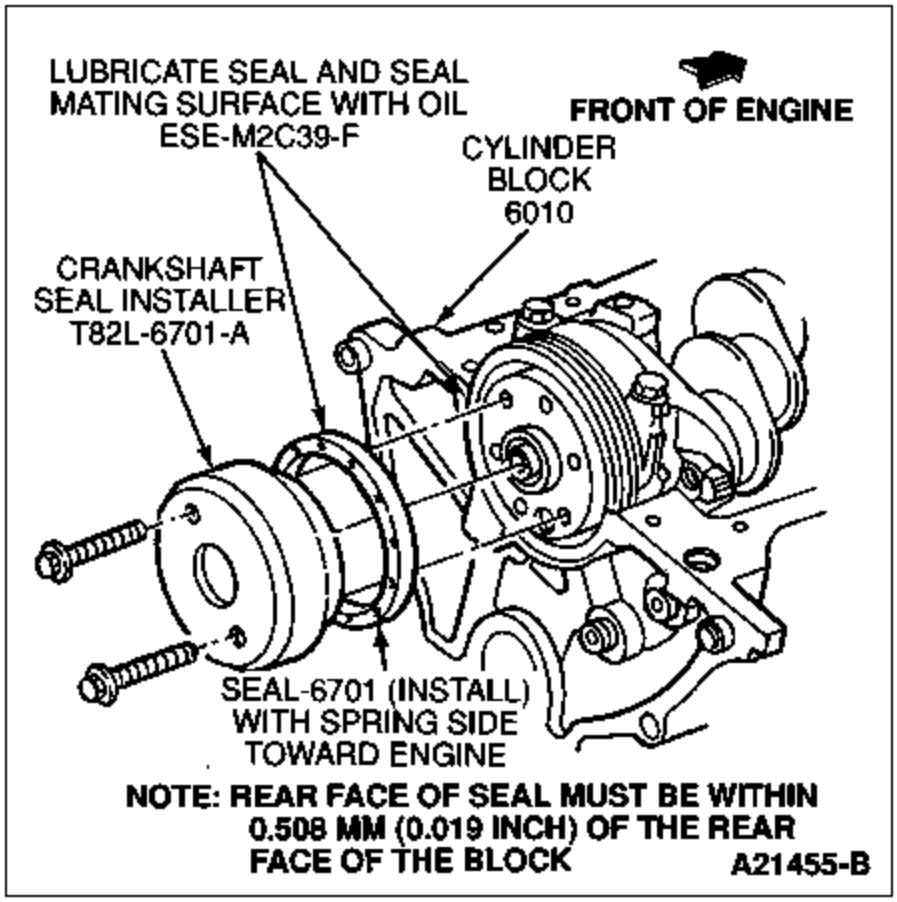
   Using a sharp awl, punch one hole into the seal metal surface between the seal lip and the cylinder blocks. Screw in the end of Jet Plug Remover T77L-9533-B. Remove crankshaft rear oil seal. Use caution to avoid scratching or damaging block or crankshaft oil seal surface.

Installation

1. Apply clean Motorcraft Super Premium Motor Oil XO-5W30-QSP or equivalent meeting Ford specification ESE-M2G153-E to seal lips and inner seal edge.

2. Place crankshaft rear oil seal on Rear Main Seal Replacer T82L-6701-A. Position to ol and crankshaft rear oil seal to rear of engine (6007). Alternate bolt tightening to seat the crankshaft rear oil seal properly.

tomsn048@gmail.com



3. Install flywheel or flex plate as outlined in this section.

4. Install transmission as outlined in Section 07-01A , Section 07-01B , or Section 07-03 , depending on transmission type.

tomsn048@gmail.com

tomsn048@gmail.com

Oil Filter and Adapter

Removal

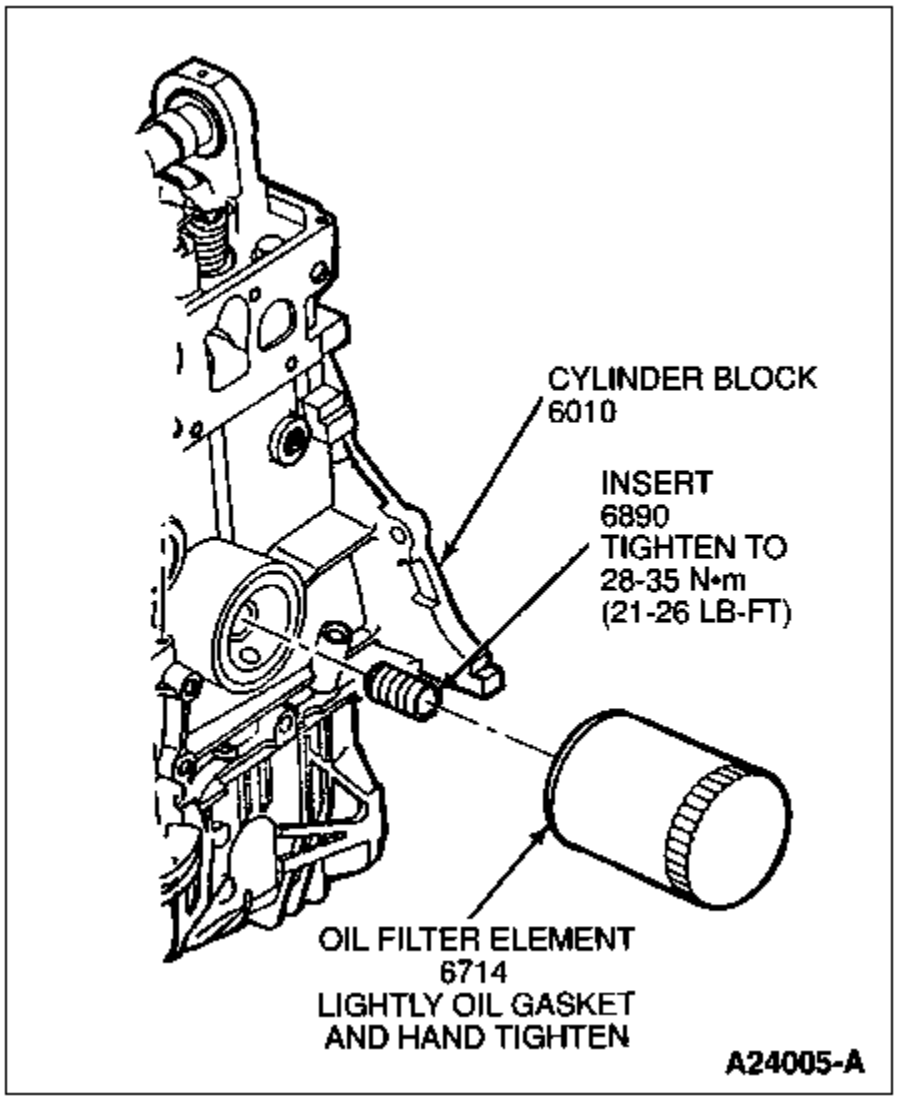
1. Position oil drain pan under oil filter.
2. Using suitable oil filter wrench, loosen oil filter.
3. Unscrew oil filter by hand and remove. Properly recycle or dispose of oil in filter.

Installation

1. Apply clean motor oil of the same type as is being used in the engine to the oil filter gasket.
2. **NOTE: Do not tighten filter with oil filter wrench.**

   Install oil filter and tighten by hand.

tomsn048@gmail.com



tomsn048@gmail.com

tomsn048@gmail.com

Oil Level Indicator Tube

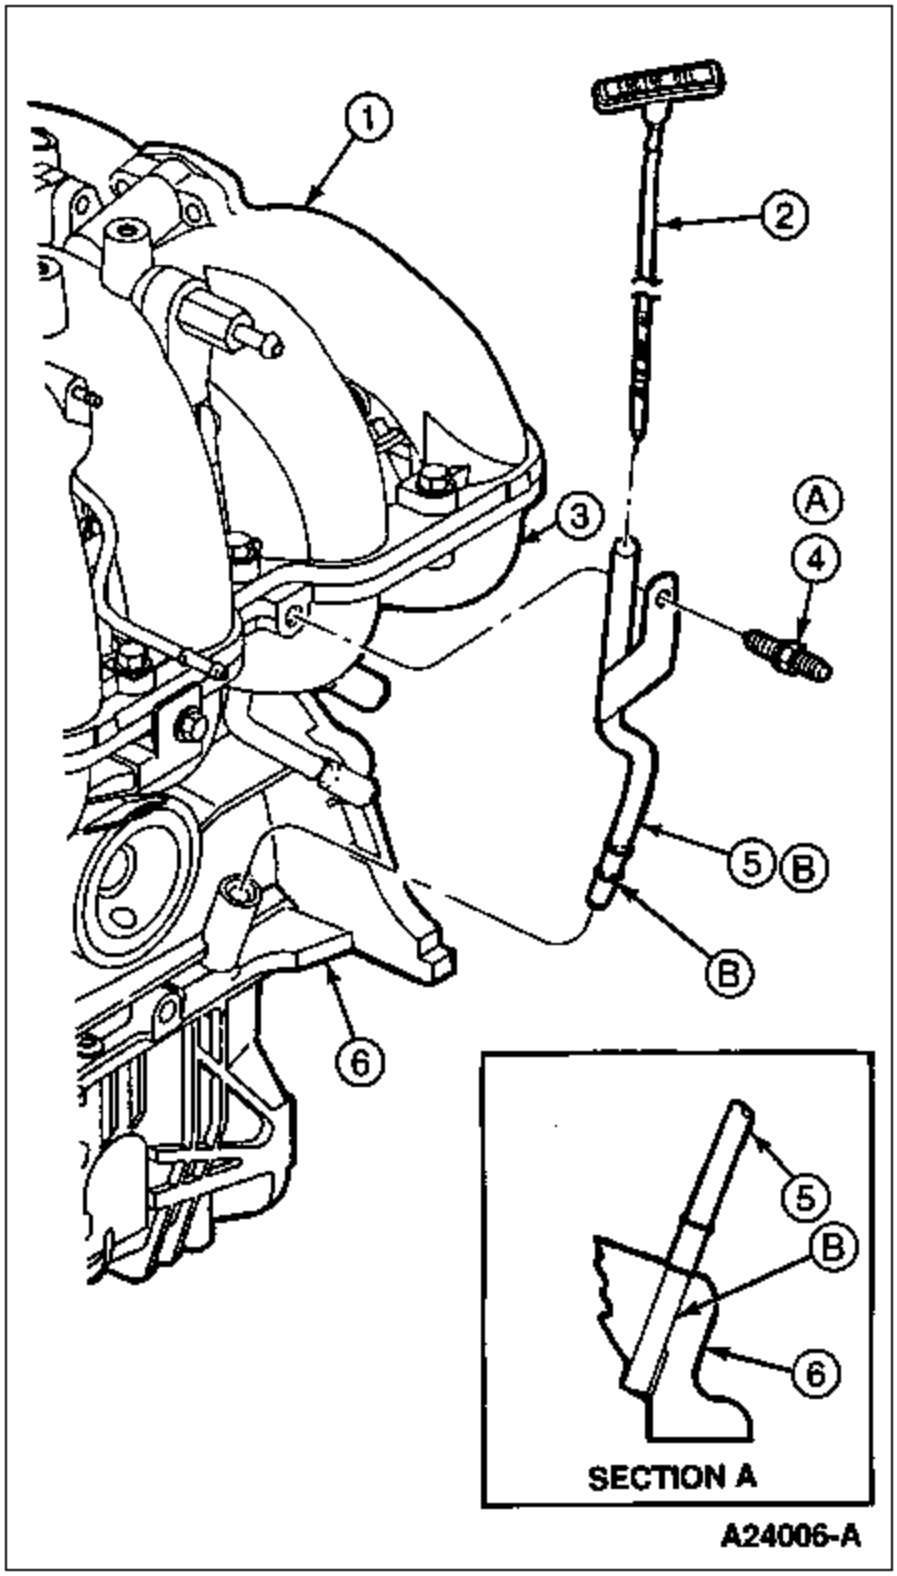
Removal

1. Remove oil level dipstick (6750).
2. Remove bolt securing oil level indicator tube (6754) to lower intake manifold.
3. Pull out oil level indicator tube from cylinder blocks (6010).

Installation

1. Clean all old sealer from the oil level indicator tube.
2. Apply Gasket Maker E2AZ-19562-B or equivalent meeting Ford specification WSK-M2G349-A10 to end of oil level indicator tube that pushes into cylinder block.
3. Install oil level indicator tube. Tighten stud to 20-30 Nm (15-22 lb-ft).
4. Install oil level dipstick.

tomsn048@gmail.com



Item	Part Number	Description
1	9424	Upper Intake Manifold

tomsn048@gmail.com

2	6750	Oil Level Dipstick
3	9424	Intake Manifold, Lower
4	N807689-S2	Stud, M8-1.25 x M5-0.80 x 42.3
5	6754	Oil Level Indicator Tube
6	6010	Cylinder Blocks
A	—	Tighten to 20-30 Nm (15-22 Lb-Ft)
B	—	Apply Gasket Maker E2AZ-19562-B (WSK-M2G349-A10) or Equivalent

tomsn048@gmail.com

Sensors

Oil Pressure Sender/Sensor

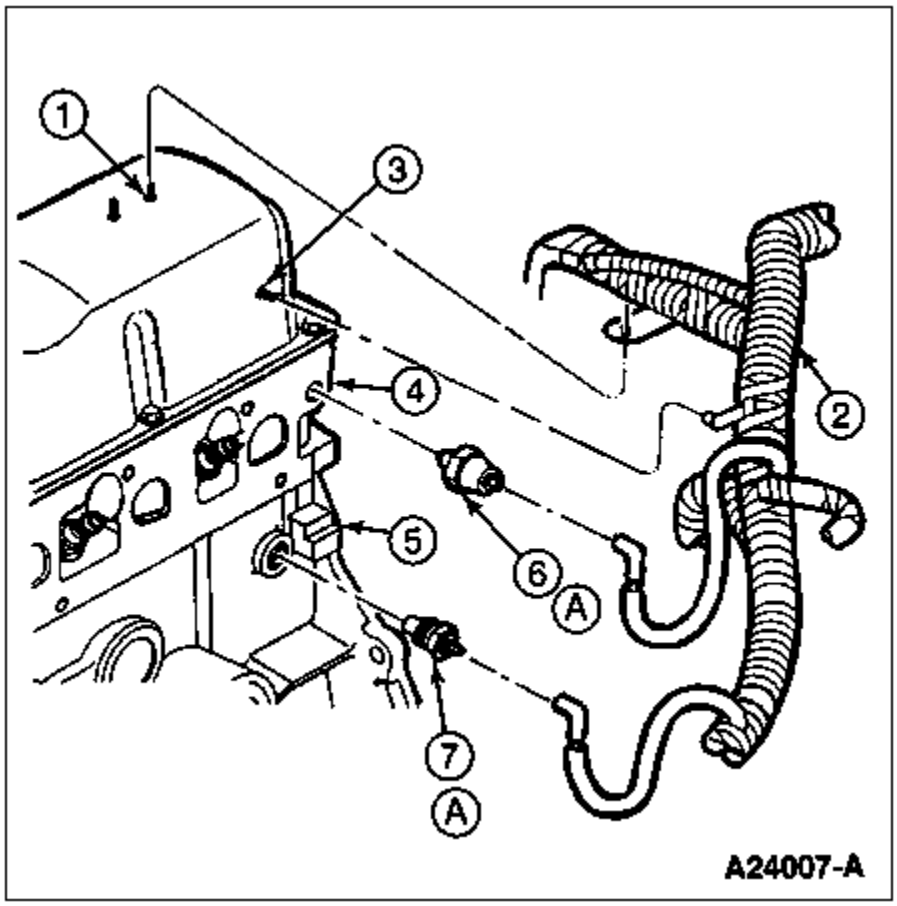
Removal and Installation

NOTE: The pressure switch-type sender used with the indicator lamp system is not interchangeable with the variable resistance-type unit which is used with the gauge system. Refer to the Master Parts Catalog for proper parts usage. Installation of the wrong part will result in an inoperative oil pressure indicating system and a damaged sender unit or gauge.

1. Make sure the ignition switch (11572) is turned off.
2. Disconnect the wire at the sender terminal.
3. Remove the oil pressure sensor (9278) from the cylinder head (6049).
4. Apply Pipe Sealant with Teflon® D8AZ-19554-A or equivalent meeting Ford specification WSK-M2G350-A2 to new sender threads.

   For installation follow removal procedures in reverse order. Tighten switch to 11-24 Nm (8-18 lb-ft).

tomsn048@gmail.com



Item	Part Number	Description
1	—	Stud (Part of 6582)
2	12A581	Engine Control Sensor Wiring
3	—	Stud (Part of 6582)
4	6049	Cylinder Head
5	6010	Cylinder Blocks
6	9278	Oil Pressure Sensor
7	10884	Water Temperature Indicator Sender Unit
A	—	Tighten to 11-24 Nm (97-212 Lb-In)

Engine Coolant Temperature Sensor

Refer to Section 03-14 for engine coolant temperature sensor (ECT sensor) (12A648) removal and installation.

tomsn048@gmail.com

tomsn048@gmail.com

Engine

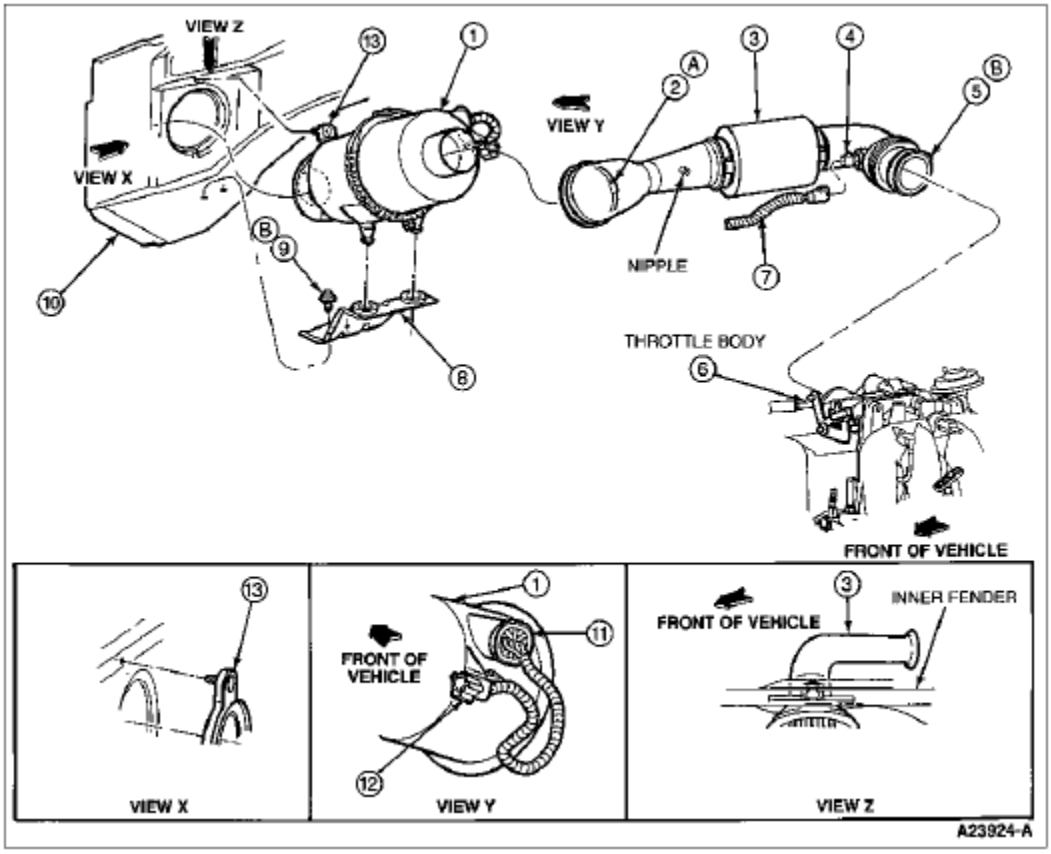
Removal

WARNING: RESIDUAL PRESSURE REMAINS IN FUEL SYSTEM AFTER ENGINE IS SHUT OFF. THIS COULD RESULT IN INJURY OR FIRE WHEN FUEL LINES ARE DISCONNECTED.

1. Disconnect inertia fuel shutoff switch (IFS switch) (9341) which is located in passenger compartment on the dash next to the transmission tunnel.
2. Crank engine (6007) with starter 15 seconds to depressurize fuel system.
3. Disconnect battery ground cable (14301) and battery to starter relay cable (14300).
4. Drain cooling system.
5. Mark hinge location and remove hood (16612).
6. Disconnect intake air temperature sensor (IAT sensor) (12A697).
7. Remove air cleaner outlet tube (9B659).

Air Filter and Inlet Tube

tomsn048@gmail.com

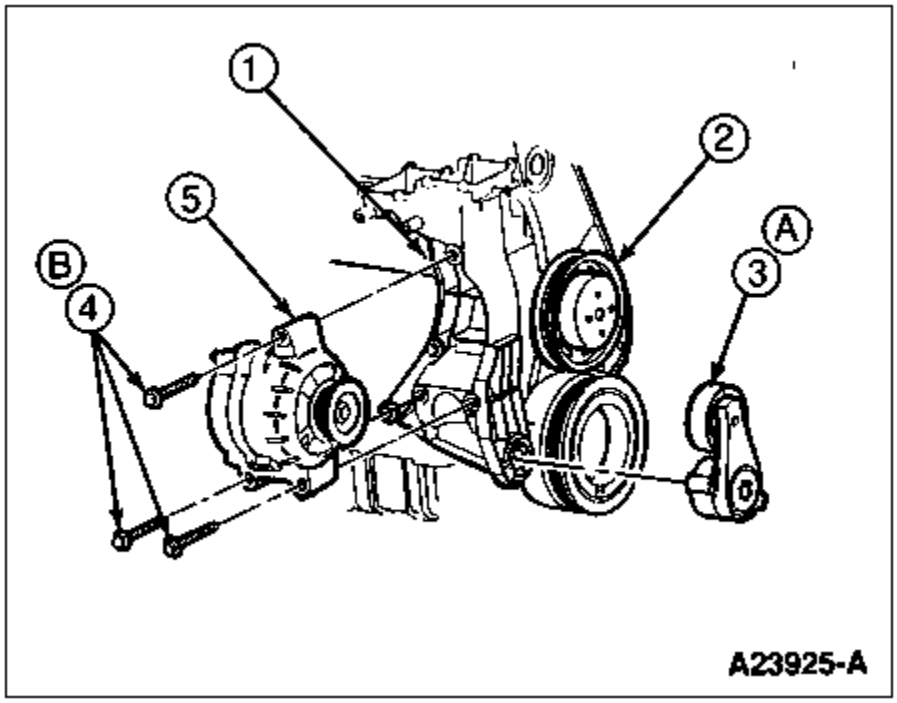


Item	Part Number	Description
1	9600	Engine Air Cleaner
2	—	Clamp (Part of 9F805)
3	9B659	Air Cleaner Outlet Tube
4	12A697	Intake Air Temperature Sensor
5	—	Clamp (Part of 9F805)
6	9E926	Throttle Body
7	12A581	Engine Control Sensor Wiring
8	9626	Engine Air Cleaner Mounting Bracket
9	N606074-S36	Screw, M6-1 x 16.5
10	16B145	Inner Fender
11	12B579	Mass Air Flow Sensor
12	—	Connector (Part of 12B579)
13	9C631	Air Cleaner Retainer
A	—	Tighten to 2.3-3.3 Nm (21-29 Lb-In)
B	—	Tighten to 9-12 Nm (79-107 Lb-In)

8. Remove accelerator control splash shield (9E766).

tomsn048@gmail.com

9. Remove upper radiator hose (8260) and lower radiator hose (8286).
10. If equipped remove fan guard (8A611) or, if equipped, remove four screws and fan shroud (8146) and hang on fan blade (8600).
11. Disconnect radiator overflow hose (8075).
12. Remove two radiator bolts and remove radiator (8005).
13. Remove nut and wire from generator (GEN) (10346).
14. Unplug generator connector.
15. Using suitable door trim tool, unfasten two wire clips and relocate generator cable out of the way.
16. Unplug engine coolant temperature sensor (ECT sensor) (12A648).
17. Remove three bolts and generator.



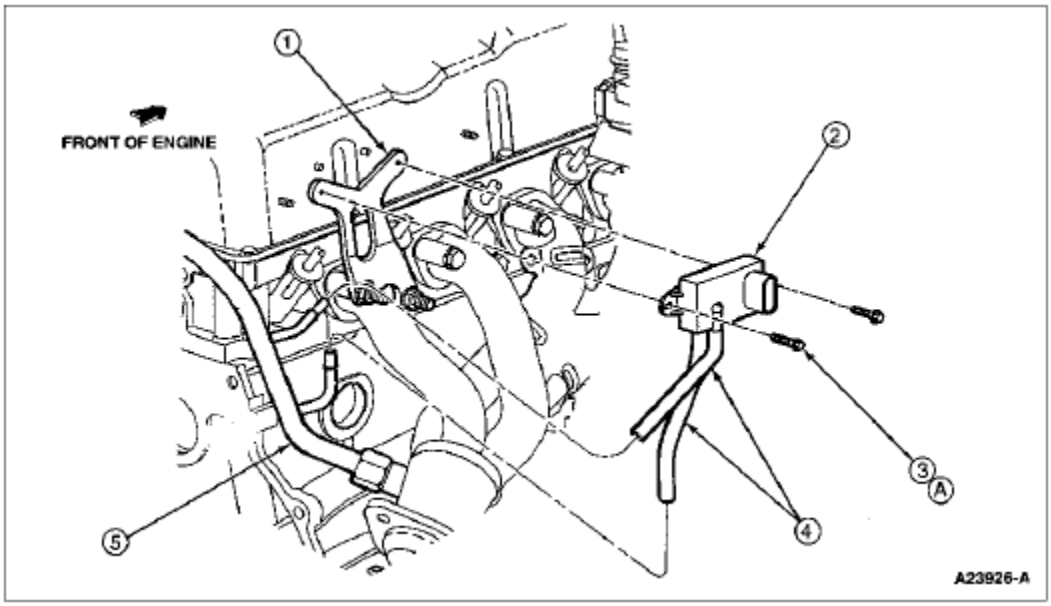
Item	Part Number	Description
1	10153	Generator Mounting Bracket
2	8509	Water Pump Pulley
3	6B209	Drive Belt Tensioner
4	N606068	Bolt, M10-1.5 x 80
5	10300	Generator
A	—	Tighten to 40-55 Nm

tomsn048@gmail.com

		(30-40 Lb-Ft)
B	—	Tighten to 41-54 Nm (30-40 Lb-Ft)

18. Disconnect upper heater water hose (18472) from water outlet connection, and tie out of the way.
19. Disconnect lower heater water hose from water pump inlet tubes.
20. Disconnect ignition wires from ignition coils (12029).
21. Disconnect engine control sensor wiring (12A581) from both ignition coils, EVR solenoid, and radio ignition interference capacitor (18801).
22. Remove two bolts and water pump inlet tube (8290) from generator mounting bracket (10153) and water pump (8501).
23. Remove three bolts and generator mounting bracket.
24. Disconnect accelerator cable (9A758) from lever on throttle body (9E926). Leave attached to bracket.
25. Remove two screws and assembled accelerator cable and bracket from throttle body and tie to the side.
26. Disconnect 42 pin and 104 pin connectors to engine compartment harness.
27. Disconnect and remove EGR pressure sensor from engine lifting eye.

EGR Transducer



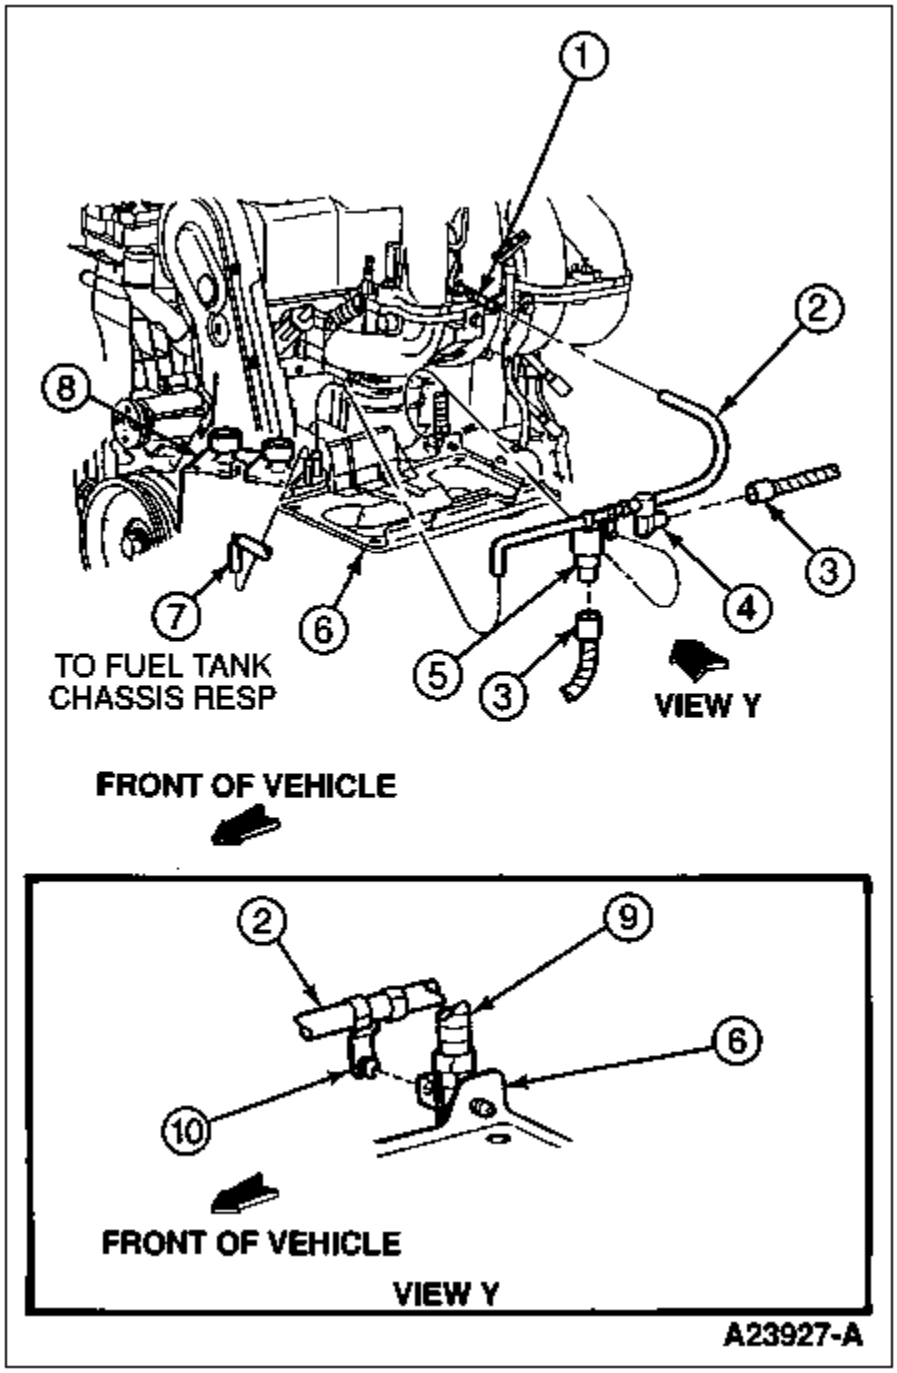
Item	Part Number	Description

tomsn048@gmail.com

1	17A084	Engine Lifting Eye
2	9J433	EGR Transducer
3	N807202-S36	Bolt, M5-0.8 x 16
4	—	Hoses (Part of 9J433)
5	9D477	EGR Valve to Exhaust Manifold Tube
A	—	Tighten to 2.7-3.7 Nm (24-32 Lb-In)

28. Disconnect Evaporative Emissions System purge hose located at left front corner of engine.

tomsn048@gmail.com



Item	Part Number	Description
1	9G271	Evaporative Emission Return Tube
2	9C987	Fuel Vapor Hose and Valve Assembly
3	14290	Engine Compartment Wiring Assembly
4	14A606	Thermistor Sensor (Part of 9C987)
5	9C915	Evaporative Emission (EVAP) Canister Purge

tomsn048@gmail.com

		Solenoid
6	10732	Battery Tray
7	9B248	Vapor Line to Fuel Tank
8	9D653	Evaporative Emissions Canister
9	14300	Battery to Starter Relay Cable
10	—	Hose Clip (Part of 9C987)

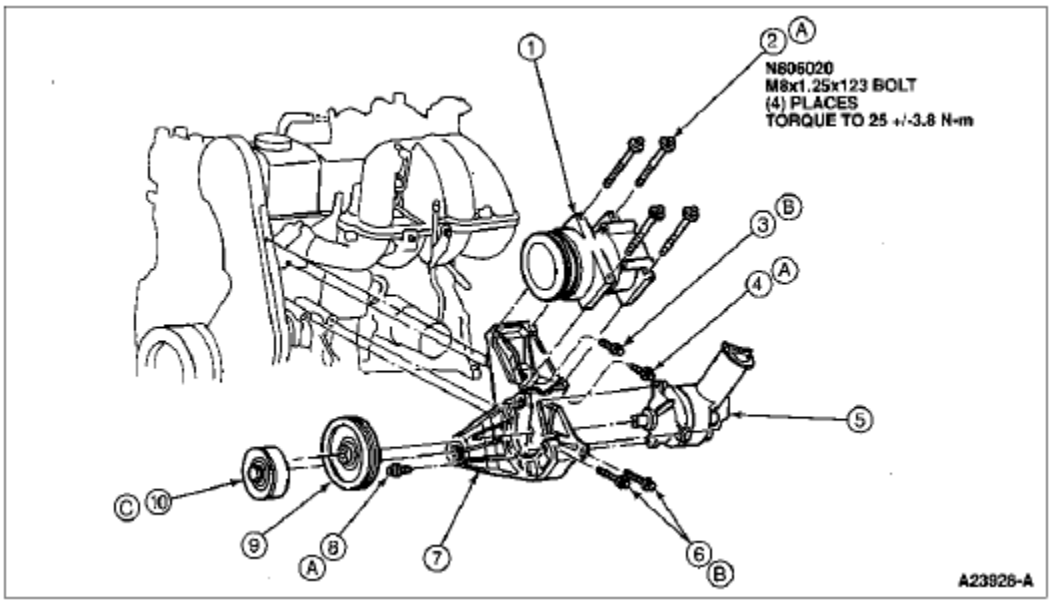
29. If equipped, using Rotunda R134a Recovery Unit, discharge Air Conditioning System.

30. Using quick disconnect tools as outlined in Section 12-00 , disconnect air conditioning hoses from suction accumulator and condenser.

31. Remove four bolts and A/C compressor (19703) and the A/C manifold and tube (19D734).

32. Remove power steering pump bracket bolts. Set off as far as possible. Bracket will catch on steering gear and intake manifold, but can be moved enough to remove engine.

EGR Transducer



Item	Part Number	Description
1	19703	A/C Compressor
2	N806020	Bolt, M8-1.25 x 123
3	N606572	Bolt, M10-1.5 x 123
4	N606051	Bolt, M8-1.25 x 100
5	3A674	Power Steering Pump

tomsn048@gmail.com

6	N606068-S309	Bolt, M10-1.5 x 80
7	2882	A/C Compressor Mounting Bracket
8	N800199	Bolt, M10-1.5 x 33
9	3A733	Power Steering Pump Pulley
10	3F671	Power Steering Belt Idler Support
A	—	Tighten to 22-28 Nm (15-21 Lb-Ft)
B	—	Tighten to 41-54 Nm (29-40 Lb-Ft)
C	—	Tighten to 53-71 Nm (39-53 Lb-Ft)

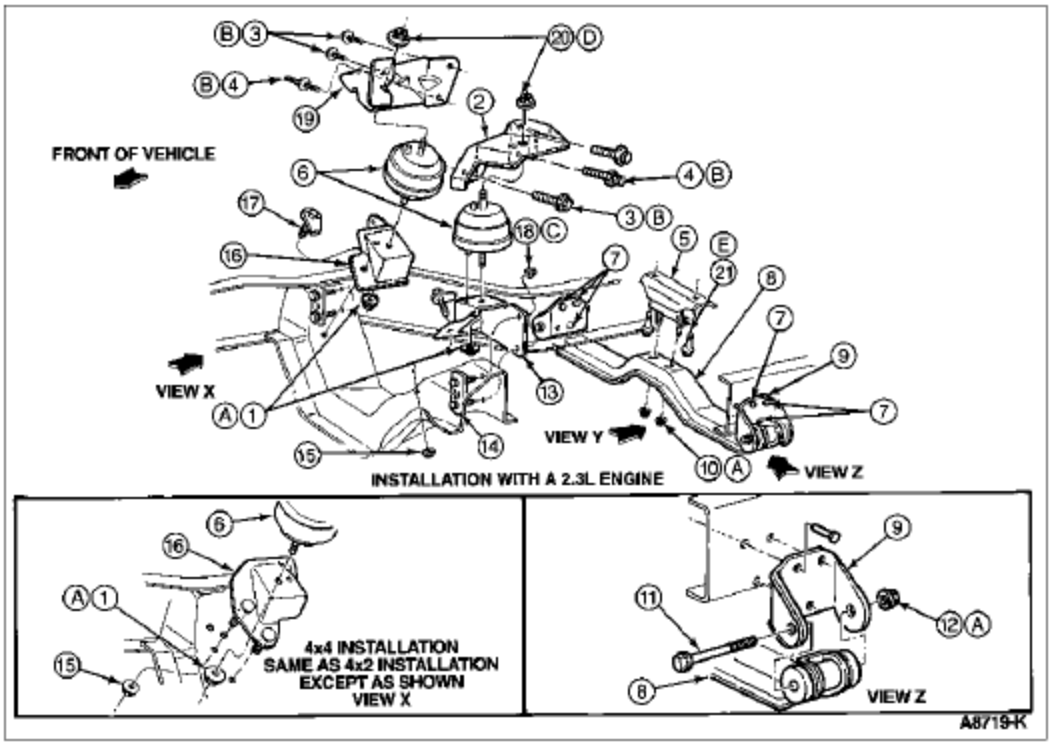
33. Raise vehicle.
34. Remove starter motor solenoid terminal cover (11N087).
35. Disconnect starter electrical connections.
36. Disconnect heated oxygen sensors (HO2S) (9F472) lead connectors.
37. Remove two bolts and disconnect three way catalytic converter (TWC) (5E212) from exhaust manifold (9430).
38. Remove both fuel tube clips.
39. Using fuel system quick disconnect tool as outlined in Section 03-04A disconnect fuel return hose from fuel injection supply manifold (9D280).
40. Using fuel system quick disconnect tool as outlined in Section 03-04A , disconnect fuel supply hose from fuel injection supply manifold.
41. Disconnect three connectors from transmission lead.
42. Remove bolt and disconnect ground cable from left side of engine.
43. Remove three bolts and starter motor (11002).
44. If vehicle has automatic transmission, remove torque converter-to-flywheel nuts.
45. Remove two engine-to-transmission bolts at right rear engine support bracket (6096) and left rear engine support bracket.
46. Remove four lower engine-to-transmission bolts and spacers, if equipped.
47. Lower vehicle.
48. Support transmission (7003) with a suitable transmission jack.
49. Connect lifting equipment to engine lifting eyes and support engine.
50. Remove top two engine-to-transmission bolts.

tomsn048@gmail.com

51. Remove two bottom engine-to-transmission bolts and spacers, if equipped.

52. Remove engine mount nuts.

Front and Rear Engine Insulator Assemblies, Ranger with 2.3L Engine



Item	Part Number	Description
1	N801995	Nut and Washer
2	6031	Front Engine Support Mounting Bracket
3	N802653	Screw and Washer
4	N804044	Stud
5	6068	Transmission Support Insulator
6	6038	Front Engine Support Insulator
7	65092	Rivet
8	6A023	Transmission Support Crossmember
9	6096	Rear Engine Support Bracket
10	—	Nut (3 Req'd) (Part of 6068)
11	N803660	Bolt
12	N800937	Nut
13	6029	Front Engine Support Bracket (LH)
14	N802453	Bolt and Retainer

tomsn048@gmail.com

15	N802330	Nut and Washer
16	6028	Front Engine Support Bracket
17	N805420	Bolt and Retainer
18	N802073	Nut
19	6030	Front Engine Support Mounting Bracket
20	N807479-S100	Nut
21	390066-S2	Screw and Washer (2 Req'd)
A	—	Tighten to 88-115 Nm (65-85 Lb-Ft)
B	—	Tighten to 61-88 Nm (45-65 Lb-Ft)
C	—	Tighten to 97-127 Nm (71-94 Lb-Ft)
D	—	Tighten to 88-118 Nm (65-87 Lb-Ft)
E	—	Tighten to 81-109 Nm (60-80 Lb-Ft)

53. With help of assistant, remove engine.

54. Mount engine on suitable engine stand.

Installation

CAUTION: If oil pan (6675) was not changed, make sure any spacers on the oil pan-to-transmission holes are in place before installing transmission. If oil pan was replaced, make sure any spacers determined necessary in oil pan installation or engine assembly procedure are in place. If clearance between the engine oil pan and transmission is insufficient or excessive, oil pan damage or oil leakage can occur when pan-to-transmission bolts are tightened.

1. Position lifting equipment and remove engine from engine stand.

2. **NOTE: To facilitate engine installation, make two guide pins from M10 x 22mm bolts by cutting off the hex-heads and grinding a screwdriver slot in the head end. Install guide pins on opposite sides in engine-to-transmission bolt holes, before attempting to install engine-to-transmission.**

   Install guide pins in transmission.

3. Install engine with help of assistant.

4. Install engine mount nuts. Tighten to 88-118 Nm (65-87 lb-ft).

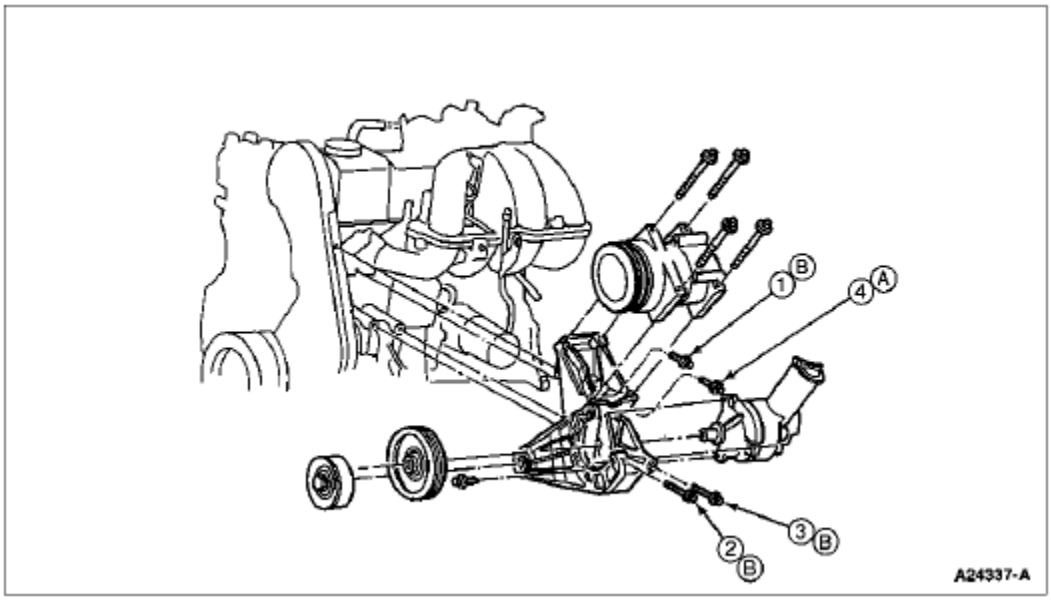
5. Position A/C compressor mounting bracket (2882) with assembled power steering pump (3A674) and install bolts. Tighten power steering pump bracket-to-engine bolts to 1 at 21-28 Nm (16-20 lb-ft) and 3 at 40-55 Nm (30-41 lb-ft).

tomsn048@gmail.com

6. Remove transmission jack from under transmission and raise vehicle on hoist.

7. Install engine-to-transmission bolts, except those where guide pins are located and the two top bolts, and tighten snug but not tight.

Compressor Mounting Bracket Torque Sequence



Item	Part Number	Description
1	N606572	Bolt, M10-1.5 x 123
2	N606068	Bolt, M10-1.5 x 80
3	N606068	Bolt, M10-1.5 x 80
4	N606051	Bolt, M8-1.25 x 100
A	—	Tighten to 22-28 Nm (15-21 Lb-Ft)
B	—	Tighten to 41-54 Nm (29-40 Lb-Ft)

8. Remove two guide pins and replace with bolts.

9. Tighten engine-to-transmission bolts to 38-51 Nm (28-38 lb-ft).

10. On vehicles with automatic transmission, install torque converter-to-flywheel nuts. Tighten to 31-39 Nm (23-39 lb-ft).

11. Install starter motor. Tighten starter-to-engine bolts to 20-27 Nm (15-20 lb-ft).

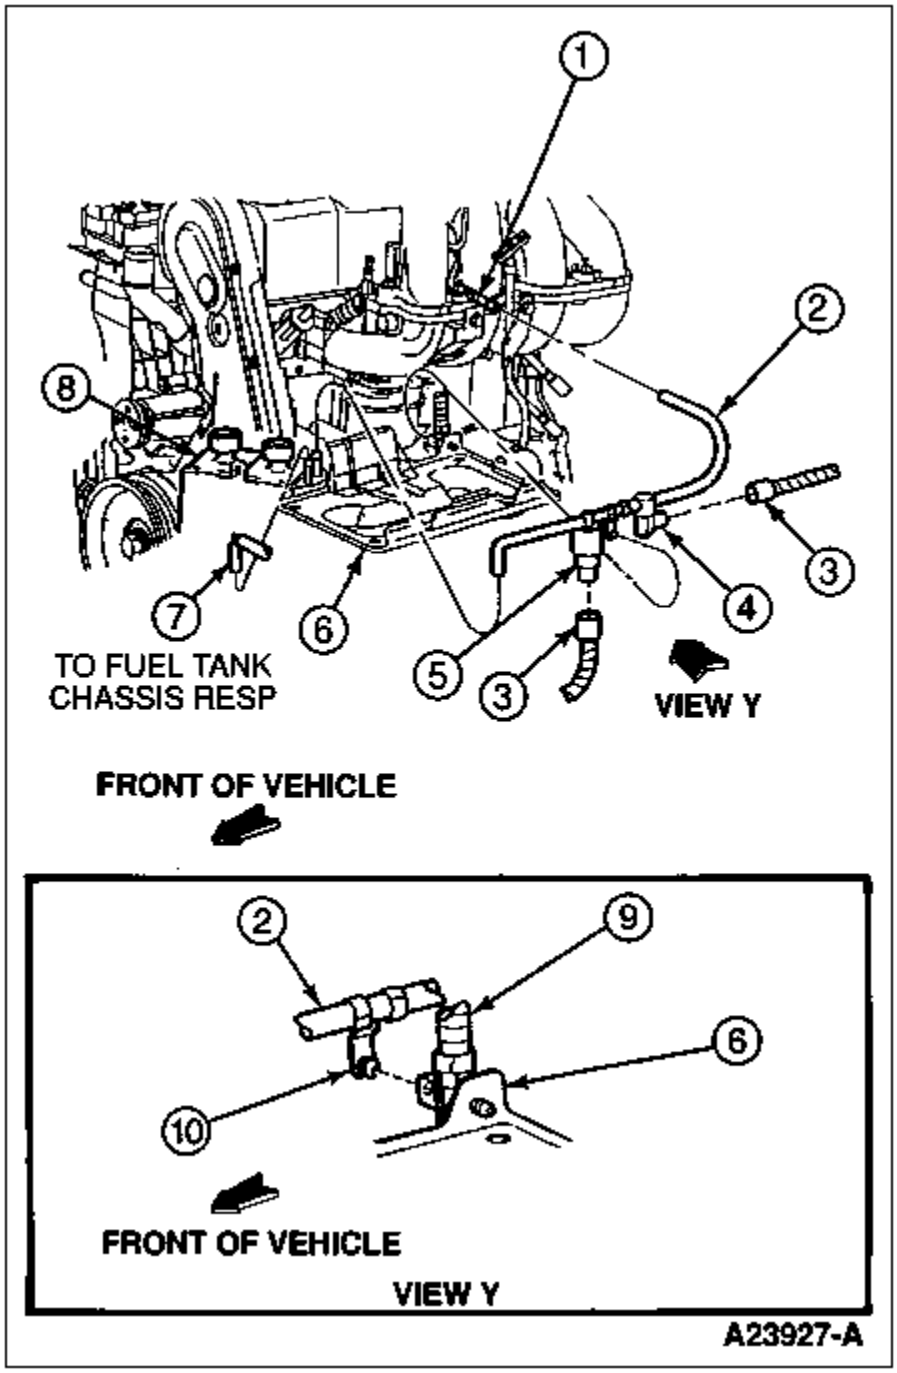
12. Install ground cable and bolt to left side of engine.

13. Connect transmission lead to engine fuel charging wiring.

tomsn048@gmail.com

14. Connect fuel line and return line to fuel injection supply manifold.
15. Install fuel tube clip.
16. Connect three way catalytic converter to exhaust manifold. Tighten bolts to 34-46 Nm (25-33 lb-ft).
17. Install cable brackets with assembled battery to starter relay cable.
18. Connect both Heated Oxygen Sensor (HO2S) leads to sensor extension harness.
19. Connect starter electrical connections. Tighten starter cable nut to 9-14 Nm (80-124 lb-in).
20. Lower vehicle.
21. Install two top engine-to-transmission bolts. Tighten to 38-51 Nm (28-38 lb-ft).
22. Connect two engine control sensor extension wiring (12A690) connectors (104 pin and 42 pin).
23. Connect evaporative emissions purge hose located behind engine.

tomsn048@gmail.com



Item	Part Number	Description
1	9G271	Evaporative Emission Return Tube
2	9C987	Fuel Vapor Hose and Valve Assembly
3	14290	Vehicle Compartment Wiring Assembly
4	—	Thermistor Sensor (Part of 9C987)
5	9C915	Evaporative Emission Solenoid
6	10732	Battery Tray

tomsn048@gmail.com

7	9B248	90° Elbow and Hose
8	9D653	Evaporative Emissions Canister
9	14300	Battery to Starter Relay Cable
10	—	Hose Clip (Part of 9C987)

24. Install EGR transducer (9J433) to rear engine lifting eye (17A084). Connect vacuum hoses electrical connections to EGR transducer. Connect Delta PFE Sensor hoses to EGR valve to exhaust manifold tube (9D477).

25. Connect dash panel ground cable (14303).

26. Connect vacuum hose to power brake booster (2005).

27. Install accelerator cable bracket (9723) to upper intake manifold. Tighten bolts to 21-28 Nm (16-21 lb-ft).

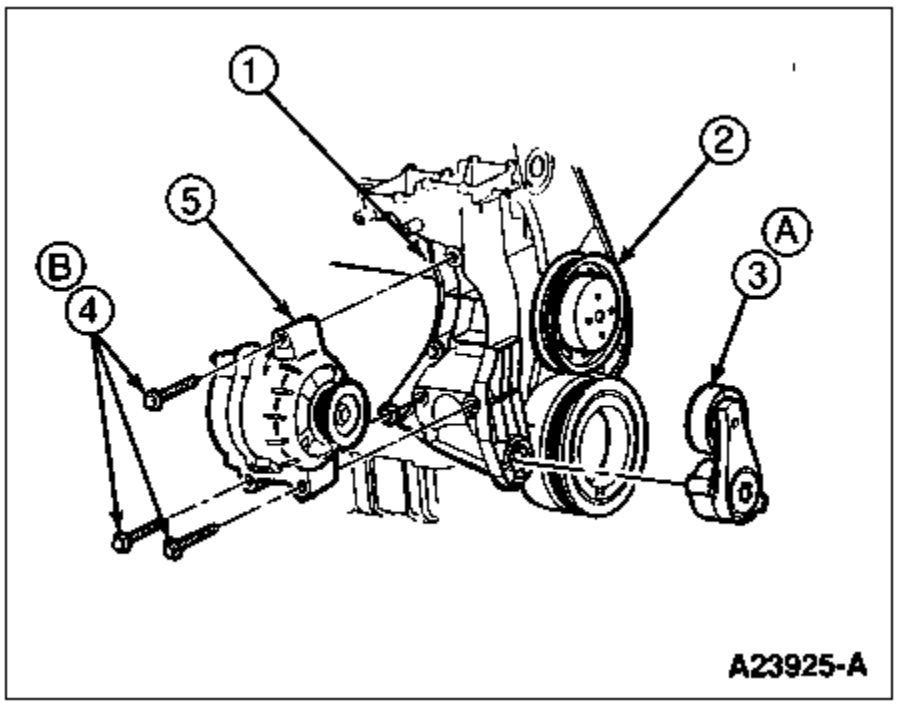
28. Connect accelerator cable to throttle body.

29. Connect lower heater water hose.

30. Connect upper heater water hose.

31. Install generator mounting bracket and tighten bolts to 44-54 Nm (30-40 lb-ft).

32. Install generator (GEN) (10300) to bracket and tighten bolts to 41-54 Nm (30-40 lb-ft).



tomsn048@gmail.com

Item	Part Number	Description
1	10153	Generator Mounting Bracket
2	8509	Water Pump Pulley
3	6B209	Drive Belt Tensioner
4	N606068	Bolt, M10-1.5 x 80
5	10300	Generator
A	—	Tighten to 40-55 Nm (30-40 Lb-Ft)
B	—	Tighten to 41-54 Nm (30-40 Lb-Ft)

33. Connect electrical connectors to ignition coils. Connect spark plug wires to ignition coils.
34. Position drive belt (8620).
35. Using socket handle (3/8 inch), rotate drive belt tensioner (6B209) against spring tension, push drive belt into position, and gradually release belt tension so tensioner pulley rests on back of belt.
36. Tighten fan clutch bolts to 17-23 Nm (13-16 lb-ft).
37. Connect engine coolant temperature sensor.
38. Position generator voltage regulator wiring (14305) over front of engine.
39. Connect generator plug-in connector.
40. Connect generator terminal and tighten nut to 7-9 Nm (60-81 lb-in).
41. If equipped with air conditioning, position fan shroud on fan blade.
42. Install radiator.
43. On air-conditioned vehicles, install fan shroud to radiator and tighten screws to 5-8 Nm (48-71 lb-in).
44. On non-air-conditioned vehicles, install fan guard and tighten screws to 5-8 Nm (48-71 lb-in).
45. Snap electrical harness guides into holders.
46. Connect radiator overflow hose to radiator.
47. Install lower radiator hose.
48. Install upper radiator hose.
49. If equipped with air conditioning, recharge system. Refer to appropriate section in Group 12.
50. Fill crankcase to proper level with oil specified in Section 03-03 .
51. Install air cleaner outlet tube.

tomsn048@gmail.com

52. Connect intake air temperature sensor and mass air flow sensor (MAF sensor) (12B579).

53. Fill cooling system with coolant specified in Section 03-03 .

54. Install accelerator control splash shield.

55. Connect inertia fuel shutoff switch.

56. **NOTE: When the battery has been disconnected and reconnected, some abnormal drive symptoms may occur while the powertrain control module (PCM) (12A650) relearns its adaptive strategy. The vehicle may need to be driven to relearn the strategy.**

    Connect battery to starter relay cable and battery ground cable.

57. With help of assistant install hood and adjust.

58. Start engine and check for leaks.

---

tomsn048@gmail.com

Engine Front Cover

SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
Cam Sprocket Holding/Removing Tool	T74P-6256-B
Front Cover Seal Remover	T74P-6700-B
Front Cover Alignment Tool	T74P-6019-B
Front Seal Replacer	T74P-6150-A

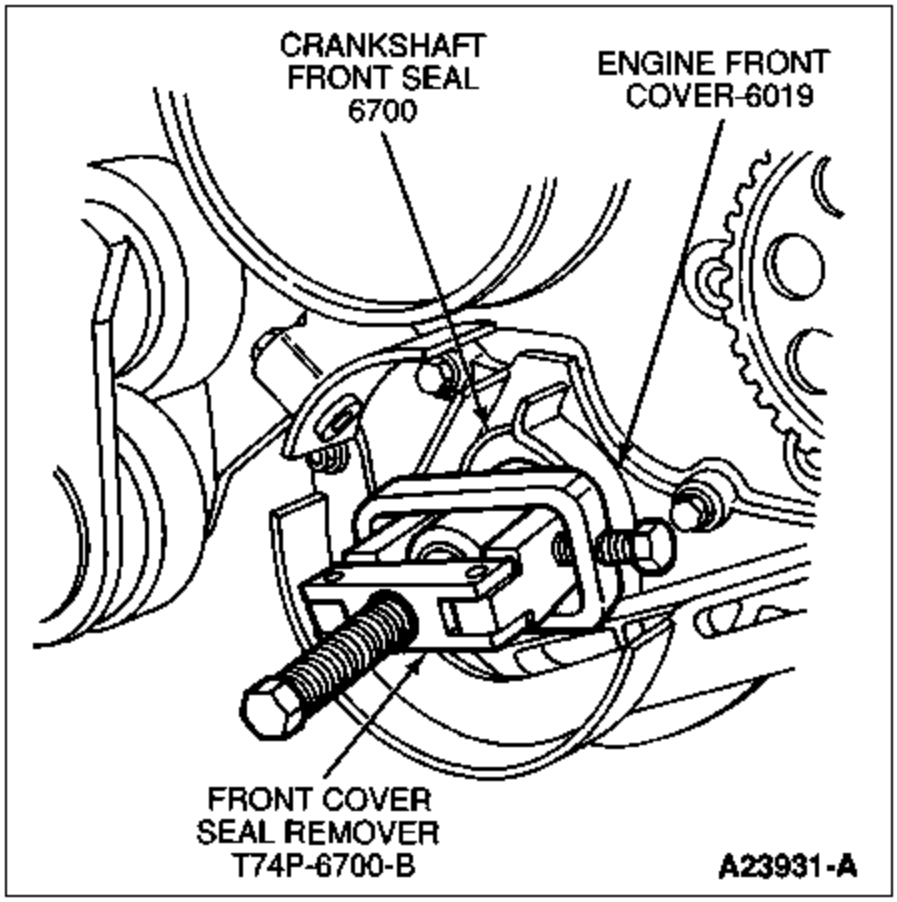
NOTE: This procedure will require the following replacement parts: oil pan gasket (6710), crankshaft front seal (6700), engine front cover gasket (6020) and a water pump inlet tube O-ring (87056-5100).

Removal

1. Remove engine (6007) as outlined in this section.
2. Remove outer timing belt cover and timing belt as outlined in this section.
3. Remove engine oil pan (6675) as outlined in this section.
4. Remove crankshaft damper bolt.
5. Remove crankshaft damper.
6. Remove crankshaft sprocket (6306).
7. Remove oil pump sprocket bolt. Using Cam Sprocket Holding/Removing Tool, T74P-6256-B, remove oil pump sprocket.
8. Remove stud, screw, nut, and timing belt tensioner.
9. Remove two screws and water pump inlet tube (8290).
10. Remove one screw and crankshaft position sensor (CKP sensor) (6C351).
11. Remove one bolt and one nut from inner timing belt cover.
12. Remove inner timing belt cover.
13. **NOTE: Remove the crankshaft front seal while the front cover is still mounted on the engine.**

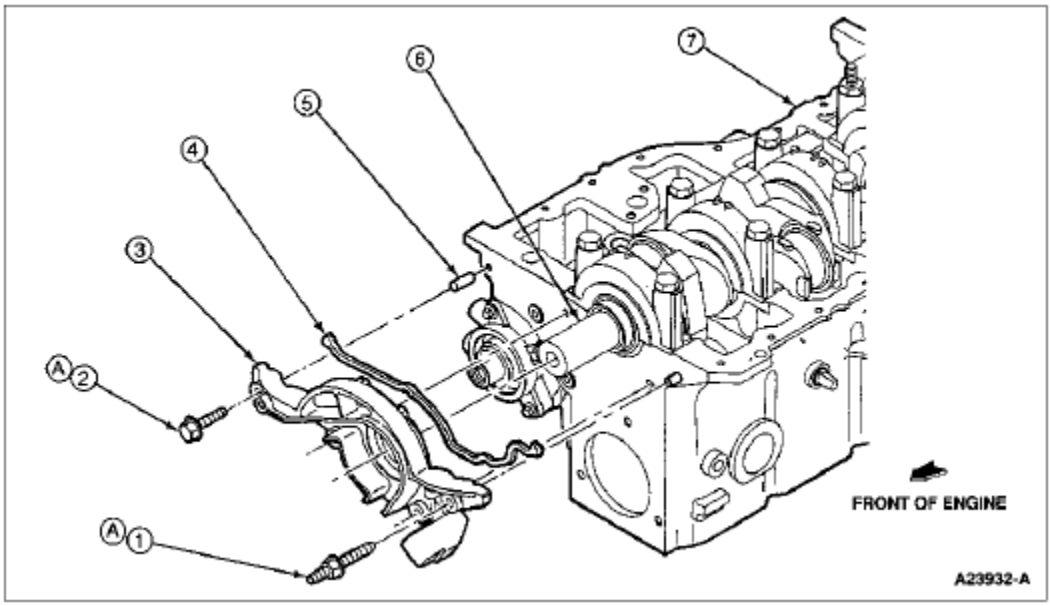
    Using Front Cover Seal Remover, T74P-6700-B, remove crankshaft front seal.

tomsn048@gmail.com



14. Remove four bolts, engine front cover and gasket.

Engine Front Cover Installation

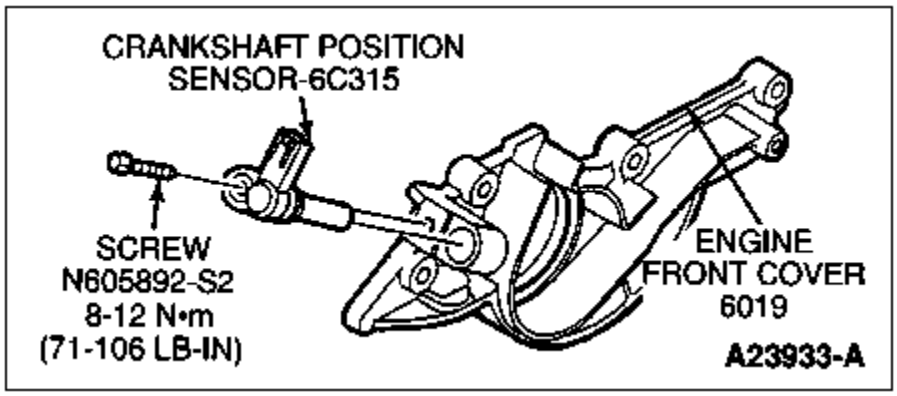


tomsn048@gmail.com

Item	Part Number	Description
1	807288-S2	Stud, M6 1-1 x 61.9
2	N807497-S2	Bolt, M6 1-1 x 37.5
3	6019	Engine Front Cover
4	6020	Engine Front Cover Gasket
5	—	Dowel Bushing (Part of 6010)
6	6303	Crankshaft
7	6010	Cylinder Blocks
A	—	Tighten to 13-16 Nm (115-141 Lb-In)

Installation

1. Install a new engine front cover gasket in engine front cover.
2. Install front cover assembly onto cylinder blocks (6010).
3. Tighten three bolts and one stud to 13-16 Nm (10-11 lb-ft).
4. Position a new crankshaft front seal on Front Seals Replacer T74P-6150-A and press into place using vibration damper bolt. Remove bolt and tool.
5. Install a new oil pan gasket and the oil pan as outlined in this section.
6. Install inner timing belt cover.
7. Tighten inner timing belt cover bolts to 8-12 Nm (70-106 lb-in).
8. Install crankshaft position sensor (CKP sensor) (6C315) and tighten bolt to 8-12 Nm (70-106 lb-in).



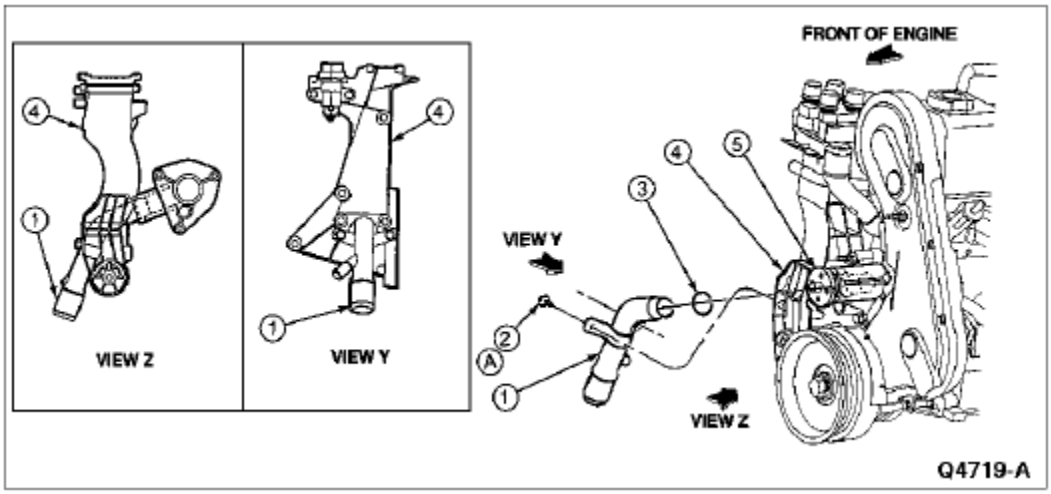
9. Lubricate and install new O-ring on water pump inlet tube.

tomsn048@gmail.com

10. Install water pump inlet tube into water pump (8501).

11. Install water inlet tube-to-generator bracket bolts and tighten to 9-12 Nm (80-106 lb-in).

Water Pump Inlet Tube



Item	Part Number	Description
1	8290	Water Pump Inlet Tube
2	N606676-S2	Screw and Washer Assembly, M6-1 x 22.5
3	87056-S100	O-Ring
4	10153	Generator Mounting Bracket
5	8501	Water Pump
A	—	Tighten to 9-12 Nm (78-107 Lb-In)

12. Install crankshaft sprocket, crankshaft damper, washer, and bolt. Tighten bolt to 125-165 Nm (92-121 lb-ft).

13. Install oil pump sprocket and tighten bolt to 40-55 Nm (30-40 lb-ft).

14. Align sprockets and install timing belt as outlined in this section.

15. Install outer timing belt cover as outlined in this section.

16. Install engine as outlined in this section.

tomsn048@gmail.com

tomsn048@gmail.com

Oil Pan—All Except Ranger 4x2 Vehicles with Manual Transmission

Removal

1. Remove the engine (6007) as detailed in this section.

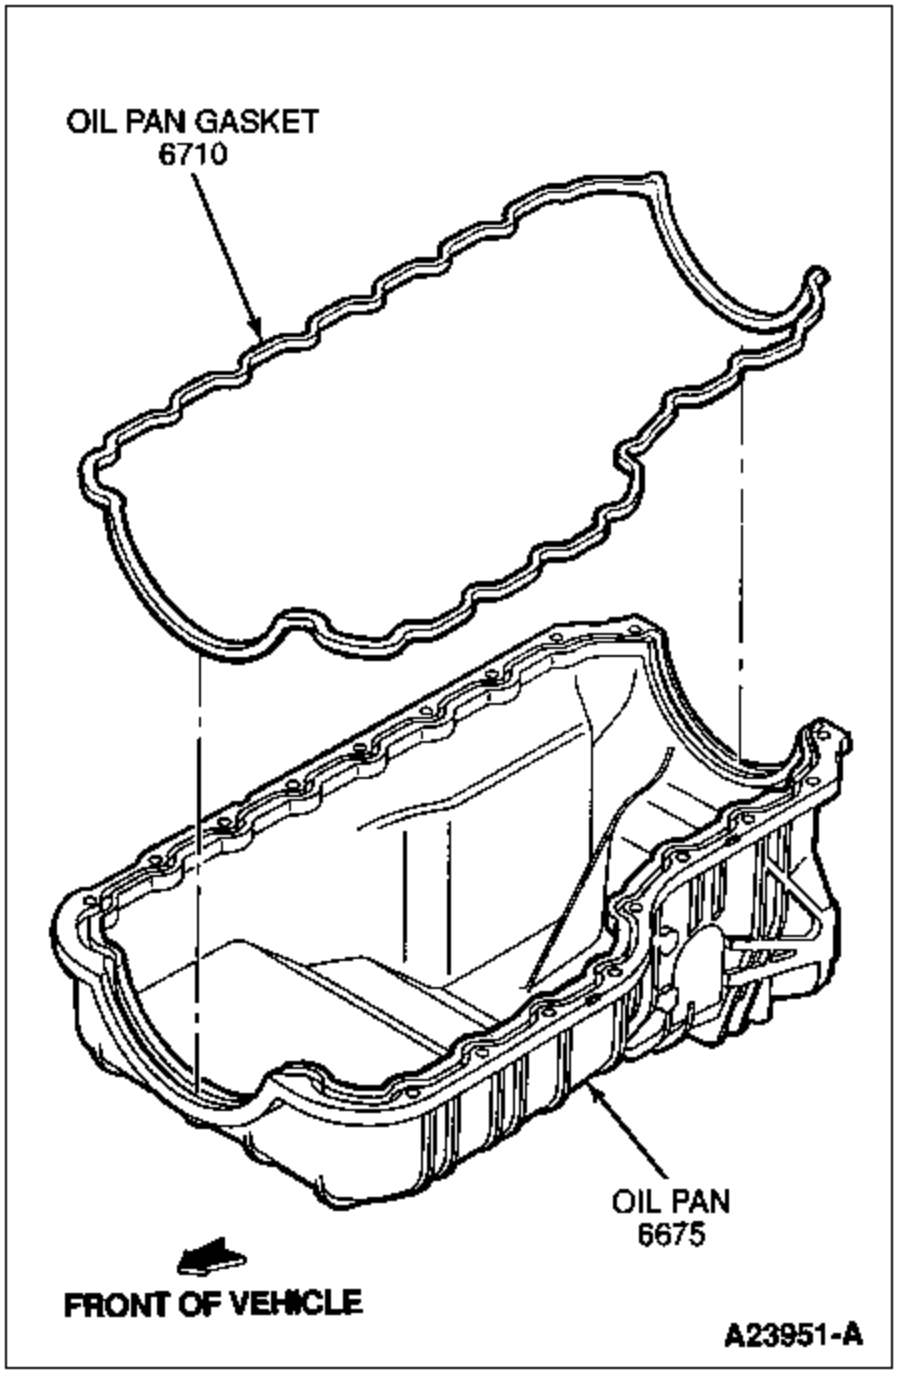
2. **CAUTION: Do not turn engine upside down with oil pan attached. Sludge and debris in oil pan will fall into cylinders, pistons, and connecting rods, possibly causing rapid wear. Sludge may also plug engine oil pickup screen.**

   Mount engine on a suitable engine stand right side up.

3. Remove the oil pan retaining bolts and remove the oil pan (6675).

4. Remove the oil pan gasket (6710) and throughly clean the engine and oil pan gasket surfaces.

tomsn048@gmail.com



Installation

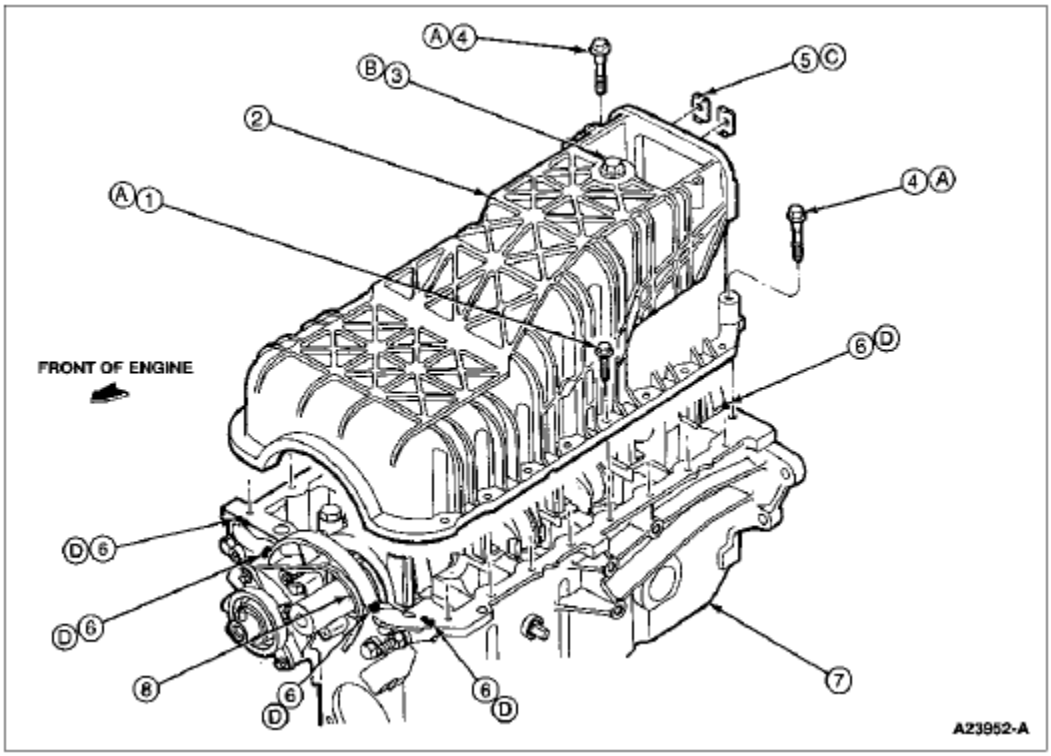
1. **NOTE: The transmission (7003) bolts to the engine and oil pan when installed. It is necessary to measure the gap between the surface of the rear face of the oil pan (at the spacer locations) and the rear face of the cylinder blocks (6010).**

   Apply Silicone Gasket and Sealant F1AZ-19562-A or equivalent meeting Ford specification WSE-M4G320-A2, in six places at joints between engine front cover (6019) and the cylinder block and rear main bearing cap and engine block as shown.

2. Install a new oil pan gasket to the oil pan and position the oil pan to the engine.

tomsn048@gmail.com

Oil Pan



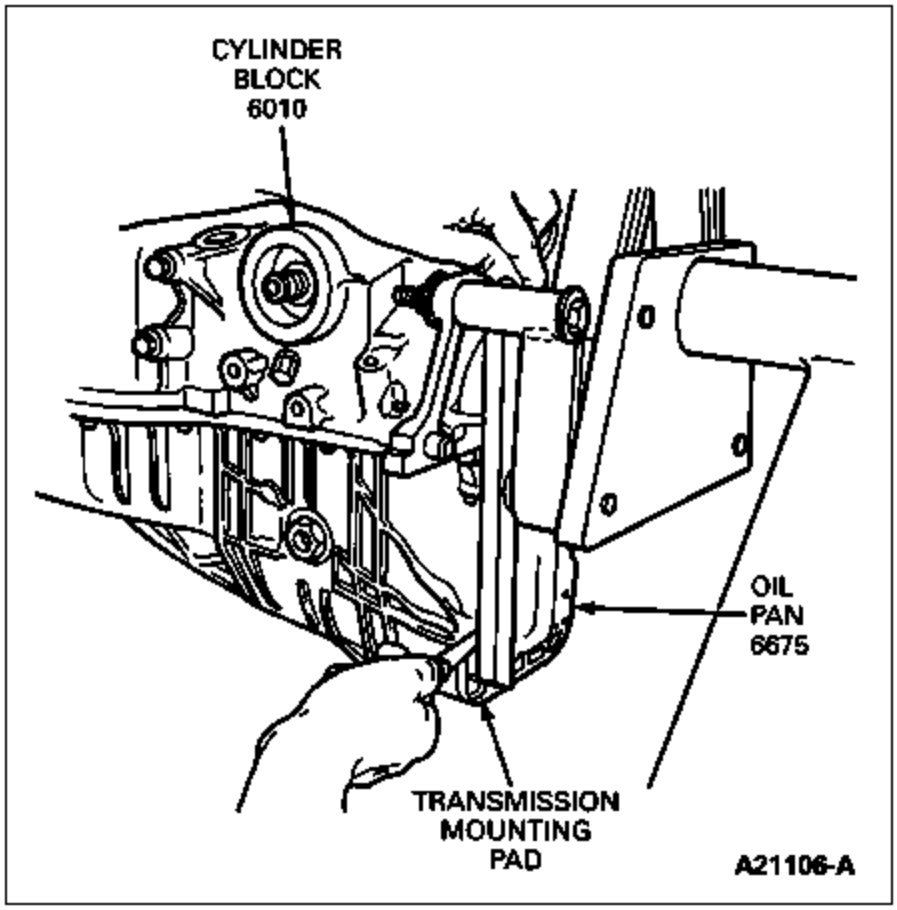
Item	Part Number	Description
1	N806378-S36	Bolt, M6-1 x 27.5 (16 Places)
2	6675	Oil Pan
3	6730	Oil Pan Drain Plug, M8
4	N806379-S36	Bolt, M6-1 x 57.5
5	6C629	Oil Pan Spacer
6	19562	Silicone Gasket and Sealant
7	6010	Cylinder Blocks
8	6019	Engine Front Cover
A	—	Tighten to 14-16 Nm (123-141 Lb-In)
B	—	Tighten to 20-34 Nm (15-25 Lb-Ft)
C	—	If Replacing Oil Pan or Transmission, Select According to Text
D	—	Apply in Six Places Shown (Left Side of Rear Main Cap Is Hidden)

tomsn048@gmail.com

3. Install and tighten the oil pan retaining bolts to 14-16 Nm (123-141 lb-in).

4. **CAUTION: Failure to measure the required spacer thickness can result in insufficient, or excessive, clearance between the engine oil pan and the transmission when installed in the vehicle. This can result in oil pan damage and an oil leak.**

   With the oil pan installed on the engine, position a straight edge flat on the rear of the cylinder blocks so that it extends over one of the oil pan/transmission bolt mounting pads.



5. Measure the gap between the mounting pad and the straight edge using a feeler gauge. Repeat the procedure for the other mounting pad. Select spacers of the required thickness from the chart.

SPACER SELECTION CHART

Measured Gap		Spacer Required		
mm	Inch	mm	Inch	Shim Color Code
0.0-0.254	0.0-0.010	None	None	—
0.27-0.51	0.011-0.020	0.254	0.010	Yellow
0.52-0.76	0.021-	0.508	0.020	Blue

tomsn048@gmail.com

	0.030			
0.78-1.01	0.041-0.040	0.762	0.030	Pink

6. Install the selected oil pan spacers (6C629) to the mounting pads on the rear of the oil pan before bolting the engine and transmission together.

7. Install engine as outlined in this section.

tomsn048@gmail.com

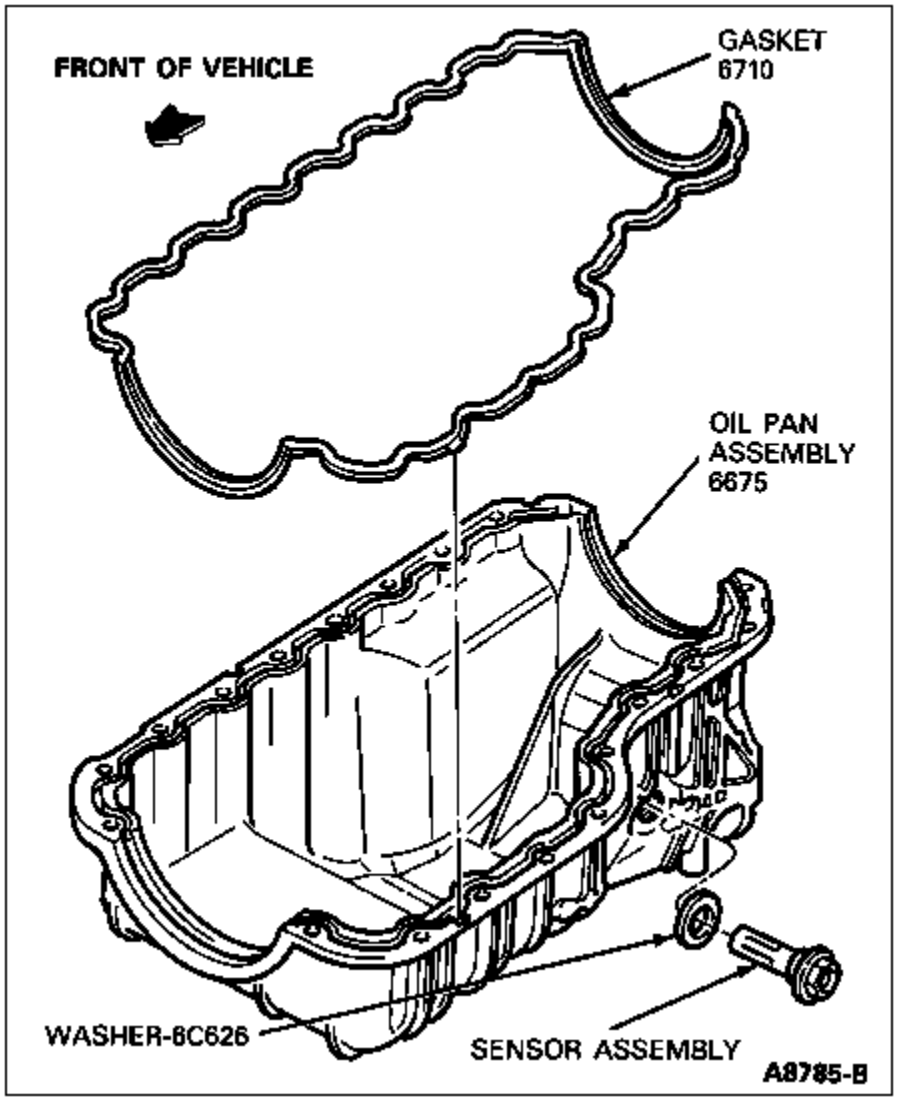
Oil Pan — Ranger Manual Transmission 4x2 Vehicles

Removal

1. Disconnect negative battery cable. Refer to Section 14-01 .
2. Shift transmission into NEUTRAL. Remove gearshift lever boot and lever.
3. Remove oil level indicator and fan shroud. Position shroud over fan blade.
4. Raise vehicle on hoist. Refer to Section 00-02 .
5. **NOTE: Make a reference mark on driveshaft for installation.**

   Remove driveshaft midship bearing retainers. Disconnect driveshaft from rear axle.
6. Remove driveshaft. Install a suitable plug in the extension housing to prevent leakage, if transmission was not drained.
7. Disconnect hydraulic clutch hose from case using Clutch Coupling Tool T88T-70522-A. Install protective caps.
8. Remove starter cable bracket hold-down.
9. Remove starter motor and secure it aside.
10. Disconnect exhaust bracket-to-transmission support insulator.
11. Disconnect electrical connectors from wiring harness at top of transmission and rear HO2S connector.
12. Secure transmission to transmission jack.
13. Remove transmission support insulator nuts from crossmember and remove crossmember-to-frame rail bolts. Lower crossmember from vehicle.
14. Remove transmission-to-engine retainers and slide transmission rearward. Lower transmission from vehicle.
15. Remove pressure plate, clutch disc, flywheel, and separator plate. Refer to Section 08-01 .
16. Drain engine oil.
17. Remove oil pan bolts and lower pan.
18. Remove oil pump screen and oil pan assembly.
19. Remove oil pan gasket and clean mating surfaces.

tomsn048@gmail.com



Installation

1. **NOTE: Transmission bolts to engine and oil pan.**

   Position a new oil pan gasket onto oil pan. Lay oil pump screen into oil pan and position oil pan under engine. Install screen and gasket to block. Tighten nut to 40-55 Nm (29-40 lb-ft) and bolts to 20-30 Nm (15-22 lb-ft).

2. Apply Silicone Gasket and Sealant F1AZ-19562-A or equivalent meeting Ford specification WSE-M4G320-A2 in six places, at joints between engine front cover and cylinder block and between rear main bearing cap and engine block.

3. Install oil pan to engine. Tighten bolts to 14-16 Nm (123-141 lb-in).

4. Install separator plate and flywheel. Tighten bolts in standard cross-tightening sequence to 73-87 Nm (54-64 lb-ft).

5. Using Clutch Aligner T74P-7137-K, install clutch disc and pressure plate. Uniformly torque the bolts to

tomsn048@gmail.com

21-32 Nm (15-24 lb-ft) in sequence. Remove clutch aligner tool.

6. Position transmission under vehicle and raise it into place. Install transmission-to-engine bolts. Tighten to 38-51 Nm (28-38 lb-ft).

7. Raise transmission. Install rear crossmember and transmission support insulator retainers. Tighten nuts to 88-115 Nm (65-85 lb-ft). Remove transmission jack.

8. Connect exhaust bracket to transmission support insulator. Tighten retainers to 88-118 Nm (65-87 lb-ft).

9. Install starter motor and harness bracket retainer. Tighten bolts to 22-28 Nm (16-21 lb-ft).

10. Connect hydraulic clutch hose, transmission harness connectors, and rear HO2S connector.

11. **NOTE: Make sure midship bearing is reinstalled, square to driveshaft. If spacers were removed from under midship bearing bracket, make sure they are reinstalled.**

    Install driveshaft slip yoke into the transmission. Install center support bearing retainers. Tighten them to 37-50 Nm (27-37 lb-ft).

12. Position driveshaft so index mark on rear yoke is in line with index mark on rear axle companion flange. Install and tighten bolts to 88-119 Nm (65-87 lb-ft).

13. Lower vehicle.

14. Position fan shroud, install bolts, and insert oil level indicator. Tighten bolts to 6-8 Nm (52-71 lb-in).

15. Install gearshift lever and tighten nut to 16-24 Nm (12-18 lb-ft). Install gearshift lever boot.

16. If needed, fill clutch reservoir to reservoir step with Ford High Performance DOT 3 Brake Fluid C6AZ-19542-A or DOT 3 equivalent fluid meeting Ford specification ESA-M6C25-A.

17. Raise vehicle.

18. Loosen bleed screw. Have an assistant slowly depress the clutch pedal to floor and hold it there. While pedal is held down, tighten bleed screw.

19. Loosen bleed screw. Have an assistant slowly depress the clutch pedal to floor and hold it there. While pedal is held down, tighten bleed screw. Tighten to 3-5 Nm (27-44 lb-in).

20. Lower vehicle.

21. **NOTE: Hydraulic system should now be fully bled and should properly release clutch. Reservoir must be kept full at all times to make sure there will be no additional introduction of air into system.**

    Refill the clutch reservoir.

22. **NOTE: When the battery has been disconnected and reconnected, some abnormal drive symptoms can occur while the powertrain control module (PCM) relearns its adaptive strategy. The vehicle may need to be driven 16 km (10 miles) or more to relearn the strategy.**

    Connect the negative battery cable.

tomsn048@gmail.com

23. Fill crankcase with Super Premium SAE 5W30 Engine Oil XO-5W30-QSP or equivalent meeting Ford specification WSS-M2C153-G.

24. Start engine and check for oil leaks.

---

tomsn048@gmail.com

Oil Pan—4 Cylinder 4x4 Ranger, Manual Transmission Only

Description	Tool Number
Clutch Coupling Tool	T88T-70522-A
Three Bar Engine Support	014-00750
Clutch Aligner	T74P-7137-K

Removal

1. Disconnect the battery ground cable.

2. **CAUTION: Be careful not to separate the gearshift lever and transfer case lever boots from the molding.**

   Shift the transmission into neutral and the transfer case into 4L position. Remove the screw retaining the gearshift lever boot (with its molding) from the floor. Slide the boot up and remove the nut from the studded bolt retaining the transmission gearshift lever. Install the nut on the opposite end of the studded bolt to release the bolt from the shifter. Remove the gearshift lever from the transmission and position it out of the way.

3. Remove the two bolts that retain the fan shroud to the radiator. Remove the fan shroud and the engine oil indicator.

4. Disconnect the IAT and MAF sensors from the air inlet tube and PCV clean air tube from the air cleaner. Loosen the air tube hose clamp at the throttle body and disconnect the clamp at the air cleaner. Remove air cleaner and inlet tube assembly.

5. Disconnect the DPFE sensor connector and remove the sensor retaining bolts and remove the sensor from the vehicle.

6. Raise the vehicle on hoist. Refer to Section 00-02 .

7. Remove the bolt retaining the starter harness bracket located at the lower right side of the engine block. Remove the starter motor retaining bolts and position the starter out of the way.

8. Disconnect the hydraulic clutch line from the transmission using Clutch Coupling Tool T88T-70522-A.

9. **NOTE: Make a reference mark on the driveshaft to aid during installation.**

   Remove the front driveshaft retaining bolts from the transfer case yoke. Using mechanics wire or a suitable strap, secure the driveshaft out of the way.

10. **NOTE: Make a reference mark on the driveshaft to aid during installation.**

    Remove the rear driveshaft retaining bolts from the center support and from the transfer case yoke. Using mechanics wire or a suitable strap, secure the driveshaft out of the way.

tomsn048@gmail.com

11. Remove the large and small bolts that retain the shifter linkage bracket to the transmission extension housing. Position the linkage out of the way.

12. Position a jack stand under the rear of the transfer case.

13. Remove the transmission support insulator nuts and the crossmember retaining bolts. Remove the crossmember from the vehicle.

14. Remove the right transmission insulator retaining bolt and position the exhaust hanger away from the transmission.

15. Loosen the catalytic converter-to-exhaust manifold retaining bolts to allow the engine to tilt rearward when the transmission is lowered. Using a mechanics wire or a suitable strap, position the exhaust as far to the right of the vehicle as possible.

16. Position a transmission jack under the transmission. Secure the transmission with a chain or strap.

17. Remove the jack stand from under the vehicle.

18. Slightly lower the transmission. Disconnect the transfer case motor, backup lamp switch, VSS, and rear HO2S connectors. Disconnect the three harness locator pins, located at the top of the transmission. Position the harness out of the way.

19. Remove the transmission-to-engine retainers, work the transmission off of the locating dowels and slide the transmission rearward. Lower the transmission and transfer case as an assembly from the vehicle.

20. **CAUTION: If the clutch cover and plate are to be reinstalled, the bolts must be removed evenly or permanent damage to the diaphragm spring will occur.**

    NOTE: Check for clutch cover finger height variation before removing the cover. Replace the clutch cover and disk if necessary.

    Mark the assembly position of the clutch pressure plate and cover to the flywheel if installing the original components. Evenly loosen the clutch pressure plate and cover attaching bolts in a star pattern until the clutch pressure plate diaphragm spring is expanded. Remove the bolts, clutch pressure plate and clutch disc from the flywheel.

21. Remove the flywheel retaining bolts and the flywheel. Remove the engine-to-transmission separator plate.

22. Partially lower the vehicle.

23. Remove the left and right engine mount retaining nuts.

24. **NOTE: Two small sections of chain may be required for the engine support hooks to reach the lifting eyes.**

    Position and adjust Rotunda Three Bar Engine Support 014-00750 or equivalent to the vehicle engine compartment and to the engine lifting eyes.

25. **CAUTION: Lift the engine approximately two inches to remove the engine oil pan. Lifting more could cause the engine to contact the body or possibly damage surrounding components.**

tomsn048@gmail.com

NOTE: To gain access to adjust the three bar engine support, lift and suppport the hood to the full upward position.

Raise the engine with a floor jack using a block of wood to protect the oil pan. Adjust the lift hooks on the three bar engine support while raising the engine, to hold the engine in place. Remove the floor jack from the oil pan.

26. Raise the vehicle. Refer to Section 00-02 .

27. Drain the oil from the engine.

28. Remove the engine oil pan retainers and remove the oil pan from the vehicle. Discard the oil pan gasket.

29. **CAUTION: Prevent engine contamination by using necessary precautions to keep the old sealer or gasket materials from getting into the engine.**

    NOTE: It is extremely important that all old sealer is removed from all joining faces and grooves.

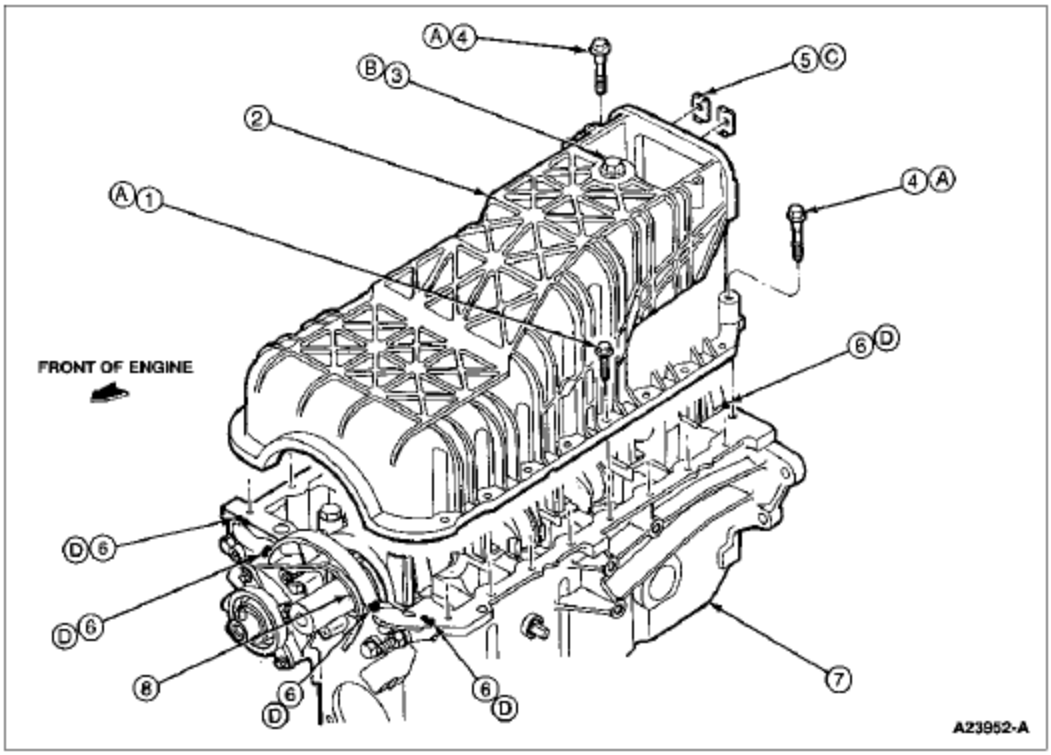
    Thoroughly clean all exposed areas with Metal Surface Cleaner F4AZ-19A536-RA or equivalent meeting Ford specification WSE-M5B392-A.

30. **NOTE: It is extremely important that all parts are wiped down with Extra Strength Spot and Stain Remover B7A-19521-AA after the parts have been cleaned and washed.**

    Thoroughly clean the transmission bell housing area and the rear of the cylinder block. Clean and inspect the oil inlet tube.

Installation

tomsn048@gmail.com



Item	Part Number	Description
1	N806378-S36	Bolt, M6-1 x 27.5 (16 Places)
2	6675	Oil Pan
3	6730	Oil Pan Drain Plug, M8
4	N806379-S36	Bolt, M6-1 x 57.5
5	6C629	Oil Pan Spacer
6	19562	Silicone Gasket and Sealant
7	6010	Cylinder Block
8	6019	Engine Front Cover
A	—	Tighten to 14-16 Nm (123-141 Lb-In)
B	—	Tighten to 20-34 Nm (15-25 Lb-Ft)
C	—	If replacing oil pan or transmission, select according to text.
D	—	Apply in six places shown (left side of rear main cap is hidden)

1. Apply Silicone Gasket and Sealant F1AZ-19562-A or equivalent meeting Ford specification WSE-M4G320-A2 in six places at the joints between the engine front cover and the cylinder block and between the rear main bearing cap and the engine block. Install a new oil pan gasket to the oil pan and position the oil pan to the engine.

tomsn048@gmail.com

2. **CAUTION: Failure to align the rear face of the oil pan mounting pads to the rear face of the cylinder block can result in oil pan damage and oil leaks.**

   NOTE: If the rear face of the oil pan cannot be aligned within 0.010 inch of rear face of the cylinder block, oil pan spacers must be used.

   Position oil pan to cylinder block. Install the four oil pan retainers tight enough to align bolt holes, but loose enough that oil pan can be pushed rearward. Align rear face of oil pan with rear face of the cylinder block. Install remaining oil pan bolts. Evenly tighten oil pan retainers to 7-10 Nm (62-89 lb-in).

3. Position a straightedge on the rear of cylinder block so it extends over the transmission mounting pads on oil pan. Using a feeler gauge, measure the gap between mounting pads and straightedge. Select and install the required spacer thickness if distance is greater than 0.010 inch.

Measured Gap		Spacer Required		
mm	**inch**	**mm**	**inch**	**Shim Color Code**
0.0 - 0.254	0.0 - 0.010	—	—	—
0.27-0.51	0.011-0.020	0.254	0.010	Yellow
0.52-0.76	0.021-0.030	0.508	0.020	Blue
0.78-1.01	0.031-040	0.762	0.030	Pink

4. Position starter to right side of engine. Install the starter harness bracket and retaining nut. Tighten nut to 20-27 Nm (15-20 lb-in).

5. Partially lower vehicle.

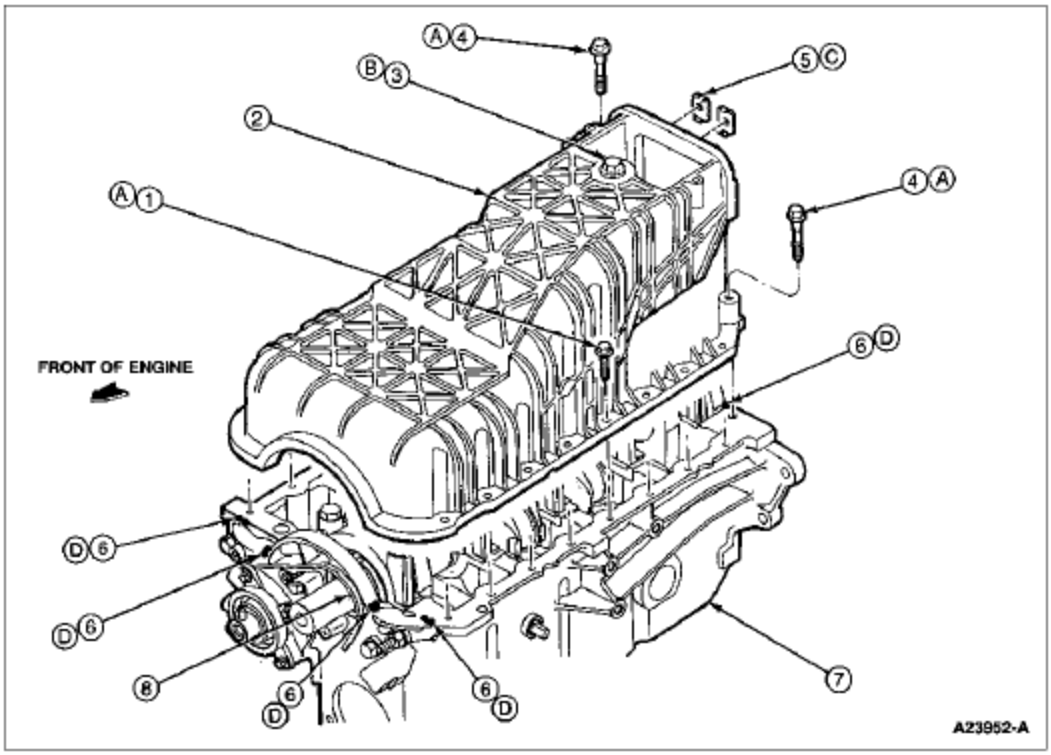
6. Position a floor jack under engine oil pan, using a block of wood to protect the pan. Use floor jack to support engine weight while lowering three bar engine support. Lower and position engine to frame mount studs and remove floor jack. Remove the hood support.

7. Remove three bar engine support.

8. Install left and right engine mount retaining nuts. Tighten nuts 94-125 Nm (69-92 lb-ft).

9. Raise vehicle.

tomsn048@gmail.com



Item	Part Number	Description
1	N806378-S36	Bolt, M6-1 x 27.5 (16 Places)
2	6675	Oil Pan
3	6730	Oil Pan Drain Plug, M8
4	N806379-S36	Bolt, M6-1 x 57.5
5	6C629	Oil Pan Spacer
6	19562	Silicone Gasket and Sealant
7	6010	Cylinder Block
8	6019	Engine Front Cover
A	—	Tighten to 14-16 Nm (123-141 Lb-In)
B	—	Tighten to 20-34 Nm (15-25 Lb-Ft)
C	—	If Replacing Oil Pan or Transmission, Select According to Text
D	—	Apply in Six Places Shown (Left Side of Rear Main Cap Is Hidden)

10. **NOTE: If necessary, pin-punch separator plate at guide pins to retain plate to engine block.**

    Install the separator plate and flywheel. Tighten flywheel retaining bolts in a standard cross-tightening sequence to 73-87 Nm (54-64 lb-ft).

tomsn048@gmail.com

11. Using Clutch Aligner T74P-7137-K, install clutch disc and pressure plate. Uniformly tighten bolts to 21-32 Nm (15-24 lb-ft) in a standard cross-tightening sequence. Remove clutch aligner tool.

12. Position transmission and transfer case assembly under vehicle and raise them into place. Install transmission-to-engine retaining bolts and tighten to 38-51 Nm (28-38 lb-ft).

13. Connect backup lamp switch, VSS and rear HO2S connectors. Connect three harness locator pins to top of transmission.

14. Position a jack stand under rear of transfer case.

15. Remove transmission jack.

16. Remove mechanics wire or retaining strap from exhaust and position exhaust hanger to right transmission insulator. Install retaining bolt and tighten to 97-118 Nm (72-87 lb-ft).

17. Slightly raise transmission and transfer case assembly. Install rear crossmember, crossmember support retaining bolts and transmission support insulator retaining nuts. Tighten retainers to 88-115 Nm (65-85 lb-ft).

18. Remove jack stand from under transfer case.

19. Install exhaust manifold bolts and tighten to 34-46 Nm (25-34 lb-ft).

20. Install starter bolt and retaining bolts. Tighten bolts to 22-28 Nm (16-21 lb-ft).

21. Connect hydraulic clutch line and transfer case shift motor connector.

22. **NOTE: On extended cab models, make sure the center bearing bracket is installed square to driveshaft. If spacers were removed from under center bearing bracket, make sure they are reinstalled.**

    Install driveshaft. Install center support bearing attaching bolts. Tighten bolts to 37-50 Nm (27-37 lb-ft).

23. **NOTE: Make sure transfer case is in 4L position before installing the shifter linkage.**

    Position shifter linkage bracket to transmission extension housing. Install large and small retaining bolts. Tighten large bolt to 94-122 Nm (69-90 lb-ft) and small bolt to 43-56 Nm (32-41 lb-ft).

24. Position rear of driveshaft to transfer case yoke and install retaining bolts. Tighten bolts to 27-38 Nm (20-28 lb-ft).

25. Lower vehicle.

26. Position fan shroud and install retaining bolts. Tighten bolts to 6-8 Nm (53-71 lb-in). Install the engine oil indicator.

27. Install the DPFE sensor and retaining bolts. Tighten bolts to 2.7-3.7 Nm (24-32 lb-in). Connect harness connector.

28. Install air inlet tube and pushpin to right fender. Connect IAT and MAF sensor connectors and PCV fresh air tube to air cleaner.

29. Install gearshift lever and retaining nut. Tighten nut to 16-24 Nm (12-18 lb-ft). Install gearshift lever

tomsn048@gmail.com

boot.

30. Fill and bleed hydraulic clutch system.
31. Connect battery ground cable.
32. Fill engine with engine oil.
33. Start engine and check for leaks.

---

tomsn048@gmail.com

Oil Pan — Ranger, Automatic Transmission, 4x2

Removal

1. Disconnect battery ground cable. For additional information, refer to Section 14-01 .
2. Remove engine and transmission fluid level indicators.
3. Raise vehicle on hoist. For additional information, refer to Section 00-02 .
4. **NOTE: Make a reference mark on the driveshaft for installation.**

   Remove driveshaft on Ranger SuperCab. Remove driveshaft center bearing bracket.
5. Remove the shift cable from ball stud on transmission and remove cable mount from transmission housing. Disconnect the transmission harness locator from the bracket.
6. Remove the starter cable bracket hold-down and the transmission cooling line bracket from the engine.
7. Remove starter motor and secure aside.
8. Remove torque converter nuts.
9. Disconnect muffler from converter.
10. Raise transmission jack up to transmission to slightly relieve weight from mount and secure. Remove nuts from number three crossmember.
11. Remove crossmember retainers, remove crossmember.
12. Lower transmission jack to gain access to transmission bolts and harness.
13. Disconnect Heated Oxygen Sensors from transmission harness. Remove bolts from converter to manifold.
14. Remove bolt from converter bracket to transmission tail-shaft then remove the converter.
15. Remove both lines from transmission.
16. Disconnect electrical connectors from wiring harness at top of transmission.
17. Remove transmission-to-engine retainers, work the transmission off locating dowels, slide transmission rearward and remove upper filler tube. Lower the transmission from vehicle.
18. Remove flywheel and separator plate.
19. Drain oil from engine.

tomsn048@gmail.com

20. Remove oil pan bolts and lower pan.

21. Remove oil pump screen and let lay in pan. Slide oil pan back over top of radius arm crossmember and remove.

22. Remove gaskets (06710 and 07E062) and clean oil pan (06675) mating surfaces.

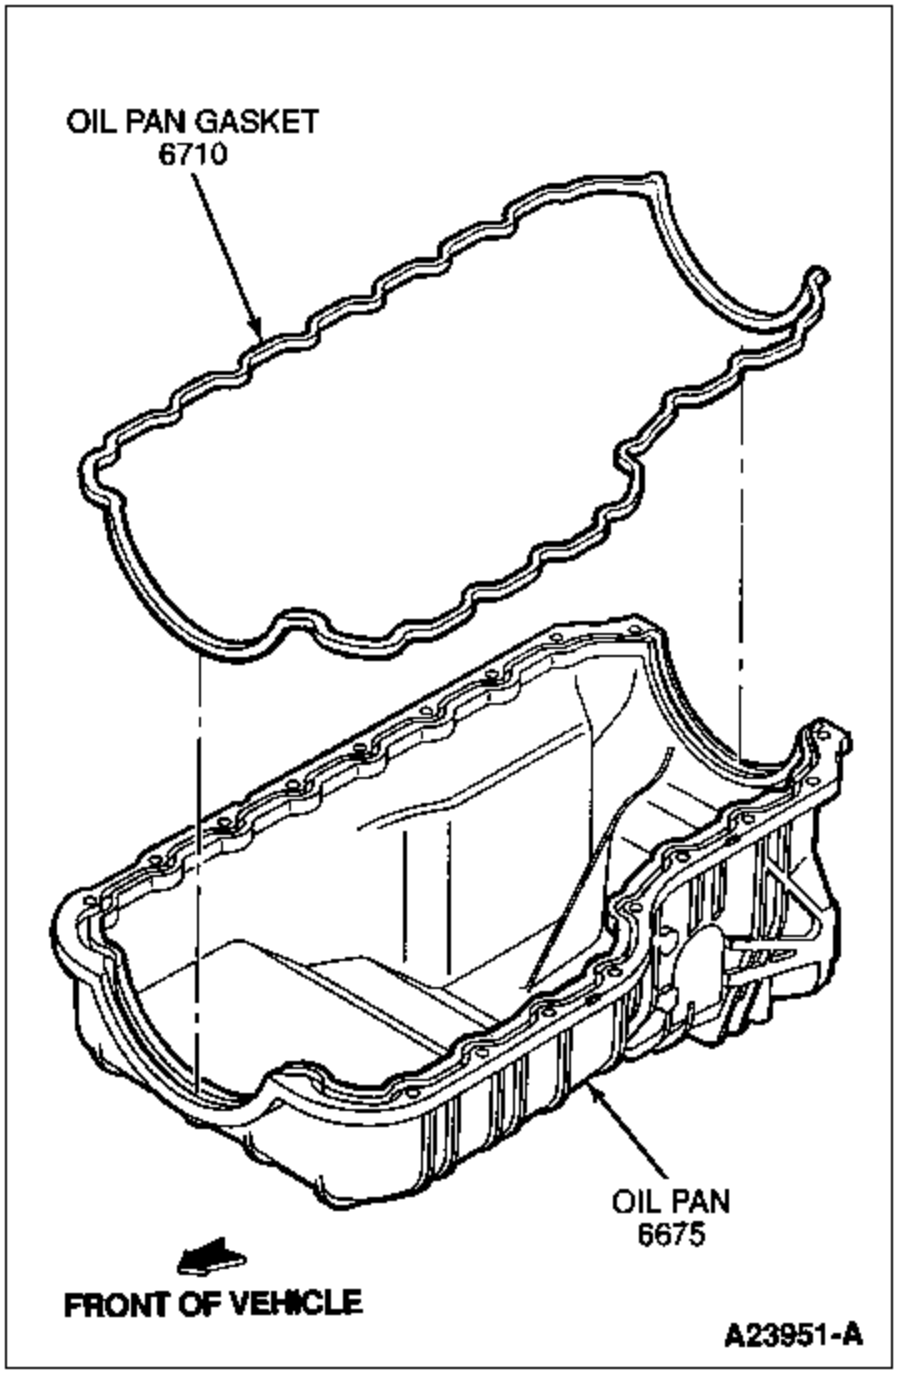
Installation

1. **NOTE: Transmission bolts are bolted to the engine and oil pan when installed. It is necessary to measure the gap between the surface of the rear face of the oil pan (at the spacer locations) and the rear face of the cylinder block.**

   Install new pan gasket, position oil pump screen into oil pan and position assembly in vehicle. Install screen with a new gasket. Tighten nut to 47 Nm (33 lb-ft) and the bolts to 25 Nm (18 lb-ft).

2. Apply Silicone Gasket Sealant F1AZ-19562-A or equivalent meeting Ford specification WSE-M4G320-A2 in six places at joints between engine front cover, cylinder block, rear main bearing cap, and engine block.

tomsn048@gmail.com



3. Install oil pan to engine. Tighten bolts to 15 Nm (132 lb-in).

4. **CAUTION: Failure to measure the required 1 spacer thickness can result in insufficient, or excessive, clearance between the engine oil pan and the transmission when installed in the vehicle. This can result in oil pan damage and an oil leak.**

   NOTE: If the rear face of the oil pan cannot be aligned within 0.010 inch of the rear face of the cylinder block, the oil pan spacer should be used.

   With the oil pan installed on engine, position a straight edge flat on rear of cylinder block so that it extends over one of oil pan/transmission bolt mounting pads.

tomsn048@gmail.com

5. Install separator plate and flexplate. Tighten in standard cross-tightening sequence to 78 Nm (58 lb-ft).

6. **CAUTION: Do not allow torque converter to disengage from transmission oil pump gear.**

   NOTE: The torque converter must rest squarely against flexplate. This indicates that the torque converter pilot is not binding against engine crankshaft.

   Position transmission under vehicle and raise into place. Install six lower bolts that attach transmission to engine. Lower transmission down to install filler tube, upper two bolts, and bracket for transmission harness connectors and filler tube. Tighten bolts to 43 Nm (32 lb-ft).

7. Connect two 16 pin connectors from transmission harness to main harness at top of transmission.

8. **NOTE: Case connector fittings should be held with a wrench to prevent them from moving when tightening the tube nuts.**

   Install the transmission cooler lines. Tighten fittings to 39 Nm (28 lb-ft). Install transmission cooler line bracket bolt at lower right side of engine block and tighten securely.

9. Snap shifter cable onto ball stud of transmission lever, install shifter cable bracket. Tighten bolts to 25 Nm (18 lb-ft).

10. Install catalytic converter to manifold bolts. Install rear converter mount to transmission tailshaft. Tighten manifold bolts to 39 Nm (29 lb-ft) and rear mount bolt to 42 Nm (31 lb-ft). Connect Heated Oxygen Sensor connectors front and rear.

11. Raise transmission, install rear crossmember, transmission support insulator attaching nuts. Tighten nuts to 88 Nm (65 lb-ft). Remove transmission jack.

12. Connect muffler to converter. Tighten bolts to 28 Nm (21 lb-ft).

13. Rotate engine clockwise using crankshaft pulley-retaining bolt to install new torque converter nuts. Tighten nuts to 34 Nm (27 lb-ft).

14. Install starter motor and starter harness bracket. Tighten bolts to 22 Nm (16 lb-ft).

15. Position the driveshaft so that the index mark on rear yoke is in line with index mark on rear axle companion flange and install retaining bolts. Tighten bolts to 88-119 Nm (65-88 lb-ft).

16. Lower vehicle.

17. Insert engine and transmission fluid indicators.

18. Connect the battery ground cable.

19. Fill crankcase with correct viscosity and amount of engine oil.

20. Start engine and check for engine oil leaks.

21. Top off transmission fluid.

tomsn048@gmail.com

tomsn048@gmail.com

Oil Pump Screen, Cover, and Tube

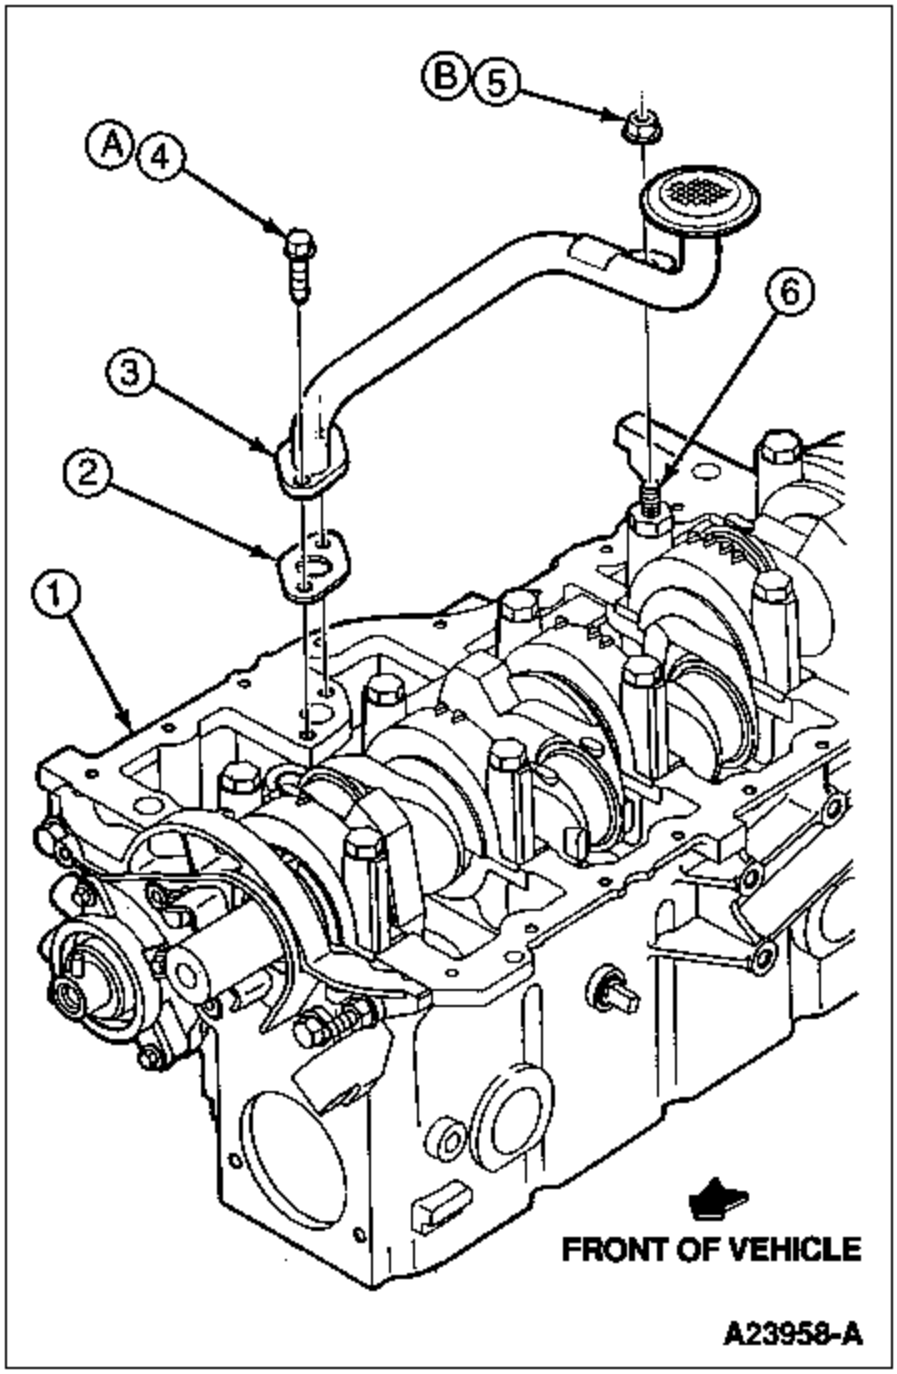
Removal

1. Remove engine (6007) as outlined in this section.
2. Remove oil pan (6675) as outlined in this section.
3. Remove nut, two screws, oil pump screen cover and tube (6622) and oil pump inlet tube gasket (6626).

Installation

1. Throughly clean oil pump screen cover and tube.
2. Clean all mounting surfaces.
3. Install oil pump screen cover and tube and oil pump inlet tube gasket.
4. Install two screws, and nut.
5. Tighten screws to 20-30 Nm (14-22 lb-ft).
6. Tighten nut to 40-55 Nm (30-41 lb-ft).
7. Install oil pan as outlined in this section.
8. Install engine as outlined in this section.

tomsn048@gmail.com



Item	Part Number	Description
1	6010	Cylinder Blocks
2	6626	Oil Pump Inlet Tube Gasket
3	6622	Oil Pump Screen Cover and Tube
4	N605786-S2	Bolt, M8-1.25 x 20
5	N620482-S	Nut, M10-5
6	N803729-S	Bearing Cap Stud

tomsn048@gmail.com

tomsn048@gmail.com

Crankshaft

SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
Cam Sprocket Holding/Removing Tool	T74P-6256-B
Front Cover Seal Remover	T74P-6700-B
Cam Bearing Adapter Tube	T72C-6250
Clutch Aligner	T71P-7137-H

Removal

1. Remove engine (6007) as outlined in this section and install on suitable engine stand.
2. If manual transmission, loosen bolts one turn at a time in sequence and remove clutch pressure plate (7563) and clutch disc (7550).
3. **NOTE: Special bolts are used for attaching flywheel to crankshaft. Keep flywheel bolts separate for installation.**

   Remove flywheel-to-crankshaft bolts (6379) and flywheel or flexplate and flywheel reinforcing plate (6A366).
4. Remove engine rear plate (7007).
5. Drain oil from engine.
6. Remove engine oil level dipstick (6750) and oil level indicator tube (6754).
7. Remove crankshaft bolt and washer.
8. Remove crankshaft damper.
9. Remove outer timing belt cover screw, depress tabs, and remove outer timing belt cover.
10. Remove screw retaining crankshaft position sensor (CKP sensor) (6C315). Remove crankshaft position sensor from engine front cover (6019).
11. Loosen timing belt pivot bolt one-half turn.
12. Hold timing belt tensioner with T74P-6254-A Camshaft Belt Tensioner Tool and remove adjusting bolt. Relax tensioner spring.
13. Remove timing belt.
14. Install T74P-6256-B Cam Sprocket Holding/Removing Tool on oil pump sprocket.

tomsn048@gmail.com

15. Remove oil pump sprocket bolt and washer.
16. Install puller part of T74P-6256-B Cam Sprocket Holding/Removing Tool. Remove oil pump sprocket.
17. Slide crankshaft sprocket (6306) off crankshaft (6303).
18. Remove inner timing belt cover.
19. Remove oil pan screws and oil pan (6675).
20. Remove oil pan gasket (6710).
21. Rotate engine on stand so crankshaft is up.
22. Remove two bolts and nut and remove oil pump screen cover and tube (6622).
23. Using T74P-6700-B Front Cover Seal Remover, remove front cover oil seal as outlined in this section.
24. Remove bolts and front engine cover.
25. Make sure connecting rod caps are marked so each cap can be kept with each rod.
26. Remove connecting rod nuts and four caps.
27. **NOTE: Each main bearing cap, except rear cap, is marked with arrows pointing to the front of the engine. The number of arrows corresponds to the number of the main bearing cap. For example, one arrow for the front cap, two arrows for the number two cap.**

    Remove bolts and main bearing caps.
28. Lift out crankshaft. Crankshaft rear oil seal (6701) will come out with crankshaft. Remove seal from crankshaft.
29. Inspect bearings and replace as necessary. Inspect crankshaft as outlined in Section 03-00 and recondition or replace as necessary.

Installation

CAUTION: Lubricate parts with Motorcraft Super Premium Motor Oil XO-5W30-QSP or equivalent meeting Ford specification ESE-M2C153-E during assembly to prevent a dry start and engine damage.

1. If removed, install upper crankshaft bearings. If reusing bearings, reinstall each bearing in the same place from which it was removed.
2. Install crankshaft.
3. If removed, install bearings in main bearing caps. If reusing bearings, install bearing in same place from which it was removed.
4. Apply Plastigage® to crankshaft bearing journals.

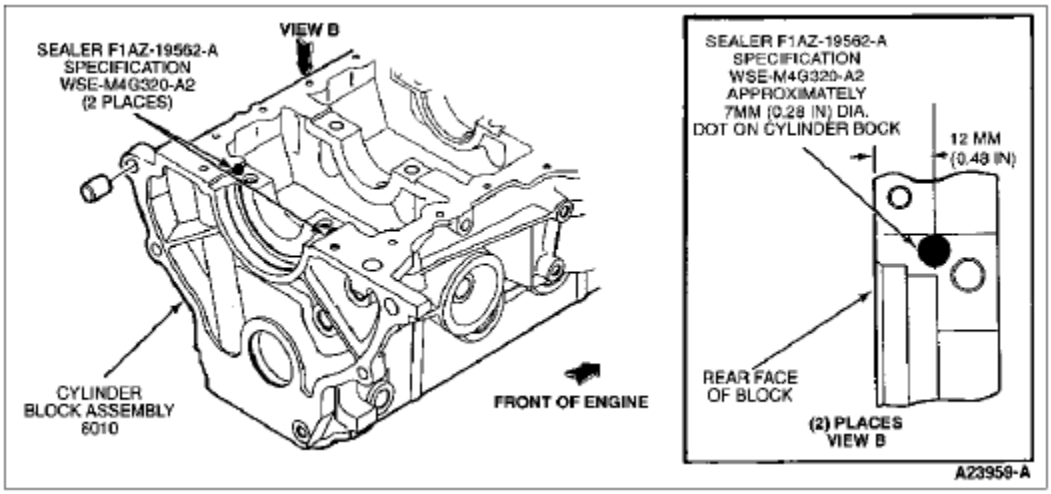
tomsn048@gmail.com

5. Install main bearing caps and bolts. Alternately tighten bolts to 68-81 Nm (50-60 lb-ft). Retighten to 108-122 Nm (80-90 lb-ft).

6. Remove caps. Check Plastigage® for bearing clearance using chart on package. If OK, go on to next step. If not, correct clearance.

7. Apply a 7mm (0.47-inch) dot of Silicone Gasket and Sealant F1AZ-19562-A, or equivalent meeting Ford specification WSE-M4G320-A2 on each side of cylinder blocks (6010) as shown in illustration. No sealer allowed on inside diameter of seal lip.

Rear Main Bearing Cap Sending



8. Lubricate bearings and reinstall main bearing caps and bolts.

9. Alternately tighten main bearing bolts to 68-81 Nm (50-60 lb-ft). Retighten to 102-115 Nm (75-85 lb-ft).

10. Check crankshaft end play as outlined in Section 03-00 .

11. Install piston and rod assemblies to crankshaft. For each assembly:

    a. Put piece of hose or other protector over connecting rod bolts (6214) to protect crankshaft journal.
    b. Rotate crankshaft so journal for piston to be installed is at bottom of stroke.
    c. Push piston and rod assembly into place guiding rod bolts around crankshaft journal.
    d. Insert connecting rod bearings (6211) in connecting rod end cap.
    e. Finish pushing piston and rod assembly into place.
    f. Apply Plastigage® to bearing journal.
    g. Install connecting rod cap and alternately tighten connecting rod nuts to 34-41 Nm (25-30 lb-ft). Then retighten to final torque of 41-49 Nm (30-36 lb-ft).
    h. Remove cap and check bearing clearance with chart on Plastigage® package.
    i. If all right, lubricate connecting rod bearings and reinstall cap.
    j. Alternately tighten connecting rod nuts to 34-41 Nm (25-30 lb-ft). Then retighten to final torque of 41-49 Nm (30-36 lb-ft).
    k. Repeat for remaining piston and connecting rod assemblies.

12. Using Cam Bearing Adapter Tube T72C-6250 and crankshaft damper bolt, press crankshaft front seal

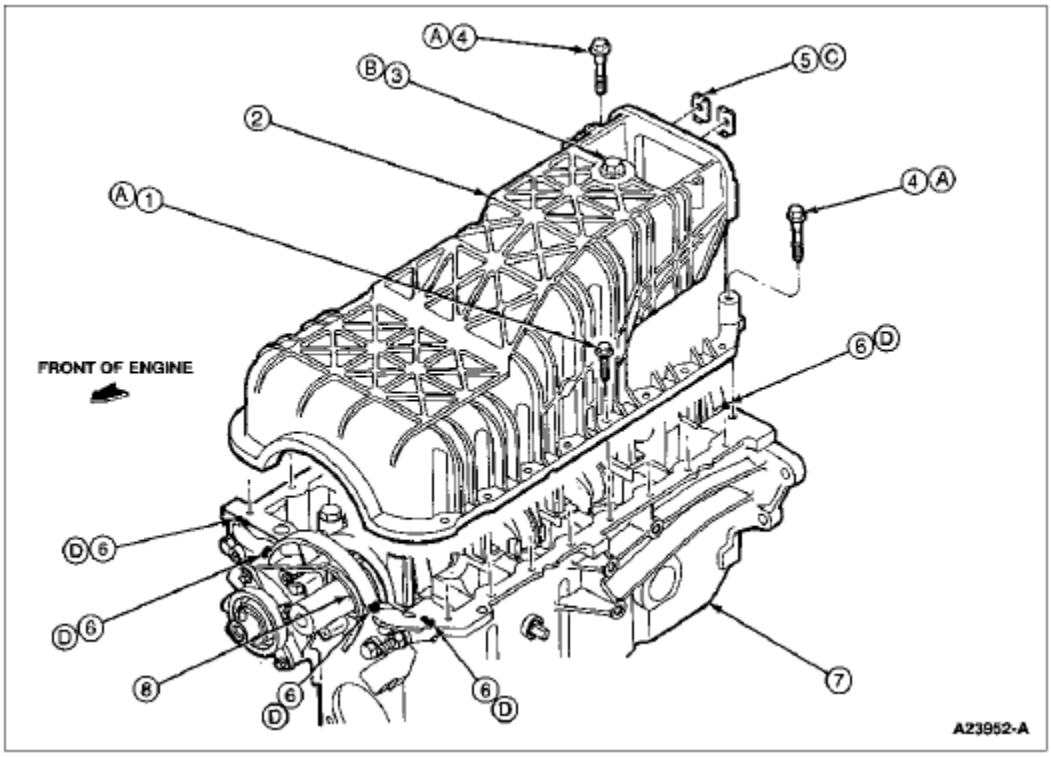
tomsn048@gmail.com

(6700) into place in engine front cover.

13. Install oil pump screen cover and tube. Tighten bolts to 20-30 Nm (15-22 lb-ft). Tighten pickup tube-to-main bearing cap nuts to 40-55 Nm (30-40 lb-ft).

14. Apply a small amount of Silicone Gasket and Sealant F1AZ-19562-A, or equivalent meeting Ford specification WSE-M4G320-A2 at joints between front engine cover and cylinder blocks and rear main cap and cylinder blocks as shown.

Oil Pan



Item	Part Number	Description
1	N806378-S36	Bolt, M6-1 x 27.5 (16 Places)
2	6675	Oil Pan
3	6730	Oil Pan Drain Plug, M8
4	N806379-S36	Bolt, M6-1 x 57.5
5	6C629	Oil Pan Spacer
6	19562	Silicone Gasket and Sealant
7	6010	Cylinder Blocks
8	6019	Engine Front Cover

tomsn048@gmail.com

A	—	Tighten to 14-16 Nm (123-141 Lb-In)
B	—	Tighten to 20-34 Nm (15-25 Lb-Ft)
C	—	If Replacing Oil Pan or Transmission, Select According to Text
D	—	Apply in Six Places Shown (Left Side of Rear Main Cap Is Hidden)

15. Press new oil pan gasket into groove in oil pan and install oil pan. Tighten screws to 13-16 Nm (10-12 lb-ft).

16. **CAUTION: If oil pan was not replaced make sure any spacers on the oil pan-to-transmission holes are in place. If replaced, make sure any spacers necessary in installation or engine assembly procedure are in place. If clearance between the engine oil pan and transmission is insufficient, or excessive, oil pan damage or oil leakage can occur when pan-to-transmission bolts are tightened.**

    If oil pan was replaced:

    a. Position a straightedge flat on the rear of the engine block so that it extends over the oil pan-to-transmission mounting bolt pads.
    b. Measure the gap between the mounting pad and the straightedge using a feeler gauge. Select spacers of the required thickness from chart. If pan cannot be brought into specifications of 0-0.254mm (0-0.009 in.) with spacers, replace oil pan.

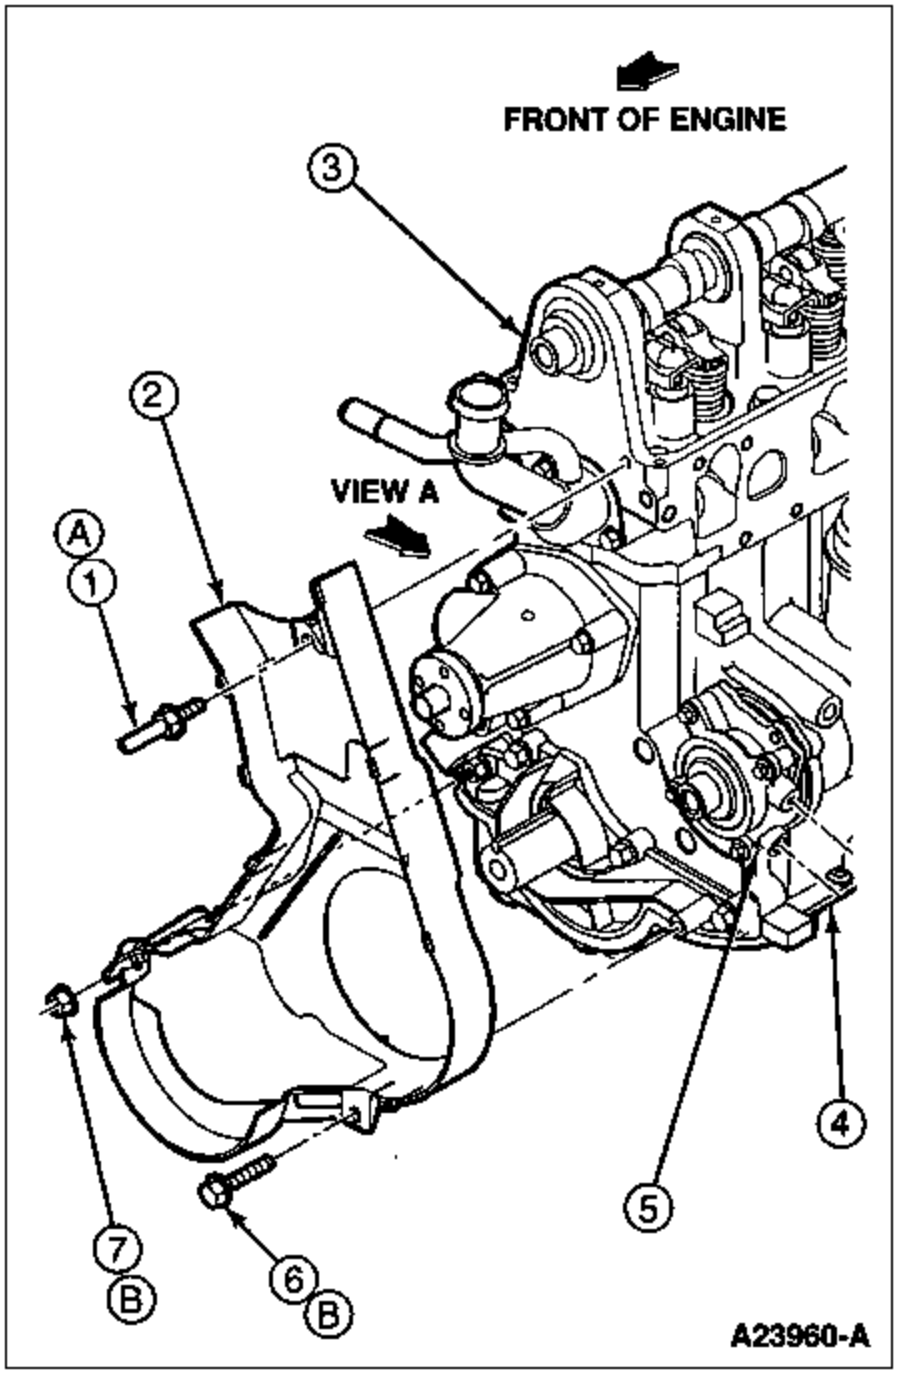
SPACER SELECTION CHART

Measured Gap		Spacer Required		
mm	**Inch**	**mm**	**Inch**	**Shim Color Code**
0.0-0.254	0.0-0.010	None	None	—
0.27-0.51	0.011-0.020	0.254	0.010	Yellow
0.52-0.76	0.021-0.030	0.508	0.020	Blue
0.78-1.01	0.031-0.040	0.762	0.030	Pink

17. Install inner timing belt cover.

18. Install inner timing belt cover screw and nut and tighten to 8-11 Nm (71-97 lb-in). Install stud nut to inner timing belt cover and cylinder head and tighten to 20-30 Nm (15-22 lb-ft).

tomsn048@gmail.com



Item	Part Number	Description
1	N808049-S102	Stud, M8-1.25 x 51
2	6E005	Inner Timing Belt Cover
3	6049	Cylinder Head
4	6010	Cylinder Blocks
5	6600	Oil Pump
6	N804958-S8	Bolt, M6-1 x 22.5

tomsn048@gmail.com

7	N621906-S2	Nut, M6-1
A	—	Tighten to 20-30 Nm (15-22 Lb-Ft)
B	—	Tighten to 8-12 Nm (71-106 Lb-In)

19. Slide crankshaft sprocket onto crankshaft. Recess goes toward cylinder blocks.

20. Apply Threadlock 262 E2FZ-19554-B or equivalent meeting Ford specification WSK-M2G351-A6 to camshaft bolt threads. Install bolt and washer finger-tight.

21. Install Cam Sprocket Holding/Removing Tool T79P-6256-B on sprocket. Tighten camshaft bolt to 70-95 Nm (52-70 lb-ft). Remove tool.

22. Install oil pump sprocket.

23. Install oil pump sprocket bolt and washer finger-tight.

24. Prime oil pump.

25. Install Cam Sprocket Holding/Removing Tool T74P-6256-B on sprocket. Tighten bolt to 40-55 Nm (30-40 lb-ft). Remove tool.

26. Install and adjust timing belt as outlined in this section.

27. Install crankshaft position sensor (CKP sensor) (6C351) and tighten bolt to 8-12 Nm (71-106 lb-in).

28. Install outer timing belt cover. Snap tabs into slot. Install screw and tighten to 8-12 Nm (70-106 lb-in).

29. Install crankshaft pulley (6312), and washer. Tighten bolt to 125-165 Nm (93-121 lb-ft).

30. Connect retaining clip for crankshaft position sensor lead.

31. Remove engine from engine stand.

32. Install crankshaft rear oil seal using T82L-6701-A Crankshaft Seal Installer.

33. Position engine rear plate.

34. Install flywheel or flexplate and flywheel reinforcing plate. Tighten special flywheel-to-crankshaft bolts to 73-87 Nm (54-64 lb-ft).

35. If equipped, install clutch disc and clutch pressure plate and tighten bolts finger-tight.

36. Install Clutch Aligner T71P-7137-H aligning clutch disc to transmission input shaft pilot bearing (7118).

37. **CAUTION: Clutch pressure plate bolts must be tightened one or two turns at a time in sequence or pressure plate will be bent causing faulty clutch operation.**

    Tighten clutch pressure plate bolts in a criss-cross pattern one or two turns at a time. Tighten pressure plate bolts 21-32 Nm (15-24 lb-ft).

tomsn048@gmail.com

38. Remove clutch alignment tool.

39. Install engine as outlined in this section.

---

tomsn048@gmail.com

Crankshaft Main Bearings

Removal

NOTE: The main bearing inserts are a precision selective fit. To check bearing clearances or to select fit a new bearing, refer to Section 03-00 .

1. Remove engine (6007) as outlined in this section.
2. Remove oil pan (6675) as outlined in this section.
3. Remove oil pump screen cover and tube (6622) as outlined in this section.
4. **NOTE: Replace one bearing at a time, leaving the other bearings securely fastened.**

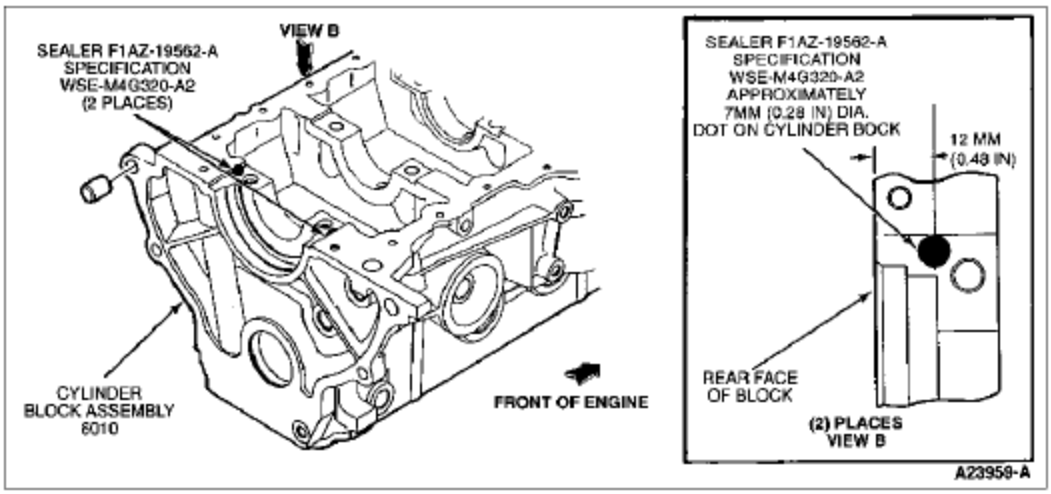
   Remove main bearing cap to which new bearings are to be installed.
5. Remove bearing from cap.
6. Press on end of upper bearing without tang to start it out.
7. Rotate bearing out from between crankshaft (6303) and cylinder blocks (6010).

Installation

1. Place lubricated, upper bearing on crankshaft and rotate into place.
2. Place lower bearing into cap.
3. Apply Plastigage® to crankshaft bearing journal.
4. Install bearing cap.
5. Lightly oil main bearing bolt or stud. Alternately tighten to 68-81 Nm (50-60 lb-ft). Retighten to 108-122 Nm (80-89 lb-ft).
6. Remove main bearing cap.
7. Check Plastigage® for bearing clearance using chart on package. Clearance should be 0.010-0.056mm (0.0004-0.0022 inch) for front main bearing or 0.020-0.066mm (0.0008-0.0026 inch) for bearings 2-5.
8. If clearance is OK, lubricate bearings with Super Premium Motor Oil X0-5W30-QSP or equivalent meeting Ford specification ESE-M2C153-E and reinstall cap.
9. Apply a 7mm (0.27-inch) dot of Silicone Gasket and Sealant F1AZ-19562-A, or equivalent meeting Ford specification WSE-M4G320-A2 on each side of cylinder blocks as shown in illustration before installing the No. 5 cap.

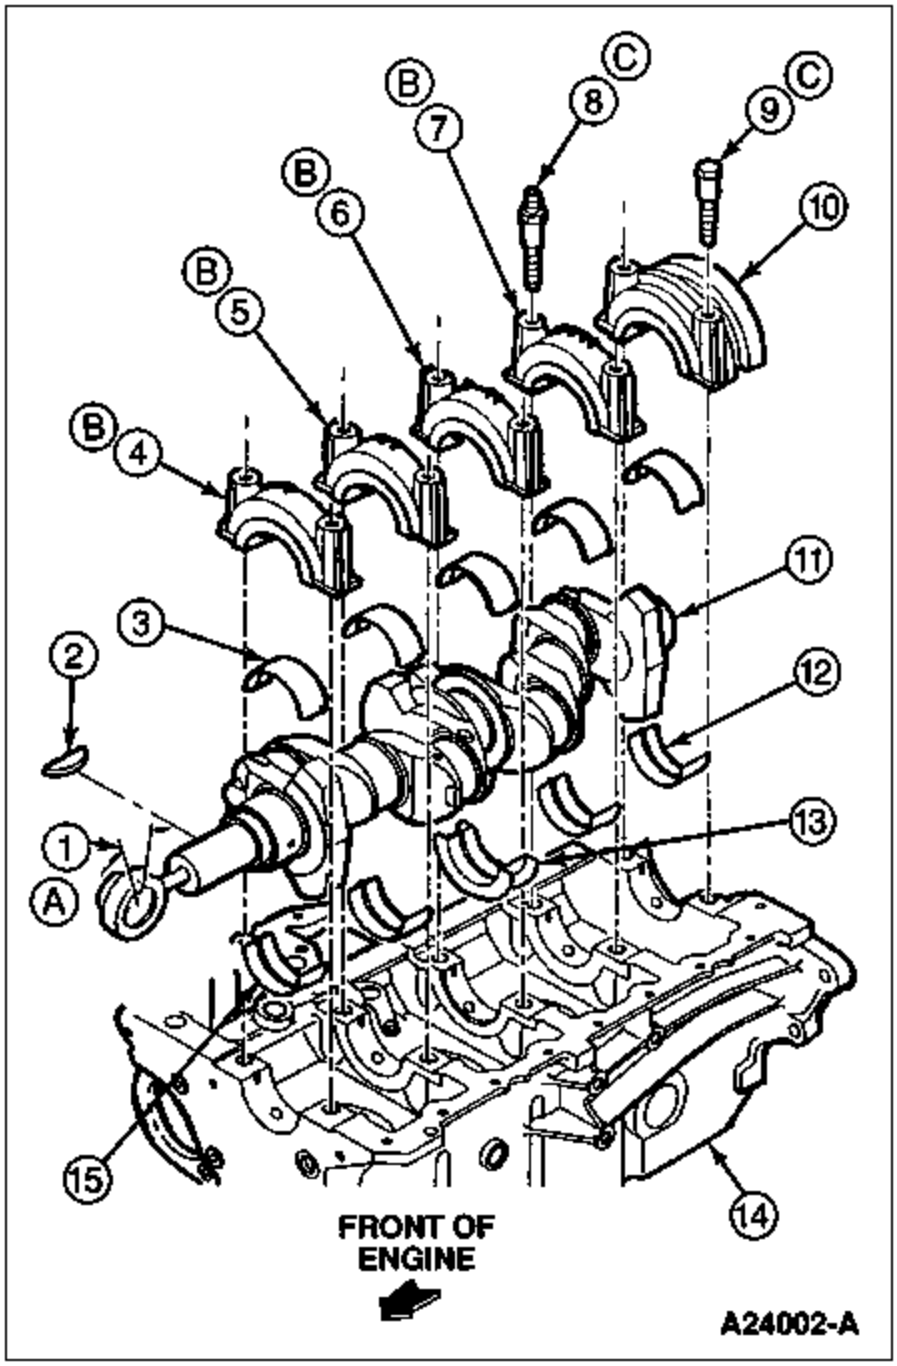
tomsn048@gmail.com

Rear Main Bearing Cap Area Sealing



10. Alternately tighten bolts or stud to 68-81 Nm (50-60 lb-ft). Retighten to 102-115 Nm (75-84 lb-ft).
11. Check crankshaft end play as outlined in Section 03-00 .
12. Install oil pump screen cover and tube as outlined in this section.
13. Install oil pan as outlined in this section.
14. Install engine as outlined in this section.

tomsn048@gmail.com



Item	Part Number	Description
1	D78P-4201-G	Dial Indicator
2	6B316	Crankshaft Key
3	6A338	Lower Main Bearing (5 Places)

tomsn048@gmail.com

Pistons and Connecting Rods

Removal

1. Remove engine (6007) as outlined in this section, and install on engine stand.
2. Remove oil pan (6675) as outlined in this section.
3. Remove oil pump screen cover and tube (6622) as outlined in this section.
4. Remove cylinder head (6049) as outlined in this section.
5. **CAUTION: Never cut into the ring travel area in excess of 0.8mm (1/32 inch) when removing ridges.**

   Remove any ridges and/or deposits from the upper end of the cylinder bores as follows.

   Turn the crankshaft until the piston to be removed is at the bottom of its travel and place a cloth on the piston head to collect the cuttings. Remove any ridge and/or deposits from the upper end of the cylinder bores. Remove the cylinder ridge with a ridge cutter. Follow the instructions furnished by the tool manufacturers.
6. Make sure all connecting rod caps are marked so that they can be installed in their original positions.
7. Turn the crankshaft until the connecting rod being removed is down.
8. Remove the connecting rod nuts and caps.
9. **CAUTION: Avoid damage to the crankshaft journal or the cylinder wall when removing the piston and rod.**

   Push the connecting rod and piston assembly out the top of the cylinder with the handle end of a hammer.
10. Remove the bearing inserts from the connecting rod (6200) and cap.
11. Select the proper bore gauge and micrometer. Measure the cylinder bore for out of round and taper as outlined in Section 03-00 . Deglaze cylinder bore as outlined in Section 03-00 .
12. Remove rings and clean ring grooves. Clean carbon from piston, pin and ring (6102).
13. Check ring gaps using the procedure given in Section 03-00 .
14. **NOTE: Never install compression rings on pistons by hand. Always use a ring expander tool.**

    Install rings using a ring expander tool. Check ring side clearance.
15. Clean crankshaft journals.

tomsn048@gmail.com

16. If necessary, disassemble piston and rod assemblies as outlined in this section.

17. Clean gasket surfaces and fasteners.

Installation

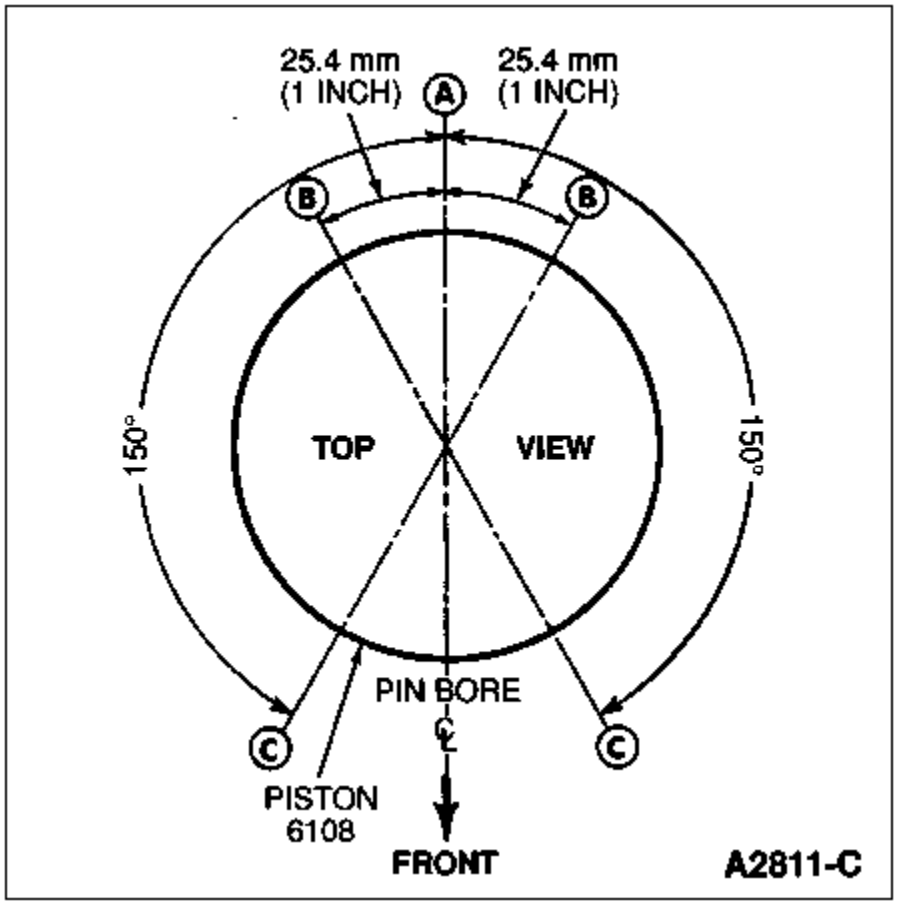
1. If disassembled, assemble piston and connecting rod assembly as outlined in this section.

2. Refer to Pistons, Piston Pins, and Piston Rings in Section 03-00 for Cleaning, Inspection, Pistons — Fitting, and Piston Rings — Fitting.

3. If necessary install piston and pin on connecting rod as outlined in this section.

4. Using a piston ring expander, install the piston rings, starting with the oil control rings. Make sure rings are installed right side up. Refer to instructions with piston ring set.

5. Rotate the rings so the end gaps are NOT lined up but are spaced properly as shown.



6. Check the ring side clearance as outlined in Section 03-00 . Side clearance for both compression rings should be 0.041-0.084mm (0.016-0.0033 inch) and snug fit for the oil control ring.

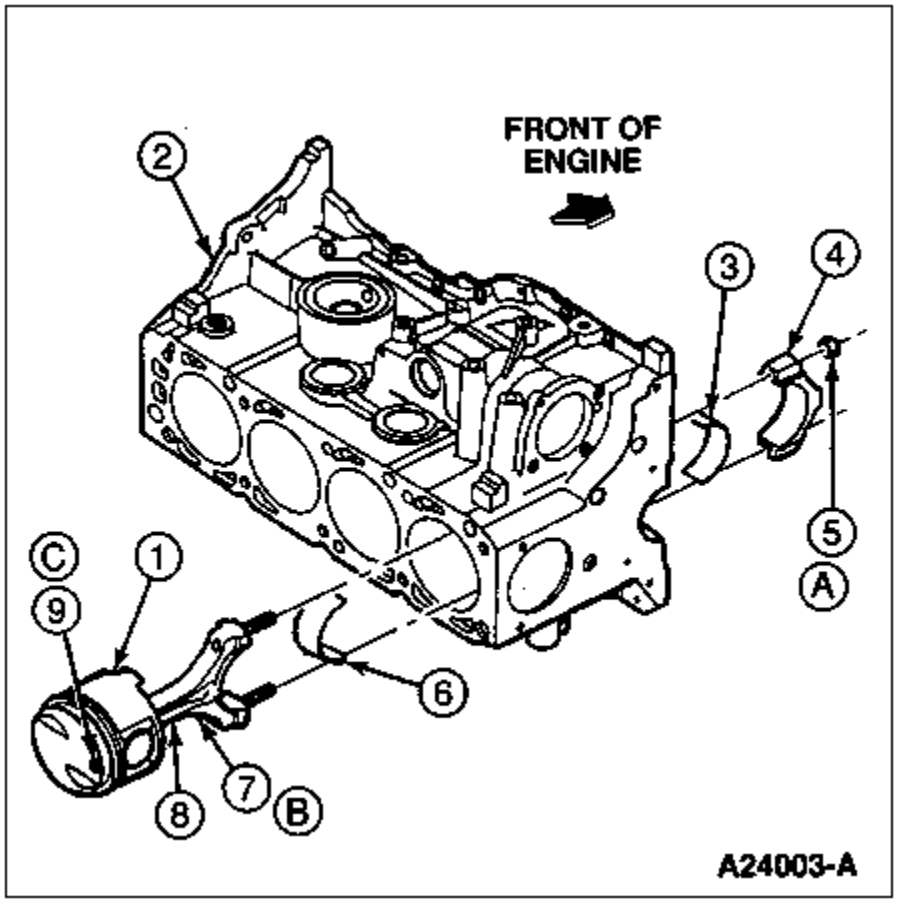
7. Put a piece of hose or other protector over connecting rod bolt (6214) to protect crankshaft journal.

tomsn048@gmail.com

8. Rotate crankshaft (6303) so journal for piston (6108) to be installed is at the bottom of its stroke.

9. **CAUTION: Install the piston, pin and ring with the indentation notch in the piston head toward the front of the engine.**

   Apply motor oil to piston and cylinder bore and start piston and rod assembly into cylinder guiding bolts around crankshaft journal.



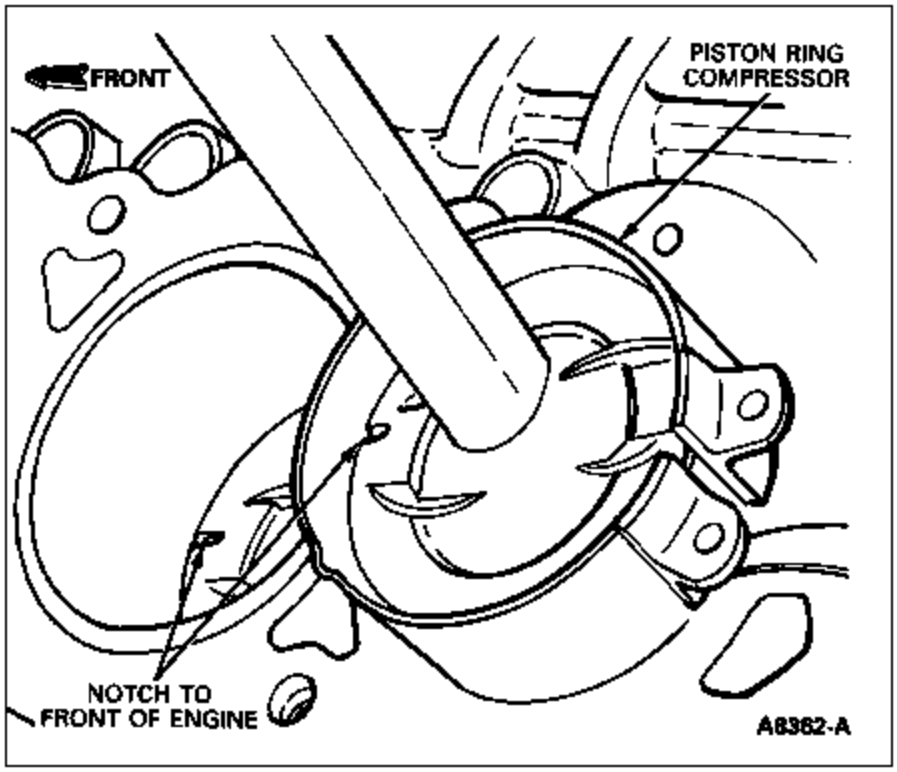
Item	Part Number	Description
1	6100	Piston
2	6010	Cylinder Blocks
3	6211	Connecting Rod Bearing, Lower
4	—	Connecting Rod Cap (Part of 6205)
5	N800113-S	Nut, M9-1
6	6211	Connecting Rod Bearing, Upper
7	—	Squirt Hole (Part of 6205)
8	6205	Connecting Rod

tomsn048@gmail.com

9	—	Notch (Part of 6100)
A	—	Tighten According to Procedure in Text
B	—	Squirt Hole Faces Away from Oil Pump
C	—	Notch Goes Toward Front of Engine

10. Compress piston rings using suitable piston ring compressor.

11. Tap piston assembly into place using bottom of hammer handle.



12. Insert bearings in connecting rod and cap.

13. Apply Plastigage® to bearing journal. Refer to Section 03-00 .

14. Install connecting rod cap. Hand-start each connecting rod nut until flush with end of rod bolt. Alternately tighten connecting rod nuts to 34-41 Nm (25-30 lb-ft). Then retighten to final torque of 41-49 Nm (30-36 lb-ft).

15. Remove cap and check bearing clearance with chart on Plastigage® package.

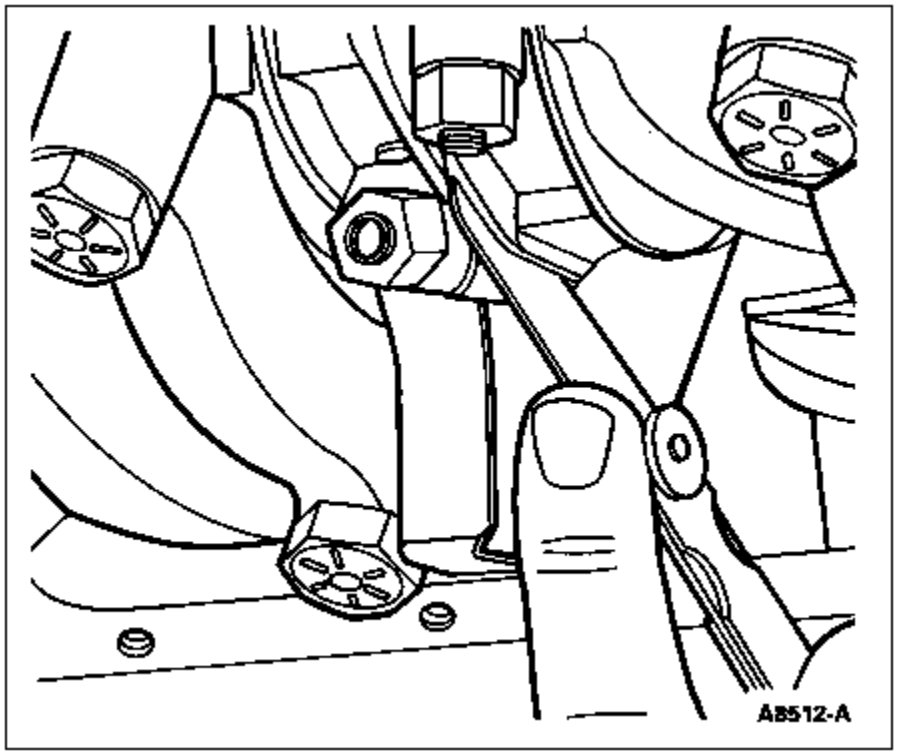
16. Lubricate connecting rod bearings (6211) with Super Premium Motor Oil XO-5W30-05P or equivalent meeting Ford specification ESE-M2C153-E.

17. Reinstall connecting rod cap.

18. Alternately tighten connecting rod nuts to 34-41 Nm (25-30 lb-ft). Then retighten to final torque of 41-49 Nm (30-36 lb-ft).

tomsn048@gmail.com

19. Check side clearance. Side clearance should be 0.09-0.29mm (0.0035-0.0115 inch).



20. Repeat for other piston and rod assemblies as needed.
21. Install cylinder head as outlined in this section.
22. Install oil pump screen cover and tube as outlined in this section.
23. Install oil pan as outlined in this section.
24. Install engine as outlined in this section.

---

tomsn048@gmail.com

tomsn048@gmail.com

Connecting Rod Bearings

Removal

1. Remove engine (6007) as outlined in this section, and install on engine stand.
2. Remove spark plug (12405) of cylinder where bearing is to be replaced.
3. Remove oil pan (6675) as outlined in this section.
4. Rotate engine so it is upside down and remove oil pump screen cover and tube (6622) as outlined in this section.
5. Rotate crankshaft (6303) until connecting rod in which bearing is to be replaced is at the bottom of its stroke.
6. Remove two connecting rod nuts.
7. Remove connecting rod cap.
8. Push piston and connecting rod assembly up into bore.
9. Remove bearing insert from connecting rod.
10. Remove bearing insert from connecting rod cap.
11. Inspect connecting rod bearings (6211) as outlined in Section 03-00 .
12. Inspect journal and measure for taper and out-of-round as outlined in Section 03-00 .

    Out-of-round should be less than 0.01524mm (0.0006 inch). Taper should be less than 0.06mm per centimeter of length (0.006 inch per inch of length).
13. Inspect connecting rod bearing bore, measure for out-of-round and taper. Maximum out-of-round is 0.0120mm (0.0004 inch). Maximum taper is 0.0102mm (0.0004 inch).
14. Thoroughly clean bearing bore of connecting rod and cap.

Installation

1. Make sure bearing bore of connecting rod and cap and bearing journal are clean.
2. Insert upper bearing insert into connecting rod.
3. Insert lower bearing insert into connecting rod cap.
4. Apply Plastigage® to bearing journal. Refer to Section 03-00 .
5. **NOTE: Do not scratch journal with connecting rod bolts.**

tomsn048@gmail.com

Carefully pull up piston and connecting rod assembly into place on crankshaft.

6. Install connecting rod cap. Hand-start each connecting rod nut until flush with end of rod bolt. Alternately tighten connecting rod nuts (6212) to 34-41 Nm (25-30 lb-ft). Then retighten to final torque of 41-49 Nm (30-36 lb-ft).
7. Remove cap and check bearing clearance.
8. Lubricate connecting rod bearings with Motorcraft Super Premium Motor Oil XO-5W30-QSP or equivalent 5W30 motor oil meeting Ford specification ESG-M2C153-E.
9. Install connecting rod cap.
10. Hand start connecting rod nuts until nuts are flush with ends of connecting rod bolts.
11. Alternately tighten connecting rod nuts to 34-41 Nm (25-30 lb-ft). Then alternately tighten again to final torque of 41-49 Nm (30-36 lb-ft).
12. Install oil pump screen cover and tube as outlined in this section.
13. Install oil pan as outlined in this section.
14. Install spark plugs.
15. Install engine as outlined in this section.

---

tomsn048@gmail.com

Engine

SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
Cam Sprocket Holding/Removing Tool	T74P-6256-B
Front Cover Seal Remover	T74P-6700-B
Cam Bearing Adapter Tube	T72C-6250
Front Seal Replacer	T74P-6150-A
Crankshaft Seal Installer	T82L-6701-A
Clutch Aligner	T71P-7137-H

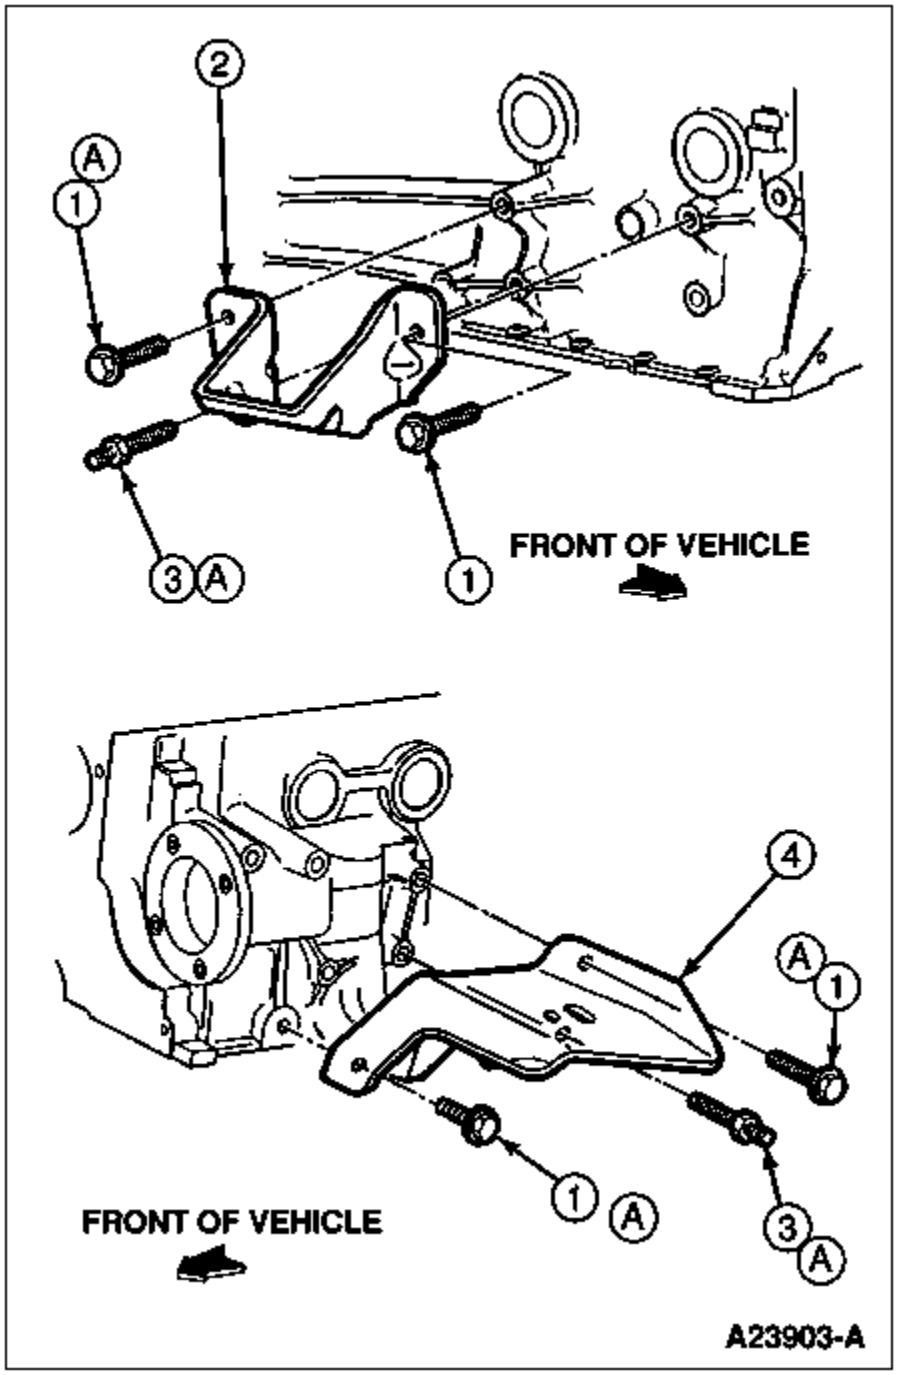
Disassembly

1. Remove engine (6007) as outlined in this section and install on suitable stand.
2. If manual transmission, loosen bolts one turn at a time and remove clutch pressure plate (7563) and clutch disc (7550).
3. **CAUTION: Special bolts are used for attaching flywheel to crankshaft (6303). Keep flywheel-to-crankshaft bolts (6379) separate for installation.**

   Remove bolts and flywheel or flexplate and reinforcement.
4. Remove engine rear plate (7007).
5. Drain oil from engine.
6. Remove oil filter.
7. Disconnect EGR transducer electrical connector.
8. Apply Penetrating Lubricant E8AZ-19A501-B or equivalent to EGR valve to exhaust manifold tube (9D477) nuts. Loosen nuts and remove EGR valve to exhaust manifold tube.
9. Remove two nuts and rear engine lifting eye.
10. Remove exhaust manifold bolts and studs and exhaust manifold (9430).
11. Remove right engine mount bracket.

tomsn048@gmail.com

Engine Support Brackets, Ranger with 2.3L Engine

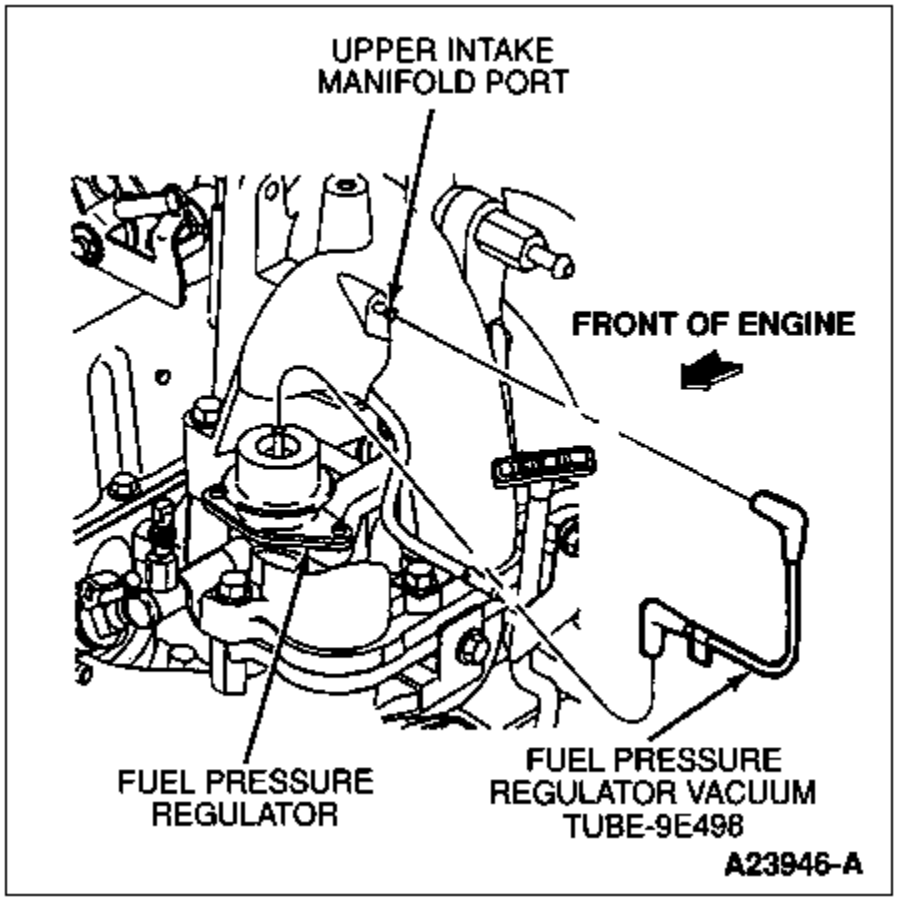


Item	Part Number	Description
1	N802653-S100	Screw and Washer, M10-1.5x22
2	6030	Front Engine Support Mounting Bracket (RH)
3	N804044-S100	Stud, M10-1.5/M10-1.5x5.1
4	6031	Front Engine Support Mounting Bracket (LH)

tomsn048@gmail.com

A	—	Tighten to 60-81 Nm (44-60 Lb-Ft)

12. Disconnect fuel pressure regulator vacuum line from fuel pressure regulator (9C968).



13. Remove vacuum connections from EGR valve (EGR valve) (9D475).

14. Remove engine control sensor wiring (12A581) and vacuum tab from top of valve cover.

15. Disconnect electrical connector at EGR vacuum regulator solenoid (9J459) valve.

16. Remove two bolts and assembled EGR vacuum regulator solenoid and EGR vacuum regulator bracket (9J472).

17. Disconnect EGR valve vacuum connector.

18. Disconnect throttle position (TP) sensor connector and idle air control (IAC) valve connector.

19. Disconnect positive crankcase ventilation valve (PCV valve) (6A666) and crankcase ventilation hose (6853) from crankcase vent oil separator (6A785).

20. Remove seven bolts, two studs and upper intake manifold with assembled throttle body (9E926). Remove intake manifold upper gasket (9H486).

tomsn048@gmail.com

21. Disconnect vacuum connection from vacuum fitting in upper intake manifold.

22. Remove crankcase ventilation hose from valve cover.

23. Remove left side spark plug wire set from coils and spark plugs, and snap clips off of valve cover.

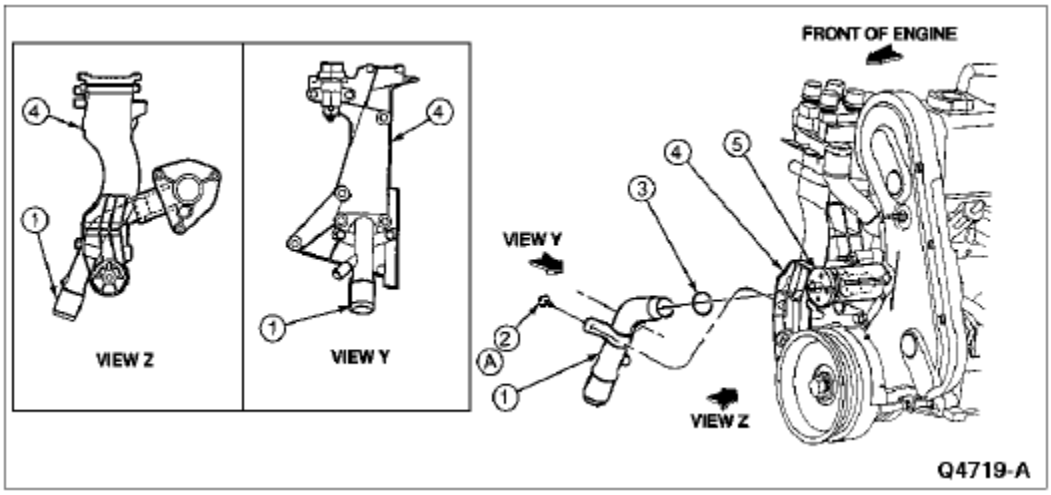
24. Disconnect engine wiring harness clip from rear left side of valve cover.

25. Remove right side spark plug wire set from ignition coils and spark plugs.

26. Disconnect vacuum harness and engine wiring from right side of valve cover and remove vacuum harness.

27. Remove two water inlet tube-to-generator bracket bolts and water pump inlet tube (8290).

Water Pump Inlet Tube



Item	Part Number	Description
1	8290	Water Pump Inlet Tube
2	N606676-S2	Screw and Washer Assembly, M6-1x22.5
3	87056-S100	O-Ring
4	10153	Generator Mounting Bracket
5	8501	Water Pump
A	—	Tighten to 9-12 Nm (78-107 Lb-In)

28. Disconnect engine control sensor wiring from ignition coils (12029) and radio voltage regulator capacitor (18832).

29. Remove three bolts and generator mounting bracket from engine with ignition coils assembled.

30. Disconnect oil pressure sensor (9278) and engine coolant sensor electrical connections from the

tomsn048@gmail.com

cylinder block.

31. Disconnect engine wiring from four fuel injector nozzles and two clips to fuel rail.

32. Remove clip on fuel charging wiring (9D930) from stud on lower intake manifold.

33. Disconnect fuel charging wiring from crankshaft position sensor (CKP sensor) (6C315).

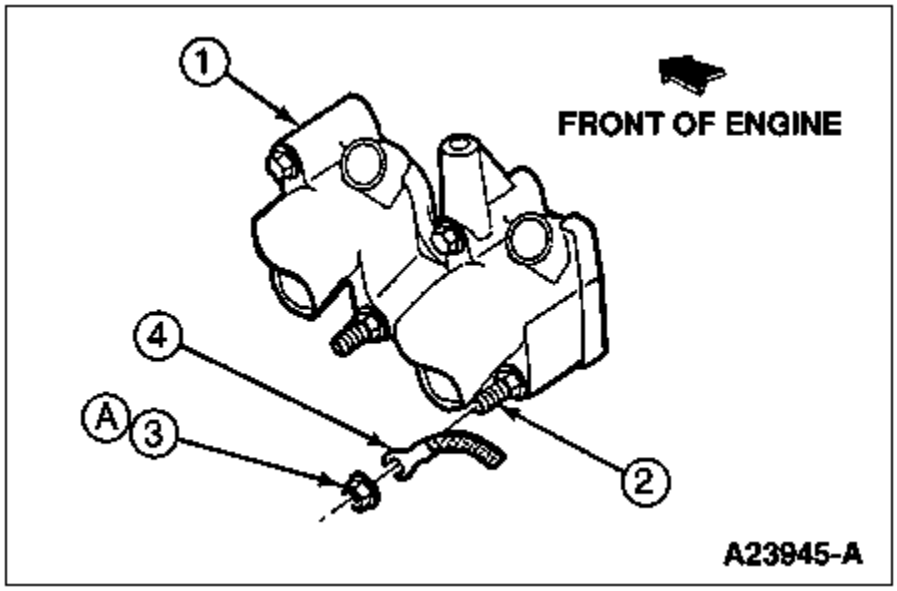
34. Disconnect fuel charging wiring from camshaft position sensor (CMP sensor) (6B288) and clip from stud on lower intake manifold.

35. Disconnect engine control sensor wiring from the 42 pin connector bracket mounted on the lower intake manifold.

36. Remove engine control sensor wiring.

37. Remove stud and engine oil level indicator tube (6754).

38. Remove bolt and audio ground cable from engine.



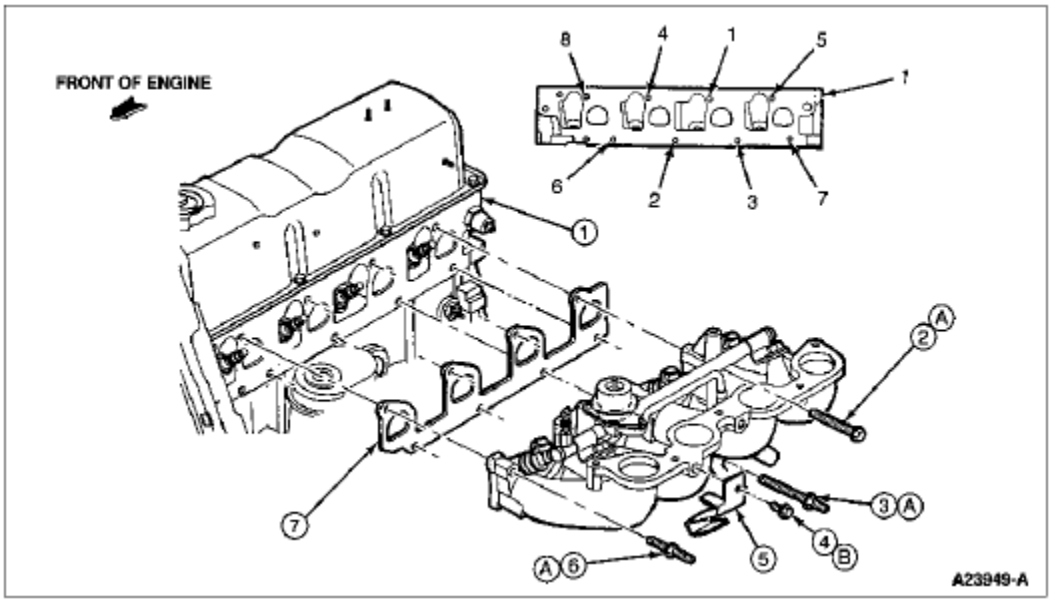
Item	Part Number	Description
1	9424	Intake Manifold, Lower
2	N807458-S101	Stud, M8-1.25 x 1.25 x 96.2
3	N620481-S2	Nut, M8 x 1
4	14303	Audio Ground Cable
A	—	Tighten to 9-12 Nm (80-106 Lb-In)

39. Remove lifting eye and lower intake manifold with assembled fuel injectors and fuel injection supply manifold (9D280).

tomsn048@gmail.com

40. Remove studs and bolts and remove lower intake manifold with assembled fuel injectors and fuel injection supply manifold.

Lower Intake Manifold



Item	Part Number	Description
1	6049	Cylinder Head
2	N807462-S101	Bolt, M8-1.25 x 67.2 (Holes 1, 2, 4 and 5)
3	N807458-S101	Stud, M8-1.25 x 1.25 x 96.2 (Holes 3, 6 and 7)
4	N605904-S36	Bolt, M8-1.25 x 16.6
5	14A004	42 Pin Connector Bracket
6	N808163-S100	Stud, M8-1.25 x 1.25 x 63.7 (Hole 8)
7	9439	Intake Manifold Gasket
A	—	Refer to Procedure in Text
B	—	Tighten to 20-30 Nm (15-22 Lb-In)

41. Remove left engine mount bracket.

42. Remove bolt and crankcase vent oil separator.

43. Remove engine coolant temperature sensor from cylinder blocks (6010).

44. Using suitable oil pressure sender socket, remove oil pressure sensor from cylinder head (6049).

45. **NOTE: Unique platinum spark plugs (12405) are used. If all eight spark plugs are not "PP" series, they will need to be marked for replacement in the same cylinder. Refer to Section 03-**

tomsn048@gmail.com

07B .

Remove eight spark plugs and use tape to label the reinstallation locations.

46. Remove crankshaft damper bolt and washer.

47. Remove crankshaft damper.

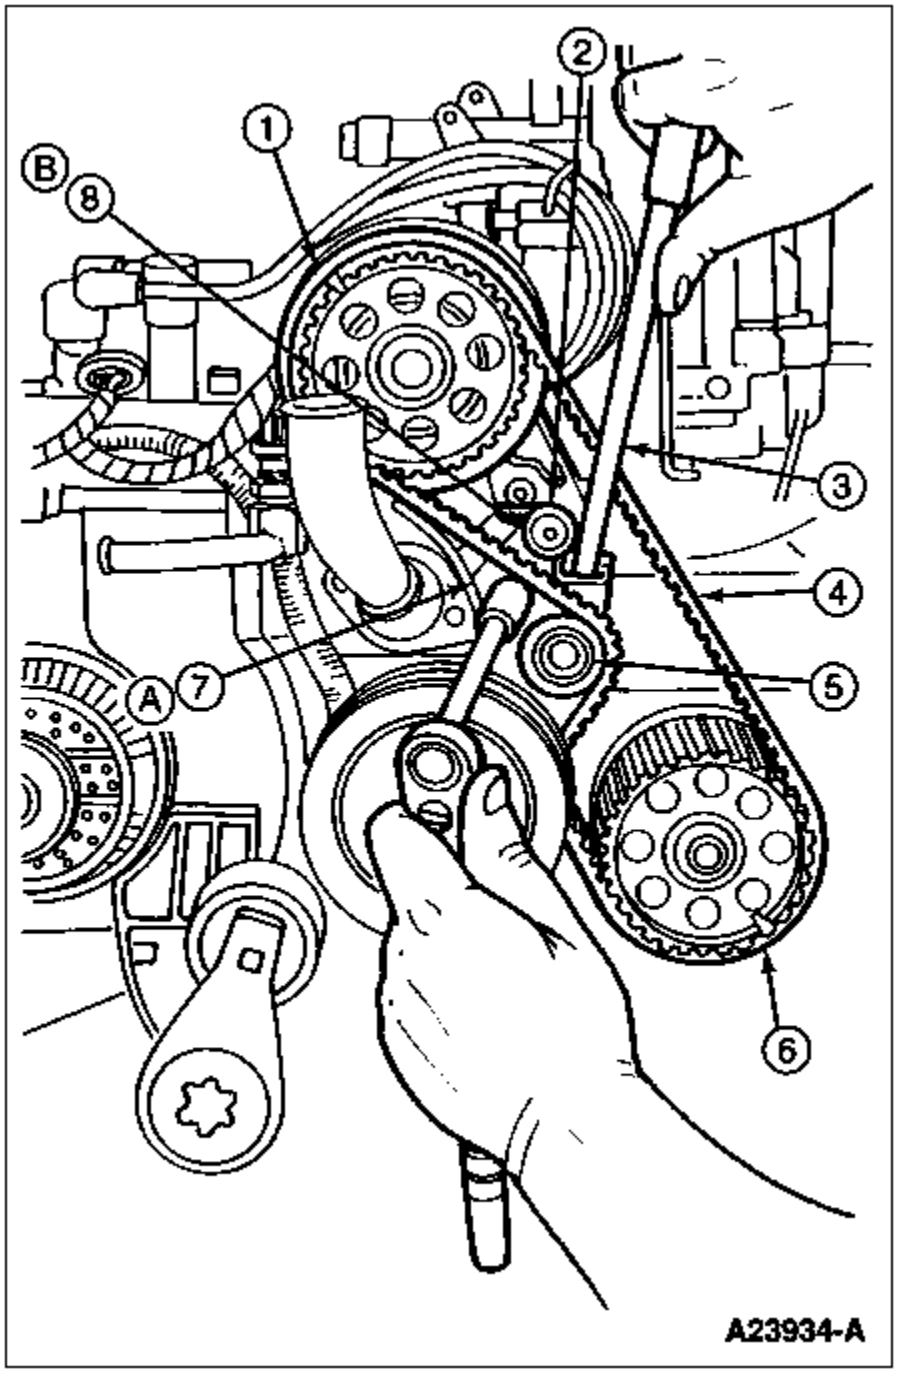
48. Remove outer timing belt cover bolt. Depress tabs and remove outer timing belt cover.

49. Remove bolt and crankshaft position sensor (CKP sensor) (6C351).

50. Loosen timing belt tensioner spring pivot bolt one-half turn.

51. Hold timing belt tensioner with T74P-6254-A Camshaft Belt Tensioner Tool and remove adjusting bolt. Relax timing belt tensioner spring.

tomsn048@gmail.com



Item	Part Number	Description
1	6256	Camshaft Sprockets
2	6L273	Timing Belt Tensioner Spring
3	T74P-6254-A	Camshaft Belt Tension Adjusting Tool
4	6268	Timing Belt
5	6K254	Timing Belt Tensioner
6	6256	Oil Pump Sprocket

tomsn048@gmail.com

7	N800112-S100	Tensioner Adjusting Bolts, M8-1.25 x 20 (Under Wrench)
8	6K282	Timing Belt Tensioner (Spring Pivot) Bolt
A	—	Tighten to 35-45 Nm (26-33 Lb-Ft) (Refer to Text)
B	—	Tighten to 40-55 Nm (30-40 Lb-Ft) (Refer to Text)

52. Remove timing belt.

53. Hold timing belt timing belt tensioner spring with T74P-6254-A Camshaft Belt Tensioner Tool and remove spring pivot bolt. Relax spring and remove spring and tensioner.

54. Install T74P-6256-B Cam Sprocket Holding/Removing Tool on camshaft sprocket.

55. Remove camshaft sprocket bolt and washer.

56. Install puller part of T74P-6256-B Cam Sprocket Holding/Removing Tool. Pull off camshaft sprocket.

57. Install T74P-6256-B Cam Sprocket Holding/Removing Tool on oil pump sprocket.

58. Remove oil pump shaft bolt and washer.

59. Install puller part of T74P-6256-B Cam Sprocket Holding/Removing Tool. Remove oil pump sprocket.

60. Remove crankshaft sprocket (6306).

61. Remove inner timing belt cover.

62. Remove two screws, clutch pressure plate, water thermostat (8575), and oil cooler return tube gasket (6N789).

63. **NOTE: Steps 1 through 63 take the engine down to a "long block." For further disassembly, continue.**

    Remove three bolts, water pump (8501), and O-ring.

64. Remove valve cover (6582) and valve cover gasket (6584).

65. Remove cylinder head bolts.

66. **NOTE: Steps 1 through 65 take the engine down to a "short block." For further disassembly, continue.**

    Remove cylinder head, and head gasket (6051).

67. Remove four bolts from oil pump (6600).

68. Remove oil pump and oil pump to cylinder block gasket (6659).

69. Remove oil pan bolts and oil pan (6675).

tomsn048@gmail.com

70. Remove oil pan gasket (6710).

71. Using ridge reamer, remove ridge from top of cylinder bores. Put a rag in cylinder to keep shavings from between piston (6108) and bore. Follow instructions of tool manufacturer.

72. Rotate engine on stand so crankshaft is up.

73. Remove two bolts and nut and remove oil pump screen cover and tube (6622) as an assembly.

74. Using T74P-6700-B Front Cover Seal Remover, remove engine front cover seal as outlined in this section.

75. Remove bolts and engine front cover (6019).

76. Make sure connecting rod caps are marked so each cap can be kept with its rod.

77. Remove connecting rod nuts and four caps.

78. **NOTE: Each main bearing cap, except the rear cap, is marked with arrows pointing to the front of the engine. The number of arrows corresponds to the number of the main bearing cap. For example, one arrow for the front cap, two arrows for the number two cap.**

    Remove main bearing bolts and main bearing caps.

79. Lift out crankshaft. Crankshaft rear oil seal (6701) will come out with crankshaft. Remove seal from crankshaft.

80. Remove upper main bearings from block. Store them so they can be put back in the same places if they are to be reused.

81. Remove lower crankshaft bearings from main bearing caps. Store them so they can be put back in the same caps if they are to be reused.

82. Replace connecting rod caps on connecting rods and install nuts finger-tight.

83. Remove piston and rod assemblies from engine. It may be necessary to tap the bottom of each piston with the end of a hammer handle to remove.

84. Use suitable Allen wrench to remove oil filter mounting insert (6890), if necessary.

85. Remove front and rear oil gallery plugs, if necessary.

86. Disassemble piston and rod assemblies as outlined in this section, if necessary.

87. Disassemble cylinder head as outlined in this section, if necessary.

88. Clean and inspect parts as outlined in Section 03-00 . Repair or replace as outlined in Section 03-00 .

89. Clean old sealer from cylinder blocks and attaching parts.

Assembly

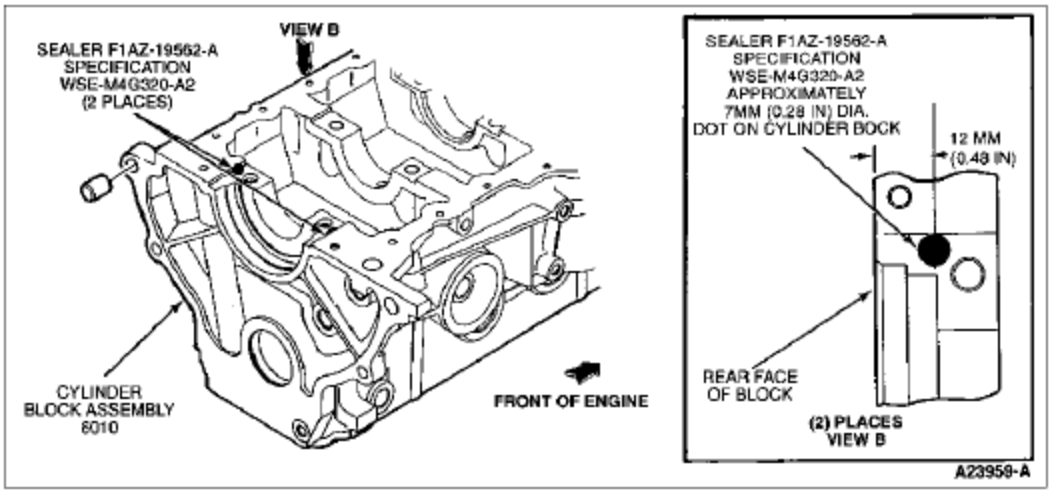
tomsn048@gmail.com

CAUTION: Lubricate parts with Motorcraft Super Premium Motor Oil XO-5W30-QSP or equivalent meeting Ford specification ESE-M2C153-E during assembly to prevent a dry start and engine damage.

1. If disassembled or repaired, reassemble cylinder head as outlined in this section.
2. If necessary, assemble piston and connecting rod assemblies as outlined in this section.
3. If necessary, replace core plugs as outlined in Section 03-00 .
4. If removed, install oil filter mounting insert and tighten to 28-35 Nm (20-25 lb-ft).
5. Install any oil gallery plugs removed and tighten to 38-45 Nm (28-33 lb-ft).
6. Install upper crankshaft main bearings. If reusing bearings, reinstall each bearing in the same place from which it was removed.
7. Install crankshaft.
8. Install bearings in main bearing caps. If reusing bearings, install bearing in same place from which it was removed.
9. Apply Plastigage® to crankshaft bearing journals.
10. Install main bearing caps and bolts. Alternately tighten bolts to 68-81 Nm (50-60 lb-ft). Retighten to 102-115 Nm (75-85 lb-ft).
11. Remove caps. Check Plastigage® for bearing clearance using chart on package. If OK, go on to next step. If not, correct clearance.
12. Apply a 7mm (0.27-inch) dot of Silicone Gasket and Sealant F1AZ-19562-A, or equivalent meeting Ford specification WSE-M4G320-A2 on each side of cylinder blocks as shown in illustration.

Rear Main Bearing Cap Area Sealing

tomsn048@gmail.com

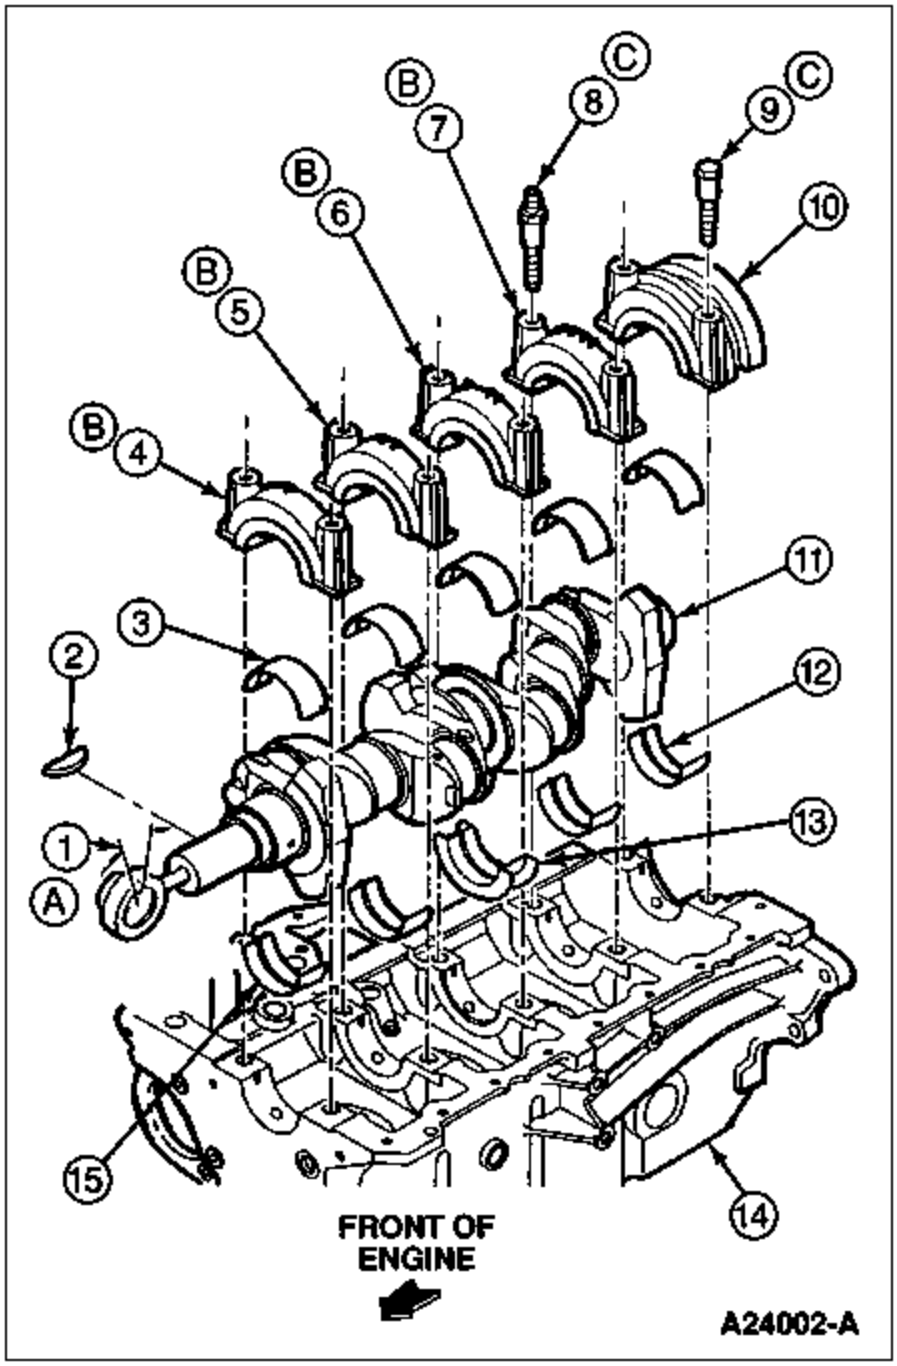


13. Lubricate crankshaft and bearings using oil meeting Ford specification ESE-M2C153-E and reinstall main bearing caps, bolts, and stud.

14. Alternately tighten main bearing bolts and stud to 68-81 Nm (50-60 lb-ft). Retighten to 102-115 Nm (80-90 lb-ft).

Crankshaft and Bearings, Installation, 2.3L Engine

tomsn048@gmail.com



Item	Part Number	Description
1	D78P-4201-G	Dial Indicator
2	N806700	Crankshaft Key
3	6A338	Lower Main Bearing (5 Places)
4	—	Front Main Bearing Cap (Part of 6010)

tomsn048@gmail.com

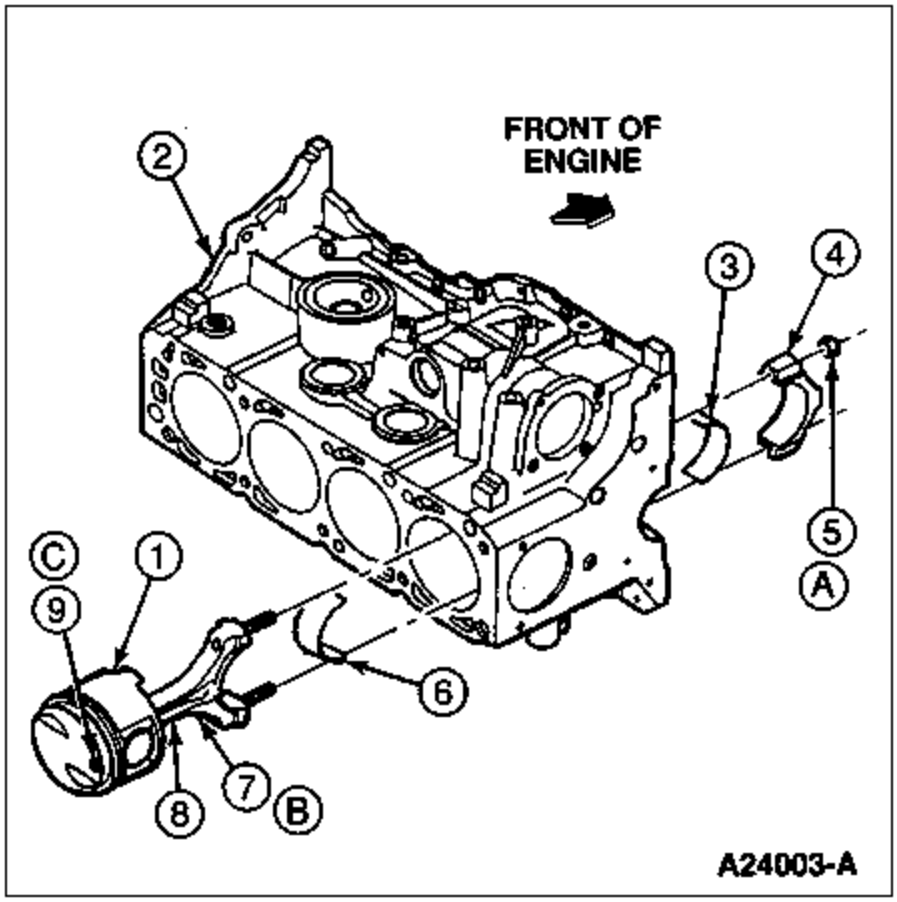
5	—	Front Intermediate Main Bearing Cap (Part of 6010)
6	—	Center Main Bearing Cap (Part of 6010)
7	—	Rear Intermediate Main Bearing Cap (Part of 6010)
8	N803729-S	M10-1.5 x M12-1.75 x 108.5 (1 Place)
9	N807497-S2	M12-1.75 x 80
10	—	Rear Main Bearing Cap (Part of 6010)
11	6303	Crankshaft
12	6333	Crankshaft Main Bearing, Upper (3 Places)
13	6337	Crankshaft Thrust Main Bearing
14	6010	Cylinder Blocks
15	6333	Crankshaft Main Bearing, Upper (Color Code Blue — Number One Journal Only)
A	—	Crankshaft End Play 0.07-0.20mm (0.002-0.007 Inch)
B	—	Assemble with Arrows Pointing Forward. Marked with 1 to 64 Arrows Front-to-Rear
C	—	Tighten According to Procedure in Text

15. Check crankshaft end play as outlined in Section 03-00 .

16. Install piston and rod assemblies. For each assembly:

    a. Put piece of hose or other protector over rod bolts to protect crankshaft journal.
    b. Rotate crankshaft so journal for piston to be installed is at the bottom of its stroke.
    c. Start piston and connecting rod assembly into cylinder, guiding bolts around crankshaft journal.
    d. Compress piston rings using suitable piston ring compressor.
    e. Tap piston assembly into place using bottom of hammer handle.
    f. Insert bearings in connecting rod and cap.
    g. Apply Plastigage® to bearing journal.
    h. Install connecting rod cap. Alternately tighten connecting rod nuts to 34-41 Nm (25-30 lb-ft). Retighten to final torque of 41-49 Nm (30-36 lb-ft).
    i. Remove connecting rod cap and check bearing clearance with chart on Plastigage® package.
    j. Lubricate bearings crankshaft journal using oil meeting Ford specification ESE-M2C153-E and reinstall connecting rod cap.
    k. Alternately tighten connecting rod nuts to 34-41 Nm (25-30 lb-ft). Retighten to final torque of 41-49 Nm (30-36 lb-ft).
    l. Check side clearance. Side clearance should be between 0.09-0.29mm (0.0035-0.0115 inch).
    m. Repeat for remaining piston and connecting rod assemblies.

tomsn048@gmail.com

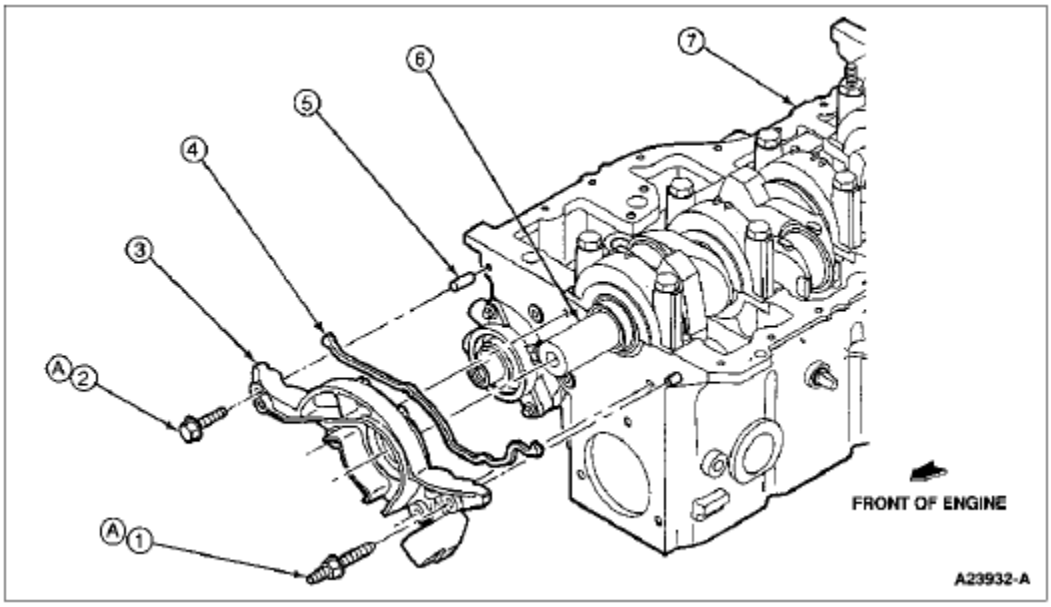


Item	Part Number	Description
1	6100	Piston
2	6010	Cylinder Blocks
3	6211	Connecting Rod Bearing, Lower
4	—	Connecting Rod Cap (Part of 6205)
5	N800113-S	Nut, M9-1
6	6211	Connecting Rod Bearing, Upper
7	—	Squirt Hole (Part of 6205)
8	6205	Connecting Rod
9	—	Notch (Part of 6100)
A	—	Tighten According to Procedure in Text
B	—	Squirt Hole Faces Away from Oil Pump
C	—	Notch Goes Toward Front of Engine

17. Install engine front cover onto cylinder block and tool.

Engine Front Cover

tomsn048@gmail.com



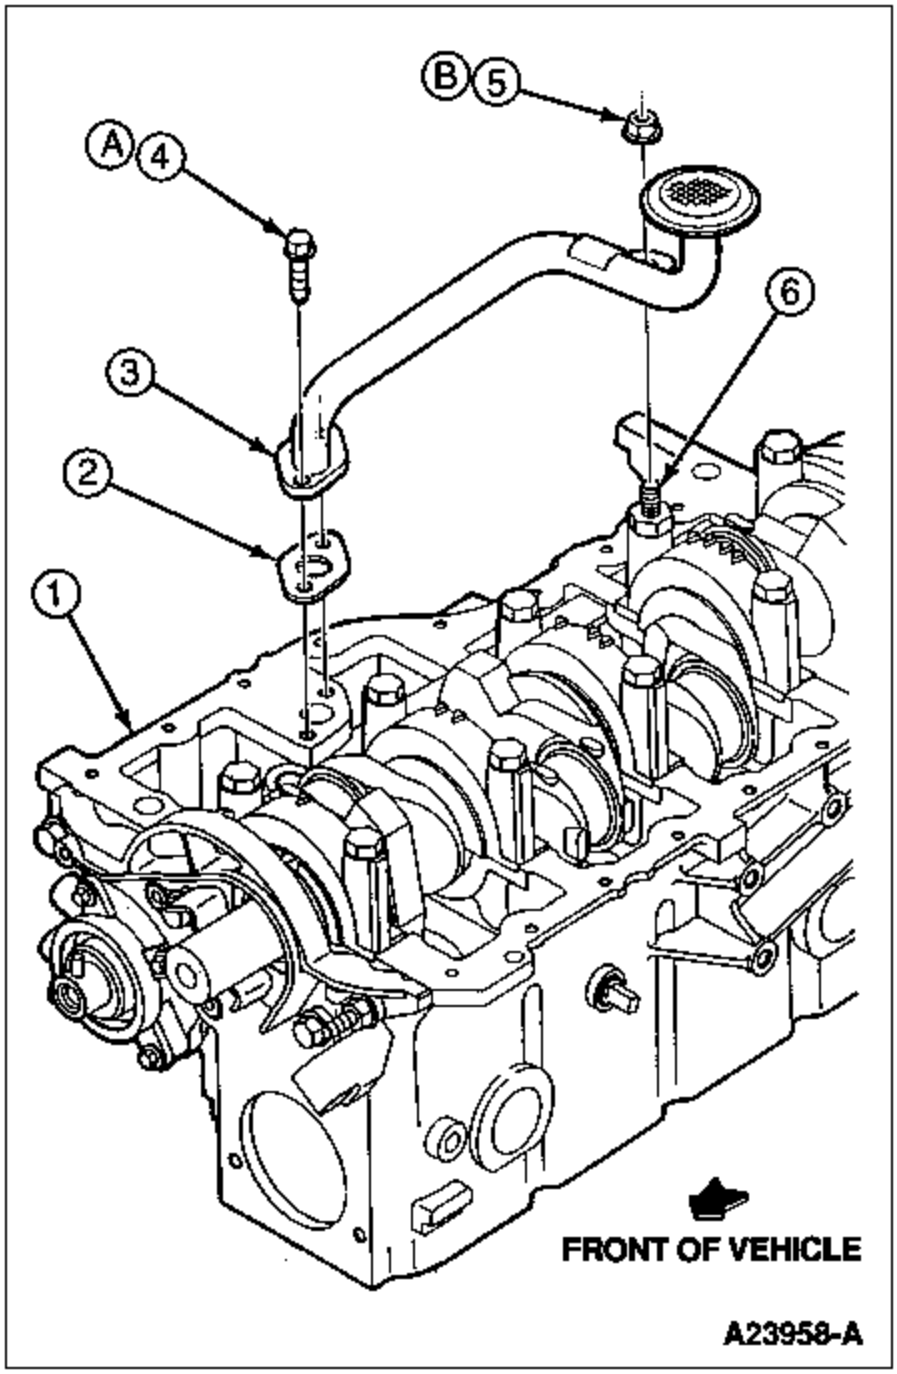
Item	Part Number	Description
1	N805892-S2	Stud, M6 1-1 x 61.9
2	N807497-S2	Bolt, M6 1-1 x 37.5
3	6019	Engine Front Cover
4	6020	Engine Front Cover Gasket
5	—	Dowel Bushing (Part of 6010)
6	6303	Crankshaft
7	6010	Cylinder Blocks
A	—	Tighten to 13-16 Nm (115-141 Lb-In)

18. Tighten three bolts and one stud to 13-16 Nm (10-11 lb-ft).

19. Using Cam Bearing Adapter Tube T72C-6250 and crankshaft damper bolt, press engine front cover seal into engine front cover.

20. Install oil pump screen cover and tube. Tighten bolts to 20-30 Nm (15-22 lb-ft). Tighten pickup tube-to-main bearing cap to 40-55 Nm (30-40 lb-ft).

tomsn048@gmail.com



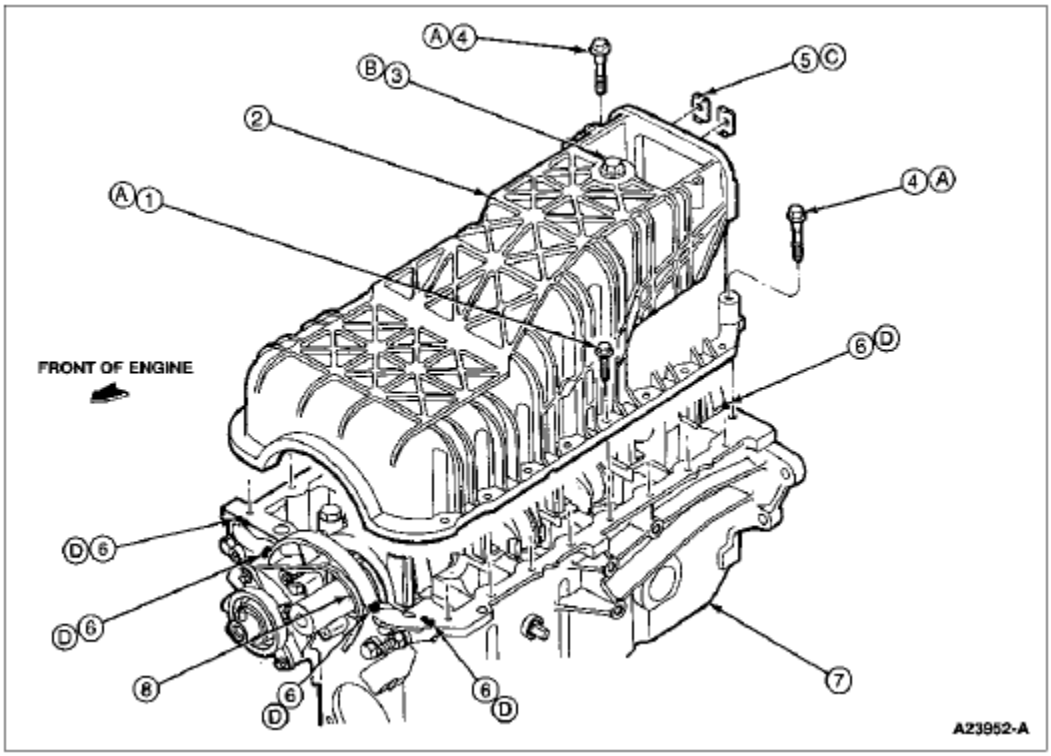
Item	Part Number	Description
1	6010	Cylinder Blocks
2	6626	Oil Pump Inlet Tube Gasket
3	6622	Oil Pump Screen Cover and Tube
4	N605786-S2	Bolt, M8-1.25 x 20
5	N620482-S	Nut, M10-5
6	N803729-S	Bearing Cap Stud

tomsn048@gmail.com

A	—	Tighten to 20-30 Nm (15-22 Lb-Ft)
B	—	Tighten to 40-55 Nm (29-40 Lb-Ft)

21. Apply a small amount of Silicone Gasket Sealant F1AZ-19562-A, or equivalent meeting Ford specification WSE-M4G320-A2 at joints between engine front cover and cylinder blocks and rear main cap and cylinder blocks as shown.

Oil Pan



Item	Part Number	Description
1	N806378-S36	Bolt, M6-1 x 27.5 (16 Places)
2	6675	Oil Pan
3	6730	Oil Pan Drain Plug, M8
4	N806379-S36	Bolt, M6-1 x 57.5
5	6C629	Oil Pan Spacer
6	19562	Sealer F1AZ-19562-A, Loctite® 598 Ultra Black, Specification WSE-M4G323-A3
7	6010	Cylinder Blocks

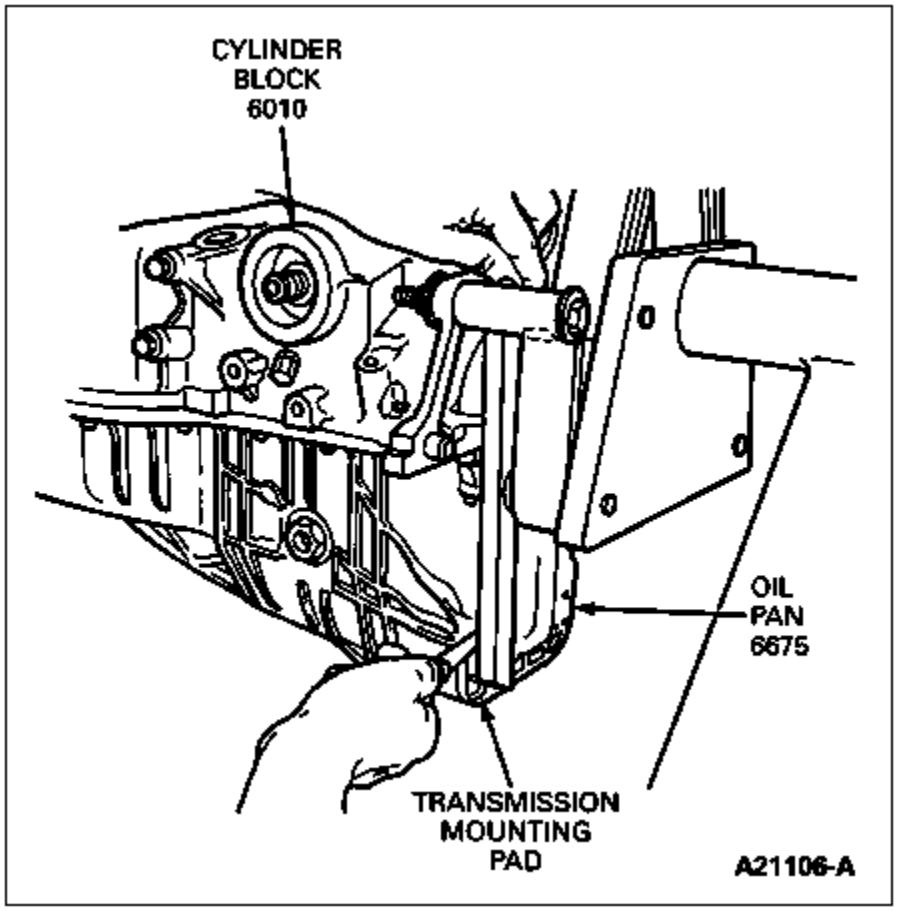
tomsn048@gmail.com

8	6019	Engine Front Cover
A	—	Tighten to 14-16 Nm (123-141 Lb-Ft)
B	—	Tighten to 20-34 Nm (15-25 Lb-Ft)
C	—	If Replacing Oil Pan or Transmission, Select According to Text
D	—	Apply in Six Places Shown (Left Side of Rear Main Cap Is Hidden)

22. Press oil pan gasket into groove in oil pan and install oil pan. Tighten bolts to 13-16 Nm (10-12 lb-ft).

23. **CAUTION: Failure to measure the required spacer thickness can result in insufficient or excessive clearance between the engine oil pan and the transmission (7003) when installed in vehicle. This can result in oil pan damage and an oil leak.**

    Position a straightedge flat on the rear of the cylinder blocks so that it extends over the oil pan-to-transmission mounting bolt pads.



24. Measure the gap between the mounting pad and the straightedge using a feeler gauge. Select spacers of the required thickness from chart. If oil pan cannot be brought into specifications of 0-0.254mm (0-0.009 inch) with spacers, replace oil pan.

tomsn048@gmail.com

SPACER SELECTION CHART (6C629)

Measured Gap		Spacer Required		
mm	**Inch**	**mm**	**Inch**	**Shim Color Code**
0.0-0.254	0.0-0.010	None	None	—
0.27-0.51	0.011-0.020	0.254	0.010	Yellow
0.52-0.76	0.021-0.030	0.508	0.020	Blue
0.78-1.01	0.031-0.040	0.762	0.030	Pink

25. Install oil pan drain plug (6730) and new oil pan drain plug gasket (6734). Tighten to 20-34 Nm (15-25 lb-ft).

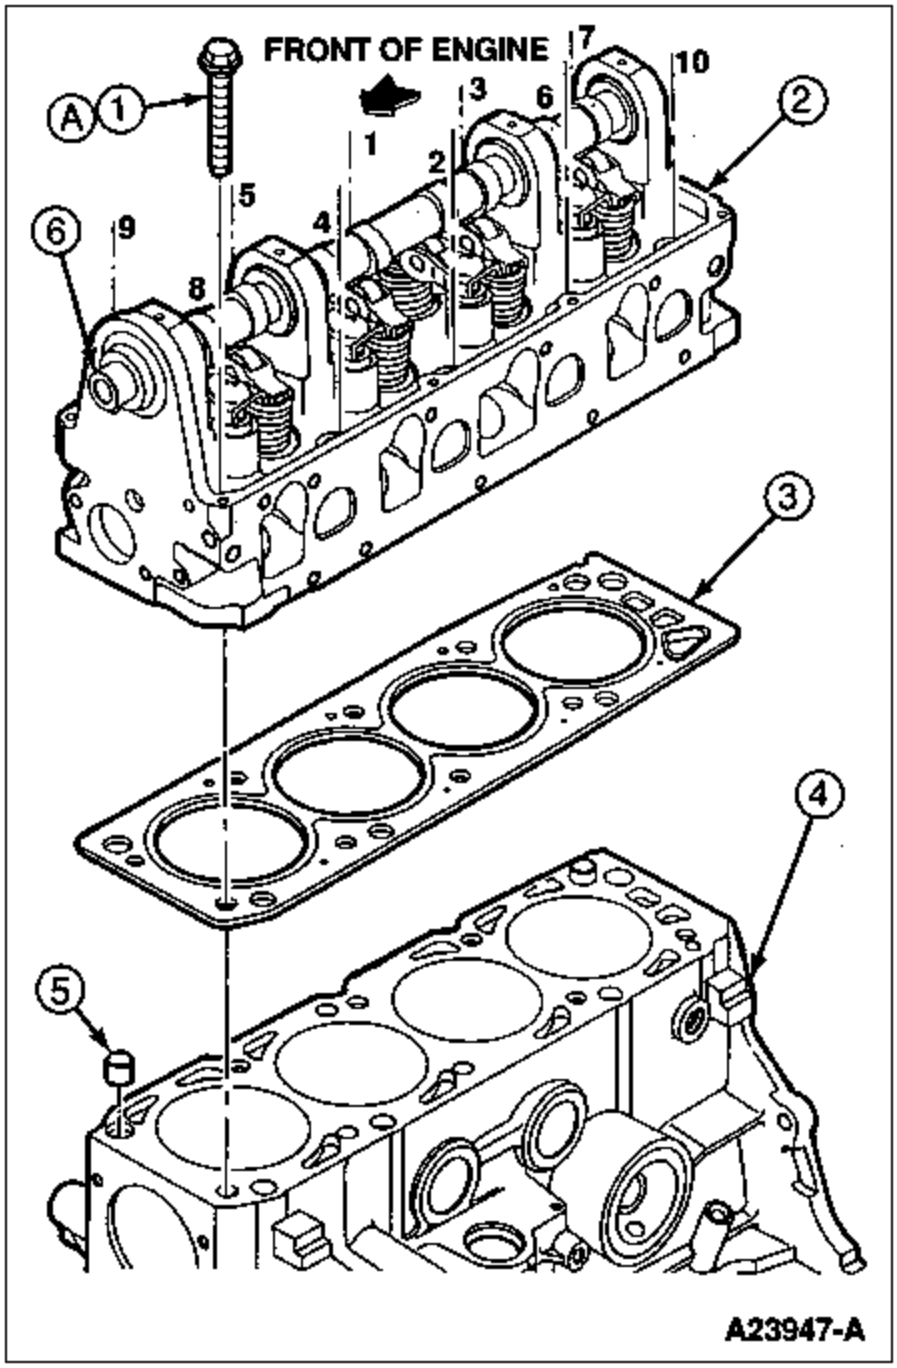
26. Rotate engine right side up on stand.

27. Position new head gasket.

28. Position cylinder head.

29. Install 10 cylinder head bolts in illustrated sequence. Tighten to 70 Nm (51 lb-ft) in illustrated sequence. Re-tighten to 70 Nm (51 lb-ft) in sequence. Then turn all head bolts an additional 80-100 degrees in sequence.

tomsn048@gmail.com



Item	Part Number	Description
1	N807013-S	Bolt, M12-1.75 x 100.7
2	6049	Cylinder Head
3	6051	Head Gasket
4	6010	Cylinder Blocks
5	—	Dowel (Part of 6010)
6	6250	Camshaft

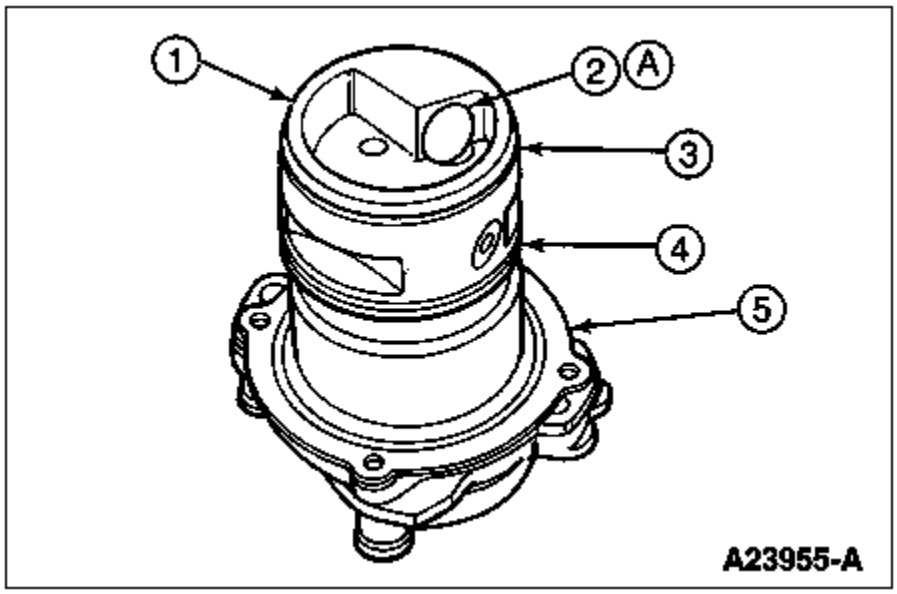
tomsn048@gmail.com

A	—	Tighten in Illustrated Sequence According to Procedure in Text

30. **NOTE: Inspect and clean oil pump hole in the cylinder block before installing the oil pump.**

    If original oil pump is to be reused, install new oil pump O-ring seals on oil pump.

31. Prime back of oil pump with 236ml (eight ounces) of fresh motor oil.

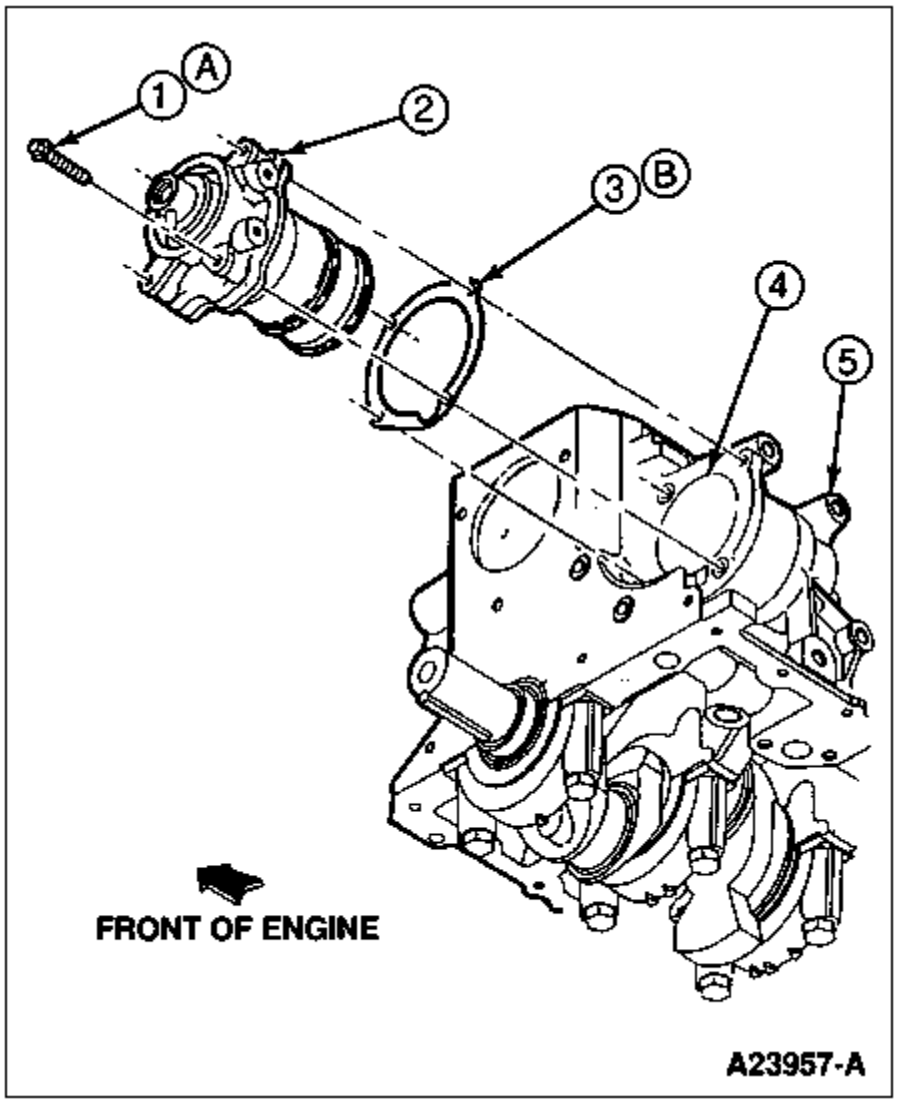


Item	Part Number	Description
1	6600	Oil Pump
2	—	Inlet Passage (Part of 6621)
3	87071-S100	O-Ring
4	87072-S100	O-Ring
5	6659	Oil Pump to Cylinder Block Gasket
A	—	Tilt Oil Pump and Pour In 236ml (8 Oz.) of Motor Oil to Prime Pump

32. Install oil pump and oil pump to cylinder block gasket being careful to retain the oil in the pump.

33. Install four oil pump bolts and tighten to 10-14 Nm (89-123 lb-in).

tomsn048@gmail.com



Item	Part Number	Description
1	N606523-S2	Bolt, M6-1 x 4.75
2	6600	Oil Pump
3	6659	Oil Pump to Cylinder Block Gasket
4	—	Oil Pump Cavity (Part of 6010)
5	6010	Cylinder Blocks
A	—	Tighten to 10-14 Nm (88-123 Lb-In)
B	—	Side Marked "Block" Goes Toward Cylinder Block

34. Position valve cover gasket on cylinder head. No sealer is required.

35. Install valve cover and screws. Tighten screws to 9-13 Nm (80-115 lb-in).

tomsn048@gmail.com

36. Install the water pump housing gasket (8507) into a groove on the rear of the water pump.

37. Apply pipe sealant with Teflon® D8AZ-19554-A or equivalent meeting Ford specification WSK-M2G350-A2 to threads of water pump bolts.

38. Install water pump. Tighten bolts to 20-30 Nm (15-22 lb-ft).

39. Make sure inner thermostat gasket is not grooved, torn, or excessively soft. Snap water thermostat into water hose outlet connection and twist.

40. Apply a small amount of sealer and position water hose connection gasket on water hose connection (8592).

41. Install water outlet connection. Tighten bolts to 20-30 Nm (15-22 lb-ft).

42. Install inner timing belt cover.

43. Install inner timing belt cover screw and nut and tighten to 8-12 Nm (71-108 lb-in). Install stud to inner timing belt cover and cylinder head and tighten to 20-30 Nm (15-22 lb-ft).

44. Slide crankshaft sprocket onto crankshaft. Recess goes toward cylinder blocks and timing mark faces out.

45. Install camshaft sprocket on camshaft (6250).

46. Apply Threadlock 262 E2FZ-19554-B or equivalent meeting Ford specification WSK-M2G351-A6 to camshaft bolt threads. Install bolt and washer finger-tight.

47. Install Cam Sprocket Holding/Removing Tool T74P-6256-B on sprocket. Tighten camshaft bolt to 70-95 Nm (52-70 lb-ft). Remove tool.

48. Install oil pump sprocket.

49. Install oil pump bolt and washer finger-tight.

50. Install Cam Sprocket Holding/Removing Tool T74P-6256-B on sprocket. Tighten bolt to 40-55 Nm (30-41 lb-ft). Remove tool.

51. Check to make sure crankcase is filled to proper level with motor oil.

52. Install oil pressure sensor into cylinder head and tighten to 11-24 Nm (8-17 lb-ft) with appropriate oil pressure gauge socket.

53. Prime oil pump by rotating oil pump sprocket with a drill motor until resistance is felt.

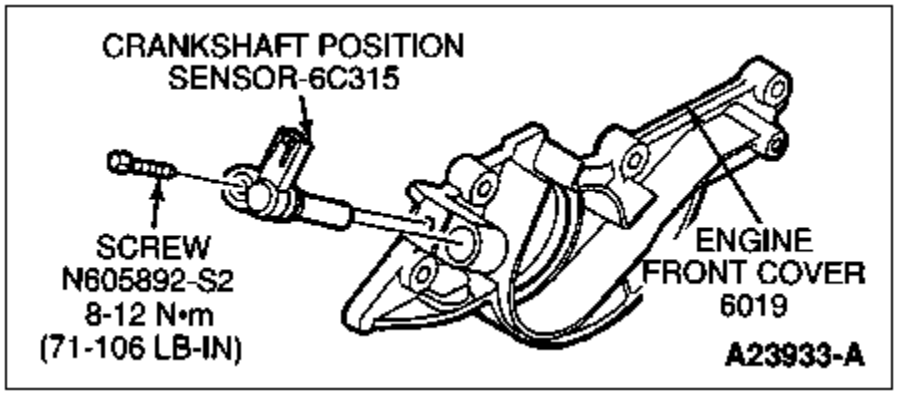
54. Install timing belt tensioner, spring, and pivot bolt with legs of timing belt tensioner spring against stud on tensioner and stud nut in cylinder head.

55. Using T74P-6254-A Camshaft Belt Tensioner Tool, rotate tensioner against spring tension and install adjusting bolt and tighten until snug enough to hold tensioner against spring tension.

56. Install and adjust timing belt as outlined in this section.

57. Install camshaft position sensor and screws. Tighten screws to 5-7 Nm (45-70 lb-in).

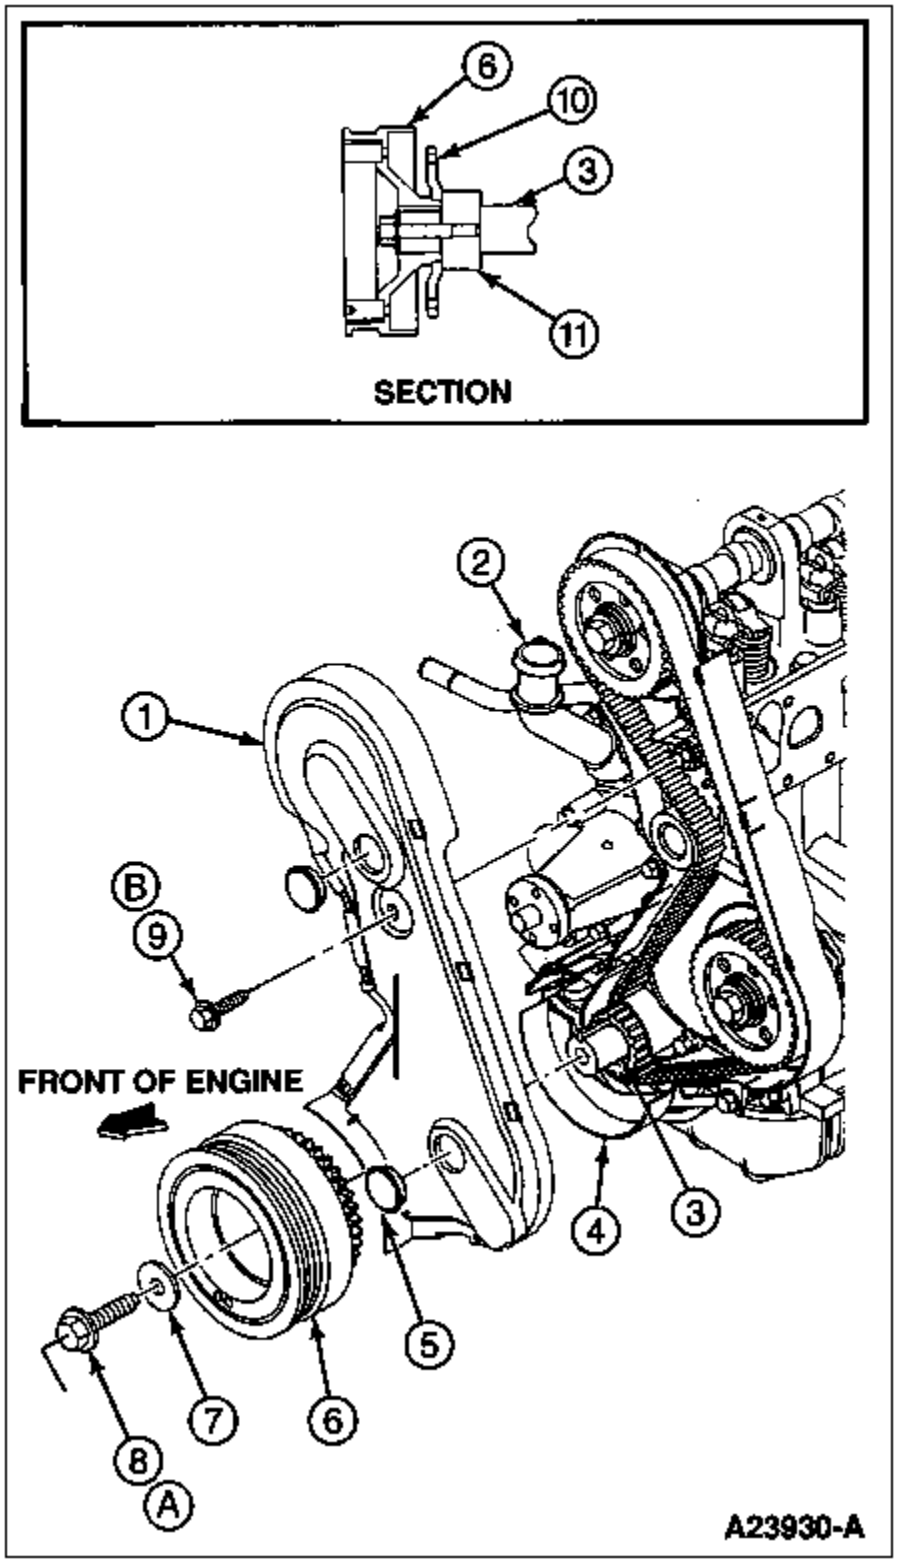
tomsn048@gmail.com



58. Install timing belt cover. Snap tabs into slot. Install bolt and tighten to 8-12 Nm (70-106 lb-in).

59. Install crankshaft damper, bolt and washer. Tighten bolt to 125-165 Nm (93-121 lb-ft).

tomsn048@gmail.com



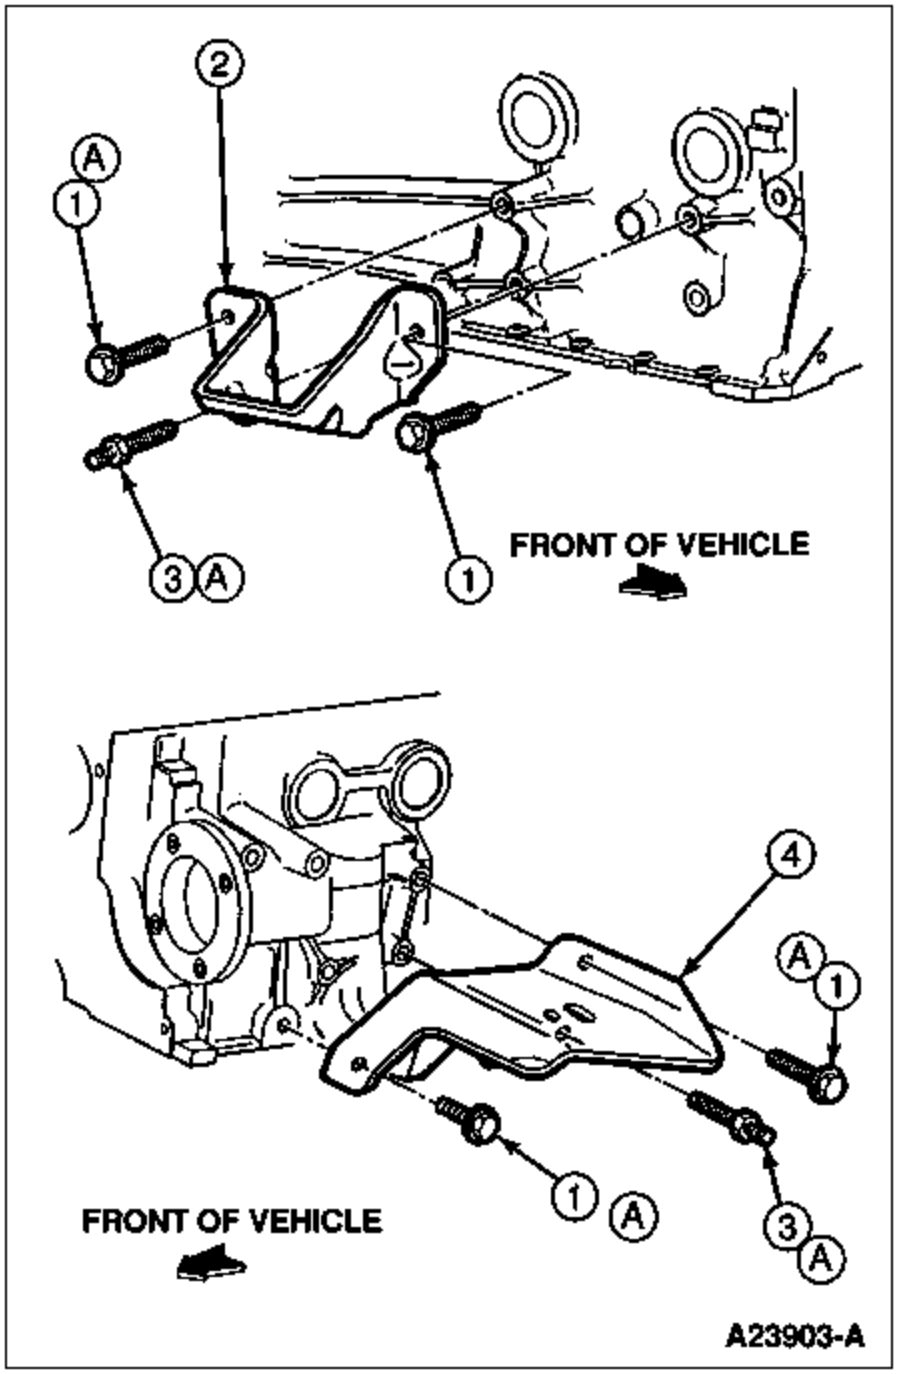
Item	Part Number	Description
1	6019	Engine Front Cover
2	8594	Water Outlet Connection

tomsn048@gmail.com

3	6303	Crankshaft
4	6019	Inner Timing Belt Cover
5	—	Plug (Part of 6019)
6	6312	Crankshaft Pulley
7	6378	Crankshaft Pulley Retaining Washer
8	N600414-S	Bolt, M14-1.5 x 55
9	N808534-S2	Bolt, M6-1 x 17
10	—	Pulse Wheel (Part of 6312)
11	6306	Crankshaft Sprocket
A	—	Tighten to 125-165 Nm (93-121 Lb-Ft)
B	—	Tighten to 8-12 Nm (70-106 Lb-In)

60. Install spark plugs in proper locations and tighten to 9-20 Nm (7-15 lb-ft).
61. Install engine coolant temperature sensor into cylinder block and tighten to 11-24 Nm (8-17 lb-ft).
62. Lubricate O-ring and install crankcase vent oil separator and tighten to 8-12 Nm (6-9 lb-ft).
63. Install left front engine support mounting bracket (6031) and tighten bolts to 60-80 Nm (44-59 lb-ft).
64. Install right front engine support mounting bracket and tighten bolts to 60-80 Nm (44-59 lb-ft).

tomsn048@gmail.com



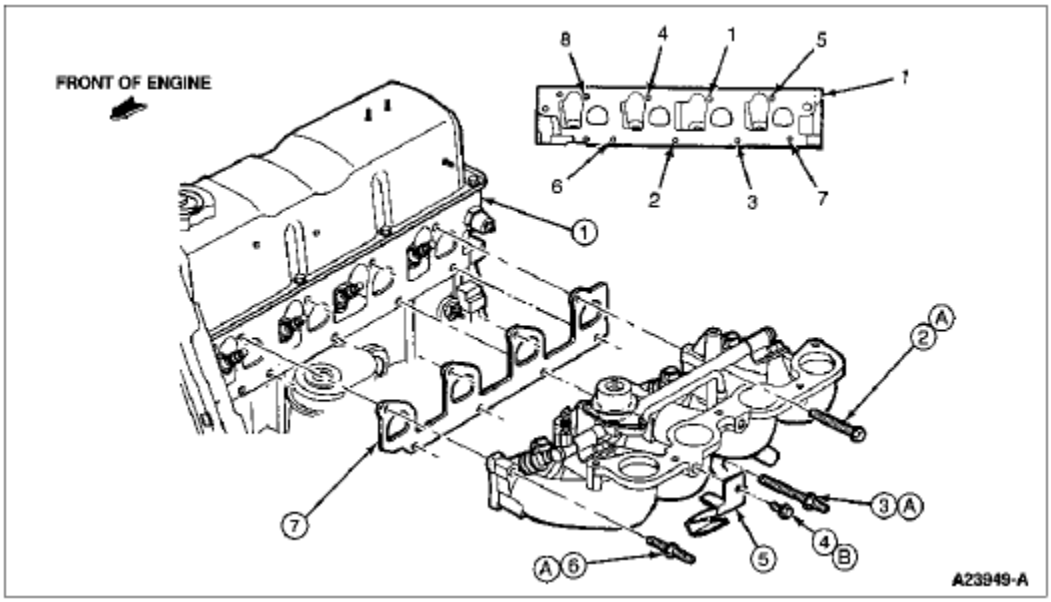
Item	Part Number	Description
1	N802653-S100	Screw and Washer, M10-1.5 x 22
2	6030	Front Engine Support Mounting Bracket
3	N804044-S100	Stud, M10-1.5/M10-1.5 x 5.1
4	6031	Front Engine Support Mounting Bracket (LH)
A	—	Tighten to 60-81 Nm (44-60 Lb-Ft)

tomsn048@gmail.com

65. Install lower intake manifold, lifting eye, and new intake manifold gasket (9439). Stud bolts go in front lower and rear lower holes. Tighten according to illustrated sequence to 26-38 Nm (19-28 lb-ft).

66. Install engine lifting eye (17A084) using bolt and nut on lower intake manifold stud. Tighten bolt and nut to 20-30 Nm (15-22 lb-ft).

Lower Intake Manifold

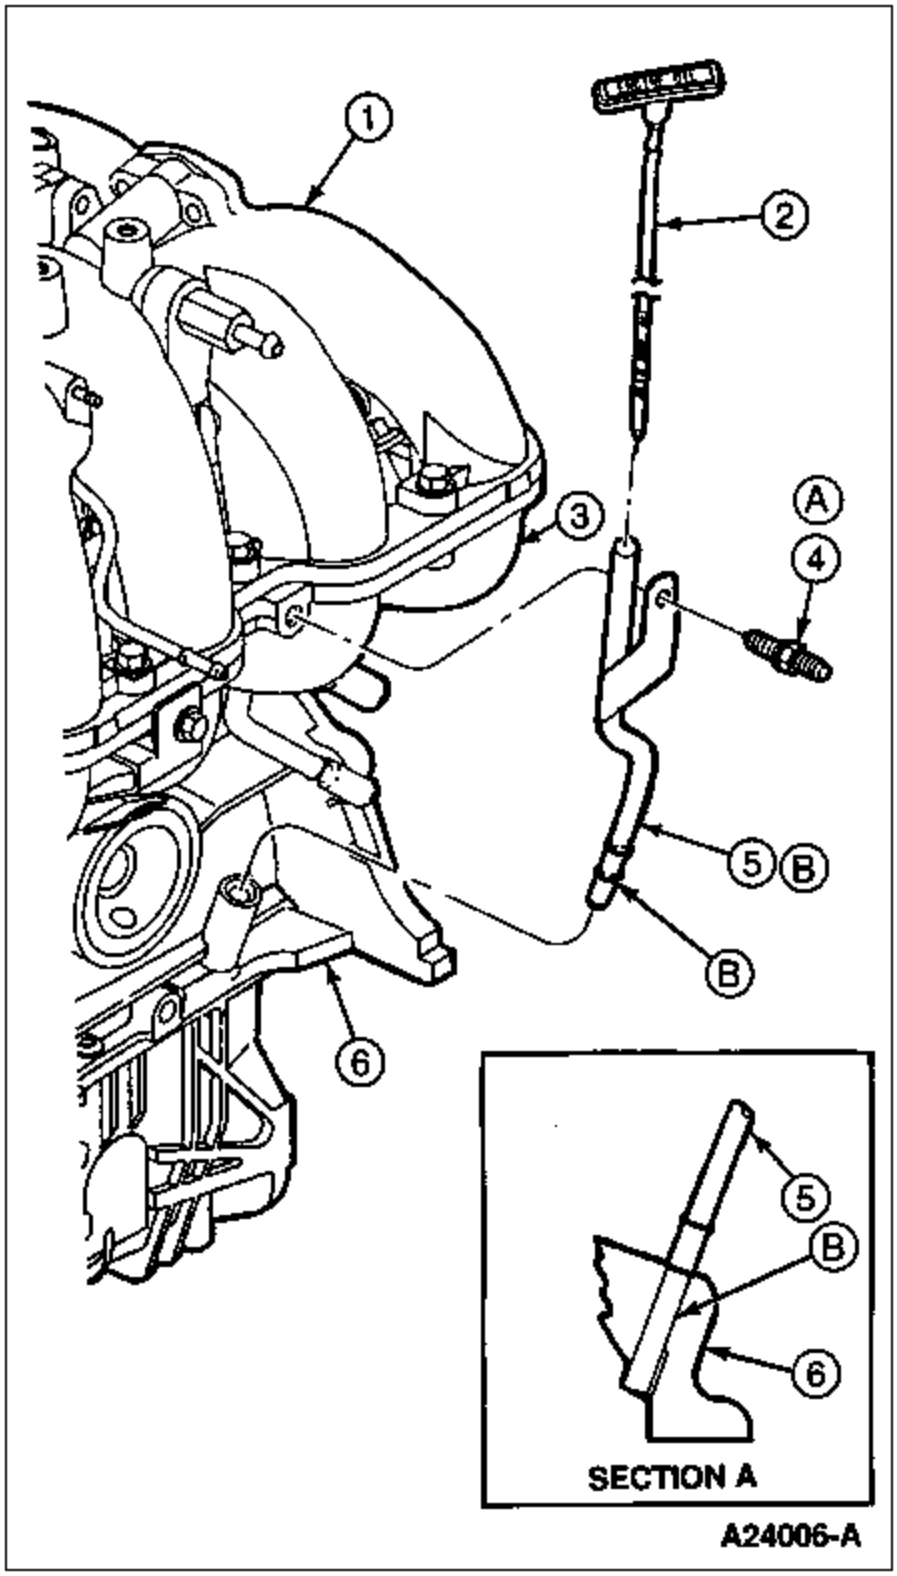


Item	Part Number	Description
1	6049	Cylinder Head
2	N807462-S101	Bolt, M8-1.25 x 67.2 (Holes 1, 2, 4 and 5)
3	N807458-S101	Stud, M8-1.25 x 1.25 x 96.2 (Holes 3, 6 and 7)
4	N605904-S36	Bolt, M8-1.25 x 16.6
5	14A004	42 Pin Connector Bracket
6	N808163-S100	Stud, M8-1.25 x 1.25 x 63.7 (Hole 8)
7	9439	Intake Manifold Gasket
A	—	Refer to Procedure in Text
B	—	Tighten to 20-30 Nm (15-22 Lb-In)

67. Install audio ground cable and tighten nut to 9-12 Nm (80-106 lb-ft).

68. Apply gasket maker E2AZ-19562-B or equivalent meeting Ford specification WSK-M2G349-A10 to end of engine oil level indicator tube that pushes into cylinder blocks.

tomsn048@gmail.com



Item	Part Number	Description
1	9424	Upper Intake Manifold

tomsn048@gmail.com

2	6750	Oil Level Dipstick
3	9424	Intake Manifold, Lower
4	N807689-S2	Stud, M8-1.25 x M5-0.80 x 42.3
5	6754	Oil Level Indicator Tube
6	6010	Cylinder Blocks
A	—	Tighten to 20-30 Nm (15-22 Lb-Ft)
B	—	Apply Gasket Maker E2AZ-19562-B (WSK-M2G349-A10) or Equivalent

69. Install engine oil level indicator tube. Tighten stud to 20-30 Nm (15-22 lb-ft). Install engine oil level dipstick (6750).

70. Connect retaining clip for crankshaft position sensor lead.

71. Install engine control sensor wiring to valve cover by pushing retaining clips into place on weld studs at the top of the valve cover. Two places on the right side and one place on the left of the cover. Connect engine control sensor wiring to:

    - Fuel injector (9F593) and clips.
    - Coolant temperature sender.
    - Oil pressure sender.

72. Install left side spark plug wires and secure to retaining clips to the side of the valve cover.

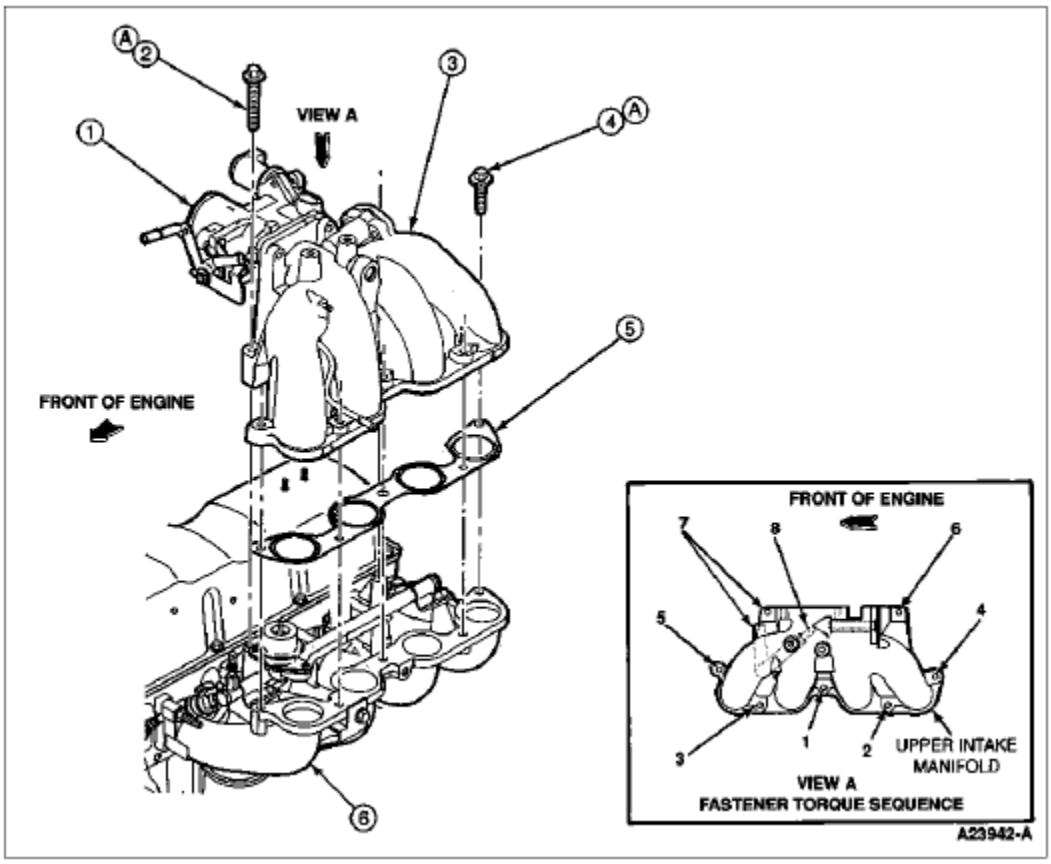
73. Position intake manifold upper gasket.

74. Install positive crankcase ventilation valve onto oil separator.

75. Install upper intake manifold with assembled throttle body, EGR external pressure valve (9F483), and tee. Tighten upper-to-lower intake manifold bolts to 7-10 Nm (26-38 lb-in) in sequence shown.

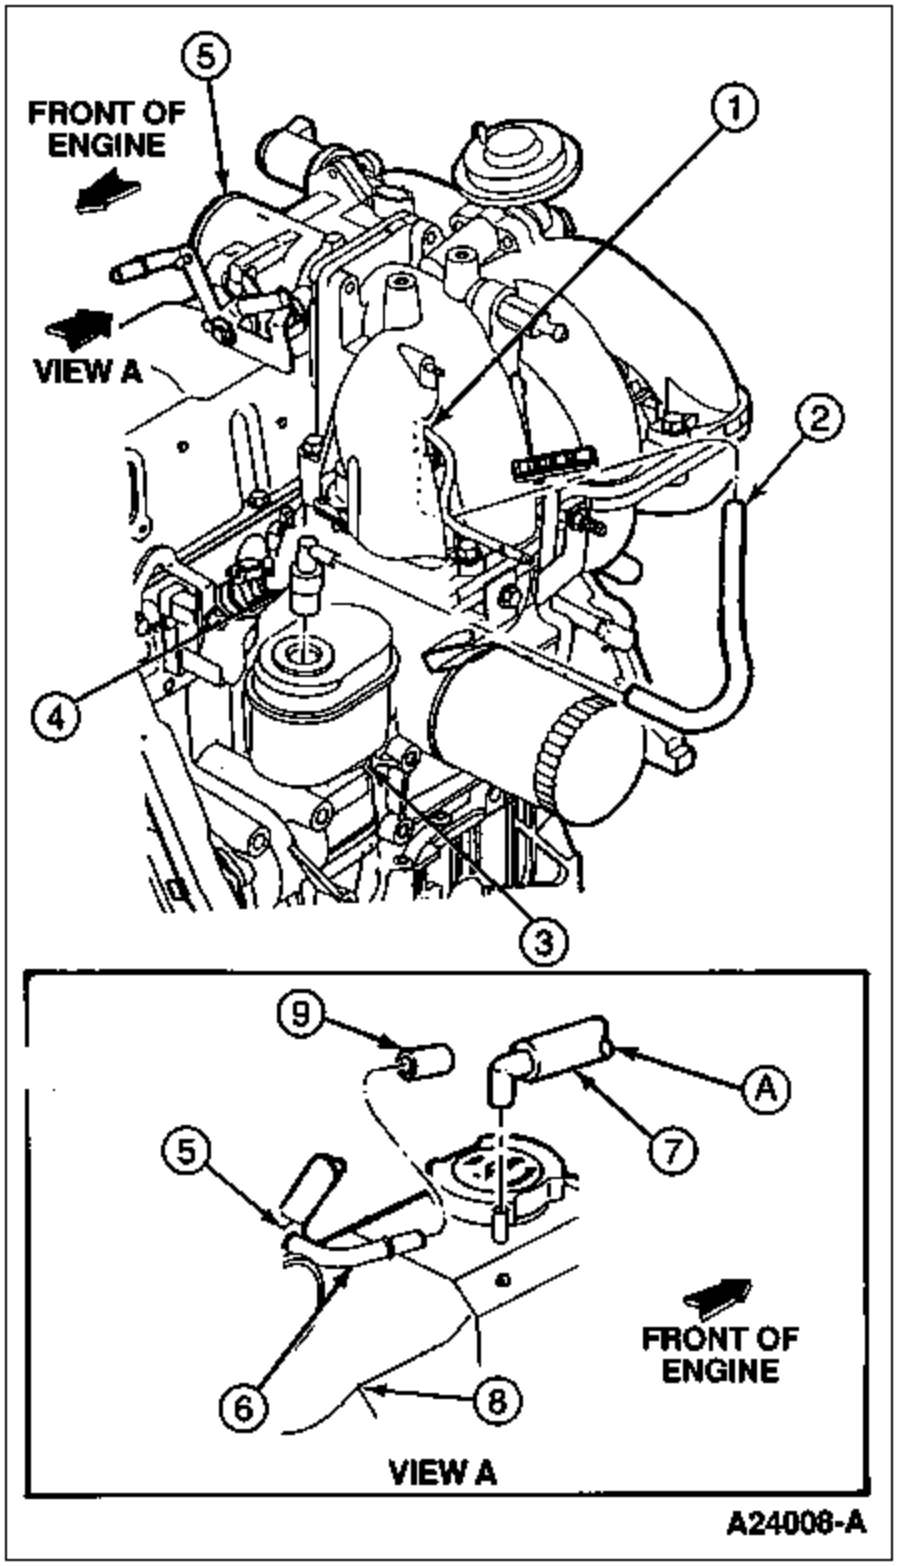
Upper Intake Manifold

tomsn048@gmail.com



Item	Part Number	Description
1	9E926	Throttle Body
2	N807462-S2	Bolt, M8-1.25 x 67.2
3	9424	Intake Manifold, Upper
4	N807461-S2	Bolt, M8-1.25 x 45
5	9H486	Intake Manifold Upper Gasket
6	9424	Intake Manifold, Lower
A	—	Tighten According to Procedure in Text

tomsn048@gmail.com



Item	Part Number	Description
1	—	PCV Tube (Part of 9424)

tomsn048@gmail.com

2	6K817	Crankcase Hose

A	—	To Air Cleaner Outlet

76. Connect engine wiring connectors to:

    - Idle air control valve (IAC valve) (9F715)
    - Throttle position sensor (TP sensor) (9B989)
    - Camshaft position sensor

    Press the wiring harness on the studs of the lower intake manifold (2 places).

77. Install the 42 pin connector bracket to the lower intake manifold and tighten to 20-30 Nm (15-22 lb-ft). Clip the 42 pin connector from the engine wiring harness to the bracket.

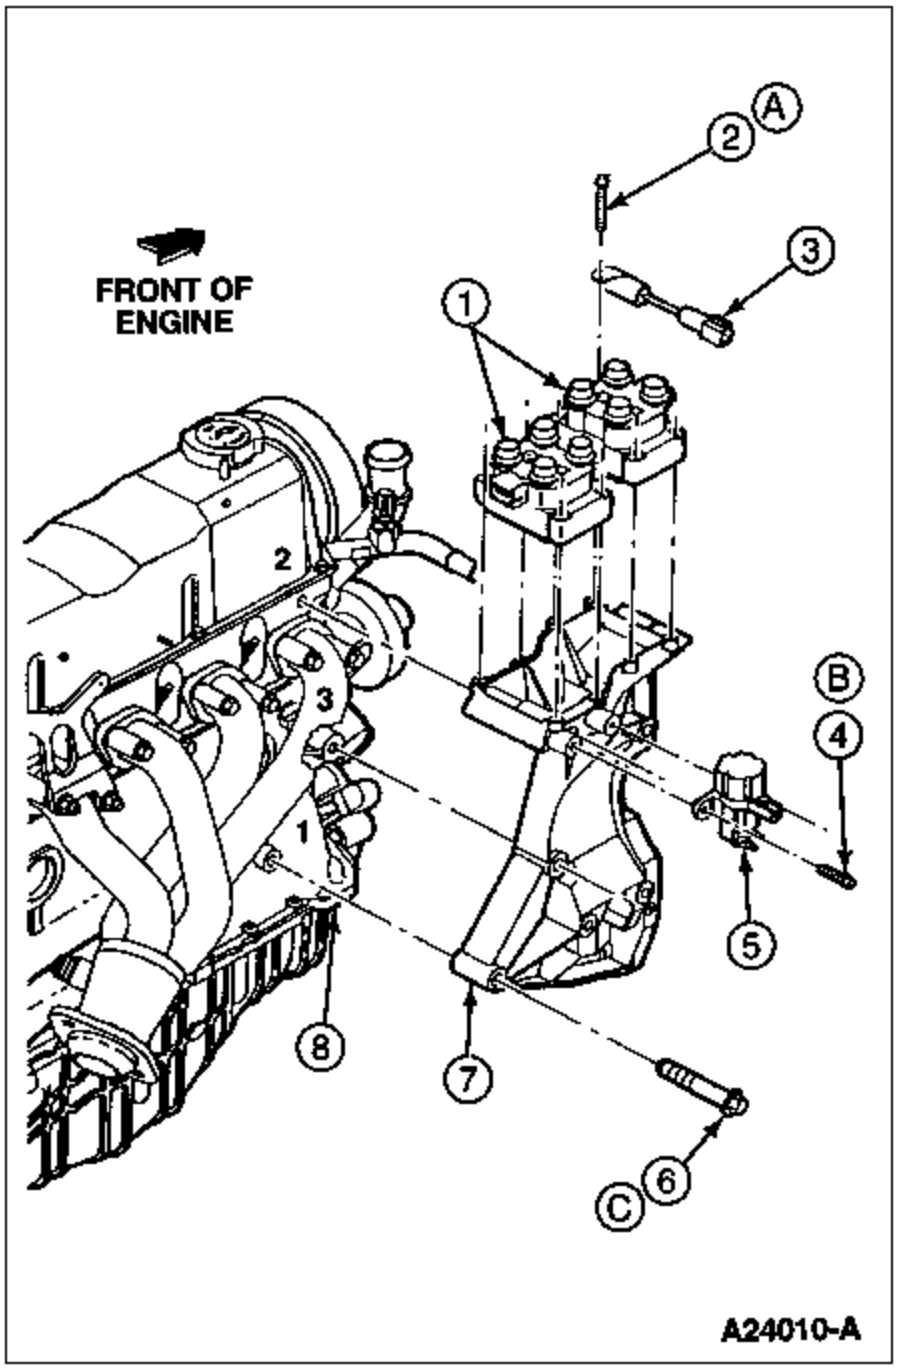
Item	Part Number	Description
1	—	Idle Air Control Valve Connector (Part of 12A581)
2	—	EGR Valve Vacuum Connection (Part of 12A581)
3	9D475	EGR Valve
4	—	Throttle Position Sensor Connector (Part of 12A581)
5	9F715	Idle Air Control Valve
6	9E926	Throttle Body
7	—	EGR Transducer Connector (Part of 12A581)
8	9J433	EGR Transducer
9	9D477	EGR Valve to Exhaust Manifold Tube
10	12A581	Engine Control Sensor Wiring

tomsn048@gmail.com

78. Install assembled ignition coils and generator mounting bracket (10153).

    a. Hand start bolt in hole No. 1 until snug.
    b. Hand start bolt in hole No. 2 until snug.
    c. Install bolt in hole No. 3 and tighten to 40-55 Nm (30-40 lb-ft).
    d. Tighten bolts No. 1 and 2 in order, to 40-55 Nm (30-40 lb-ft).

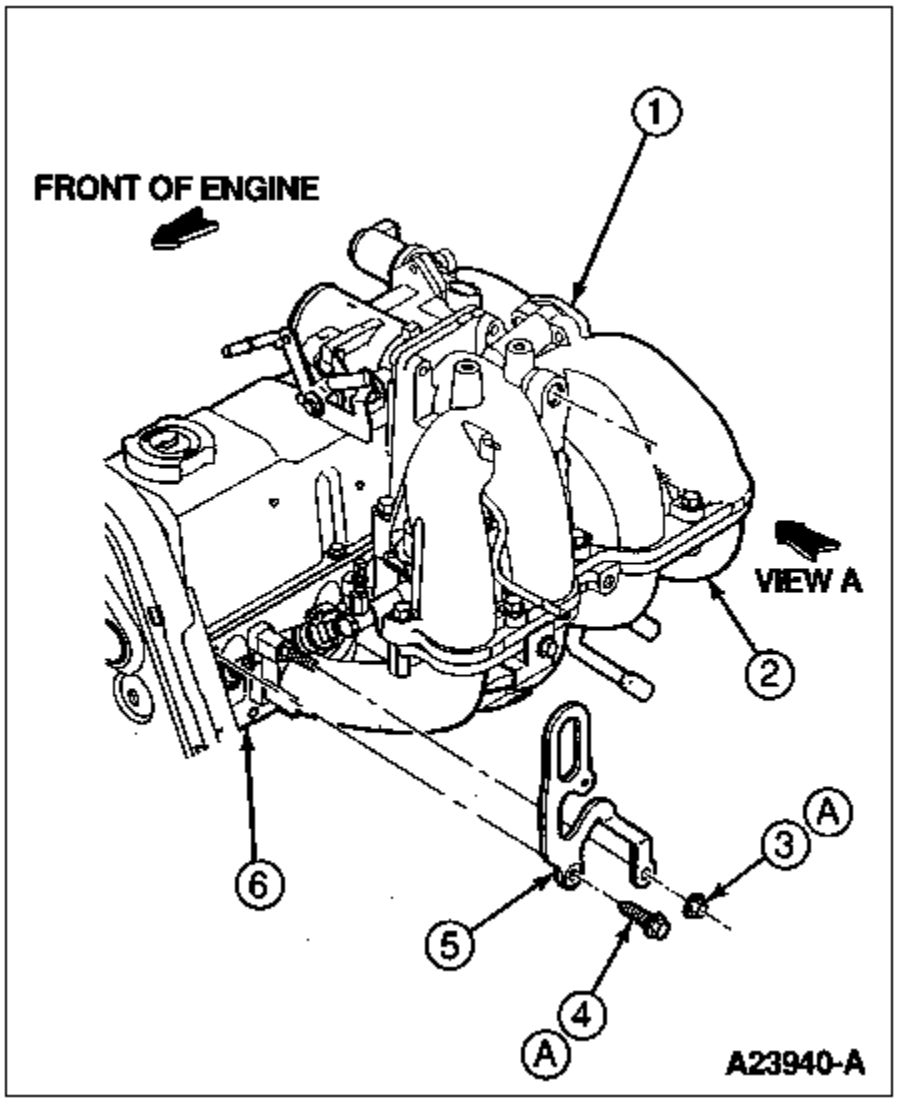


Item	Part Number	Description
1	12029	Ignition Coils
2	N606502-S36	Bolt, M5-0.8 x 37

tomsn048@gmail.com

3	18801	Radio Ignition Interference Capacitor
4	N606676-S2	Screw, M6-1 x 20
5	9J459	EGR Vacuum Regulator Solenoid
6	N606064-S309	Bolt, M10-1.5 x 60
7	10153	Generator Mounting Bracket
8	6010	Cylinder Blocks
A	—	Tighten to 5-7 Nm (45-61 Lb-In)
B	—	Tighten to 8-12 Nm (70-106 Lb-In)
C	—	Tighten According to Instructions in Text

79. Install EGR vacuum regulator (EVR) control. Tighten bolts to 8-12 Nm (70-106 lb-in).



tomsn048@gmail.com

Item	Part Number	Description
1	9424	Upper Intake Manifold
2	9424	Lower Intake Manifold
3	N620481-S2	Nut, M8-1.25
4	N808162-S2	Bolt, M8-1.25 x 33
5	17A084	Engine Lifting Eye, Front
6	6049	Cylinder Head
A	—	Tighten to 20-30 Nm (14-22 Lb-Ft)

80. Install vacuum line harness to top of engine and right side of valve cover.

81. Connect EVR electrical connector and the two double vacuum hose connections.

82. Make the following engine wiring harness connections:

    - Crankshaft position sensor and mounting clip to generator mounting bracket.
    - Both ignition coils.
    - Radio capacitor.
    - Engine coolant temperature sensor (ECT sensor) (12A648) located in the water outlet connector.

83. Connect triple connector at intake manifold vacuum outlet fitting.

84. Connect EGR vacuum line.

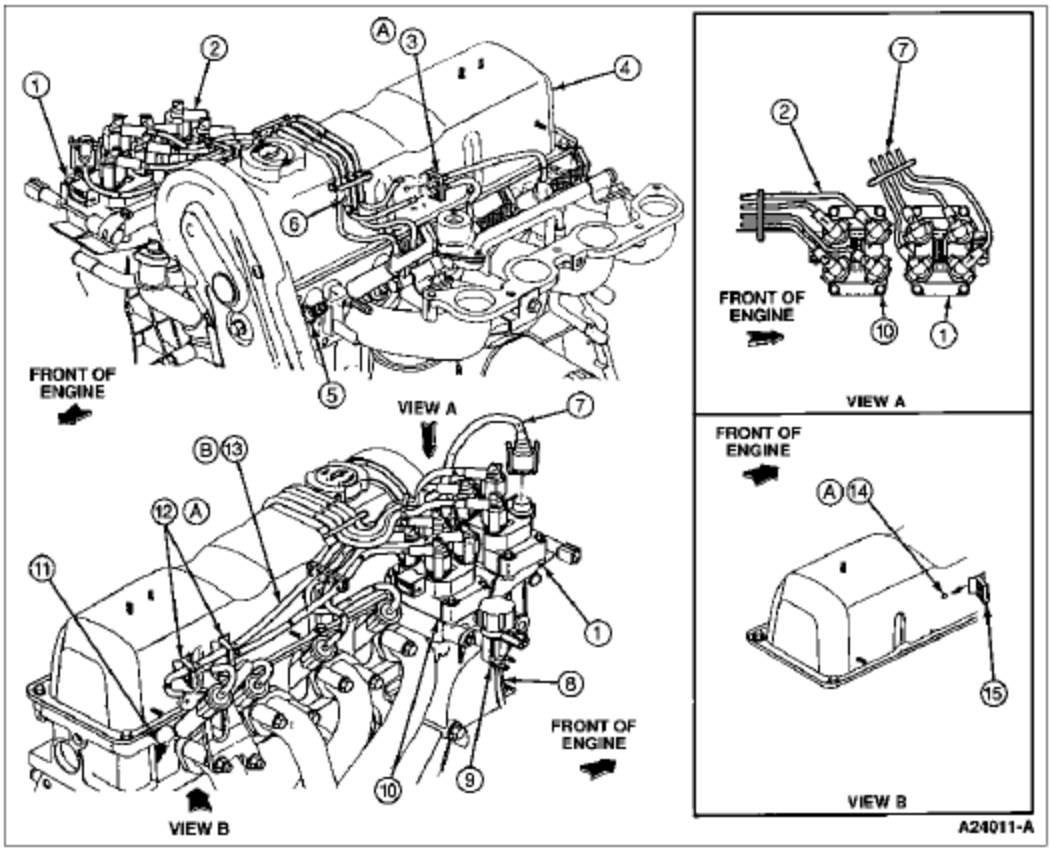
85. Connect vacuum line to fuel pressure regulator vacuum line to upper intake manifold.

86. Install spark plug wire set (12259) to ignition coils.

87. Connect right side spark plug wires and clip spark plug wire separator to valve cover.

Ignition Wiring

tomsn048@gmail.com



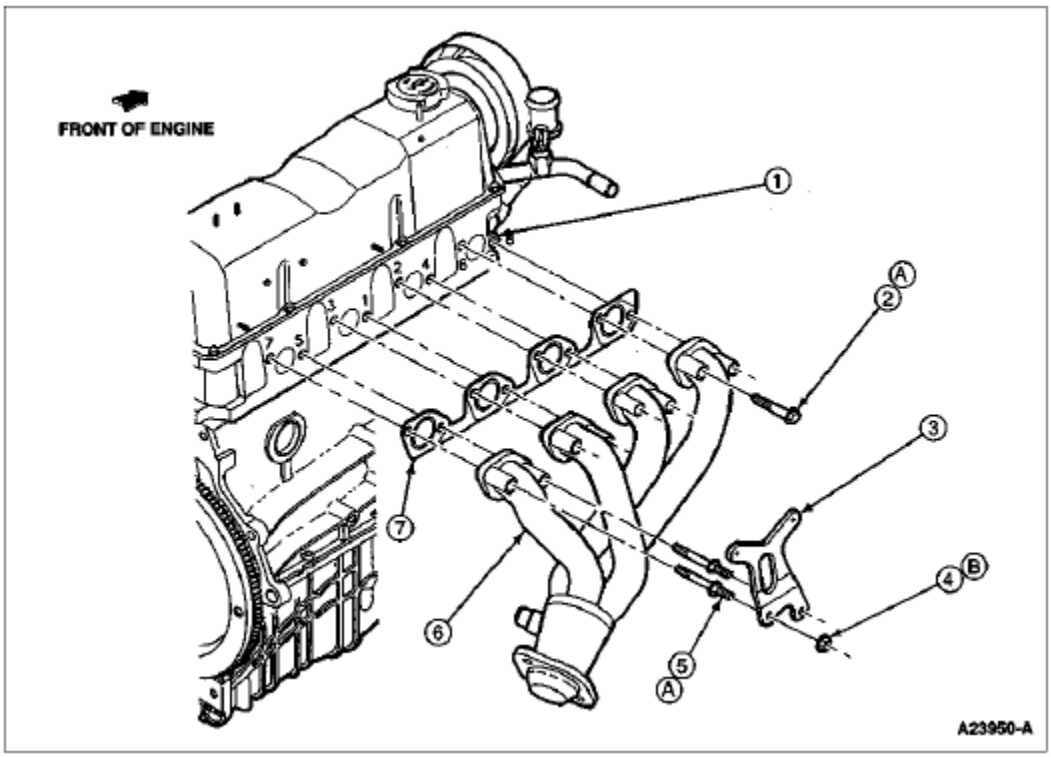
Item	Part Number	Description
1	12029	Ignition Coil — Secondary
2	12280	Ignition Wire and Bracket (Right)
3	—	Retainer (Part of 12281)
4	6582	Valve Cover
5	12405	Spark Plug (LH)
6	—	T-Stud (Part of 6582)
7	12281	Ignition Wire and Bracket (Left)
8	10153	Generator Mounting Bracket
9	9J459	EGR Vacuum Regulator Solenoid
10	12029	Ignition Coil — Primary
11	12405	Spark Plug (RH)
12	—	Retainer (Part of 12280)
13	—	"R" (Part of 12280)
14	—	T-Stud (Part of 6582)
15	—	Retainer (Part of 12280)
A	—	Retainers Push Onto T-Studs (Part of 6582)

tomsn048@gmail.com

B	—	"R" Indicates Right Side

88. Install exhaust manifold and gasket. Tighten bolts in sequence to 20-30 Nm (15-22 lb-ft). Retighten in sequence to 60-80 Nm (45-59 lb-ft). Stud bolts go in holes No. 5 and No. 7.

Exhaust Manifold

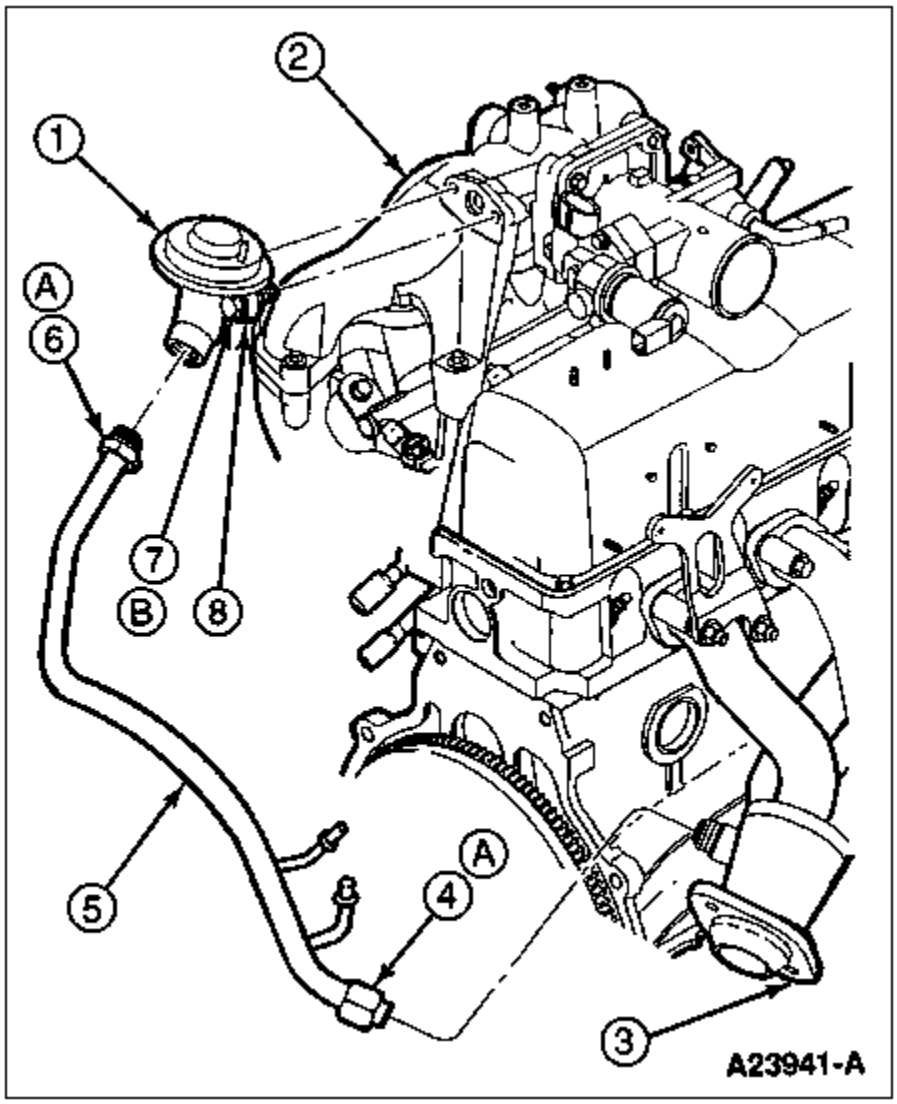


Item	Part Number	Description
1	6049	Cylinder Head
2	N806949-S100	Bolt, M10-1.5 x 59.1 (6 Places)
3	17A084	Engine Lifting Eye
4	N620481-S2	Nut, M8-1.25 (2 Places)
5	N806948-S100	Stud, M10-1.5 x M8-1.25 x 89.6 (2 Places)
6	9430	Exhaust Manifold
7	9448	Exhaust Manifold Gasket
A	—	Tighten in Two Stages According to Instructions in Text
B	—	Tighten to 20-30 Nm (15-22 Lb-Ft)

tomsn048@gmail.com

89. Install right engine lifting eye. Tighten nuts to 20-30 Nm (15-22 lb-ft).

90. Install EGR valve to exhaust manifold tube to exhaust manifold and EGR valve. Tighten nuts to 34-47 Nm (25-34 lb-ft).



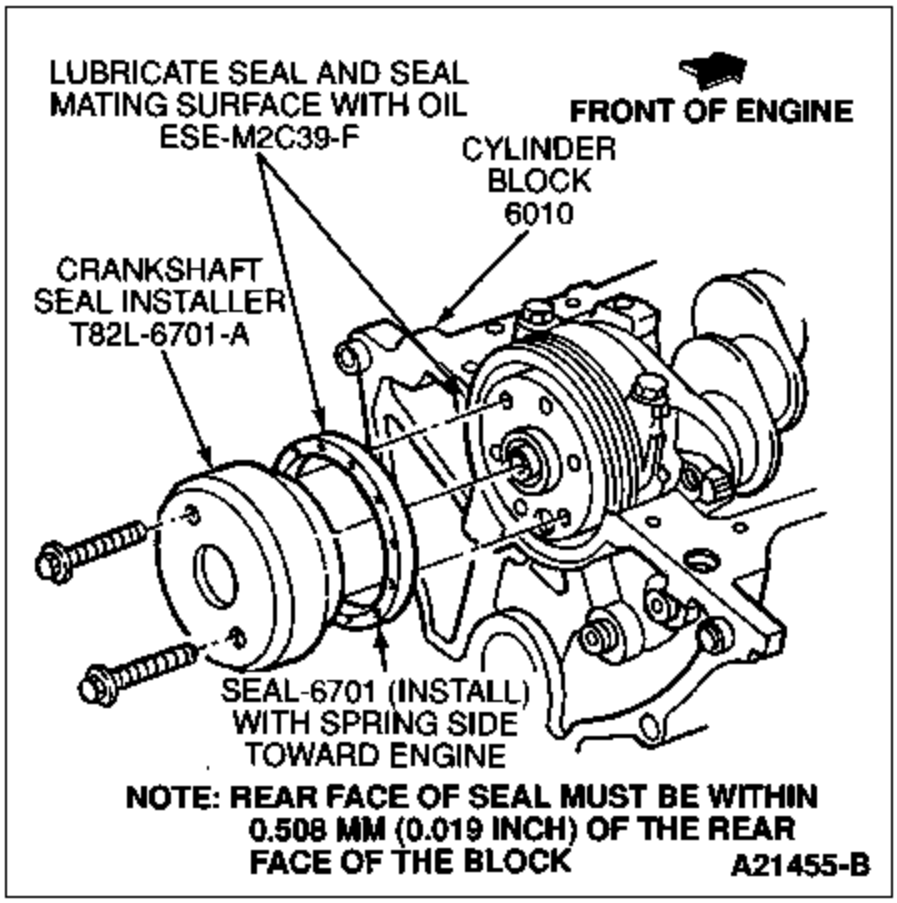
Item	Part Number	Description
1	9D475	EGR Valve
2	9424	Intake Manifold, Upper
3	9430	Exhaust Manifold
4	—	Nut (Part of 9D477)
5	9D477	EGR Valve to Exhaust Manifold Tube
6	—	Nut (Part of 9D477)
7	N806781-S2	Screw, M8-1.25 x 35

tomsn048@gmail.com

8	9D476	EGR Valve Gasket
A	—	Tighten to 34-47 Nm (25-35 Lb-Ft)
B	—	Tighten to 20-30 Nm (15-22 Lb-Ft)

91. Remove engine from engine stand.

92. Install crankshaft rear oil seal using T82L-6701-A Crankshaft Seal Installer.



93. Position engine rear plate.

94. Install flywheel or flexplate and reinforcement. Tighten special flywheel-to-crankshaft bolt to 73-87 Nm (54-64 lb-ft).

95. If equipped, install clutch disc and clutch pressure plate and tighten bolts finger-tight.

96. Install Clutch Aligner T71P-7137-H aligning clutch disc to transmission input shaft pilot bearing (7118).

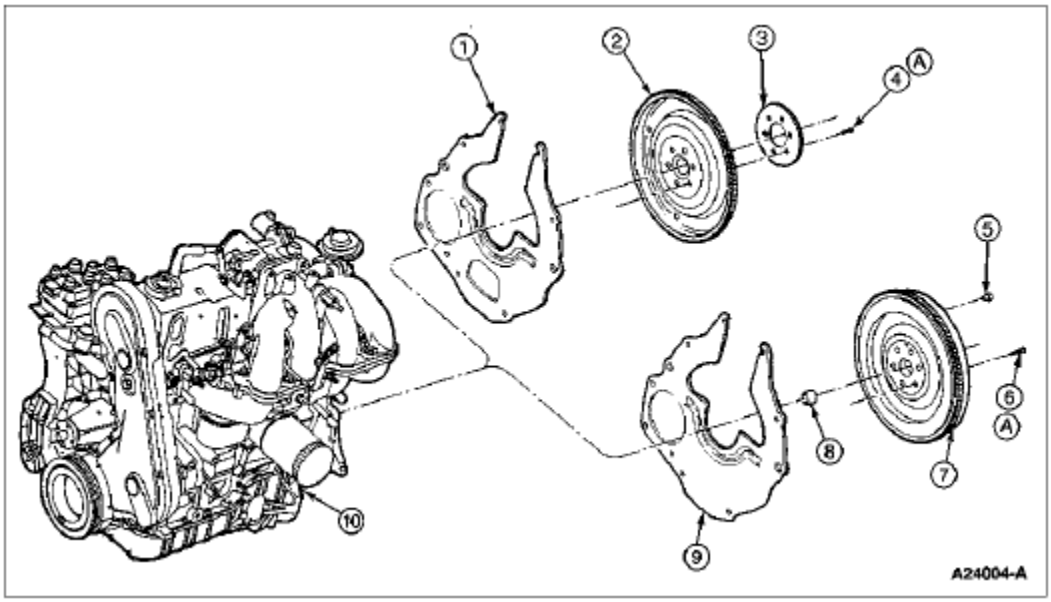
97. **CAUTION: Clutch pressure plate bolts must be tightened one turn at a time in sequence or faulty clutch operation can occur.**

tomsn048@gmail.com

Tighten clutch pressure plate bolts in a criss-cross sequence one turn at a time until clutch pressure plate is contacting flywheel. Tighten pressure plate bolts to 21-32 Nm (15-24 lb-ft).

98. Remove clutch alignment tool.

Flywheel Installation, 2.3L Engine



Item	Part Number	Description
1	7007	Engine Rear Plate (Automatic Transmission)
2	6375	Flywheel (Automatic Transmission — Also Called Flexplate)
3	6A366	Flywheel Reinforcing Plate (Automatic Transmission)
4	N802741-S	Bolt, M10-1 x 20
5	6397	Flywheel Dowel (3 Places)
6	N800028-S	Bolt, M10-1 x 30
7	6375	Flywheel (Manual Transmission)
8	7120	PIlot Bearing
9	7007	Engine Rear Plate (Manual Transmission)
10	6007	Engine (2.3L)
A	—	Tighten to 73-87 Nm (54-64 Lb-Ft)

99. Install engine as outlined in this section.

tomsn048@gmail.com

tomsn048@gmail.com

Cylinder Head

SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
Valve Spring Compressor	T95T-6565-A
Cam Sprocket Holding/Removing Tool	T74P-6256-B
Front Cover Seal Remover	T74P-6700-B
Cam Bearing Replacer	T71P-6250-A
Camshaft Bearing Set	T65L-6250-A
Front Seals Replacer	T74P-6150-A
Valve Stem Seal Replacer	T95L-6510-A
Valve Guide Replacer	T95T-6510-B

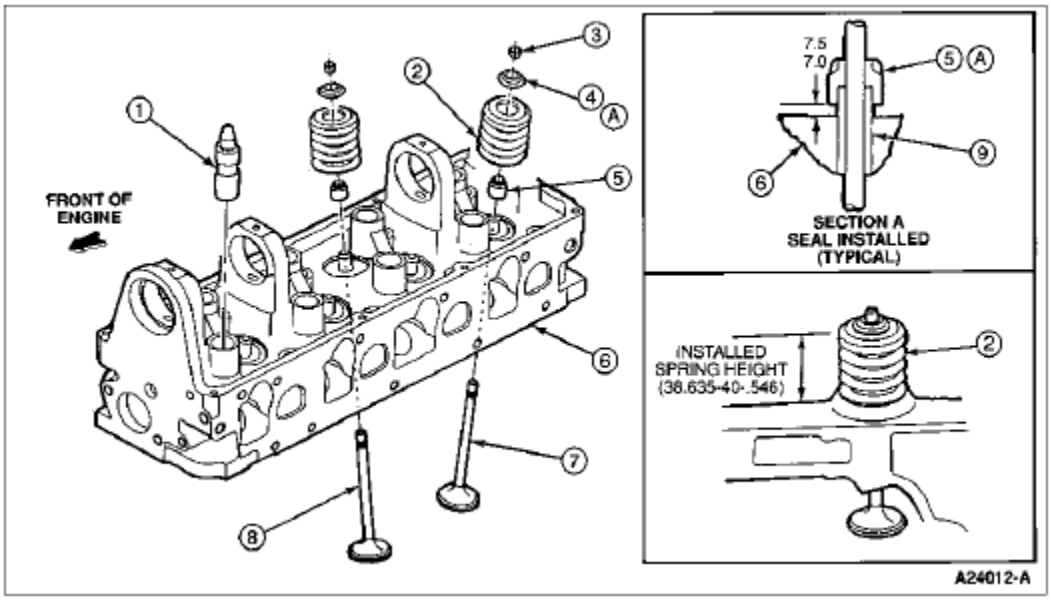
Disassembly

NOTE: When disassembling cylinder head (6049), mark the cam followers, lash adjusters, and valves so that they can be installed in the original positions.

1. Remove cylinder head as outlined in this section.
2. Remove the deposits from the combustion chambers with scraper and wire brush.
3. Mount cylinder head on bench fixture.
4. Rotate the camshaft (6250) so the cam follower to be removed is on the heel of its cam.
5. Using Valve Spring Compressor T95T-6565-A, compress and hold down the valve spring (6513). Slide out the cam follower over the lash adjuster.
6. Repeat steps 4 and 5 until all the cam followers are removed.
7. Store lash adjusters in order.
8. Using Valve Spring Compressor T95T-6565-A, compress valve spring and remove valve spring retainer key (6518), valve spring retainer (6514), and valve spring.
9. Remove valve and store in order.
10. Remove valve stem seal (6571).
11. Repeat above three steps until all the valves are removed.

tomsn048@gmail.com

Cylinder Head Assembly



Item	Part Number	Description
1	6500	Valve Tappet
2	6513	Valve Spring
3	6518	Valve Spring Retainer Key
4	6514	Valve Spring Retainer
5	6571	Valve Stem Seal
6	6049	Cylinder Head
7	6507	Intake Valve
8	6505	Exhaust Valve
9	6510	Valve Guide
A	—	Press Seal into Place So Distance from Bottom of Seal to Surface of Cylinder Head Is 7.5-7.0mm (0.30-0.28 Inch)
B	—	Valve Spring Installed Height 38.635-40.546mm (1.52-1.59 Inch)

12. **NOTE: It is not necessary to remove sprocket from camshaft unless camshaft or sprocket is to be serviced.**

    Install Cam Sprocket Holding/Removing Tool T74P-6256-B on sprocket. Using tool to hold sprocket remove bolt and washer.

13. Install threaded puller insert in Cam Sprocket Holding/Removing Tool T74P-6256-B and remove sprocket.

14. Remove tool from sprocket.

tomsn048@gmail.com

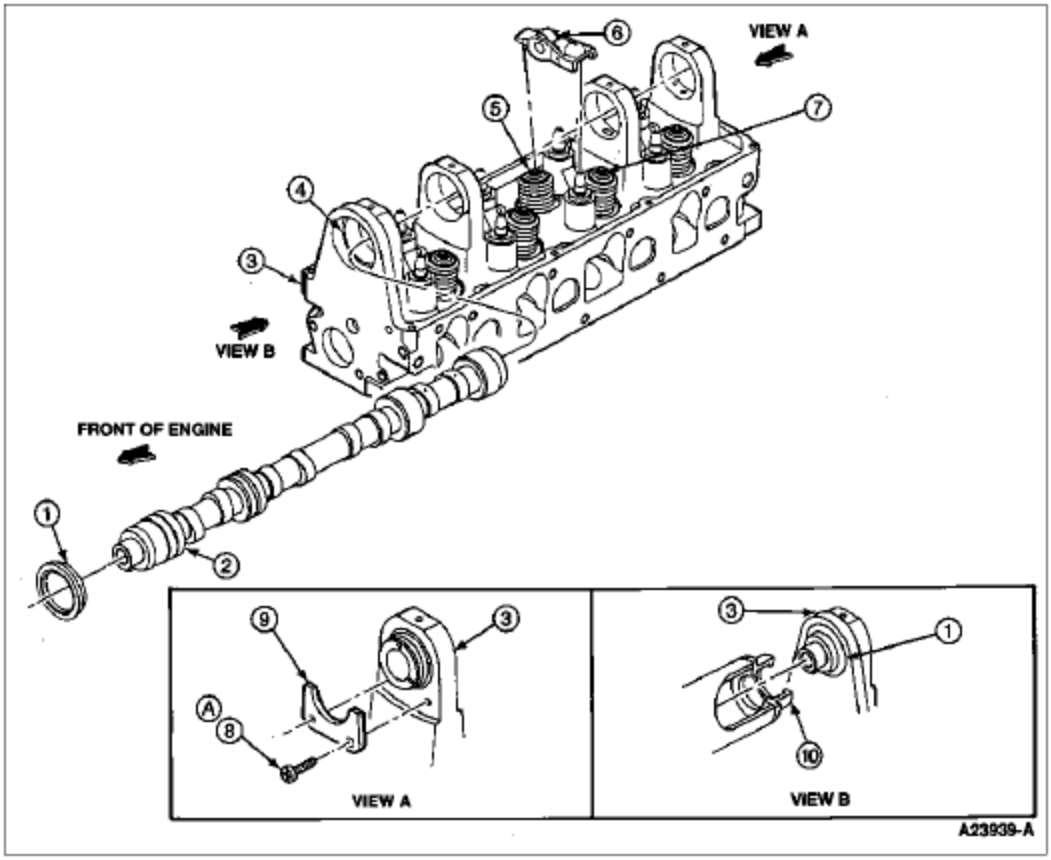
15. **NOTE: When positioning Front Cover Seal Remover T74P-6700-B, make sure the jaws are gripping the thin edge of the seal tightly before operating the jack screw portion of the tool.**

    Install Front Cover Seal Remover T74P-6700-B. Pull camshaft front seal.

16. Remove two screws and camshaft retaining plate.

17. Remove camshaft.

Camshaft



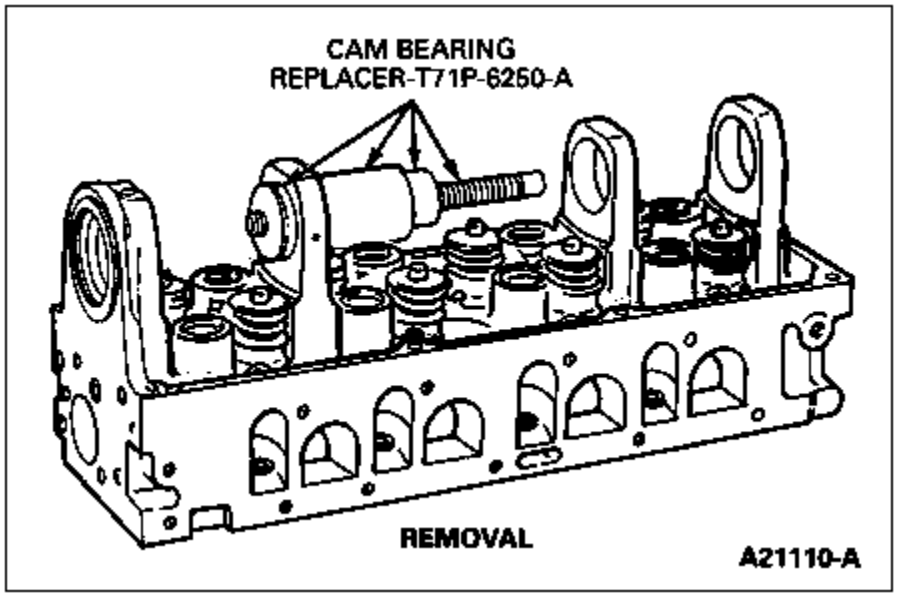
Item	Part Number	Description
1	6700	Camshaft Front Seal
2	6250	Camshaft
3	6049	Cylinder Head
4	6261	Camshaft Bearing
5	6505	Exhaust Valve
6	6564	Rocker Arm
7	6507	Intake Valve
8	N604465-S	Pan Head Screw, M6-1 x 16

tomsn048@gmail.com

9	6613	Auxiliary Shaft Retaining Plate
10	T74P-6150-A	Cam and Auxiliary Shaft Seal Replacer
A	—	Tighten to 8-12 Nm (71-106 Lb-In)

18. To remove camshaft bearing (6261):

    a. Use tool sets Cam Bearing Replacer T71P-6250-A and Camshaft Bearing Set T65L-6250-A.
    b. Select proper size expanding collet and backup nut, and assemble on expanding mandrel.
    c. With expanding collet collapsed, install coiled assembly in the camshaft bearing, and tighten backup nut on the expanding mandrel until the collet fits the camshaft bearing.
    d. Assemble puller screw, cup, and nut on expanding mandrel.
    e. Tighten the puller nut against the thrust bearing to remove the camshaft bearing. Be sure to hold the end of the puller screw to prevent it from turning.
    f. Repeat steps to remove the other three bearings.



Assembly

1. Clean and inspect cylinder head, cam followers, valve springs, and valves as outlined in Section 03-00 .

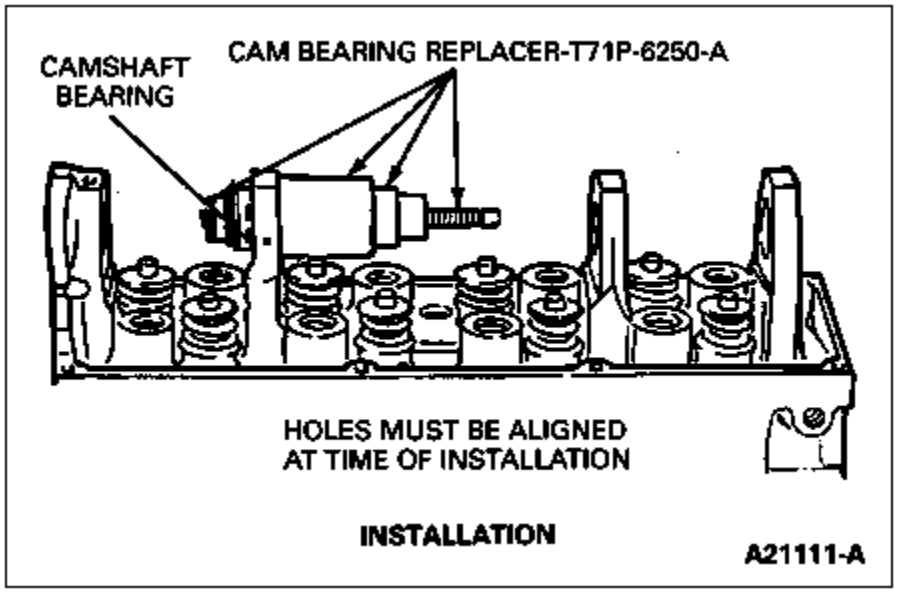
2. **CAUTION: Failure to use the correct expanding collet can cause severe bearing damage.**

   NOTE: The camshaft bearings are available pre-finished to size and require no reaming for standard and 0.08mm (0.15-inch) undersize journal diameters.

   NOTE: Make sure to align oil hole in camshaft bearing with the oil hole in the cylinder head before pressing camshaft bearing into place.

   Position new camshaft bearing at the bearing bore and press into place using Camshaft Bearing Set T65L-6250-A and Cam Bearing Replacer T71P-6250-A.

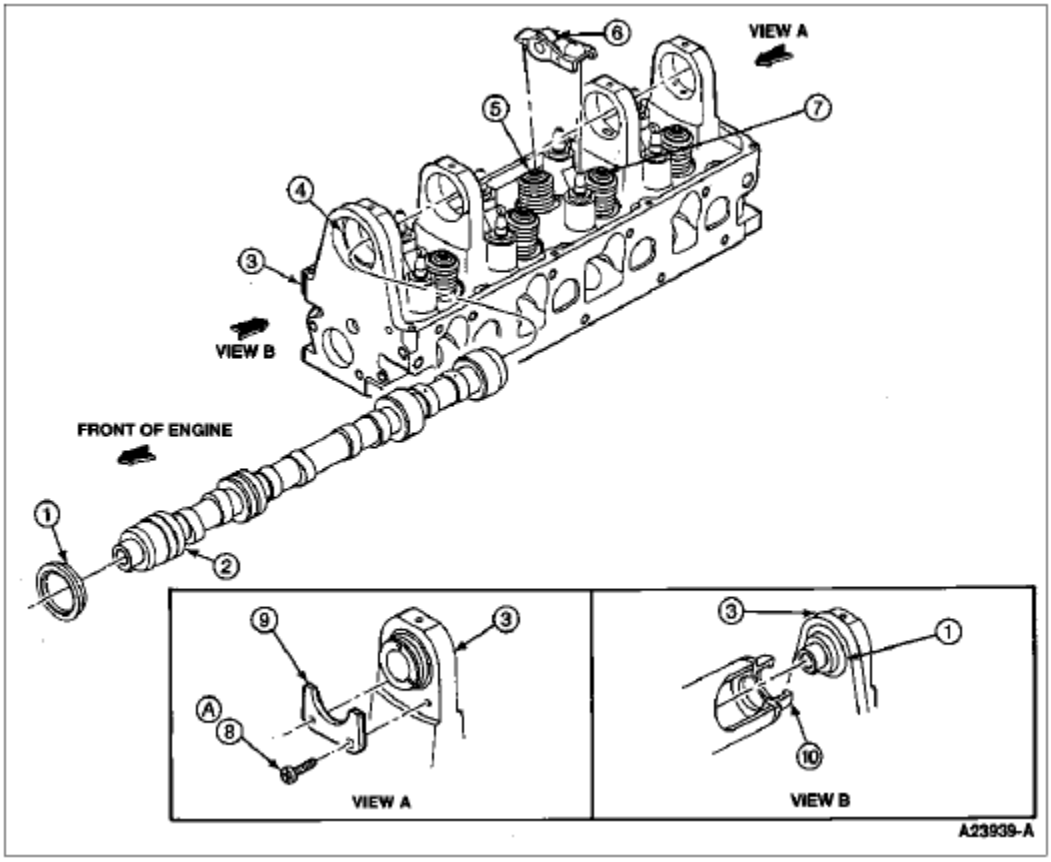
tomsn048@gmail.com



3. Make sure the cup plug is in the rear of the camshaft.
4. Lubricate the camshaft lobes and journals with Motorcraft Super Premium Motor Oil XO-5W30-ASP or equivalent meeting Ford specification ESE-M2C153-E.
5. Carefully slide the camshaft into place through the camshaft bearings. Be careful not to scratch camshaft bearings.
6. Install the camshaft rear retainer. Tighten the two screws to 8-12 Nm (70-106 lb-in).
7. Position camshaft front seal on Front Seals Replacer T74P-6150-A and press into place.
8. Remove tool.

Camshaft

tomsn048@gmail.com



Item	Part Number	Description
1	6700	Camshaft Front Seal
2	6250	Camshaft
3	6049	Cylinder Head
4	6261	Camshaft Bearing
5	6505	Exhaust Valve
6	6564	Rocker Arm
7	6507	Intake Valve
8	N604465-S	Pan Head Screw, M6-1 x 16
9	6613	Auxiliary Shaft Retaining Plate
10	T74P-6150-A	Cam and Auxiliary Shaft Seal Replacer
A	—	Tighten to 8-12 Nm (71-106 Lb-In)

9. Check camshaft end play as outlined in Section 03-00 .
10. Position camshaft sprocket on camshaft.
11. Install Cam Sprocket Holding/Removing Tool T74P-6256-B, without threaded puller insert, on sprocket.

tomsn048@gmail.com

12. Install sprocket bolt and washer. Tighten to 70-95 Nm (52-70 lb-ft).

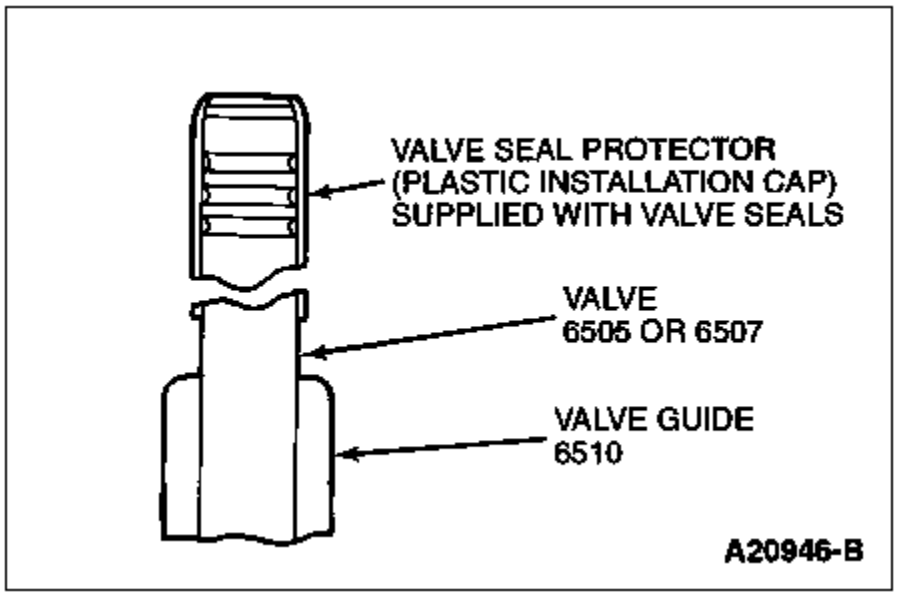
13. Remove tool.

14. Install valve lash adjusters.

15. Install one valve and check valve runout, looseness in guide, and seating as outlined in Section 03-00 .

16. **CAUTION: Install valve seal protector (plastic installation cap) included with valve seal kit over end of valve before installing valve stem seal or valve stem seal will be cut by valve keeper grooves in valve. If valve stem seal is cut it will leak, causing oil burning and valve fouling.**

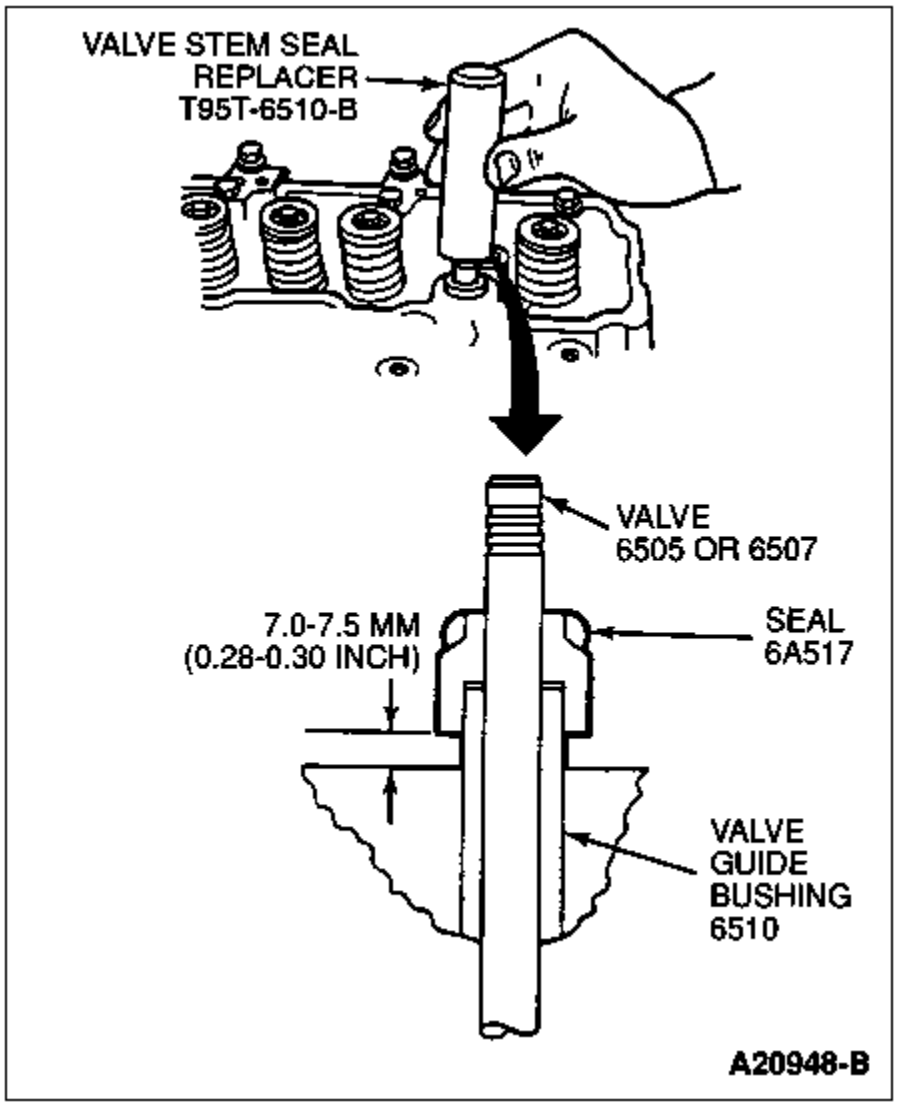
    Put valve seal protector (plastic installation cap) over end of valve as illustrated.



17. Start valve stem seal carefully over cap. Push valve stem seal down until jacket touches top of guide.

18. Remove seal protector (plastic cap). Use Valve Stem Seal Replacer T95T-6510-B to seat valve stem seal on valve guide.

tomsn048@gmail.com



19. Apply a small amount of Ford Multi-Purpose Grease D0AZ-19584-AA or equivalent to valve spring retainer keys to hold them in place during installation.

20. Put valve spring and valve spring retainer into place.

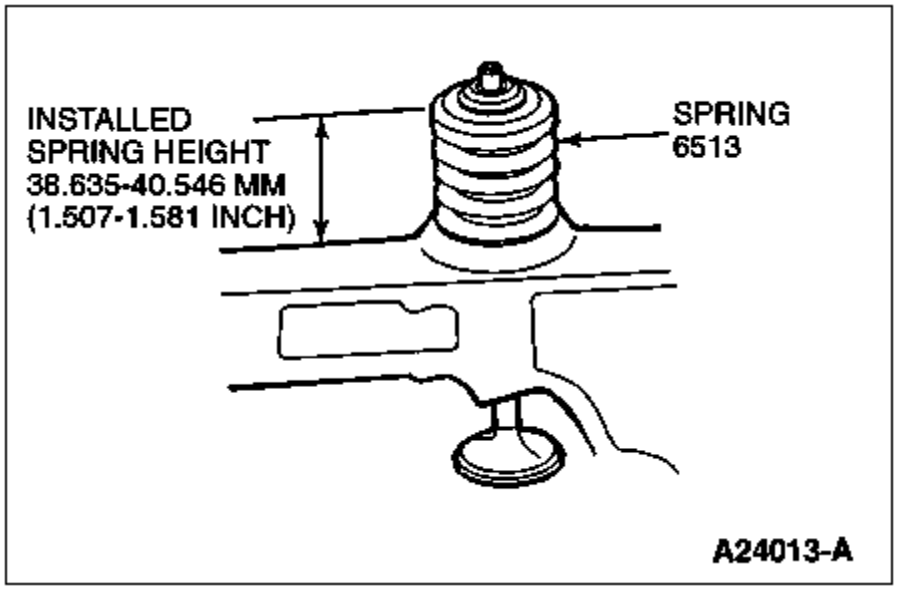
21. **NOTE: Spring must not be compressed beyond a height of 27.5mm (1.08 inch) during assembly.**

    Compress valve spring with Valve Spring Compressor T95T-6565-A and install valve spring retainer keys. Release spring to seat valve spring retainer keys.

22. Check installed height of valve spring assembly:

    a. Measure from cylinder head machined spring pad to top of valve spring. Dimension should be 38.635-40.546mm (1.507-1.581 inch).

tomsn048@gmail.com



23. Repeat steps 15 through 22 until all valves are installed.

24. Oil contact surfaces of cam followers with clean engine oil.

25. With heel of cam facing down, use Valve Spring Compressor T95T-6565-A to compress and hold down the valve spring. Slide the cam follower into place.

26. **CAUTION: Make sure the affected lash adjuster has been collapsed and released before rotating camshaft.**

    Using Valve Spring Compressor T95T-6565-A, compress and release lash adjuster.

27. Repeat the above steps until all cam followers are installed.

28. Install cylinder head as outlined in this section.

---

tomsn048@gmail.com

tomsn048@gmail.com

Piston and Piston Pins

SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
Piston Pin Removing and Installing Set	T68P-6135-A

Disassembly

1. Remove the connecting rod bearing (6211) from the connecting rod and cap.

   Install the cap on the connecting rod from which it was removed.

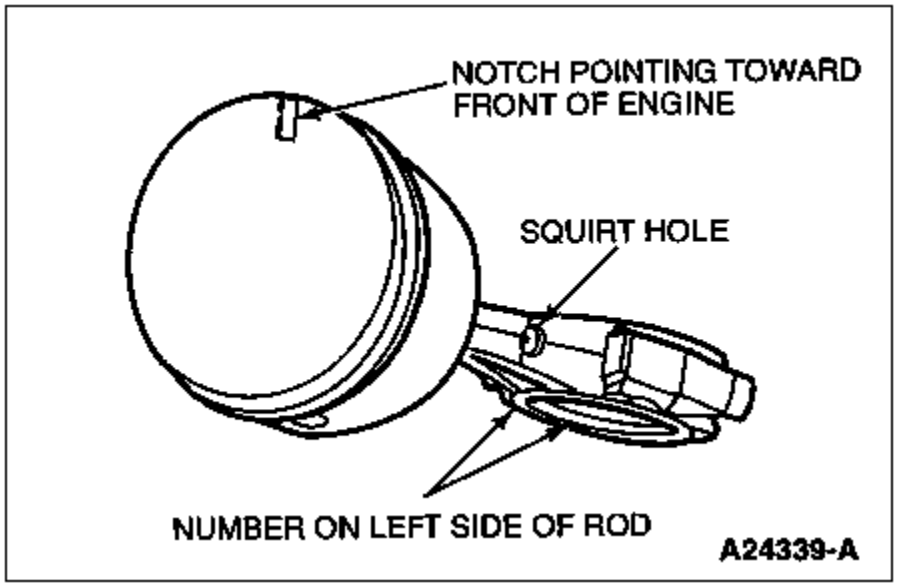
2. Remove the piston rings using a suitable piston ring expander.

3. Store the piston, pin and connecting rod to ensure assembly with the same rod and installation in the same cylinders from which they were removed.

4. Using an arbor press and Piston Pin Removing and Installing Set T68P-6135-A press the piston pin (6135) from the piston and connecting rod (6200).

Assembly

1. Apply a light coat of Motorcraft Super Premium Motor Oil XO-5W30-QSP or equivalent to all parts. Assemble the piston to the connecting rod with the oil squirt holes on the side of the connecting rod and the notch in the piston positioned as shown. Use arbor press and Piston Pin Removing and Installing Set T68P-6135-A.



2. Install the piston rings using a suitable piston ring expander. Check the end gap of all piston rings.

tomsn048@gmail.com

They must be within specifications of 0.20-0.41mm (0.008-0.016 inch) for top ring, 0.33-0.50mm (0.013-0.019 inch) for second ring, and 0.25-0.76mm (0.010-0.030 inch) for oil control ring.

3. Check the ring side clearance. Refer to Section 03-00 . Side clearance for both compression rings should be 0.041-0.084mm (0.0016-.0033 inch) and a snug fit for the oil control ring.

4. Make sure the connecting rod bearings and the bearing bore in the connecting rod and cap are clean. Foreign material under the inserts will distort the bearing and cause a failure. Install the connecting rod bearings in the connecting rod and cap with the tangs fitting the slots provided.

   Make certain lock slots in cap are on the same side of bore as the lock slot in rod. Avoid nicking crank pin journals during rod installation.

5. Install assembled piston and connecting rod assembly as outlined in this section.

---

tomsn048@gmail.com

Cylinder Block Assembly

Disassembly

1. Mount the engine (6007) on a work stand and remove all parts not furnished with the new cylinder blocks (6010), following Engine Disassembly and Assembly in this section.

2. Remove the old cylinder blocks from the work stand.

Assembly

1. Clean the gasket and seal surfaces of all serviceable parts and assemblies.

2. Position the new cylinder blocks on a work stand and transfer all serviceable parts removed from the old cylinder blocks, following Engine Disassembly and Assembly as outlined in this section.

3. Check all assembly clearances and correct as necessary.

tomsn048@gmail.com

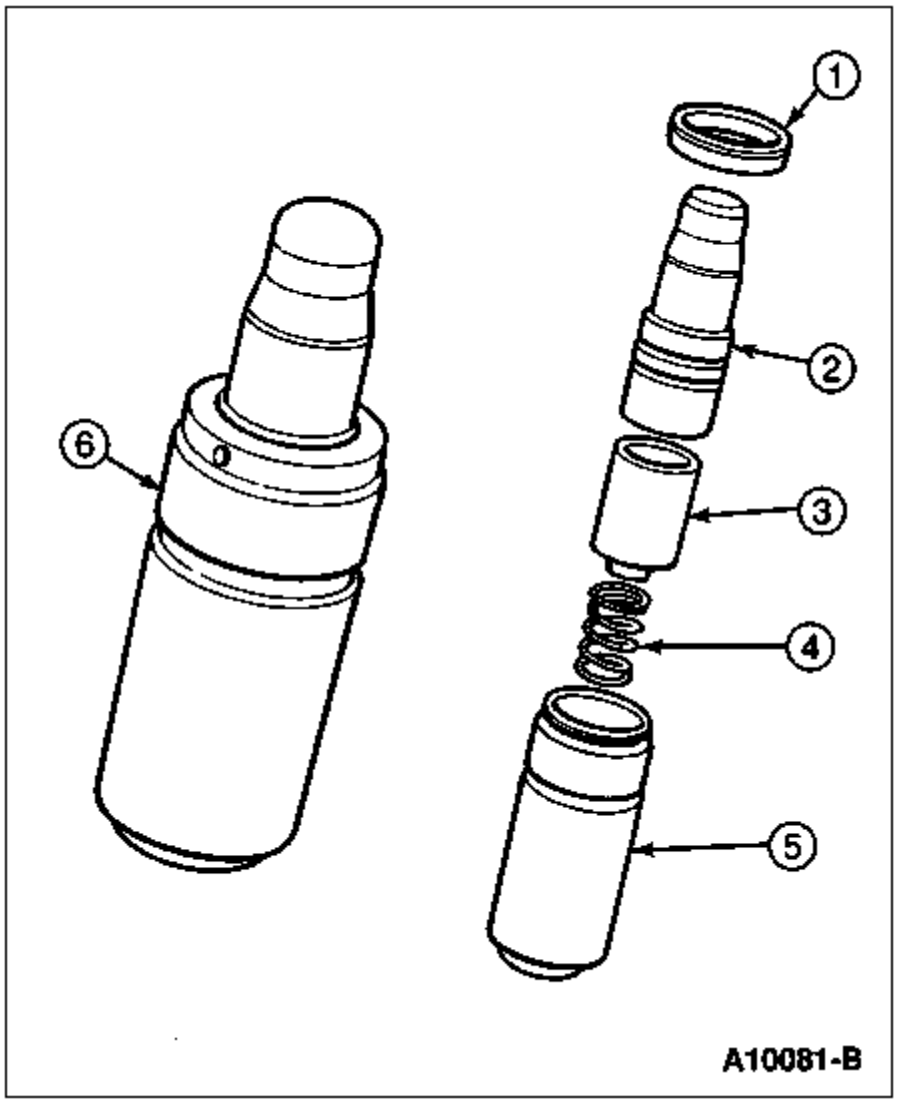
Hydraulic Lash Adjuster

Disassembly and Assembly

NOTE: Do not mix parts from different lash adjusters. Parts are select fit and not interchangeable.

1. Remove snap ring.
2. Remove fulcrum, plunger, and spring.
3. Clean to remove all traces of motor oil and varnish. Make sure check ball is free.
4. To assemble, lubricate parts with clean Super Premium Motor Oil XO-5W30-QSP or equivalent meeting Ford specification ESE-M2C153-E and reverse disassembly steps. If it is necessary to store lash adjusters for some time before installation, protect them from dust and dirt. If not kept clean, they may stick in operation.
5. Perform leak-down test as outlined in Section 03-00 .

tomsn048@gmail.com



Item	Part Number	Description
1	—	Retaining Ring (Part of 6500)
2	—	Arm Fulcrum (Part of 6500)
3	—	Plunger (Part of 6500)
4	—	Plunger Return Spring (Part of 6500)
5	—	Body (Part of 6500)
6	6500	Valve Tappet (Assembled)

tomsn048@gmail.com

tomsn048@gmail.com

Cylinder Block, Bare

Before replacing a cylinder blocks (6010) determine if it is repairable. If so, make the necessary repairs following the procedures given in Section 03-00 .

Disassembly

1. Completely disassemble the old engine, following engine Disassembly procedure in this section.
2. Remove core plugs as outlined in Section 03-00 .
3. Remove oil gallery pipe plugs.
4. **NOTE: A rifle-cleaning brush is helpful for cleaning engine oil galleries.**

   Clean cylinder blocks and inspect as outlined in Section 03-00 .

Assembly

1. If using new or reconditioned cylinder blocks, uncrate and clean preservative materials according to suppliers' instructions.
2. Position the new cylinder block in a work stand and install all serviceable parts removed from the old cylinder block, following engine Assembly procedure in this section.
3. Check all assembly clearances and correct as necessary.

tomsn048@gmail.com

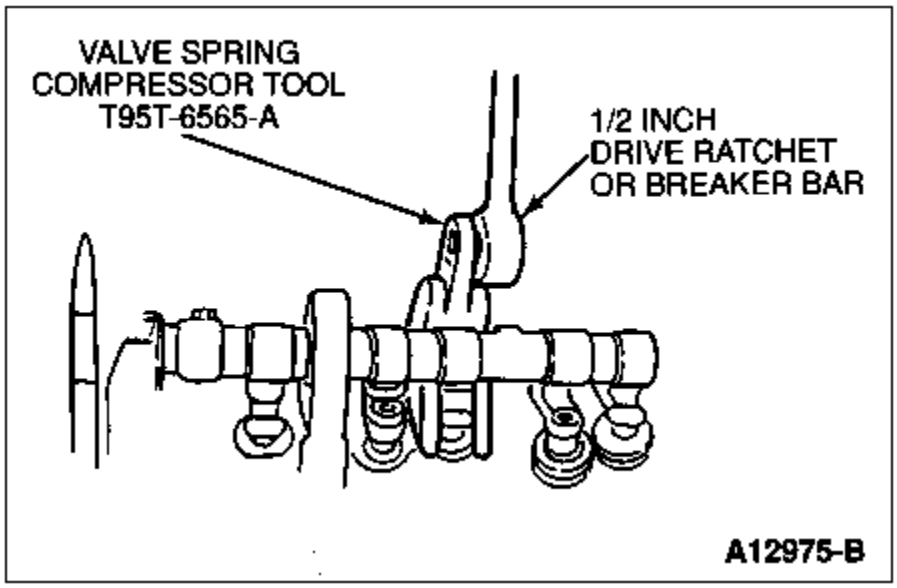
Valve Clearance, Hydraulic Valve Lash Adjuster

SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
Valve Spring Compressor	T95T-6565-A

1. Position the camshaft (6250) so that the base circle of the lobe is facing the cam follower of the valve to be checked.

2. Using Valve Spring Compressor T95T-6565-A slowly apply pressure to the cam follower until the lash adjuster is completely collapsed. Hold the follower in this position and insert the proper size feeler gauge between the base circle of the cam and the follower.



3. Remove the cam follower and inspect for damage if the clearance is excessive.

4. Measure the valve spring assembled height to make sure the valve is not sticking if the cam follower appears to be intact and not excessively worn.

5. If the valve spring assembled height is correct, check the dimensions of the camshaft. Refer to Camshaft Lobe Lift, Section 03-00 .

6. If the camshaft dimensions are to specifications, remove, clean and test the lash adjuster. Refer to Hydraulic Tappets, Section 03-00 .

7. Install the lash adjuster and check the clearance. Replace damaged or worn parts as necessary.

tomsn048@gmail.com

tomsn048@gmail.com

Camshaft Timing

Checking Timing

An access plug is provided in the cam drive belt cover so that camshaft timing can be checked without removal of the cover or any other parts.

NOTE: Camshaft and timing belt sprockets turn one revolution for every two revolutions of the crankshaft.

NOTE: If the timing belt has greater than 193,000 km (120,000 miles) of use, the timing belt will need to be replaced. Refer to service procedures in this section.

1. Remove both of the rubber access caps (camshaft sprocket and oil pump sprocket) from the outer timing cover.

2. Rotate crankshaft so that number one cylinder is at the compression stroke of Top Dead Center (TDC). TDC will be indicated when the three timing marks are aligned:

    a. The timing mark on the crankshaft damper assembly will align with "TC" on the outer timing cover.
    b. The triangular timing mark on the camshaft sprocket will align with the timing mark on the inner timing cover.
    c. The diamond timing mark on the engine oil pump socket will align with the timing mark on the inner timing cover.

3. If the diamond or the triangle timing marks cannot be seen through the access holes of the outer timing cover, rotate crankshaft one revolution. TDC will be indicated when the three timing marks are aligned.

4. If the diamond or the triangle timing marks cannot be properly aligned, set the timing mark of the crankshaft damper assembly with "TC" on the outer timing cover. Remove the crankshaft damper assembly and outer timing cover as outlined in this section.

Inspecting Camshaft and Oil Pump Sprocket Timing, 2.3L Engine

Adjusting Timing Belt

SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
Crankshaft Belt Tension Adjusting Tool	T74P-6254-A

1. Remove the outer timing belt cover as outlined in this section.

2. **NOTE: Timing belt should be replaced at 193,000 km (120,000-mile) intervals. If belt has more than 193,000 km (120,000 miles), replace timing belt as outlined in this section.**

   Inspect belt for cracked or damaged teeth, fraying, cracking, or oil. If belt is worn or damaged, replace. If there is oil on the belt, determine which seal is leaking and replace seal before replacing belt.

3. **CAUTION: Attempting to adjust timing belt tension without loosening spring pivot bolt will break Crankshaft Belt Tension Adjusting Tool T74P-6254-A when relieving tension on the belt.**

   If belt timing or tension is incorrect, loosen timing belt spring pivot bolt.

4. Hold tensioner with Camshaft Belt Tension Adjusting Tool T74P-6254-A.

5. While holding tensioner, loosen adjusting bolt and gradually release spring tension.

Loosening Timing Belt Tensioner, 2.3L

tomsn048@gmail.com

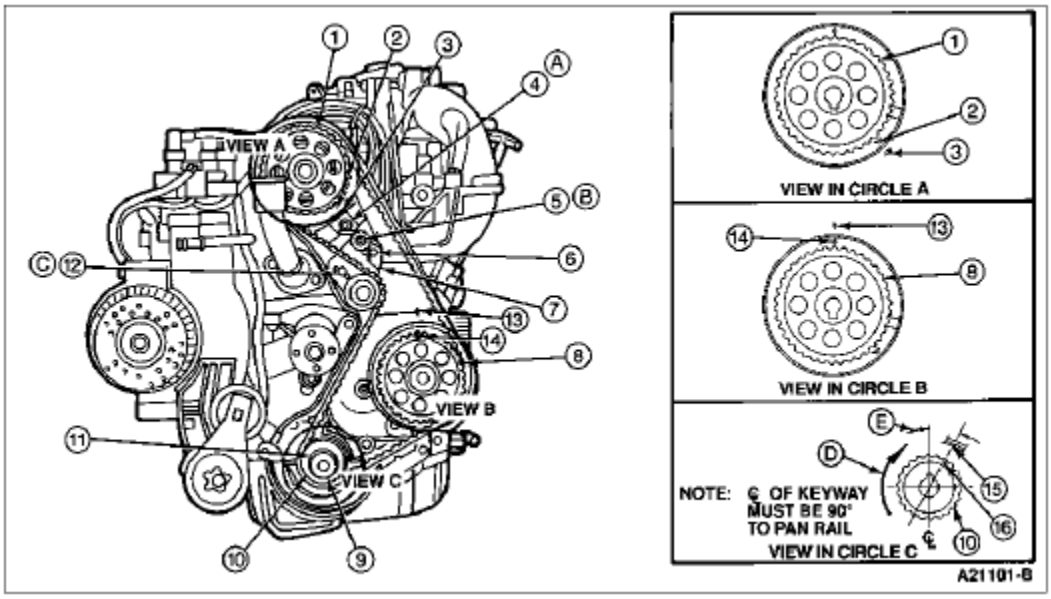
9	6L273	Timing Belt Tensioner Spring
10	6K254	Belt Tensioner Assembly
11	N808049-S102	Stud (Part of 6049)
12	6303	Crankshaft
13	6306	Crankshaft Sprocket
14	6600	Oil Pump
15	6019	Inner Timing Belt Cover
16	6256	Oil Pump Sprocket
17	6278	Camshaft Sprocket Washer
18	N600313-S2	Bolt, M10-1.5 x 40
19	—	Recess (Part of 6306)
A	—	Tighten to 70-95 Nm (51-70 Lb-Ft See Text)
B	—	Tighten to 35-45 Nm (25-33 Lb-Ft) (Refer to Text)
C	—	Tighten to 40-55 Nm (30-40 Lb-Ft) (Refer to Text)

7. Remove bolt, washer, and crankshaft damper.
8. Remove the drive belt and inspect it for wear or damage. If the belt is damaged, replace it.
9. Remove one spark plug (12405) from each cylinder and mark locations on a piece of tape for reinstallation.
10. If not done:
    a. Loosen tensioner adjusting bolt.
    b. Using Camshaft Belt Tension Adjusting Tool T74P-6254-A, pry tensioner clockwise against spring tension as far as possible.
    c. Tighten adjusting bolt to hold tensioner in released position.
11. Align crankshaft (6303) so number one piston (6108) is at TDC (top dead center) as indicated by timing mark.
12. Align circle on crankshaft sprocket with line on engine front cover.
13. Align triangle on camshaft sprocket with triangle on inner timing belt cover.
14. Align diamond on oil pump sprocket with diamond on inner timing belt cover.

Timing Mark Alignment

tomsn048@gmail.com



Item	Part Number	Description
1	6256	Camshaft Sprocket
2	—	Pointer Triangle (Part of Camshaft Sprocket)
3	—	Pointer Triangle (on Inner Timing Belt Cover)
4	N808049-S102	Stud, M8 x 1.25
5	6K282	Spring Pivot Bolt
6	—	Stud (Part of 6K254)
7	6K254	Timing Belt Tensioner
8	6256	Oil Pump Sprocket
9	6303	Crankshaft
10	6306	Crankshaft Sprocket
11	N806700-S	Key
12	N800112-S2	Adjusting Bolt, M8-1.25 x 20
13	—	Pointer Diamond (on Inner Timing Belt Cover)
14	—	Pointer Diamond (on Oil Pump Sprocket)
15	—	Pointer Line (Part of 6019)
16	—	Pointer Circle (on 6306)
A	—	Tighten to 20-30 Nm (15-22 Lb-Ft) (Refer to Text)
B	—	Tighten to 40-55 Nm

tomsn048@gmail.com

		(30-40 Lb-Ft) (Refer to Text)
C	—	Tighten to 35-45 Nm (26-33 Lb-Ft) (Refer to Text)
D	—	Direction of Rotation
E	—	29°

15. Install timing belt over crankshaft sprocket (6306). Then, proceeding counterclockwise, over oil pump sprocket and camshaft sprocket, verify all three timing marks are aligned.

16. Loosen tensioner adjusting bolt allowing tensioner pulley to press against timing belt.

17. **NOTE: When performing the following step, do not rotate crankshaft counterclockwise as timing belt may jump a cog, putting camshaft or oil pump (6600) out of time.**

    Rotate crankshaft two revolutions clockwise.

18. Bring crankshaft slowly, without stopping, to number one cylinder firing position (keyway directly up).

19. Recheck timing mark alignment. Repeat steps if timing marks are no longer properly aligned.

20. Rotate tensioner assembly against bolt with torque wrench up to 41-45 Nm (30-33 lb-ft) and tighten adjusting bolt.

21. Tighten adjusting bolt to 35-45 Nm (26-33 lb-ft).

22. Tighten spring pivot bolt to 40-55 Nm (30-40 lb-ft).

23. Install outer timing belt cover as outlined in this section.

24. Install spark plugs in proper locations.

---

(1) Time required for plunger to leak down 3.18mm (1/8 in.) of travel with 22.68 kg (50 lb.) load leak-down fluid in lash adjuster.

(2) Distance in inches that front bearing is installed below front face of bearing tower.

(3) 0.002 undersize = add 0.001 to standard thickness.

(4) Pin bore and crank bearing bore must be parallel and in the same vertical plane, within the specified total difference when measured at the ends of an 8 in. bar — 4 in. on each side of rod centerline.

(5) Measured at 14.58mm from bottom of skirt, centerline — 90°to the pin.

(6) Add one quart with filter change.

(7) On engine, temperature normal, curb idle, in neutral, brakes set.

(8) Pump to tank return line pinched off, new fuel filter in line.

(9) Smallest orifice = no less than 0.220 in. I.D.

(10) Torque in sequence in two steps:

- Step 1 — 34-41 Nm (25-30 lb-ft).
- Step 2 — 39-41 Nm (28-30 lb-ft).

(11) Install cylinder head bolts in sequence. Tighten in sequence to 70 Nm (51 lb-ft). Retighten in sequence to 70 Nm (51 lb-ft). Turn all cylinder item bolts an additional 90-100 degrees in sequence.

(12) Torque in sequence in two steps:

- Step 1 — 20-30 Nm (15-22 lb-ft).
- Step 2 — 60-80 Nm (44-59 lb-ft).

(13) Torque in sequence in two steps:

- Step 1 — 7-10 Nm (62-88 lb-in).
- Step 2 — 26-38 Nm (19-28 lb-ft).

(14) Torque in sequence in two steps:

- Step 1 — 68-81 Nm (50-60 lb-ft).
- Step 2 — 102-115 Nm (75-85 lb-ft).

(15) 1/2 turn after gasket contacts surface — oil gasket.

tomsn048@gmail.com

tomsn048@gmail.com

Valve Cover and Gasket

NOTE: The rocker covers installed on the 3.0L engine incorporate integral (built-in) gaskets which should last the life of the vehicle. Be sure to adhere to the following steps when removing and replacing rocker covers. Replacement gaskets are available if required.

Removal

1. Disconnect battery ground cable (14301) and set aside.

2. Disconnect the crankcase ventilation hose from the air cleaner outlet tube. Disconnect the wiring connectors from the mass air flow (MAF) sensor, intake air temperature (IAT) sensor, and the harness locator from the outlet tube. Loosen the clamps at the throttle body and air cleaner and remove the outlet tube.

3. Remove air cleaner outlet tube.

4. Disconnect the canister purge hose from the canister purge valve at the LH frame rail and the locator from the accelerator control bracket. Remove the accelerator control splash shield.

5. Disconnect the throttle cable (09A758A) and speed control cable (9A825) from the throttle body and the locator at the top of the intake manifold. Remove the cable bracket retaining bolts and remove bracket with cables attached. Position the bracket and cables out of the way.

6. Disconnect the wiring connectors from the coil connector, radio noise suppressor, the EVR and left side spark plug wires from coil. Disconnect right side spark plug wires from the locators and wires from the spark plugs. Disconnect the vacuum hose from the EVR and heater control tee. Remove the brace from the coil bracket and the exhaust manifold. Remove the coil assembly.

7. Disconnect the right side valve cover harness locators. Disconnect the IAT harness locator from the generator bracket. Remove the right side valve cover and gasket.

8. Disconnect the DPFE vacuum hoses and the wiring connector. Remove the EGR valve tube from the valve and exhaust manifold.

9. Disconnect the vacuum hoses from the brake booster, EGR, and the engine vacuum harness from upper intake and position the harness out of the way.

10. Disconnec the wiring connectors from the throttle position sensor (TPS) and idle air control (IAC). Disconnect the 42-pin connector from the bracket at the rear of intake manifold. Remove the positive crankcase ventilation (PCV) valve from the valve cover.

11. Remove the upper intake manifold and gasket. Tape the lower intake openings closed.

12. Disconnect the left side spark plug wire locators and wires from the spark plugs. Remove the left side valve cover and gasket.

13. **NOTE: Do not clean the valve cover gasket with solvent. Damage to the valve cover gasket may occur.**

    Clean the valve covers and mating surfaces.

tomsn048@gmail.com

14. Clean upper intake manifold and mating surfaces.

Installation

1. **NOTE: Use Silicone Gasket and Sealant F6AZ-19562-AA or equivalent meeting Ford specification WSE-M4G323-A6.**

   Apply sealant and install the left valve cover and a new gasket. Tighten the bolts to 14 Nm (10 lb-ft).

2. **NOTE: Use Silicone Gasket and Sealant F6AZ-19562-AA or equivalent meeting Ford specification WSE-M4G323-A6.**

   Apply sealant and install the right valve cover and a new gasket. Tighten the bolts to 14 Nm (10 lb-ft).

3. Route the left side spark plug wires and connect the wires to the locators on the valve cover and to the spark plugs.

4. **NOTE: Tighten the bolts in sequence in two steps.**

   Remove the tape from the lower intake manifold and install a new gasket. Install upper intake manifold, and the three bolts and the three stud bolts. Tighten the bolts in two steps. Tighten to 20 Nm (14 (lb-ft) then tighten to 25 Nm (18 lb-ft). Route and connect the PCV valve and hose.

5. Connect the brake booster vacuum, EGR valve and the engine vacuum harness to the upper intake manifold.

6. Install the coil and bracket assembly to the upper intake manifold. Install the coil bracket brace to the bracket and exhaust manifold. Tighten the retainers to 18 Nm (13 lb-ft).

7. Connect the wiring connectors to the coil connector, radio noise suppressor, EVR vacuum and electrical connectors, left side spark plug wires to the coil and right side spark plug wires to the spark plugs.

8. Connect the right side valve cover harness locators. Connect the heater control vacuum hose source to the engine vacuum harness. Connect the IAT harness locator to the generator bracket.

9. Install the EGR valve tube. Tighten the tube nut to 20 Nm (15 lb-ft). Tighten the bolt to 16 Nm (11 lb-ft). Connect the DPFE vacuum hoses and electrical connector.

10. Connect the throttle cable (09A758A) and speed control cable (9A825) to the throttle body and locator. Install the bracket with cables attached to the throttle body. Tighten the bolts to 10 Nm (89 lb-in).

11. Connect the canister purge hose to the valve and the locator to the accelerator control bracket. Install the accelerator control splash shield.

12. Connect the wiring connectors to the TPS and IAC and the 42-pin connector to the bracket at the rear of the intake manifold.

13. Install the outlet tube and tighten the clamps securely. Connect the crankcase ventilation hose to the air cleaner outlet tube. Connect the wiring connectors to the MAF sensor, IAT sensor, and the harness locator to the outlet tube.

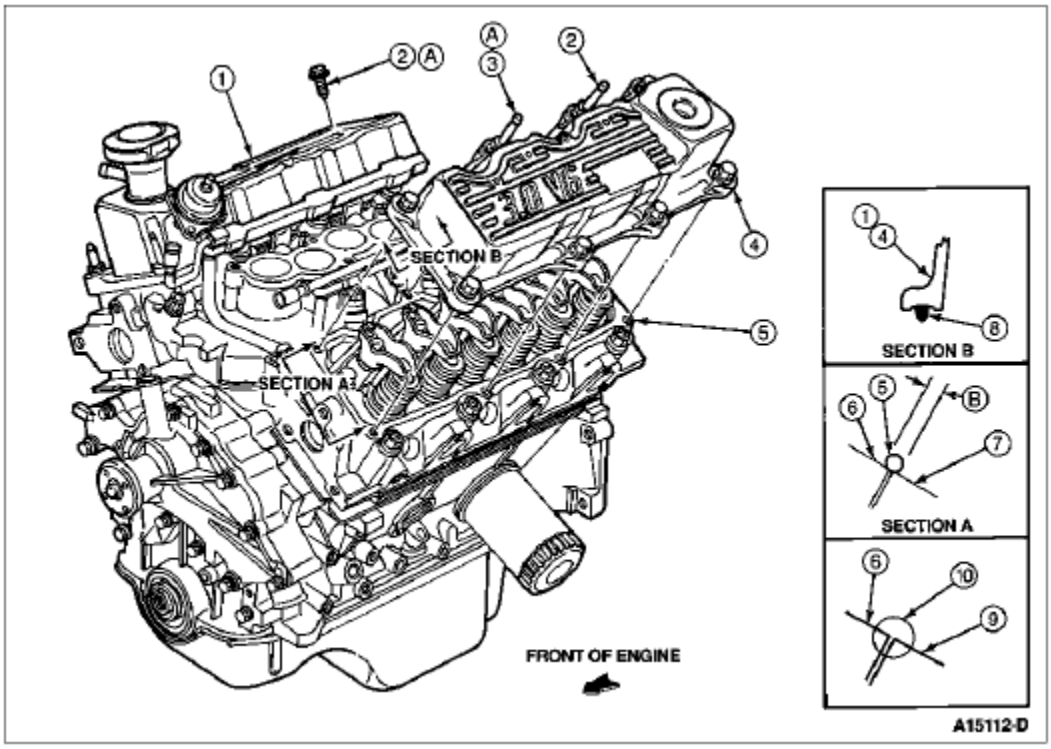
14. **NOTE: When the battery has been disconnected and reconnected, some abnormal drive symptoms may occur while the powertrain control module (PCM) (12A650) relearns its**

tomsn048@gmail.com

adaptive strategy. The vehicle may need to be driven 16 km (10 miles) or more to relearn the strategy.

Connect battery ground cable .

Valve Cover Installation, Ranger



Item	Part Number	Description
1	6582	Valve Cover (RH)
2	N803298-S	Screw and Washer
3	N803262-S	Stud
4	6582	Valve Cover (LH)
5	ESE-M4G195-B	Sealer
6	9424	Intake Manifold
7	6049	Cylinder Head
8	6584	Valve Cover Gasket
9	6049	Cylinder Head
10	—	Intersection of Head and Intake Manifold Must Be Flush to Within ± 1mm (0.04 In.). Gasket Must Not Protrude Above Highest Surface.
A	—	Tighten to 10-14 Nm

tomsn048@gmail.com

		(7-10 Lb-Ft)
B	—	4-6mm (.15-.23 In.)

tomsn048@gmail.com

Rocker Arm

Refer to Valve Tappet, Hydraulic In-Vehicle Service for removal and installation of the rocker arms. Perform only the steps necessary to remove the rocker arms.

tomsn048@gmail.com

Valve Tappet, Hydraulic

NOTE: Before replacing a tappet for noisy operation, make sure the noise is not caused by improper valve-to-rocker arm clearance or by worn rocker arms or push rods. Refer to Section 03-00 .

Removal

1. **NOTE: On 3.0L Aerostar it is necessary to remove the engine (6007) from the vehicle to perform this procedure. Refer to Engine Assembly, Aerostar , Removal and Installation, in this section.**

   Disconnect ground cable at battery and set aside.

2. Drain engine cooling system.

3. Remove PCV closure hose from valve cover (6582) and air cleaner outlet tube.

4. Remove air cleaner outlet tube from throttle body (9E926) and engine air cleaner (ACL) (9600).

5. **WARNING: COVER THE VALVE WITH A SHOP RAG TO PREVENT ACCIDENTAL FUEL SPRAY INTO THE EYES.**

   Carefully relieve fuel pressure at fuel supply manifold fuel pressure relief valve as outlined in Section 03-04B .

6. Remove fuel tube clips. Disconnect fuel lines as outlined in Section 03-04B .

7. Mark location of vacuum lines and remove.

8. Disconnect electrical connectors of:

   - Intake air temperature sensor (IAT sensor) (12A697)
   - Idle air control valve (IAC valve) (9F715)
   - Engine coolant temperature sensor (ECT sensor) (12A648)
   - Camshaft position sensor (12A112)
   - Ignition coil
   - Radio ignition interference capacitor (18801)
   - Water temperature indicator sender unit (10884)
   - EGR pressure sensor, if equipped
   - EGR vacuum regulator control, if equipped

9. Disconnect upper radiator hose from thermostat housing. After loosening hose clamp, use a twisting motion on hose to loosen from housing.

tomsn048@gmail.com

10. Remove ignition coil and bracket assembly (two nuts) from top of throttle body and pencil brace at exhaust manifold.

11. Remove throttle body, refer to Section 03-04B .

12. Disconnect fuel injector harness retaining standoffs from inboard rocker arm cover studs. Carefully disconnect electrical connections to each fuel injector and remove fuel charging wiring (9D930) from engine.

13. Disconnect heater water hoses at engine.

14. Remove spark plug wire set (12281) from spark plugs (12405) by using a twisting motion on the rubber boot. Remove harness retaining standoffs from rocker arm cover studs.

15. Remove valve covers as outlined in this section.

16. **NOTE: Intake manifold (9424) may be removed with fuel injection supply manifold (9F792) and fuel injectors in place.**

    Remove intake manifold retaining bolts using a Torx® head socket. Before attempting to remove intake manifold, break the seal between the manifold and cylinder blocks (6010). Wedge a large screwdriver or similar heavy-duty tool between the intake manifold and the cylinder blocks. Pry upward on the tool using the lug on top of the engine front cover (6019) as a leverage point. Removal of generator (GEN) (10300) may be required for this step. Use care to prevent damage to machined surfaces.

17. Loosen rocker arm bolt of the valve tappet (6500) to be replaced enough to allow the rocker arm (6564) to be lifted off the push rod (6565) and rotated to one side.

18. Remove push rods. If more than one is removed, identify each push rod's location. The push rods should be installed in their original location and position during reassembly.

19. Loosen roller tappet guide plate retainer bolts (2). Remove tappet guide plate retainer from tappet valley.

20. Remove valve tappet guide plate (6K512) from valve tappets by lifting straight up.

21. **NOTE: If the valve tappets are stuck in the bore(s) due to excessive varnish or gum deposits, it may be necessary to use a claw-type tool to aid removal. Work the valve tappet in and out of the lifter bore to loosen it from the deposits.**

    To remove, grasp valve tappet and pull in line with bore.

Installation

NOTE: Lightly oil all bolt and stud threads before installation.

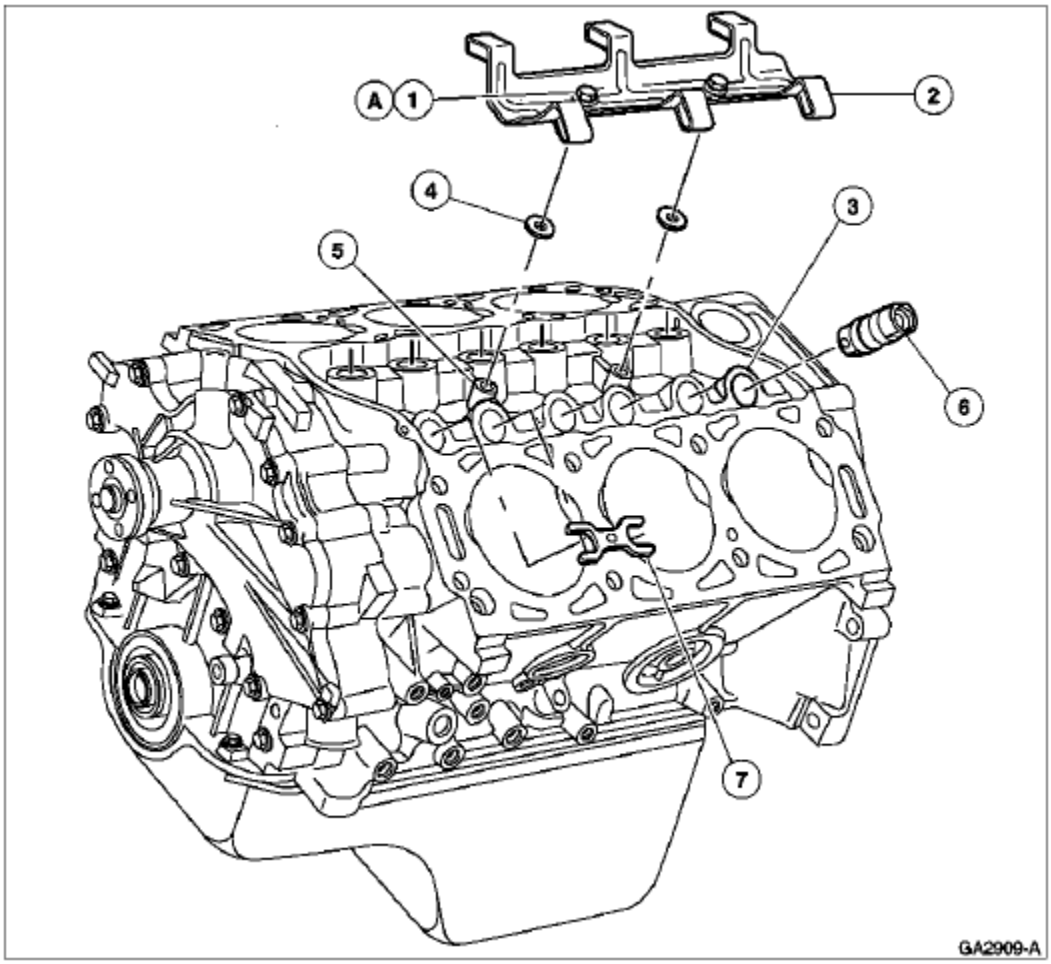
1. **CAUTION: Aluminum components gouge easily, which may result in gasket leaks. Always use care when scraping aluminum gasket surfaces.**

   Clean mating gasket surfaces of intake manifold and cylinder head (6049). Lay a clean cloth or shop rag in the tappet valley to catch any gasket material. After scraping, carefully lift cloth from tappet

tomsn048@gmail.com

valley preventing any particles to enter oil drain holes or cylinder head. Use a suitable solvent to remove old rubber sealant.

2. Lubricate valve tappets and bore with Engine Assembly Lubricant D9AZ-19579-D or equivalent meeting Ford specification ESR-M99C80-A.



Item	Part Number	Description
1	—	Bolt (Part of 6K564)
2	6K564	Tappet Guide Plate and Retainer
3	—	Cylinder Block Assembly Tappet Bore (Part of 6010)
4	—	Washer (Part of 6K564)
5	—	Cylinder Block Assembly Guide Plate Retainer (Part of 6010)
6	6500	Valve Tappet
7	6K512	Valve Tappet Guide Plate
A	—	Tighten to 10-14 Nm (7-10 Lb-Ft)

tomsn048@gmail.com

3. Install valve tappet into bore.

4. **NOTE: Install plate with the word "UP" and button visible.**

   Align valve tappet flats. Install valve tappet guide plate.

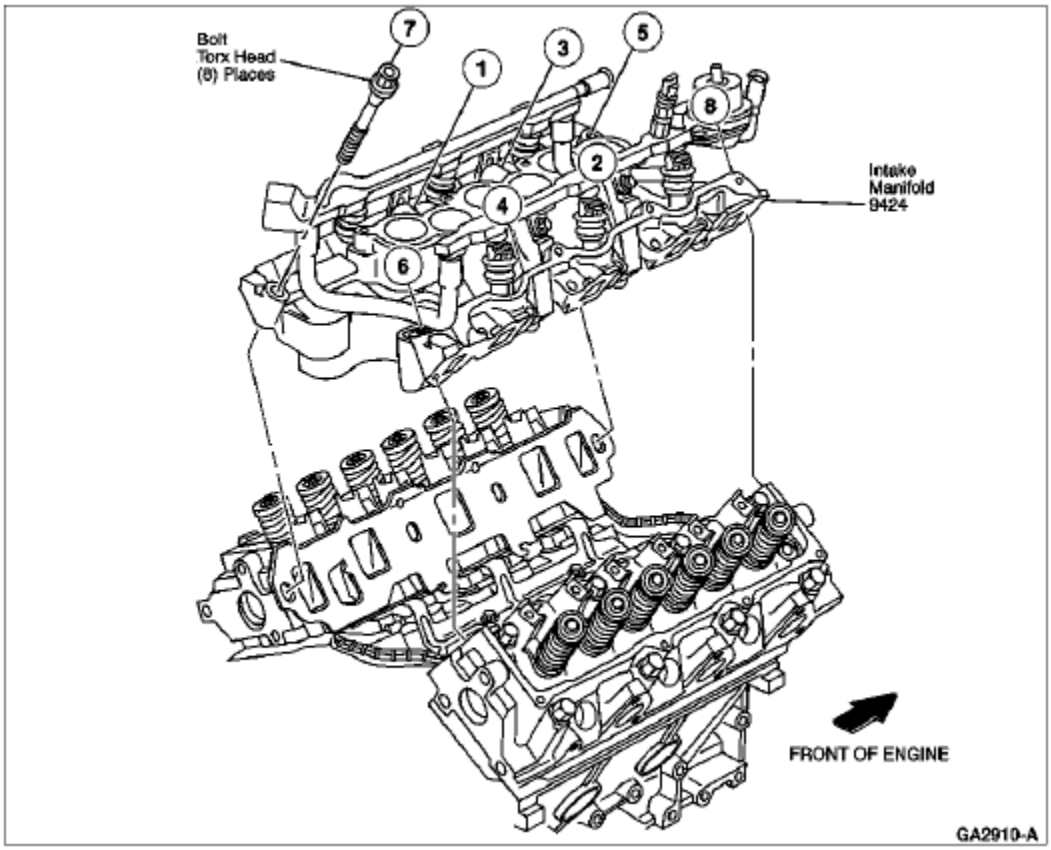
5. Install tappet guide plate retainer over valve tappet guide plates. Retainer orientation is not important. Hand-start two retaining bolts. Tighten bolts to 10-14 Nm (7-10 lb-ft).

6. Apply a 5-6mm drop of Silicone Rubber D6AZ-19562-AA or -BA or equivalent meeting Ford specification ESB-M4G92-A or ESE-M4G195-A to intersection of cylinder block and cylinder head assembly at four corners as shown in the illustration under Intake Manifold in this section.

7. Position intake manifold gaskets (9439) onto cylinder heads. Align the intake gasket locking tabs to the provisions on the cylinder head gaskets as shown in the illustration.

8. Install front and rear intake manifold seals as shown in the illustration under Intake Manifold in this section. Secure with retaining features.

9. Lower intake manifold into position aligning manifold bolt holes to those in the cylinder head. Use care to prevent disturbing the rubber sealer which can cause sealing voids. Install bolts 1, 2, 3 and 4 and hand-snug. Install remaining bolts and tighten in a two-step process. Tighten in numerical sequence to 15 Nm (11 lb-ft), then again to 26-32 Nm (19-24 lb-ft).



10. **NOTE: Rocker arm must be fully seated into cylinder head and push rod must be fully seated in rocker arm and lifter sockets prior to final-tightening.**

tomsn048@gmail.com

Apply ESE-M2C39-F oil to removed push rods and rocker arms. Install push rods. Move rocker arms into position with push rod and snug rocker arm bolts. Rotate crankshaft (6303) to position camshaft lobe(s) straight down and away from push rods. Tighten rocker arm bolt to 11 Nm (8 lb-ft) to seat rocker arm into cylinder head. Final-tighten bolt to 26-38 Nm (19-28 lb-ft).

11. Install valve covers as outlined in this section.

12. Install fuel charging wiring to each fuel injector. Secure with standoffs to inboard rocker arm cover studs.

13. Install throttle body assembly and new intake manifold upper gasket (9H486) as outlined in Section 03-04B . Install ignition coil and bracket assembly (Ranger only). Tighten retaining nuts to 16-20 Nm (12-15 lb-ft).

14. Install spark plug wire set and bracket RH and/or spark plug wire set LH. Install wire harness standoffs to rocker arm cover studs and connect wires to spark plugs and ignition coil.

15. Install fuel lines to fuel injection supply manifold as outlined in Section 03-04B .

16. Install fuel tube clips.

17. Install upper radiator hose and heater water hoses. Tighten hose clamps securely.

18. Connect vacuum lines to premarked locations.

19. Connect electrical connections of:

    - Intake air temperature sensor
    - Idle air control valve (IAC valve)
    - Engine coolant temperature sensor
    - Distributor
    - Ignition coil
    - Radio ignition interference capacitor
    - Water temperature indicator sender unit
    - EGR pressure sensor, if equipped
    - EGR vacuum regulator control, if equipped

    Refer to Section 18-01 for further information.

20. **NOTE: Engine coolant is corrosive to all engine bearing material. Replacing oil after removal of a coolant carrying component prevents failure later.**

    Fill and bleed cooling system with specified coolant and proper mixture.

21. Replace crankcase oil and filter.

22. Install air cleaner outlet tube to throttle body and engine air cleaner. Tighten retaining clamps to 1.9 Nm (17 lb-in).

23. Install PCV closure hose to valve cover and air cleaner outlet tube.

24. **NOTE: When the battery has been disconnected and reconnected, some abnormal drive symptoms may occur while the powertrain control module (PCM) (12A650) relearns its adaptive strategy. The vehicle may need to be driven 16 km (10 miles) or more to relearn the**

tomsn048@gmail.com

strategy.

Connect ground cable at battery.

25. Start engine and check for coolant, oil fuel and vacuum leaks.

26. Verify and correct default base initial engine timing to 10 degrees BTDC. Refer to the Powertrain Control/Emissions Diagnosis Manual.

---

tomsn048@gmail.com

Intake Manifold

Upper

Refer to Section 03-04B for throttle body removal and installation procedures.

Lower

Removal

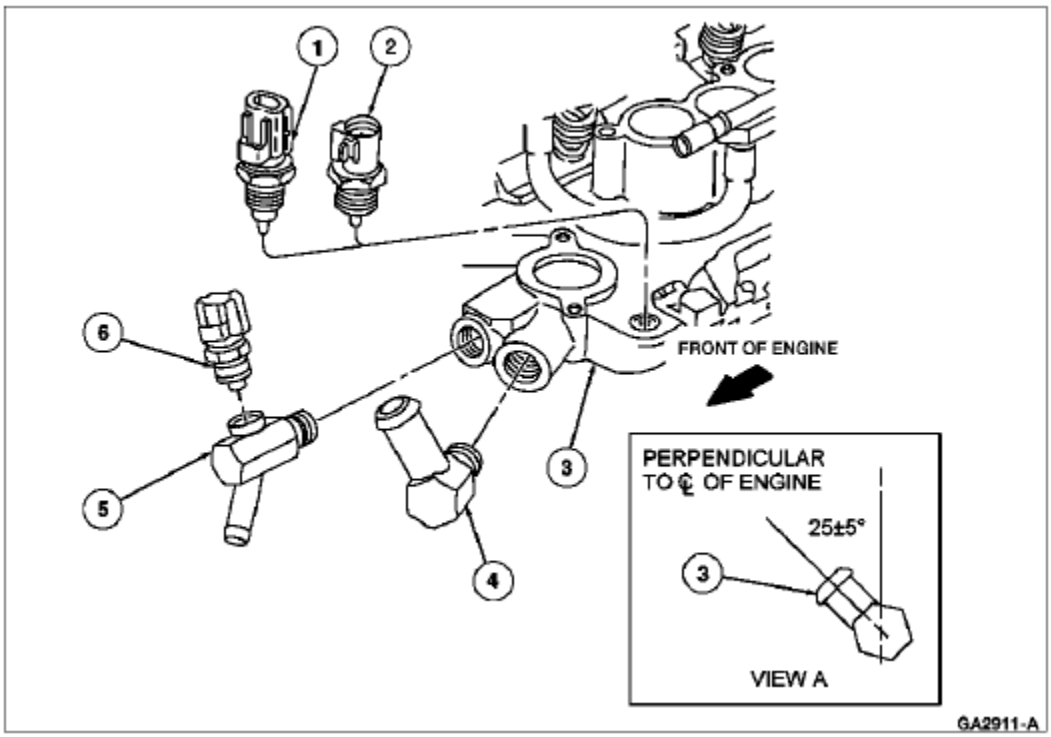
1. Disconnect ground cable at battery and set aside.
2. Drain engine cooling system.
3. Remove PCV closure hose from valve cover (6582) and air cleaner outlet tube.
4. Remove air cleaner outlet tube from throttle body (9E926) and engine air cleaner (ACL) (9600).
5. **CAUTION: Cover the fuel pressure relief valve with a shop rag to prevent accidental fuel spray into the eyes.**

   Carefully relieve fuel pressure at fuel pressure relief valve as outlined in Section 03-04B .
6. Remove fuel tube clips. Disconnect fuel supply and return lines as outlined in Section 03-04B .
7. Mark location of vacuum lines and remove.
8. Disconnect electrical connectors of:

   - Intake air temperature sensor (IAT sensor) (12A697)
   - Idle air control valve (IAC valve) (9F715)
   - Engine coolant temperature sensor (ECT sensor) (12A648)
   - Camshaft position sensor (12A112)
   - Ignition coil
   - Radio ignition interference capacitor (18801)
   - Water temperature indicator sender unit (10884)
   - EGR pressure sensor, if equipped
   - EGR vacuum regulator control, if equipped

   Refer to Section 18-01 for further information.

tomsn048@gmail.com



Item	Part Number	Description
1	12A648	Engine Coolant Temperature Sensor(Ranger)
2	124648	Engine Coolant Temperature Sensor (Aerostar)
3	9424	Intake Manifold
4	806344	Heater Elbow
5	18599	Hot Water Heater Elbow Connection
6	10884	Water Temperature Indicator Sender Unit
A	—	Tighten to 16-24 Nm (12-17 Lb-Ft)

9. Disconnect upper radiator hose from thermostat housing connection. After loosening hose clamp, use a twisting motion on hose to loosen from housing.

10. Remove ignition coil and bracket assembly (two nuts) from top of throttle body and pencil brace at exhaust manifold.

11. Remove throttle body as outlined in Section 03-04B .

12. Disconnect fuel charging wiring retaining standoffs from inboard rocker arm cover studs. Carefully disconnect electrical connections to each fuel injector and remove harness from engine.

13. Disconnect heater water hoses.

14. Remove spark plug wire set (12281) from spark plugs (12405) by using a twisting motion on the rubber boot. Remove harness retaining standoffs from rocker arm cover studs.

15. Remove valve covers as outlined in this section.

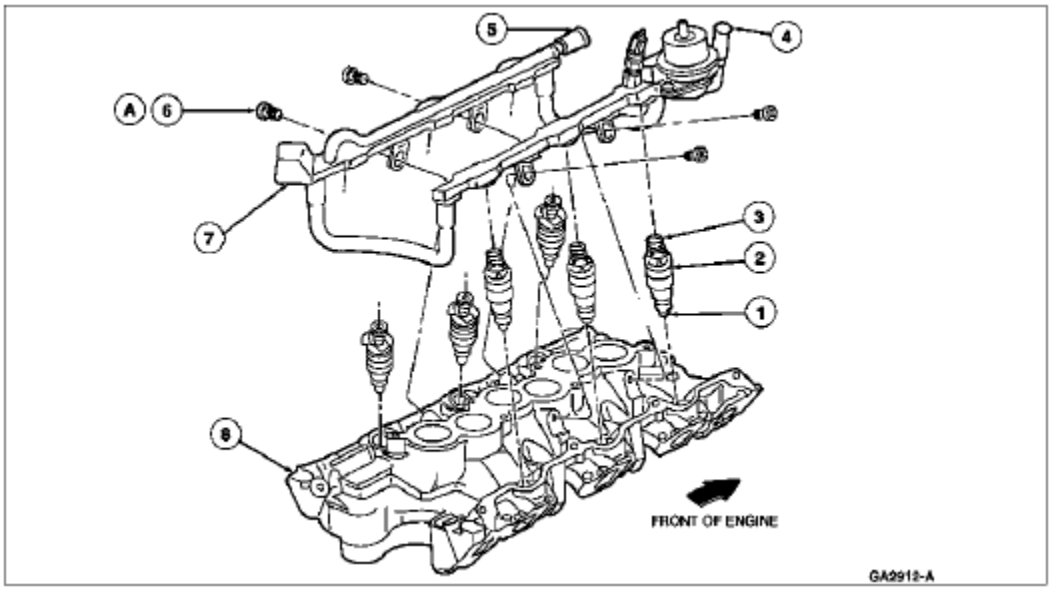
tomsn048@gmail.com

16. Loosen cylinder No. 3 intake valve rocker arm bolt and rotate rocker arm (6564) off push rod (6565) and away from top of valve stem. Remove push rod.

NOTE: Intake manifold (9424) may be removed with fuel injector and fuel injection supply manifolds (9F792) in place.

17. Remove intake manifold retaining bolts using a Torx® head socket. Before attempting to remove intake manifold, break the seal between the intake manifold and cylinder blocks (6010). Wedge a large screwdriver or similar heavy-duty tool between the manifold and the block. Pry upward on the tool using the lug on top of the front cover as a leverage point. Removal of generator (GEN) (10300) may be required for this step. Use care to prevent damage to machined surfaces.

Fuel Rail and Injectors to Intake Manifold, Installation



Item	Part Number	Description
1	—	Outlet End (Part of 9F593)
2	9F593	Fuel Injector
3	—	Inlet End (Part of 9F593)
4	—	Black Shipping Cap (Part of 9F593)
5	—	Green Shipping Cap (Part of 9F593)
6	N802353-S100	Bolt
7	9F792	Fuel Injection Supply Manifold
8	9424	Intake Manifold
A	—	Tighten to 8-12 Nm (71-106 Lb-In)

tomsn048@gmail.com

Installation

NOTE: Lightly oil all retaining bolt and stud threads before installation.

CAUTION: Aluminum components gouge easily which may cause gasket to leak. Always use care when scraping aluminum gasket surfaces.

1. Clean mating gasket surfaces of intake manifold and cylinder blocks. Lay a clean cloth or shop rag in the tappet valley to catch any gasket material. After scraping, carefully lift cloth from tappet valley preventing any particles from entering oil drain holes or cylinder head. Use a suitable solvent to remove old rubber sealant.

2. If installing new intake manifold, transfer:

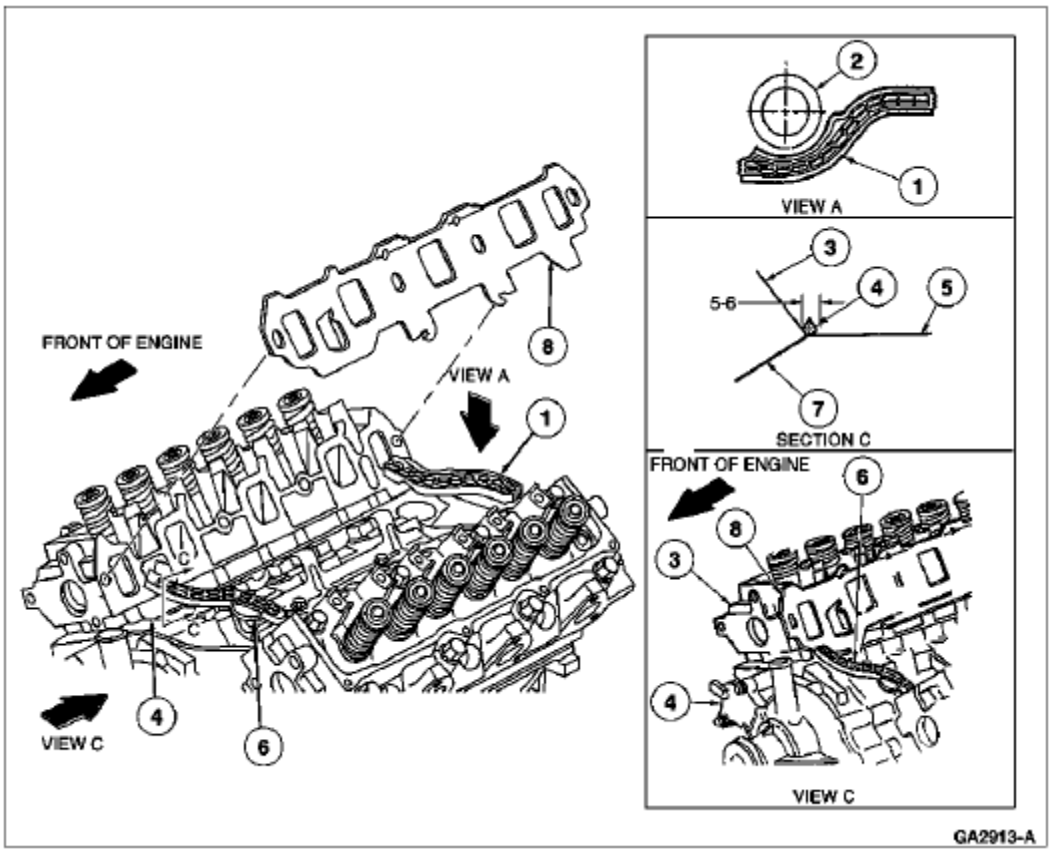
    - Fuel injectors
    - Fuel injection supply manifold
    - Engine coolant temperature sensor
    - Water thermostat (8575)
    - Water thermostat housing
    - Hot water heater elbow connection (18599) by-pass fitting (18599).
    - Coolant temperature sending unit

3. Apply a 5-6mm drop of Silicone Rubber D6AZ-19562-AA or -BA or equivalent meeting Ford specification ESB-M4G92-A or ESE-M4G195-A to intersection of cylinder blocks and cylinder head (6049) at four corners as shown in the illustration.

4. Position intake manifold gaskets (9439) onto cylinder heads. Align the intake gasket locking tabs to the provisions on the cylinder head gaskets as shown in the illustration.

Intake Manifold Gasket, Installation

tomsn048@gmail.com



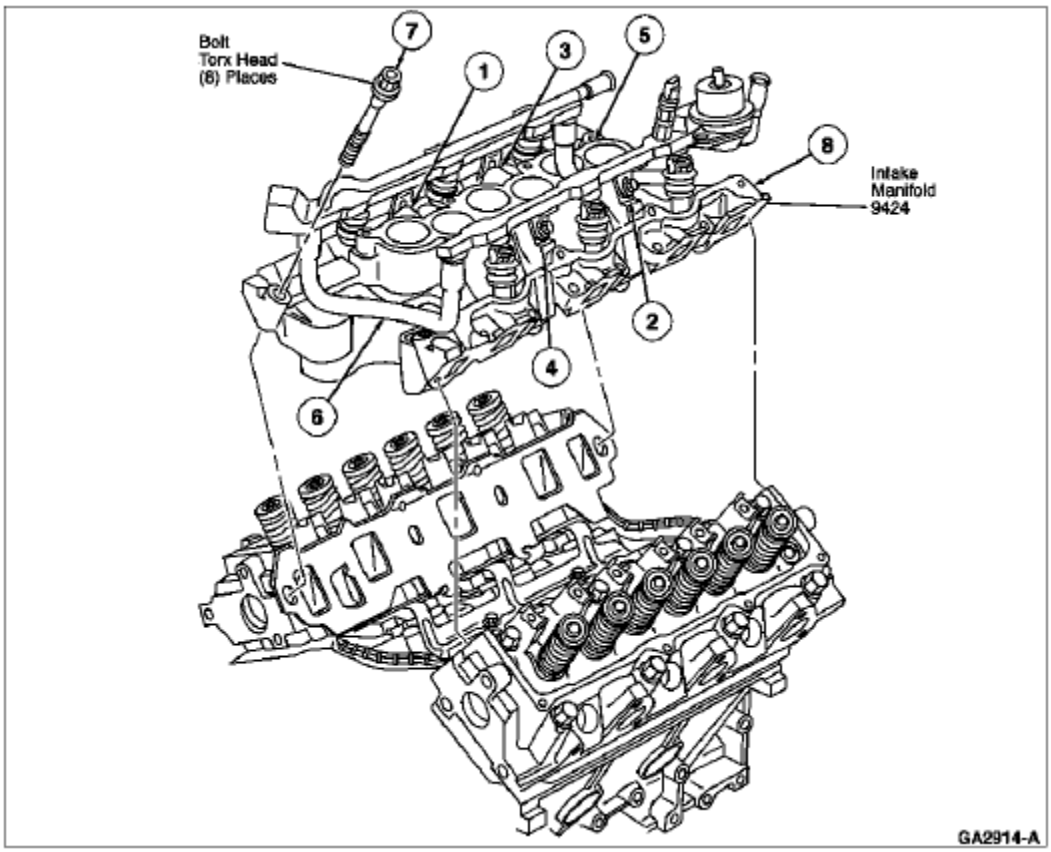
Item	Part Number	Description
1	9A424	Seal, Intake Manifold, Rear
2	—	Distributor Hole (Part of Cylinder Block)
3	6049	Cylinder Head
4	ESE-M4G195-B	Sealer (4 places)
5	6010	Cylinder Blocks
6	9A424	Seal, Intake Manifold, Front
7	6051	Head Gasket
8	9439	Intake Manifold Gasket

5. Install front and rear intake manifold seals as shown in the illustration. Secure with retaining features.

6. Lower intake manifold into position aligning manifold bolt holes to those in the cylinder head. Use care to prevent disturbing the rubber sealer which can cause sealing voids. Install bolts 1, 2, 3 and 4 and hand-snug. Install remaining bolts and tighten in a two-step process. Tighten in numerical sequence to 15 Nm (11 lb-ft), then again to 26-32 Nm (19-24 lb-ft).

Intake Manifold Bolt Torquing Sequence

tomsn048@gmail.com



7. **CAUTION: If a new distributor or camshaft position sensor is installed, be sure to add the rest of the pint of Engine Assembly Lubricant D9AZ-19579-D or equivalent meeting Ford specification ESR-M99C80-A to the engine oil by pouring it through the distributor hole onto the cam drive gear. Run engine at idle for five minutes before driving vehicle.**

   Dip entire distributor or camshaft position sensor drive gear in Engine Assembly Lubricant D9AZ-19579-D or equivalent meeting Ford specification ESR-M99C80-A.

8. **NOTE: Rocker arm fulcrum must be fully seated into cylinder head and push rod must be fully seated in rocker arm and lifter sockets prior to final tightening.**

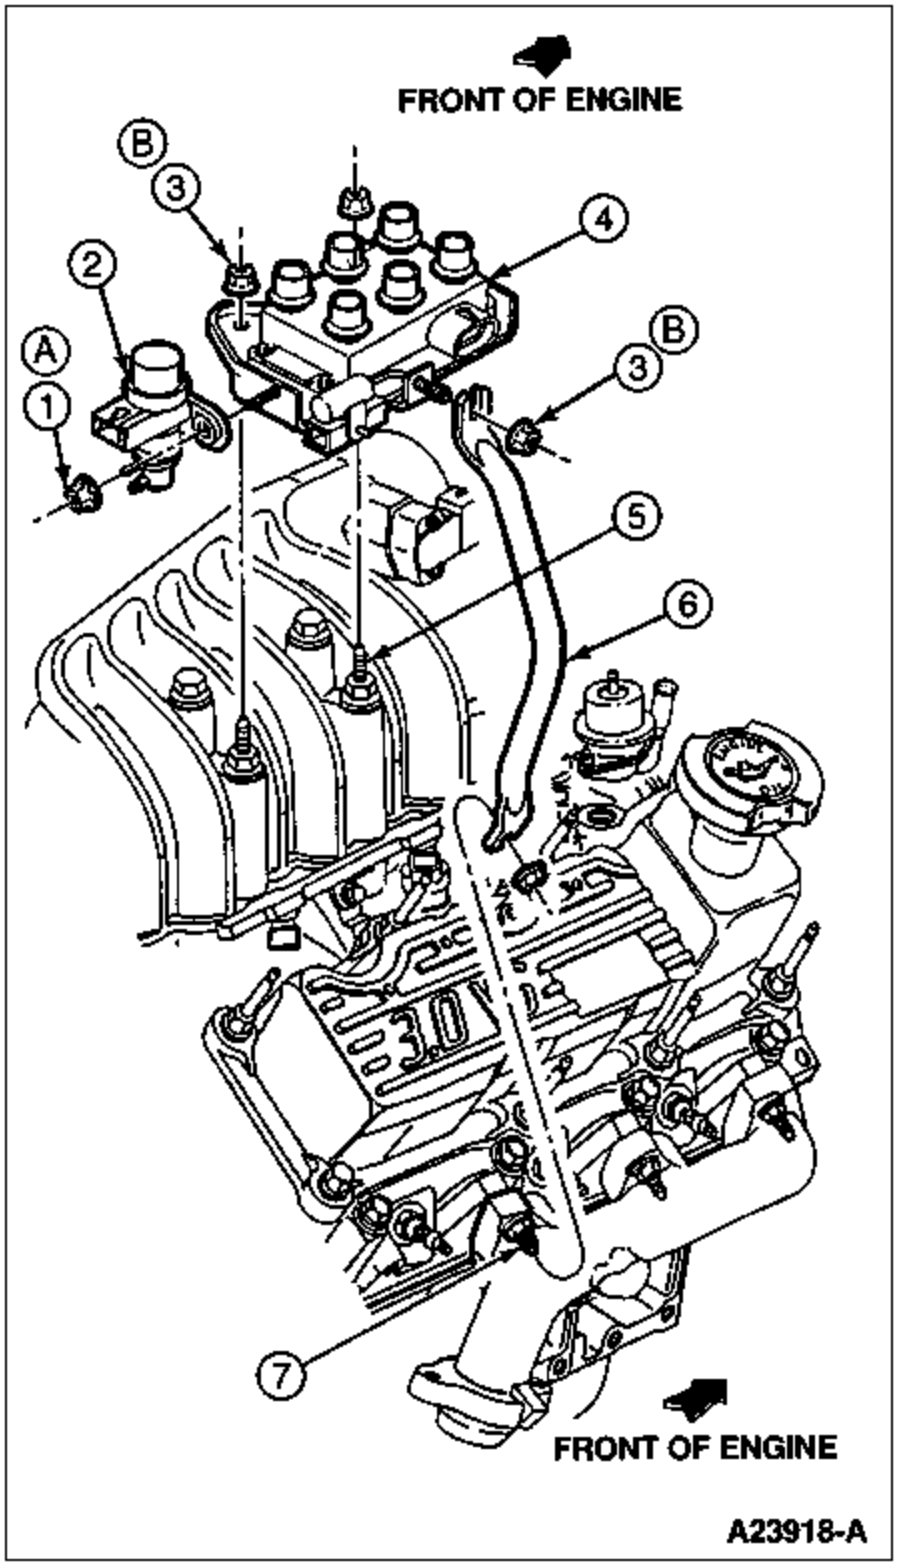
   Apply Engine Assembly Lubricant D9AZ-19579-D or equivalent meeting Ford specification ESR-M99C80-A to cylinder No. 3 intake valve push rod and rocker arm. Install push rod. Move rocker arm into position with push rod and snug rocker arm bolt. Rotate crankshaft (6303) to position camshaft lobe straight down and away from valve tappet (6500). Tighten retaining bolt to 11 Nm (8 lb-ft) to seat rocker arm fulcrum into cylinder head. Final-tighten bolt to 26-38 Nm (19-28 lb-ft) in any position.

9. Install valve covers as outlined in this section.

10. Install fuel charging wiring (9D930) to each fuel injector. Secure with standoffs to inboard rocker arm cover studs.

Ignition Coil Installation

tomsn048@gmail.com



Item	Part Number	Description
1	—	Nut (Part of 12A310)
2	9J472	EGR Vacuum Regulator Bracket

tomsn048@gmail.com

3	—	Nut (Part of 12A310)
4	12A310	Ignition Coil and Bracket Assembly
5	—	Stud (Part of 9E926)
6	12N004	Ignition Coil Mounting Bracket
7	—	Exhaust Manifold Stud (Part of 9430)
A	—	Tighten to 8-12 Nm (6-9 Lb-Ft)
B	—	Tighten to 16-20 Nm (12-15 Lb-Ft)

11. Installthrottle body and newintake manifold gasketas outlined in Section 03-04B . Install coil and bracket assembly (Ranger only). Tighten retaining nuts to 16-20 Nm (12-15 lb-ft).

12. Install wire harness standoffs to rocker arm cover studs and connect wires to spark plug and ignition coil.

13. Install fuel supply and return lines to fuel injection supply manifold as outlined in Section 03-04B .

14. Install fuel tube clips.

15. Install upper radiator hose and heater water hoses. Tighten hose clamps securely.

16. Connect vacuum lines to premarked locations.

17. Connect electrical connections of:

    - Radio ignition interference capacitor
    - Idle air control valve
    - Engine coolant temperature sensor
    - Distributor
    - Ignition coil
    - Radio ignition interference capacitor
    - Water temperature indicator sender unit
    - EGR pressure sensor, if equipped
    - EGR vacuum regulator control, if equipped

    Refer to Section 18-01 for further information.

18. **NOTE: Engine coolant is corrosive to all engine bearing material. Replacing oil after removal of a coolant carrying component prevents failure later.**

    Fill and bleed cooling system with specified coolant and proper mixture.

19. Replace crankcase oil and oil filter.

20. Install air cleaner outlet tube to throttle body and MAF sensor (12B579). Tighten retaining clamps to 1.9 Nm (17 lb-in).

21. Install closure hose to valve cover and air cleaner outlet tube.

tomsn048@gmail.com

22. **NOTE: When the battery has been disconnected and reconnected, some abnormal drive symptoms may occur while the powertrain control module (PCM) (12A650) relearns its adaptive strategy. The vehicle may need to be driven 16 km (10 miles) or more to relearn the strategy.**

    Connect ground cable at battery.

23. Start engine (6007) and check for coolant, oil, fuel and vacuum leaks.

24. Verify and correct default base initial engine timing to 10 degrees BTDC. Refer to the Powertrain Control/Emissions Diagnosis Manual. Tighten retaining bolt to 19-30 Nm (14-22 lb-ft).

---

tomsn048@gmail.com

Cylinder Head(s)

Removal

1. **NOTE: On 3.0L Aerostar it is necessary to remove the engine (6007) from the vehicle to perform this procedure. Refer to Engine Assembly, Aerostar , Removal and Installation, in this section.**

   Disconnect ground cable at battery and set aside.

2. Drain cooling system. Refer to Section 03-03 .

3. Remove:

   - Engine air cleaner outlet tube
   - Engine air cleaner
   - PCV closure hose

4. Remove throttle body (9E926) as outlined in Section 03-04B .

5. Remove engine oil filler adapter (Aerostar only).

6. Disconnect fuel lines as outlined in Section 03-04B .

7. Mark vacuum line location and remove lines.

8. Disconnect upper radiator hose and heater water hoses and move out of the way.

9. Disconnect spark plug wires from spark plugs with a turning motion and remove spark plug wire separators from valve cover retaining pins.

10. Remove ignition coil and bracket from top of throttle body and pencil at exhaust manifold.

11. Remove spark plugs (12405) and bring number one piston to top dead center of the compression stroke.

12. Remove intake manifold (9424) as outlined.

13. Remove engine accessory drive belt (8620).

14. On Ranger only:

    a. Recover refrigerant from A/C system. Refer to Section 12-00 .
    b. Disconnect liquid line at condenser and suction hose from accumulator.
    c. Plug or cap all openings in the air conditioning system to keep dirt, foreign material and excess moisture out of the system.
    d. Remove 4 bolts securing A/C compressor to power steering pump support bracket and remove A/C compressor and hoses assembly from vehicle.

tomsn048@gmail.com

15. If left cylinder head is being removed, perform the following:

    a. Remove fuel line retaining bracket from stud bolt on left side of power steering pump support bracket and remove stud bolt.
    b. Loosen lower bolt on left side of power steering pump support bracket two or three turns, but DO NOT REMOVE.
    c. Remove three bolts securing power steering pump support bracket to front of left cylinder head and carefully allow power steering pump and bracket to tilt forward.
    d. Remove engine oil level indicator tube attaching nut from exhaust manifold stud. Remove oil level indicator tube from exhaust manifold.

16. If right cylinder head (6049) is being removed, perform the following:

    a. Disconnect wiring from generator.
    b. Remove three generator bracket and adjusting arm retaining bolts. Remove generator/bracket assembly from vehicle.

17. Remove exhaust inlet pipe or pipes and exhaust manifolds (9430) and exhaust manifold.

18. Loosen rocker arm bolts and remove rocker arm assemblies. Identify the location of each assembly. The rocker arm assemblies must be installed in their original location during reassembly.

19. Remove push rods (6565). Identify the position of each rod. The push rods should be installed in their original position during reassembly.

20. Remove cylinder head retaining bolts.

21. Remove cylinder heads.

22. Remove head gaskets (6051) and discard.

Installation

NOTE: Lightly oil all bolt and threads before installation. Always use new bolts when installing a cylinder head.

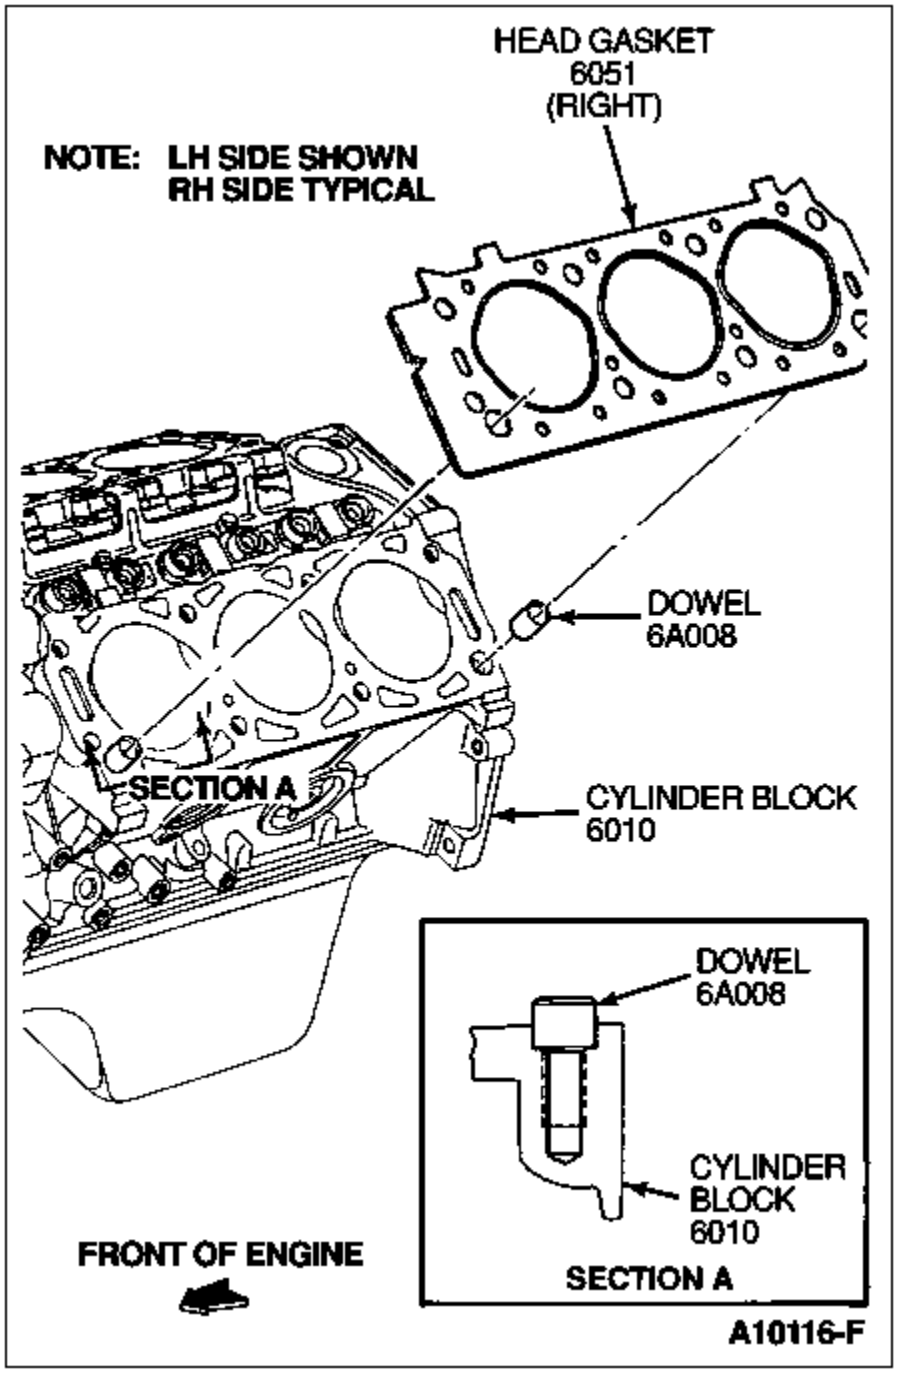
1. **CAUTION: Aluminum components gouge easily. Gouges in aluminum components will cause gaskets to leak.**

   Lay a clean shop rag in lifter valley to catch any gasket particles. Clean cylinder head, intake manifold and cylinder head to block gasket surfaces. After scraping, lift cloth so no gasket material falls into lifter valley. If the cylinder head was removed for a head gasket replacement, check the flatness of the cylinder head and block gasket surfaces. Refer to Section 03-00 .

2. **NOTE: Replace alignment dowels if damaged.**

   Position head gaskets on cylinder blocks (6010) using the dowels for alignment. Make sure gasket is aligned as shown in the illustration.

tomsn048@gmail.com



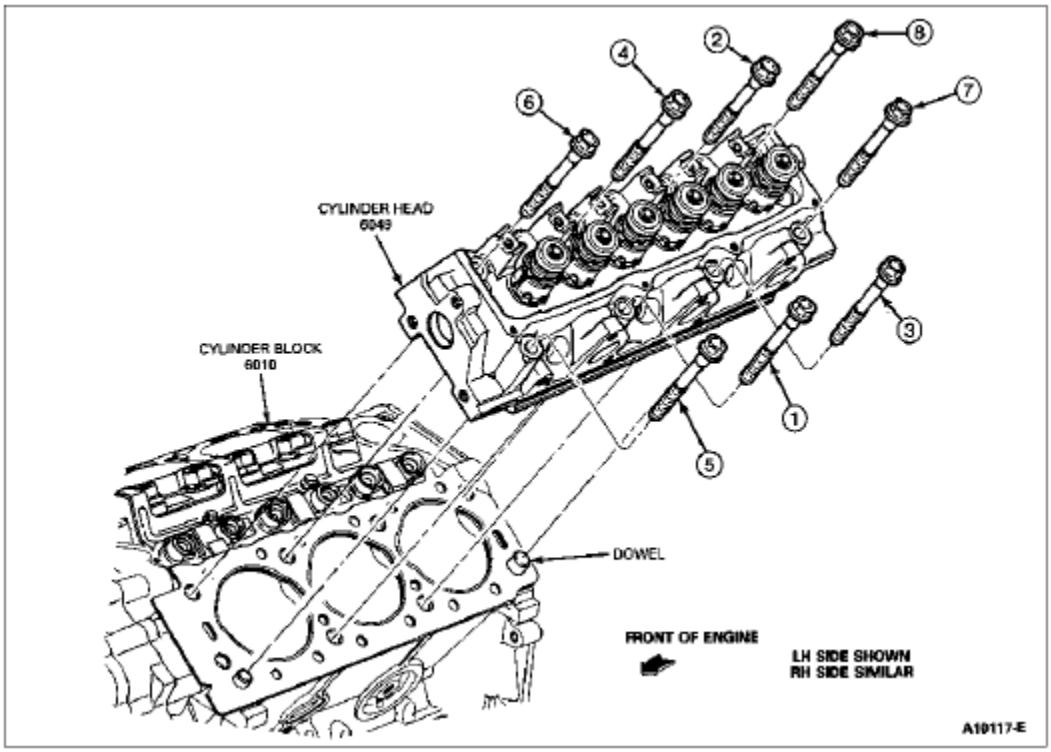
3. Carefully position cylinder heads on cylinder blocks.
4. Install new cylinder head retaining bolts and hand tighten.
5. Tighten retaining bolts in sequence as illustrated to 80 Nm (59 lb-ft).
6. Back off all bolts a minimum of one full turn (360 degrees).
7. **NOTE: When the cylinder head retaining bolts have been tightened using this procedure, it is not necessary to retighten the bolts after extended engine operation. However, the bolts can be checked for tightness if desired.**

tomsn048@gmail.com

Retighten the cylinder head retaining bolts in sequence in two tightening steps as follows:

- 45-55 Nm (33-41 lb-ft)
- 85-99 Nm (63-73 lb-ft)

Cylinder Head Assembly, Installation



8. Install intake manifold as outlined in this section.

9. Dip each push rod Engine Assembly Lubricant D9AZ-19579-D or equivalent meeting Ford specification ESR-M99C80-A heavy engine oil. Install push rods in their original positions and orientation.

10. Loosely install rocker arm assemblies in original locations. Apply Engine Assembly Lubricant D9AZ-19579-D or equivalent meeting Ford specification ESR-M99C80-A heavy engine oil. Tighten rocker arm fulcrum bolts to 10-12 Nm (8-10 lb/ft) while lifter is on base circle of corresponding cam lobe. Final tighten rocker arm fulcrum bolts to 26-38 Nm (20-28 lb/ft).

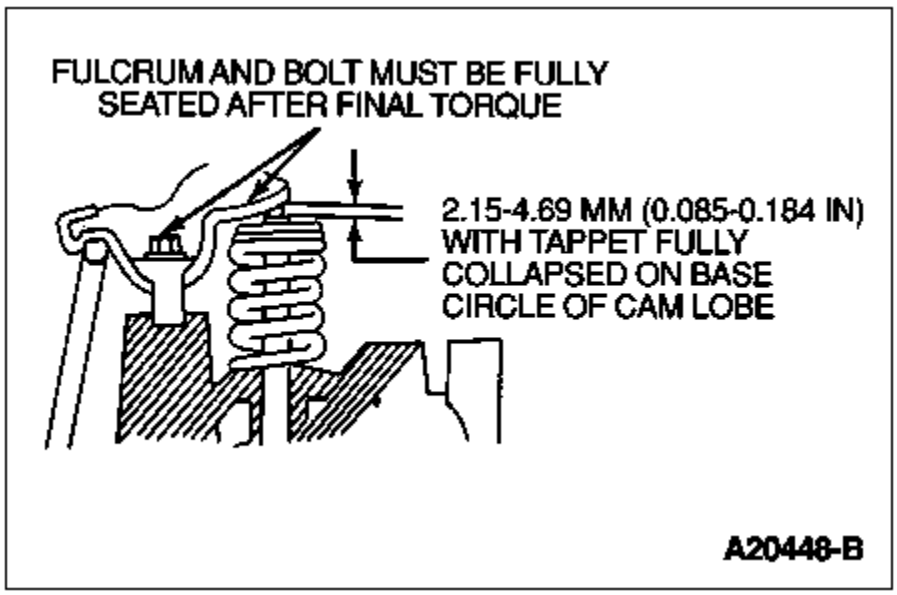
11. **CAUTION: Rocker arm fulcrum must be fully seated into cylinder head and push rods must be fully seated in lifter and rocker arm sockets during final tightening.**

    NOTE: With number one piston at top dead center (TDC) of the exhaust stroke, you can tighten intake rockers of cylinder numbers 1 and 4, and exhaust rockers of cylinder 2 and 5. With the crankshaft rotated so number one piston is 135 degs. after top dead center (ATDC) of the exhaust stroke, you can tighten intake rockers of cylinder numbers 2, 3, 5 and 6, and exhaust rockers of cylinder numbers 1, 3, 4 and 6.

    NOTE: If the original valve train components are being reused, a valve clearance check is not required.

tomsn048@gmail.com

You must check rocker arm to valve tip clearance if a cam, lifters, push rods, rocker arms, rocker arm fulcrums or valves are replaced, or valves are ground.

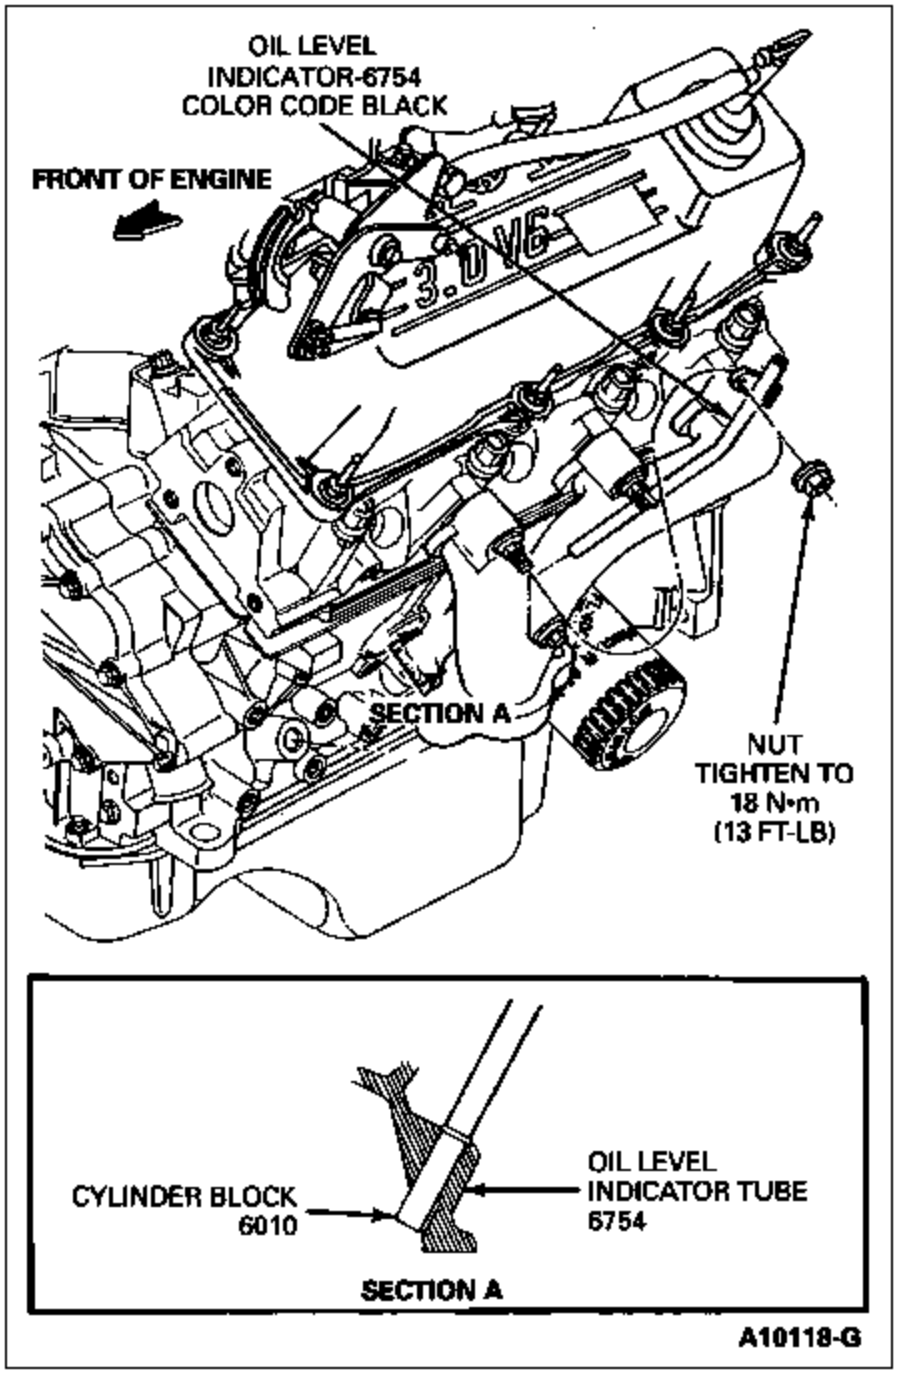


12. Install valve covers as outlined in this section.

13. Install exhaust manifolds as outlined in this section. Tighten retaining bolts to 20-30 Nm (15-22 lb/ft). Install inlet pipe retaining nuts, tighten to 39-42 Nm (30-32 lb/ft).

14. Apply Cup Plug Sealer meeting Ford specification ESE-M4621-A or equivalent to cylinder block. Install oil level indicator tube into cylinder block. Oil level indicator tube must bottom out as illustrated. Tighten oil level indicator tube retaining nut at exhaust manifold stud bolt to 16-20 Nm (12-14 lb/ft).

tomsn048@gmail.com



15. Install fuel charging wiring (9D930) to fuel injectors and inboard rocker arm cover studs. Connect fuel charging wiring to engine control sensor wiring (12A581) and secure with retaining features.

16. Install throttle body and new intake manifold gasket (9439) as outlined. Refer to Section 03-04B .

17. If left cylinder head was removed, perform the following:

    a. Install three bolts securing power steering pump support bracket to front of left cylinder head, finger tight only.
    b. Install stud bolt at left side of power steering pump support bracket. Tighten all five bolts securing power steering pump support bracket to engine block and cylinder head to 40-62 Nm

tomsn048@gmail.com

(30-46 lb/ft).
c. Install fuel line retaining bracket to stud bolt on left side of power steering pump support bracket and secure with nut. Tighten nut to 16-20 Nm (12-15 lb/ft).

18. If right cylinder head was removed, perform the following:

    a. Install generator (GEN) (10300) and generator bracket assembly. Tighten three retaining bolts to 48 Nm (35 lb-ft).
    b. Install generator brace and tighten nuts to 26-35 Nm (20-25 lb-ft).
    c. Connect generator voltage regulator wiring.

19. On Ranger only:

    a. Position A/C compressor and hose assembly on power steering pump support bracket. Install 4 bolts securing A/C compressor to power steering pump support bracket and tighten four fasteners to 21-29 Nm (15-21 lb/ft).
    b. Remove plugs and caps from all openings in the air conditioning system.
    c. Connect liquid line at condenser and suction hose to accumulator.
    d. Evacuate and recharge A/C system. Refer to Section 12-00 .

20. Install engine accessory drive belt.

21. Install ignition coil and bracket assembly to throttle body stud bolts and pencil brace at exhaust manifold. Tighten three nuts to 16-20 Nm (12-14 lb/ft).

22. Connect fuel lines to fuel injection supply manifold (9F792) as outlined in Section 03-04A . Install fuel tube clips.

23. Connect upper radiator hose and heater water hoses. Tighten hose clamps securely. Refer to Section 03-03 .

24. Connect vacuum lines to premarked locations.

25. Install engine oil filler adapter (Aerostar only).

26. **NOTE: Engine coolant is corrosive to all engine bearing material. Replacing engine oil after removal of a coolant-carrying component prevents failure later.**

    Drain and change engine oil.

27. Install air cleaner outlet tube to throttle body and engine air cleaner (ACL) (9600). Tighten clamps securely. Refer to Section 03-12 .

28. Install closure hose at air cleaner outlet tube and valve cover (6582).

29. **CAUTION: This engine has aluminum components and requires a special corrosion-inhibiting coolant formulation to avoid radiator damage. Refer to Section 03-03 for coolant specifications.**

    Fill and bleed cooling system.

30. **NOTE: When the battery has been disconnected and reconnected, some abnormal drive symptoms may occur while the powertrain control module (PCM) (12A650) relearns its adaptive strategy. The vehicle may need to be driven 16 km (10 miles) or more to relearn the strategy.**

tomsn048@gmail.com

Connect ground cable at battery.

31. Start engine and check for coolant, fuel, oil, vacuum and exhaust leaks.
32. Verify base ignition timing as outlined.
33. Check and, if necessary, adjust speed control linkage.

---

tomsn048@gmail.com

Crankshaft Pulley/Vibration Damper/Crankshaft Front Seal

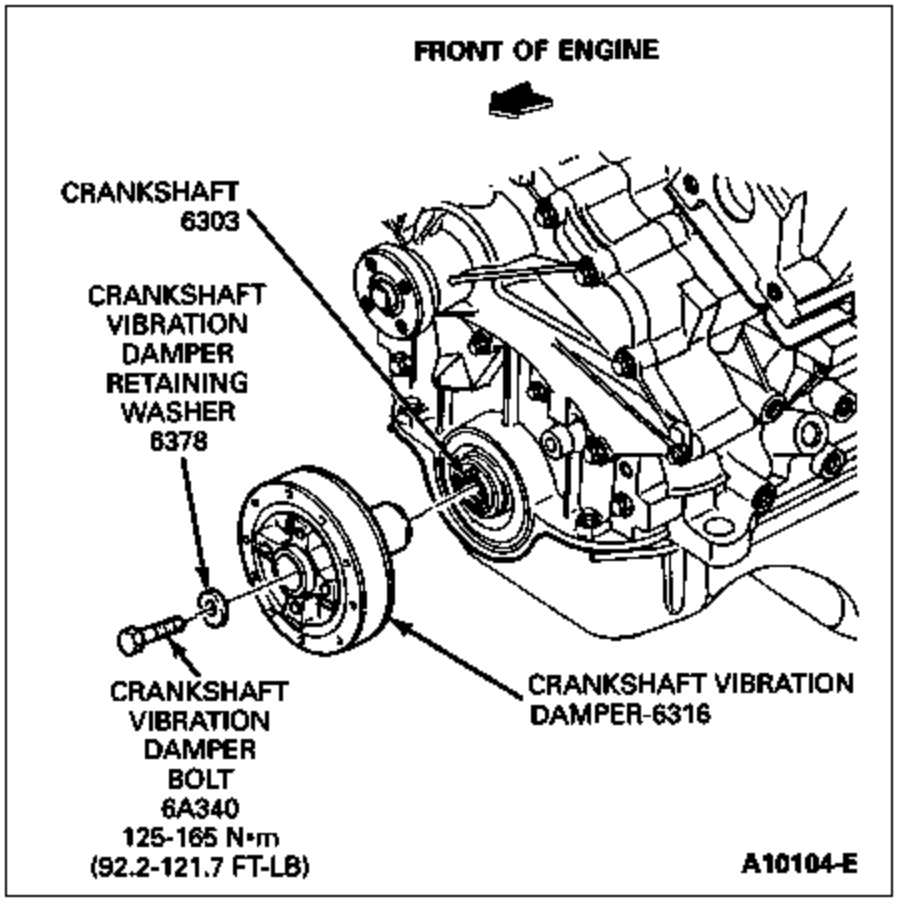
SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
Front Cover Seal Replacer	T70P-6B070-A
Crankshaft Damper Remover	T58P-6316-D
Vibration Damper Remover Adapter	T82L-6316-B
Vibration Damper and Seal Replacer	T82L-6316-A

Removal

1. Disconnect ground cable at battery and set aside.
2. Remove air cleaner outlet tube assembly.
3. Remove drive belts.
4. Remove four pulley-to-damper retaining bolts.
5. Remove crankshaft pulley (6312).
6. Remove crankshaft vibration damper bolt and crankshaft vibration damper washer.
7. Remove crankshaft vibration damper from crankshaft (6303) using Crankshaft Damper Remover T58P-6316-D and Vibration Damper Remover Adapter T82L-6316-B.
8. Pry crankshaft front seal (6700) from engine front cover (6019) with a flat-bladed screwdriver or other similar tool. Use care to prevent damage to engine front cover and crankshaft.

tomsn048@gmail.com



Installation

1. Inspect front cover and shaft seal surface of the crankshaft damper for damage, nicks, burrs or other roughness which may cause the new seal to fail. Service or replace components as necessary.

2. Lubricate seal lip with clean engine oil and install crankshaft front seal using Vibration Damper and Seal Replacer T82L-6316-A and Front Cover Seal Replacer T70P-6B070-A.

3. Coat crankshaft damper sealing surface with clean engine oil. Apply RTV F4AZ-19562-B or equivalent meeting Ford specification WSE-M4G323-A1 using Rotunda Gasket Gun with Regulator 071-R0001 or equivalent to keyway of damper prior to installation. Install crankshaft vibration damper using Vibration Damper and Seal Replacer T82L-6316-A. Install crankshaft vibration damper bolt and crankshaft vibration damper washer and tighten to 125-165 Nm (92-122 lb-ft).

4. Position crankshaft pulley and install attaching bolts. Tighten attaching bolts to 32 Nm (24 lb-ft).

5. Install engine (6007) accessory drive belt (8620) and route as illustrated. Check to ensure drive belt is riding in ribbed pulley correctly or early failure will result.

6. Install air cleaner outlet tube.

7. **NOTE: When the battery has been disconnected and reconnected, some abnormal drive symptoms may occur while the powertrain control module (PCM) (12A650) relearns its adaptive strategy. The vehicle may need to be driven 16 km (10 miles) or more to relearn the strategy.**

tomsn048@gmail.com

Connect ground cable at battery.

8. Start engine and check for oil leaks.

tomsn048@gmail.com

Water Pump

SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
Fan Clutch Holding Tool	T84T-6312-C
Fan Clutch Nut Wrench	T84T-6312-D

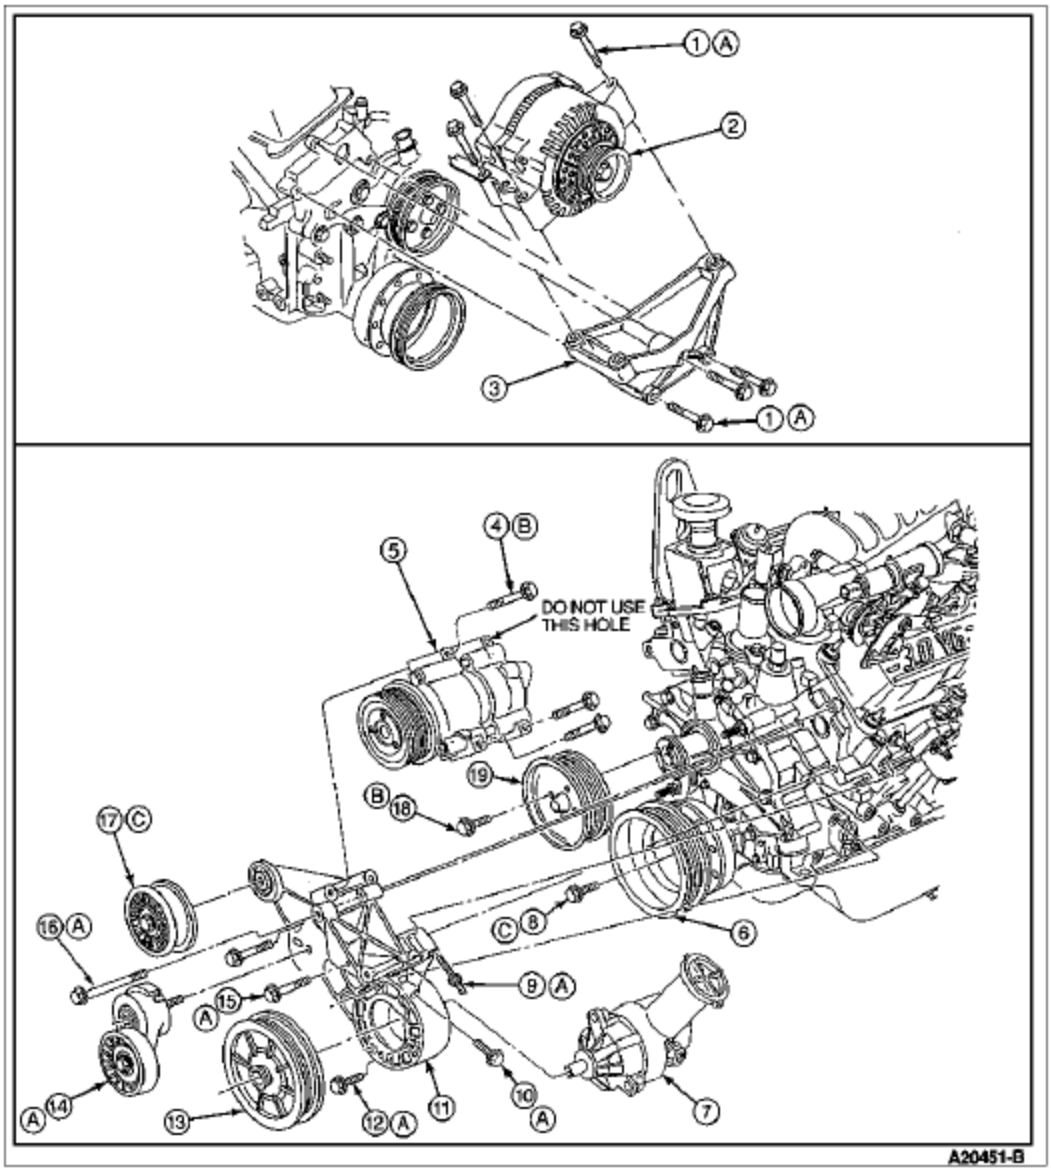
Removal

1. Disconnect ground cable at battery and set aside.
2. Remove engine air cleaner outlet tube.
3. **CAUTION: Fan clutch has left-hand threads so nut must be turned clockwise to remove.**

   Loosen nut on fan clutch using Fan Clutch Holding Tool T84T-6312-C and Fan Clutch Nut Wrench T84T-6312-D and remove fan blade and clutch assembly from water pump (8501).
4. Remove 2 screws holding fan shroud to radiator (8005). Remove fan blade and clutch assembly and fan shroud together.
5. Drain cooling system.
6. Loosen, do not remove, 4 water pump pulley (8509) retaining screws.
7. Rotate engine drive belt tensioner clockwise and remove engine drive belt (8620).
8. Remove 4 water pump pulley retaining screws and water pump pulley.
9. Remove 3 electrical connectors at generator (GEN) (10300).
10. On Aerostar only, remove oil fill tube retaining nut at generator stud and lift tube from stud.
11. Remove 3 bolts retaining generator bracket to cylinder head (6049) and remove generator and bracket as an assembly.

Engine Accessory Installation, 3.0L, Ranger

tomsn048@gmail.com



Item	Part Number	Description
1	N606068-S2	Bolt
2	10300	Generator
3	10153	Generator Mounting Bracket
4	N806020-S2	Bolt
5	19703	A/C Compressor

13	3A733	Power Steering Pump Pulley
14	6B209	Drive Belt Tensioner
15	N60608-S2	Bolt
16	N807124-S2	Bolt
17	3F671	Belt Adjuster
18	N802096-S2	Bolt
19	8509	Water Pump Pulley
A	—	Tighten to 40-55 Nm (30-41 Lb-Ft)
B	—	Tighten to 21-29 Nm (15-21 Lb-Ft)
C	—	Tighten to 53-72 Nm (39-53 Lb-Ft)

12. Disconnect crank position sensor (CKP) wiring.

13. Remove heater water return hose at water pump.

14. Remove bypass hose from fitting at intake manifold (9424).

15. **CAUTION: Use care not to damage the throttle linkage or fuel lines.**

    On Ranger only, remove 3 screws securing A/C compressor to power steering pump support bracket. Using a piece of wood bridged from the top of the battery to the throttle body (9E926), suspend the A/C compressor with a wire tie or other suitable material.

16. Using a Torx® 50 driver, remove enginedrive belt tensioner (6B209) assembly.

17. On Aerostar only, if equipped with auxiliary heater, remove screw retaining auxiliary heater tube bracket at power steering pump support bracket.

18. Remove lower radiator hose at radiator and water pump.

19. Remove 5 screws retaining power steering pump support bracket to the engine (6007) and secure power steering pump and bracket assembly toward battery tray.

20. Remove 12 water pump retaining bolts and note bolt location.

21. Remove water pump and discard old water pump gasket.

Installation

NOTE: Lightly oil all bolts and stud threads before installation except those requiring special sealant.

1. Clean gasket surfaces on engine front cover (6019) and water pump carefully. (Use care as

tomsn048@gmail.com

aluminum gouges easily.)

2. Position a new gasket on water pump sealing surface using Gasket and Trim Adhesive D7AZ-19B508-B or equivalent meeting Ford specification ESE-M2G52-A to hold gasket in position.

3. Install water pump on engine front cover and hand-tighten 12 attaching bolts. Refer to Engine Front Cover in this section for tightening specifications.

4. Reinstall lower radiator hose at water pump and radiator and tighten clamps.

5. Reinstall power steering pump support bracket to engine and torque to (5 fasteners) (Ranger) 48-61 Nm (35-45 lb-ft) or (3 fasteners) (Aerostar) 40-54 Nm (30-40 lb-ft).

6. Reinstall engine accessory drive belt tensioner and torque to 35-45 Nm (27-33 lb-ft).
7. On Ranger only, install A/C compressor to steering pump support bracket with 3 bolts and torque to 22-28 Nm (17-21 lb-ft).
8. Reconnect bypass hose to fitting on intake manifold and tighten clamp.
9. Install heater water return hose at water pump fitting and tighten clamp.
10. On Aerostar only, if equipped with auxiliary heater, reinstall auxiliary heater tube bracket at power steering pump support bracket and torque to 8-12 Nm (6-8 lb-ft).
11. Connect crank position sensor (CKP) wiring at sensor.
12. Reinstall generator and bracket assembly to right cylinder head with 3 bolts and torque to 40-54 Nm (30-40 lb-ft).

Front End Accessory Drive, Upper — Aerostar

17. Torque water pump pulley bolts to 23-32 Nm (18-24 lb-ft).

18. Place radiator fan and clutch assembly in fan shroud and slide fan shroud into position. Lower edge

tomsn048@gmail.com

of fan shroud should locate in clips at bottom of radiator. Secure top of fan shroud with 2 screws and torque to 6-8 Nm (53-71 lb-in).

19. **CAUTION: Fan clutch has left-hand threads so nut must be turned clockwise to remove.**

    Install fan clutch on water pump hub and torque to 41-135 Nm (30-100 lb-ft) using Tool T84T-6312-C and Fan Clutch Nut Wrench T84T-6312-D.

20. Reinstall engine air cleaner outlet tube and tighten clamps.

21. Fill engine cooling system to specified level. Refer to Section 03-03 .

22. Reconnect ground cable at battery.

23. Start vehicle and check for leaks. Allow engine to reach operating temperature and verify no fluid leaks. Shut off engine, check and correct all fluid levels.

tomsn048@gmail.com

Engine Front Cover

SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
Fan Clutch Holding Tool	T84T-6312-C
Fan Clutch Nut Wrench	T84T-6312-D
Vibration Damper and Seal Replacer	T82L-6316-A
Vibration Damper Remover Adapter	T82L-6316-B
Crankshaft Damper Remover	T58P-6316-D

Removal

1. Disconnect ground cable at battery and set aside.
2. **NOTE: Engine front cover (6019) can be removed with water pump (8501) installed. To perform this operation, do not remove bolts 11 through 15 in the Fastener Location, Water Pump Front Cover illustration.**

   Remove water pump as outlined in this section (if required).
3. Raise vehicle on hoist.
4. On Aerostar only, remove 4 screws holding A/C compressor (19703) to engine bracket and support compressor to sidemember of engine compartment.
5. On Aerostar only, remove 3 screws securing A/C compressor bracket to cylinder blocks (6010) and 2 nuts in front at timing cover studs.

15	N804576-S8	M6 x 1.0 x 28.5	8-12	6-8

[a] Apply Pipe Sealant with Teflon D8AZ-19554-A or equivalent meeting Ford specifications WSK-M2G350-AZ and ESR-M18P7-A to fastener threads.

12. Remove remaining bolts in engine front cover and remove cover. Discard old engine front cover gasket (6020).

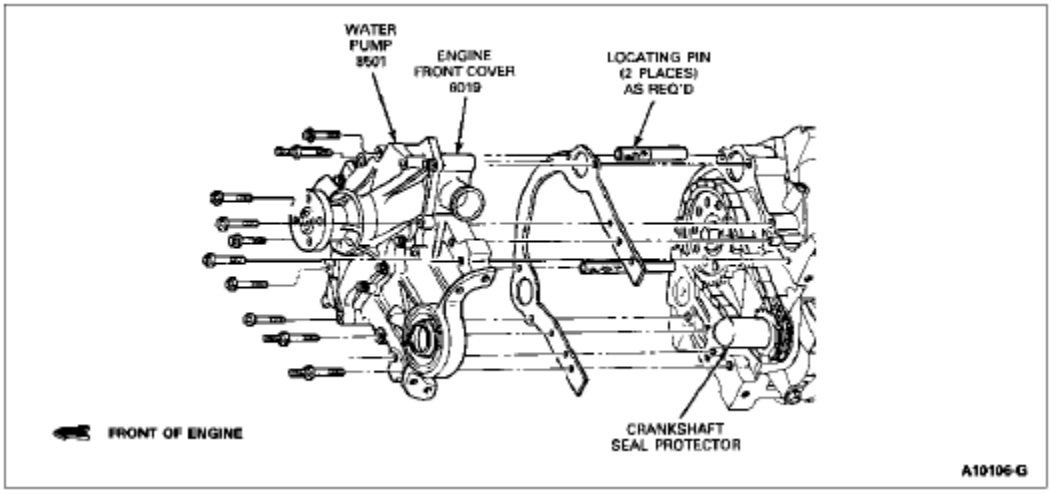
13. Pry crankshaft front seal (6700) from engine front cover with a flat-blade screwdriver or similar tool. Use care to prevent damage to engine front cover.

14. While timing cover is off, inspect timing chain and sprockets to ensure continued service as outlined in Section 03-00 .

Installation

CAUTION: Aluminum components gouge easily, which may result in gasket leaks. Always use care when servicing aluminum gasket surfaces.

Engine Front Cover



NOTE: Lightly oil all bolt threads except those requiring special sealants.

1. If crankshaft front seal is to be replaced, follow instructions outlined in this section.

2. Clean gasket surfaces on cylinder blocks and engine front cover.

tomsn048@gmail.com

3. Align new engine front cover gasket on cylinder blocks dowel pins. Note bolts that require pipe sealant on accompanying chart.

[a] Apply Pipe Sealant with Teflon D8AZ-19554-A or equivalent meeting Ford specifications WSK-M2G350-AZ and ESR-M18P7-A to fastener threads.

4. Install engine front cover and attaching bolts. Refer to the previous illustration. Tighten bolts 1 through 10 to 20-30 Nm (15-22 lb-ft) and bolts 11 through 15 to 8-12 Nm (6-8 lb-ft).

5. Raise vehicle.

6. Install oil pan as outlined in this section.

7. Coat crankshaft vibration damper sealing surface with clean engine oil. Apply RTV or equivalent meeting Ford specification ESE-M4G195-B, using Rotunda RTV Dispenser 021-00031, to keyway of damper prior to installation. Install damper using Damper/Front Cover Seal Installer T82L-6316-A. Install crankshaft pulley bolt (6A340) and crankshaft pulley retaining washer (6378) and torque to 125-165 Nm (94-123 lb-ft).

8. Install crankshaft pulley and torque 4 screws to 53-70 Nm (40-52 lb-ft).

9. On Aerostar only, position A/C compressor bracket over 2 engine front cover studs and install 2 nuts on engine front cover studs and 3 screws into engine block bosses. Torque all A/C compressor bracket retainers to 41-54 Nm (31-40 lb-ft).

10. Detach A/C compressor from sidemember of engine compartment and secure to A/C compressor bracket with 4 screws. Torque fasteners to 22-28 Nm (17-21 lb-ft).

11. Lower vehicle.

12. Install water pump as outlined in this section (if removed).

---

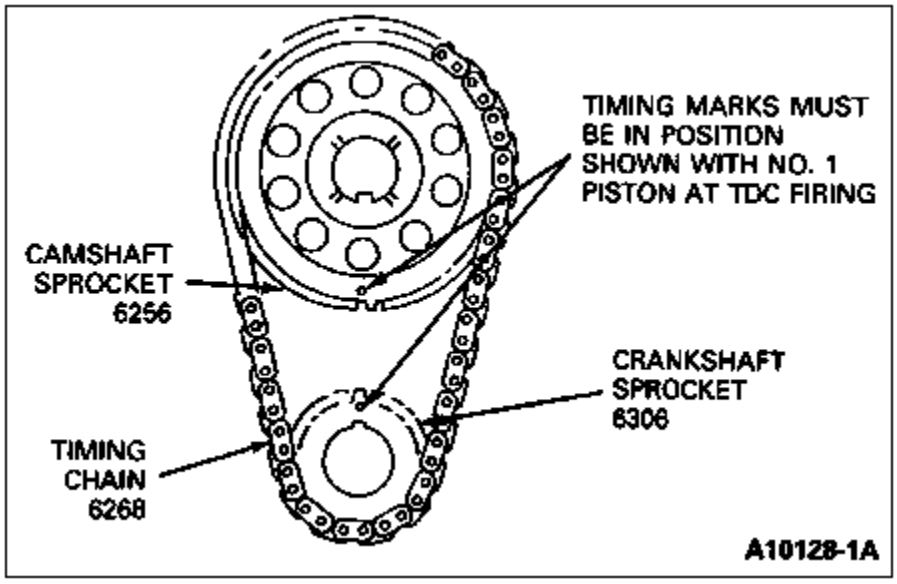
tomsn048@gmail.com

tomsn048@gmail.com

Timing Chain, Sprockets, Tensioners and Guides

Removal

1. Disconnect ground cable at battery and set aside.
2. Remove engine front cover (6019) as outlined in this section.
3. Rotate crankshaft (6303) until No. 1 piston (6108) is at top dead center (TDC) and the timing marks are aligned as illustrated.
4. Check timing chain deflection for excessive wear as outlined in Section 03-00 .
5. Slide camshaft sprocket (6256), crankshaft sprocket (6306) and timing chain forward and remove as an assembly.
6. Clean timing cover and oil pan sealing surfaces of all gasket material and silicone sealer.



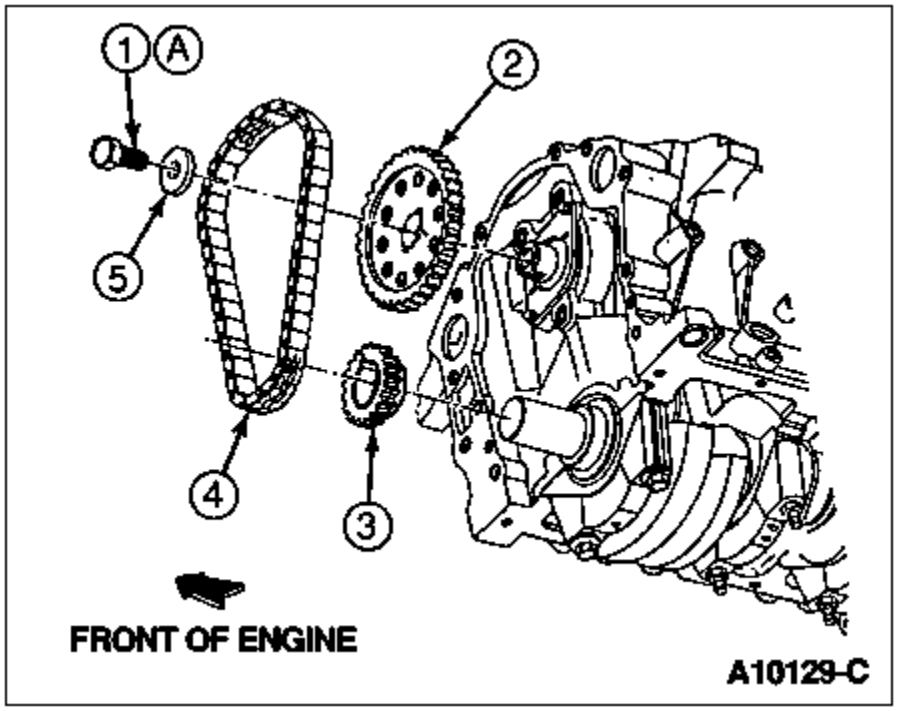
Installation

1. Clean and inspect all parts before installation.
2. Slide camshaft sprocket, crankshaft sprocket and timing chain on as an assembly with timing marks aligned as illustrated.
3. **NOTE: The timing chain sprocket bolt has a drilled oil passage for timing chain lubrication. If damaged, do not replace with standard bolt. Clean oil passage with solvent.**

   Install timing chain sprocket bolt and crankshaft pulley retaining washer (6378). Tighten bolt to 55-70

tomsn048@gmail.com

Nm (41-52 lb-ft). Lubricate chain and sprockets with engine oil.



Item	Part Number	Description
1	6279	Camshaft Sprocket Bolt
2	6256	Camshaft Sprocket
3	6306	Crankshaft Sprocket
4	6268	Timing Chain/Belt
5	6278	Camshaft Sprocket Washer
A	—	Tighten to 55-70 Nm (41-52 Lb-Ft)

4. Inspect crankshaft front seal (6700) for burrs or cuts. If required, replace seal using Front Cover Seal Installer T70P-6B070-A.
5. Position engine front cover gasket (6020) onto cylinder block alignment dowels.
6. Install engine front cover onto cylinder blocks (6010) using caution to not damage crankshaft front seal.
7. Install retaining bolts and tighten as outlined in this section.
8. Install oil pan (6675) and new oil pan gasket (6710) as outlined in this section.
9. Install water pump (8501) if removed.
10. Install crankshaft vibration damper and crankshaft pulley as outlined in this section.

tomsn048@gmail.com

11. Install front end accessory drive components as outlined. Refer to Section 03-05 for routing and tension of drive belt.

12. Fill crankcase with the correct viscosity and weight engine oil.

13. **CAUTION: This engine has aluminum components and requires a special corrosion-inhibiting coolant formulation to avoid radiator damage. Refer to Section 03-03 for coolant specifications.**

    Fill and bleed cooling system.

14. **NOTE: When the battery has been disconnected and reconnected, some abnormal drive symptoms may occur while the powertrain control module (PCM) (12A650) relearns its adaptive strategy. The vehicle may need to be driven 16 km (10 miles) or more to relearn the strategy.**

    Connect battery ground cable (14301).

15. Start engine (6007) and check for coolant, oil and exhaust leaks.

---

tomsn048@gmail.com

Camshaft

Removal

1. **NOTE: On 3.0L Aerostar it is necessary to remove the engine (6007) from the vehicle to perform this procedure. Refer to Engine Assembly, Aerostar , Removal and Installation, in this section.**

   Disconnect ground cable at battery and set aside.

2. Rotate crankshaft (6303) so No. 1 piston is at 0 degrees at Top Dead Center (TDC) on the compression stroke.

3. Remove radiator as outlined in Section 03-03 .

4. Recover A/C refrigerant and remove A/C condenser core as outlined in Section 12-00 .

5. Remove engine front cover (6019) and timing chain and sprockets as outlined in this section.

6. Remove intake manifold (9424) and valve covers (6582) as outlined in this section.

7. Loosen rocker arm bolts enough to allow the rocker arms (6564) to be lifted off the push rod (6565) and rotated to one side.

8. Remove push rods. Identify each push rod's location. The push rods should be installed in their original location and position during reassembly.

9. Loosen roller tappet guide plate retainer bolts (2). Remove tappet guide plate retainer from tappet valley.

10. Remove valve tappet guide plates (6K512) from valve tappets (6500) by lifting straight up.

11. **NOTE: If the valve tappets are stuck in the bores due to excessive varnish or gum deposits, it may be necessary to use a claw-type tool to aid removal. Work the valve tappet up and down in the bore to loosen it from the deposits.**

    Remove valve tappets by grasping each valve tappet and pulling in line with bore.

12. Remove the two camshaft thrust plate retaining bolts and camshaft thrust plate (6269).

13. **CAUTION: Damage to camshaft bearings and/or camshaft can occur if camshaft is allowed to drop on bearing surface or cylinder block.**

    Remove camshaft (6250) by pulling slowly toward front of engine keeping camshaft perfectly in line with camshaft bores.

Installation

NOTE: Lightly oil all retaining bolt and stud threads before installation except those specified for

tomsn048@gmail.com

special sealant.

1. **CAUTION: Aluminum components gouge easily which can cause gasket leaks. Always use care when scraping aluminum gasket surfaces.**

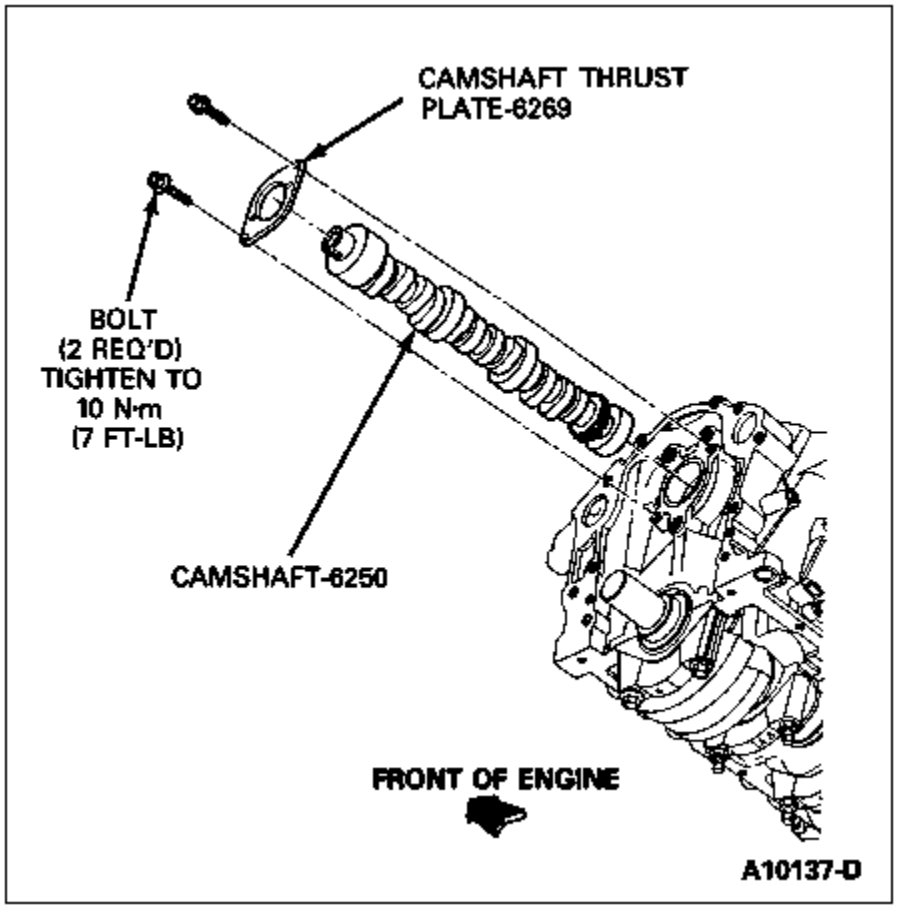
   Clean mating gasket surfaces of intake manifold and cylinder head (6049). Lay a clean cloth or shop rag in the tappet valley to catch any gasket material. After scraping, carefully lift cloth from tappet valley preventing any particles from entering oil drain holes or cylinder head. Use a suitable solvent to remove old rubber sealant. Clean gasket mating surfaces of engine front cover to cylinder block.

2. Inspect camshaft bearings for wear. Replace as outlined in this section.

3. Clean and inspect all components before installation.

4. Lubricate camshaft lobes, bearing surfaces, and distributor drive gear liberally with Engine Assembly Lubricant D9AZ-19579-D or equivalent meeting Ford specification ESR-M99C80-A.

5. Slide camshaft through bearings into cylinder blocks (6010) remembering to keep camshaft perfectly in line with front bearing.



6. Lubricate camshaft thrust plate with Engine Assembly Lubricant D9AZ-19579-D or equivalent meeting Ford specification ESR-M99C80-A and install with two retaining bolts. Tighten bolts to 8-12 Nm (6-8 lb-ft).

tomsn048@gmail.com

7. If installing a new camshaft, check end play as specified in Section 03-00 . If clearance is excessive, replace camshaft.

8. **CAUTION: Do not replace camshaft sprocket bolt (6279) with a standard bolt or severe engine damage will occur. This bolt is an oil carrying, precision component.**

   Lubricate timing chain and sprockets with Engine Assembly Lubricant D9AZ-19579-D or equivalent meeting Ford specification ESR-M99C80-A and install as an assembly. Align marks as illustrated. Inspect camshaft sprocket (6256) for blockage of drilled oil passages and clean as required. Install camshaft sprocket bolt and washer and tighten to 50-70 Nm (37-52 lb-ft).

9. Lubricate valve tappets and bore with Engine Assembly Lubricant D9AZ-19579-D or equivalent meeting Ford specification ESR-M99C80-A.

10. Install valve tappets into original bores.

11. **NOTE: Install valve tappet guide plates with the word "UP" or button visible.**

    Aligning tappet flats, install valve tappet guide plates.

12. Install tappet guide plate and retainer (6K564) over valve tappet guide plates. (NOTE: Retainer orientation is not important.) Hand-start two retaining bolts. Tighten bolts to 10-14 Nm (7-10 lb-ft).

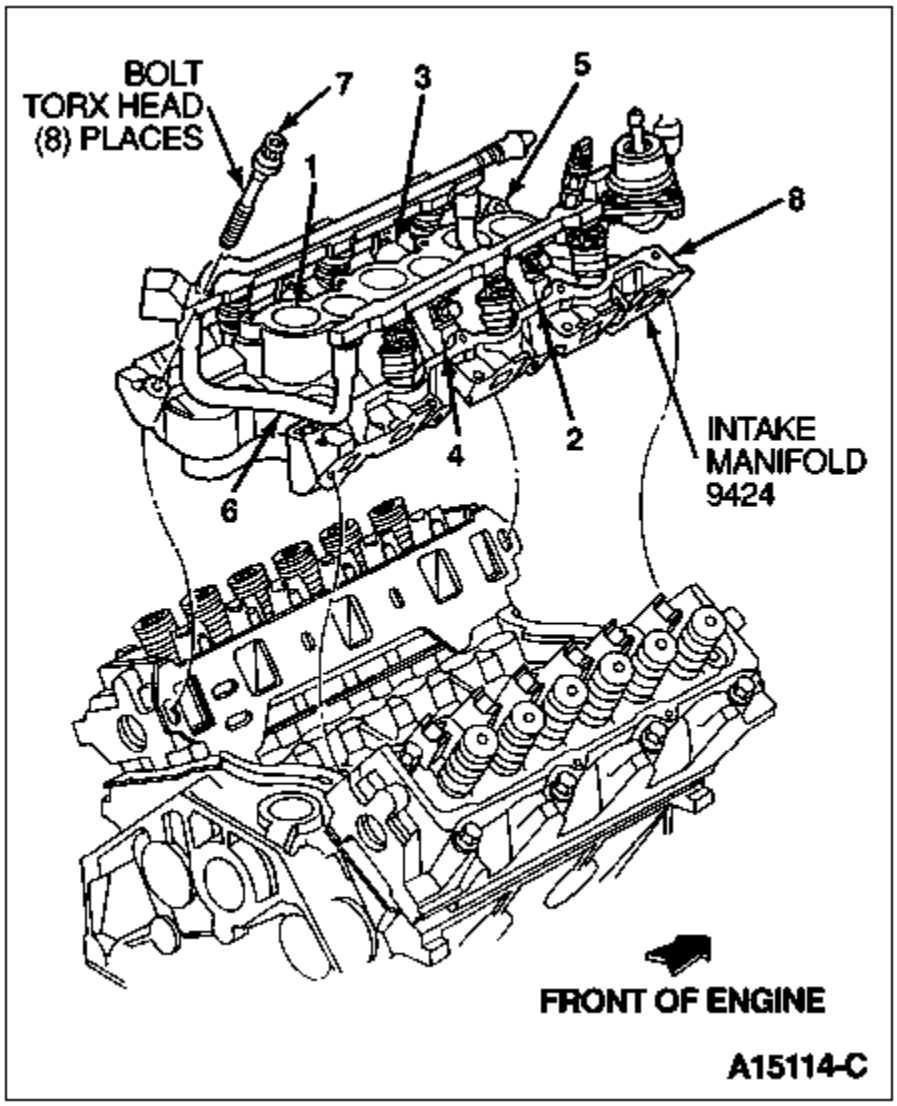
13. Apply a 5-6mm drop of Silicone Rubber D6AZ-19562-AA or equivalent meeting Ford specification ESB-M4G92-A or ESE-M4G195-A to intersection of cylinder block and cylinder head assembly at four corners.

14. Position intake manifold gaskets (9439) on tocylinder heads. Align the intake gasket locking tabs to the provisions on the head gaskets (6051).

15. Install front and rear intake manifold seals. Secure with retaining features.

16. Lower intake manifold into position aligning manifold bolt holes to those in the cylinder head. Use care to prevent disturbing the rubber sealer which can cause sealing voids. Install bolts 1, 2, 3 and 4 and hand-snug. Install remaining bolts. Tighten in numerical sequence to 15 Nm (11 lb-ft), then again to 26-32 Nm (19-24 lb-ft).

tomsn048@gmail.com



17. Completely coat camshaft position sensor gear teeth with Engine Assembly Lubricant D9AZ-19579-D or equivalent meeting Ford specification ESR-M99C80-A.

18. **CAUTION: If a new camshaft is installed, always add the rest of the pint of Engine Assembly Lubricant D9AZ-19579-D or equivalent meeting Ford specification ESR-M99C80-A to the engine oil by pouring it through the distributor hole onto the camshaft drive gear. Run engine at idle for five minutes before driving vehicle.**

    Install camshaft position sensor. Refer to Section 03-14 .

19. Rotate engine socamshaft is in Position A, as shown, with camshaft sprocket timing mark and crankshaft sprocket timing mark at top center.

20. **NOTE: Lubricate each push rod, rocker arm, and rocker arm fulcrum with Engine Assembly Lubricant D9AZ-19579-D or equivalent meeting Ford specification ESR-M99C80-A before installing.**

    Install push rod, rocker arm, rocker arm fulcrum, and rocker arm bolt for valves:

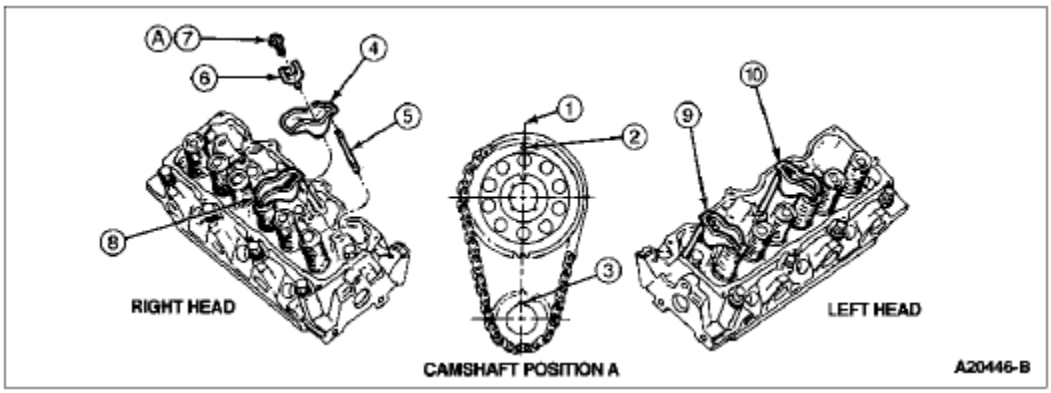
tomsn048@gmail.com

- Cylinder No. 1 Intake
- Cylinder No. 2 Exhaust
- Cylinder No. 4 Intake
- Cylinder No. 5 Exhaust

Tighten rocker arm bolts to 11 Nm (8 lb-ft).

21. For valves in above step, check rocker arm-to-valve clearance. Clearance should be 2.15-4.69mm (0.084-0.184 in.).

Camshaft Position A — Rocker Arm, Push Rod, and Fulcrum Installation



Item	Part Number	Description
1	—	Centerline of Keyway Vertical Within Five Degrees
2	—	Camshaft Sprocket Timing Mark at Top Center
3	—	Crankshaft Sprocket Timing Mark at Top Center
4	6564	Rocker Arm, No. 1 Intake
5	6565	Push Rod
6	6A528	Rocker Arm Fulcrum
7	6A527	Rocker Arm Bolt
8	6564	Rocker Arm and Parts
9	6564	Rocker Arm and Parts
10	6564	Rocker Arm and Parts
A	—	Tighten to 11 Nm (8 Lb-Ft)

22. Rotate engine so camshaft is in Position B, as shown, with camshaft sprocket timing mark at two o'clock position and crankshaft sprocket timing mark at 4:30 position.

23. **NOTE: Lubricate each push rod, rocker arm, and rocker arm fulcrum with Engine Assembly Lubricant D9AZ-19579-D or equivalent meeting Ford specification ESR-M99C80-A before installing.**

tomsn048@gmail.com

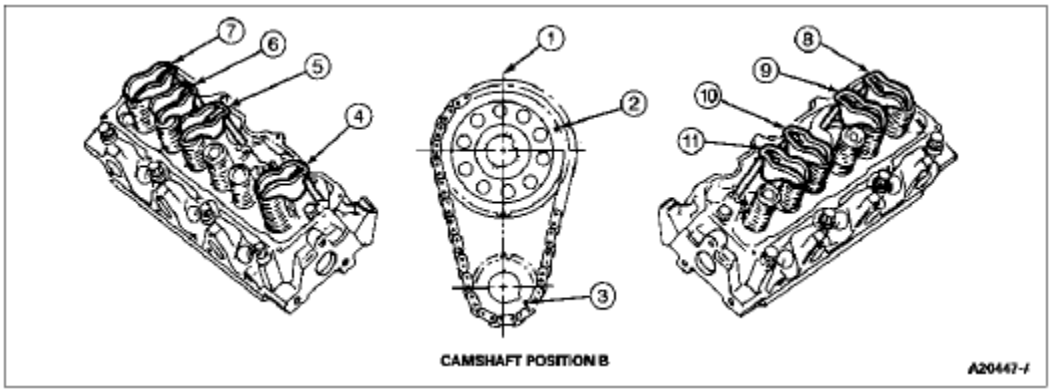
Install push rod, rocker arm, rocker arm seat (6A528), and rocker arm bolt for valves:

- Cylinder No. 1 Exhaust
- Cylinder No. 2 Intake
- Cylinder No. 3 Exhaust
- Cylinder No. 3 Intake
- Cylinder No. 4 Exhaust
- Cylinder No. 5 Intake
- Cylinder No. 6 Exhaust
- Cylinder No. 6 Intake

Tighten rocker arm bolts to 11 Nm (8lb-ft).

24. For valves in above step, check rocker arm-to-valve clearance. Clearance should be 2.15-4.69mm (0.084-0.184 in.).

Camshaft Position B — Rocker Arm, Push Rod, and Fulcrum Installation

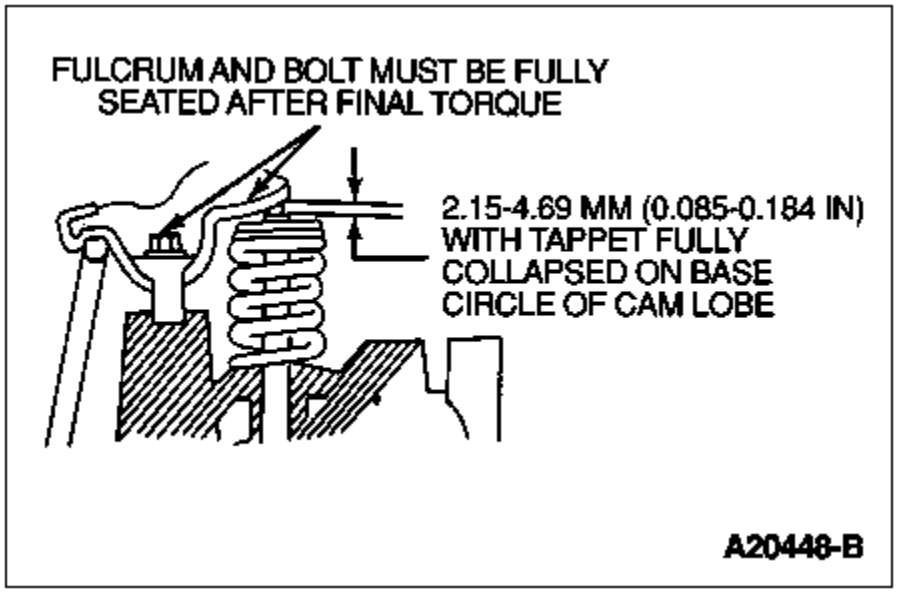


Item	Part Number	Description
1	—	Centerline
2	—	Camshaft Sprocket Timing Mark at Two o'Clock Position
3	—	Crankshaft Sprocket Timing Mark at 4:30 Position
4	6564	Rocker Arm (No. 1 Exhaust Rocker Arm and Parts)
5	6564	Rocker Arm (No. 2 Intake Rocker Arm and Parts)
6	6564	Rocker Arm (No. 3 Exhaust Rocker Arm and Parts)
7	6564	Rocker Arm (No. 3 Intake Rocker Arm and Parts)
8	6564	Rocker Arm (No. 6 Exhaust Rocker Arm and Parts)
9	6564	Rocker Arm (No. 6 Intake Rocker Arm and Parts)
10	6564	Rocker Arm (No. 5 Intake Rocker Arm and Parts)
11	6564	Rocker Arm (No. 4 Exhaust Rocker Arm and Parts)

tomsn048@gmail.com

25. **CAUTION: Rocker arm fulcrum must be fully seated into cylinder head and push rod must be fully seated into lifter sockets before final tightening.**

    Final-tighten allrocker arm bolts (6A527) to 26-38 Nm (19-28 lb-ft) with camshaft in any position.



26. Installengine front cover including oil pan (6675), crankshaft vibration damper and front accessory components as outlined in this section for Aerostar or Ranger.

27. On Ranger vehicles, position the air conditioning hose and manifold assembly in engine compartment with hoses as originally routed with no kinks or binds.

28. Remove all caps and plugs. Push suction hose into coupling on accumulator and liquid line into coupling on condenser.

29. Position hose assembly manifold to A/C compressor and install retaining bolt. Tighten to 25-30 Nm (18-22 lb-ft).

30. Evacuate and recharge air conditioning system as outlined in Section 12-00 .

31. Install valve covers as outlined in this section.

32. Install fuel injector electrical harness to each injector. Secure with standoffs to inboard rocker arm cover studs.

33. Install throttle body (9E926) as outlined in Section 03-04B .

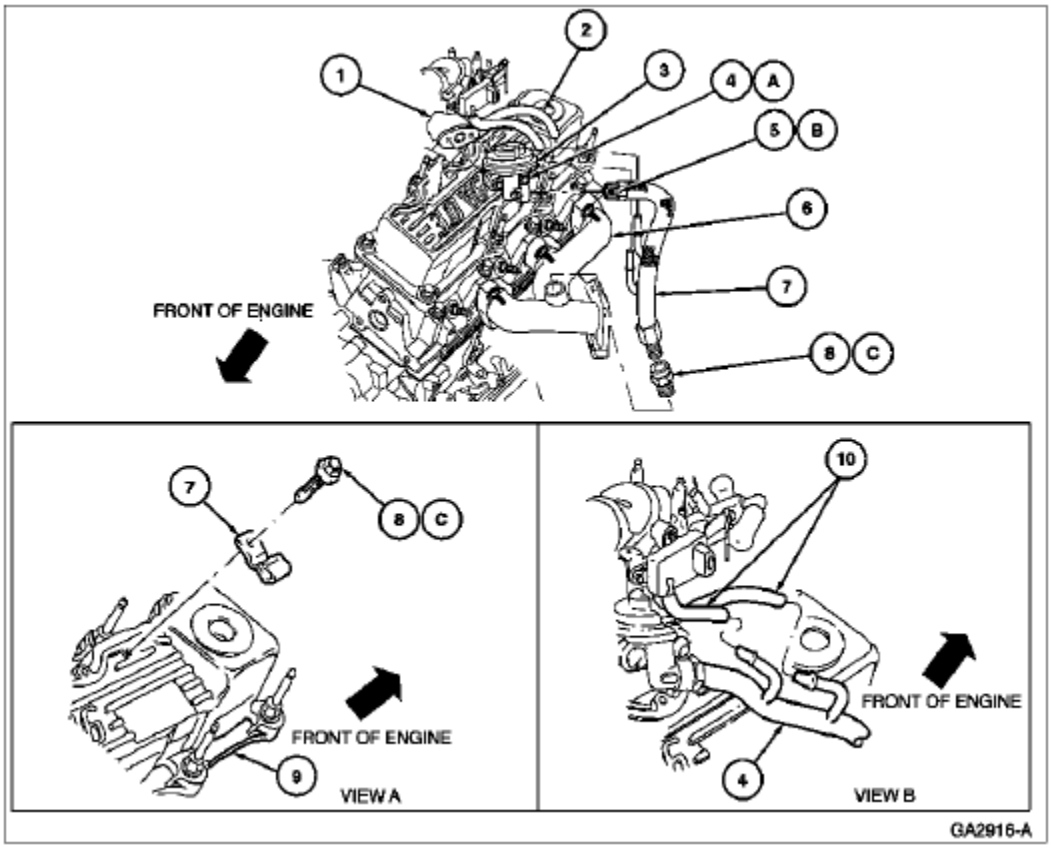
34. Install ignition coil and bracket assembly (Ranger only). Tighten retaining nuts to 16-20 Nm (12-15 lb-ft).

35. Position the EGR tube in the EGR valve and start the first few threads of the flare nut. Install the bolt at the exhaust manifold end and tighten to 20-30 Nm (15-22 lb-ft). Tighten the flare nut to 35-65 Nm (26-48 lb-ft).

tomsn048@gmail.com

36. Connect two pressure differential hoses from the EGR pressure sensor to the EGR tube.

EGR Tube — Ranger



Item	Part Number	Description
1	—	Throttle Body
2	—	Transducer Hose
3	—	EGR Valve
4	—	Bolt & Washer
5	—	EGR Tube Upper Fitting
6	—	Exhaust Manifold (L.H.)
7	—	EGR Valve to Exhaust Manifold Tube
8	—	EGR Tube Lower Fitting
A	—	Tighten to 20-30 Nm (15-22 lb/ft)
B	—	Tighten to 35-65 Nm 26-48 lb/ft)
C	—	Tighten to 35-65 Nm (26-48 Lb-Ft)

37. Connect fuel lines tofuel injection supply manifold (9F792) as outlined in Section 03-04B .

tomsn048@gmail.com

38. Install fuel line safety clips.

39. Connect vacuum lines to premarked locations.

40. Connect electrical connections of:

    - Intake air temperature sensor (IAT sensor) (12A697)
    - Idle air control valve (IAC valve) (9F715)
    - Engine coolant temperature sensor (ECT sensor) (12A648)
    - Camshaft position sensor
    - Ignition coil
    - Radio ignition interference capacitor (18801)
    - Water temperature indicator sender unit (10884)
    - EGR pressure sensor, if equipped
    - EGR vacuum regulator control, if equipped

Refer to Section 18-01 for further information.

41. Fill and bleed cooling system with specified coolant and proper mixture.

42. Fill crankcase with specified amount and viscosity of oil.

43. Install air cleaner outlet tube to throttle body and MAF sensor (12B579) . Tighten retaining clamps to 1.9 Nm (16 lb-in).

44. Install closure hose to valve cover and air cleaner outlet tube provisions.

45. **NOTE: When the battery has been disconnected and reconnected, some abnormal drive symptoms may occur while thepowertrain control module (PCM) (12A650) relearns its adaptive strategy. The vehicle may need to be driven 16 km (10 miles) or more to relearn the strategy.**

    Connect ground cable at battery.

46. Start engine and check for coolant, oil, fuel and vacuum leaks.

47. Verify and correct default base initial engine timing to 10 degrees BTDC. Refer to the Powertrain Control/Emissions Diagnosis Manual. Tighten retaining bolt to 24 Nm (18 lb-ft).

---

tomsn048@gmail.com

tomsn048@gmail.com

Exhaust Manifolds

Removal

WARNING: ALLOW ENGINE (6007) TO COOL SUFFICIENTLY BEFORE REMOVING MANIFOLDS. SERIOUS INJURY WILL RESULT FROM CONTACT WITH HOT EXHAUST MANIFOLDS.

1. Disconnect ground cable at battery and set aside.
2. **NOTE: Spray retaining nuts with rust penetrant prior to loosening to prevent removal of stud with nut.**

   Raise vehicle. Loosen and remove muffler inlet pipe retaining nuts from exhaust manifolds (9430).
3. Lower vehicle.

Right-Hand Side

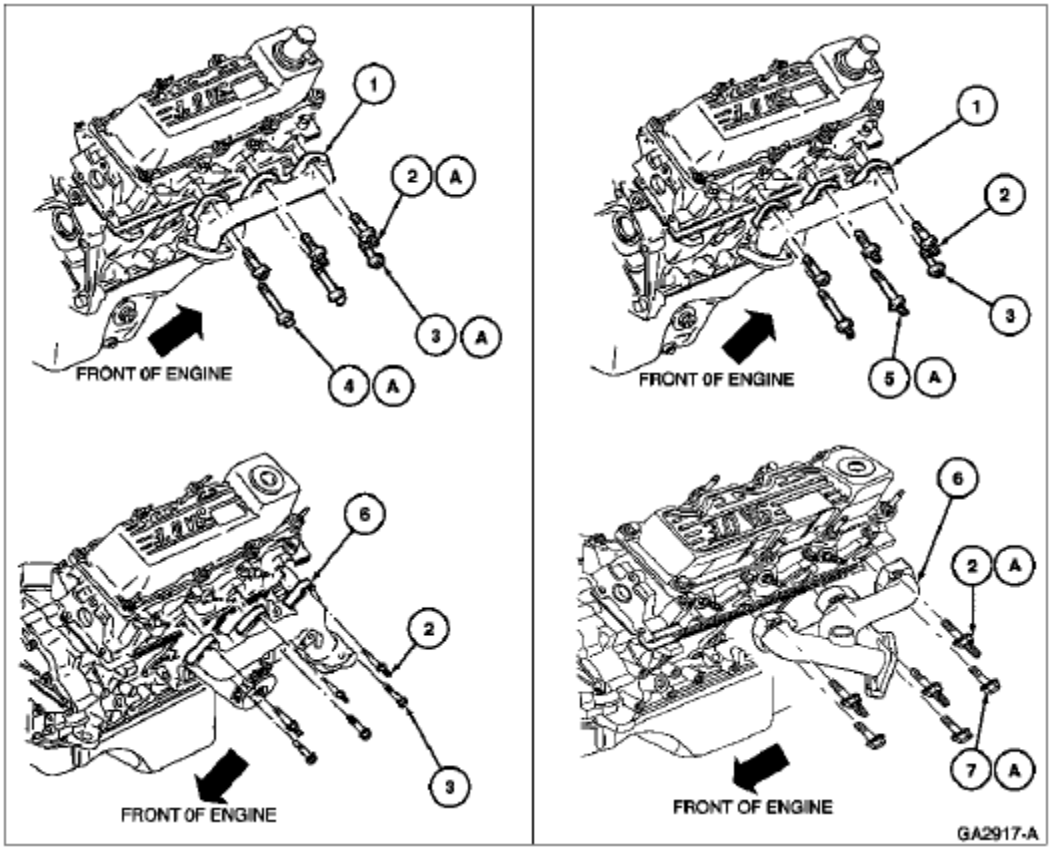
1. Remove spark plugs (12405).
2. Remove exhaust manifold retaining bolts and studs.
3. Remove exhaust manifold from vehicle.

Left-Hand Side

1. Disconnect two Delta PFE sensor hoses from EGR valve to exhaust manifold tube (9D477).
2. Loosen EGR tube flare nut at EGR valve (EGR valve) (9D475).
3. On Ranger, remove EGR tube bolt at exhaust manifold. On Aerostar, loosen and remove flare nut at exhaust manifold connector (9F485).
4. Remove engine oil level indicator dipstick tube retaining nut. Rotate or remove tube out of way.
5. Remove exhaust manifold and exhaust manifold gasket (9448) from vehicle.

Exhaust Manifold Installation

tomsn048@gmail.com



Item	Part Number	Description
1	9430	Exhaust Manifold, Right
2	N804468-S	Stud
3	N804465-S2	Screw and Washer
4	—	Bolt
5	N805702-S2	Hex Flange Stud, M8 x 1.25 x 90
6	9430	Exhaust Manifold, Left
7	—	Screw and Washer
A	—	Tighten to 20-30 Nm (15-22 Lb-Ft)

Installation

1. Clean mating surfaces of exhaust manifolds and cylinder heads (6049) of carbon deposits.
2. Position right or left exhaust manifold and exhaust manifold gasket in place to cylinder head and hand-tighten retaining bolts and studs. Tighten to 20-30 Nm (15-22 lb-ft).
3. Rotate or install oil level indicator tube (6754) to appropriate exhaust stud and install retaining nut if exhaust manifold was removed. Tighten to 16-20 Nm (12-15 lb-ft). Apply ESE-M4G217-A sealer to tube prior to installation if tube was removed.

tomsn048@gmail.com

4. Install spark plugs. Tighten to 11 Nm (8 lb-ft).

5. Install EGR tube flare nut into exhaust manifold connector (9F485) (Aerostar) finger tight.

6. Install EGR tube flare nut into EGR valve finger-tight.

7. Install bolt in EGR valve to exhaust manifold tube at exhaust manifold and tighten to 20-30 Nm (15-22 lb-ft).

8. Tighten flare nuts to 35-65 Nm (26-48 lb-ft).

9. Connect two Delta PFE sensor hoses onto ports in EGR tube.

10. Connect exhaust inlet pipe to left exhaust manifold and right exhaust manifold. Tighten retaining nuts to 41 Nm (30 lb-ft). Tighten both nuts in equal amounts to correctly seat inlet pipe flange.

11. **NOTE: When the battery has been disconnected and reconnected, some abnormal drive symptoms may occur while the powertrain control module (PCM) (12A650) relearns its adaptive strategy. The vehicle may need to be driven 16 km (10 miles) or more to relearn the strategy.**

    Connect ground cable at battery.

12. Start engine and check for oil and exhaust leaks.

---

tomsn048@gmail.com

Oil Pan, Ranger

SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
Engine Lifting Sling	014-00036

Removal

1. Disconnect battery ground cable. For additional information, refer to Section 14-01 .
2. Remove air cleaner outlet tube assembly by unclipping air cleaner clamp, loosening hose clamp at outlet tube, disconnecting intake air temperature (IAT) sensor and mass air flow (MAF) sensor connectors, and crankcase ventilation hose.
3. Remove oil level indicator fan shroud retaining bolts. Position shroud over fan blade.
4. Remove radiator support bolts. Raise and secure radiator to front core support.
5. Remove engine mount nuts from studs.
6. Unclip 42-pin connector from bracket and position it aside.
7. Install suitable lifting brackets to left and right exhaust manifolds. Attach Rotunda Engine Lifting Sling 014-00036 (or equivalent) to lifting brackets. With a suitable lifting device raise engine approximately 50.8 mm (2 in). Install wood blocks between engine mounts and support brackets. Remove lifting device.
8. Raise vehicle on hoist. For additional information, refer to Section 00-02 .
9. Drain the oil.
10. Remove transmission insulator retaining nuts and install a jack stand to extension housing. Raise transmission about 25.4-101.6mm (1-4 in) to gain access for removal of oil pan.
11. Remove transmission inspection cover.
12. Remove starter motor splash shield.
13. Remove starter motor retaining bolts and secure starter aside.
14. If equipped, disconnect and remove low oil level sensor.
15. **NOTE: Oil pan fits tightly between transmission spacer plate and oil pump pickup tube. Use care when removing pan to avoid damaging either part.**

    Remove oil pan bolts and lower pan.
16. Remove oil pump retaining bolts. Lower and twist pump to allow the oil pan to lower completely.

tomsn048@gmail.com

Remove the pump and pan assembly from vehicle.

17. Remove and discard oil pan gasket.

18. Clean the oil pan mating surface.

Installation

1. **NOTE: When using silicone rubber sealer, assembly should occur within 15 minutes after sealer application. After this time, the sealer may start to set up, and its sealing effectiveness could be reduced.**

   Apply a 4.0-6.0 mm (1/5 inch) bead of Silicone Rubber D6AZ-19562-AA or -BA (or equivalent meeting Ford specifications ESB-M4G92-A and ESE-M4G195-A) to junction of rear main bearing cap and cylinder block and to junction of front cover assembly and cylinder block. Position oil pan gasket to cylinder block and secure it with Gasket and Trim Adhesive D7AZ-19B508-B (or equivalent meeting Ford specifications ESR-M11P17-A and ESE-M2G52-A).

2. Install oil pump assembly and bolt. Tighten bolt to 40-55 Nm (30-40 lb-ft).

3. **NOTE: If oil pan is replaced with a new pan you must tighten new pan to spec then loosen and retighten.**

   Position oil pan to cylinder block and install oil pan to engine bolts. Tighten bolts to 10-14 Nm (7-10 lb-ft).

4. Remove jack stand and install transmission insulator retaining nuts. Tighten nuts to 85-118 Nm (63-87 lb-ft).

5. **NOTE: When replacing low oil level sensor, use a new metal gasket with a rubber O-ring.**

   Install low oil level sensor. Tighten sensor to 20-34 Nm (15-25 lb-ft).

6. Install transmission inspection cover and retaining bolts. Tighten bolts to 10-14 Nm (7-10 lb-ft).

7. Install starter motor and bolts. Tighten bolts to 22-28 Nm (17-20 lb-ft).

8. Securely install starter motor splash shield.

9. Lower vehicle.

10. Install lifting device and support engine. Remove wood blocks and lower engine back into original position. Remove lifting device and Rotunda Engine Lifting Sling 014-00036 (or equivalent). Remove lifting brackets from right and left exhaust manifolds.

11. Remove support straps, lower radiator into position, and install radiator bolts to core support. Position fan shroud and install the retaining bolts. Tighten bolts to 6-8 Nm (52-71 lb-in).

12. Install engine mount nuts and tighten to 98-132 Nm (72-97 lb-ft).

13. Connect 42-pin connector to the bracket and install oil level indicator.

14. Install engine air cleaner outlet tube assembly. Connect IAT sensor, MAF sensor, and crankcase ventilation hose. Securely tighten the hose clamp.

tomsn048@gmail.com

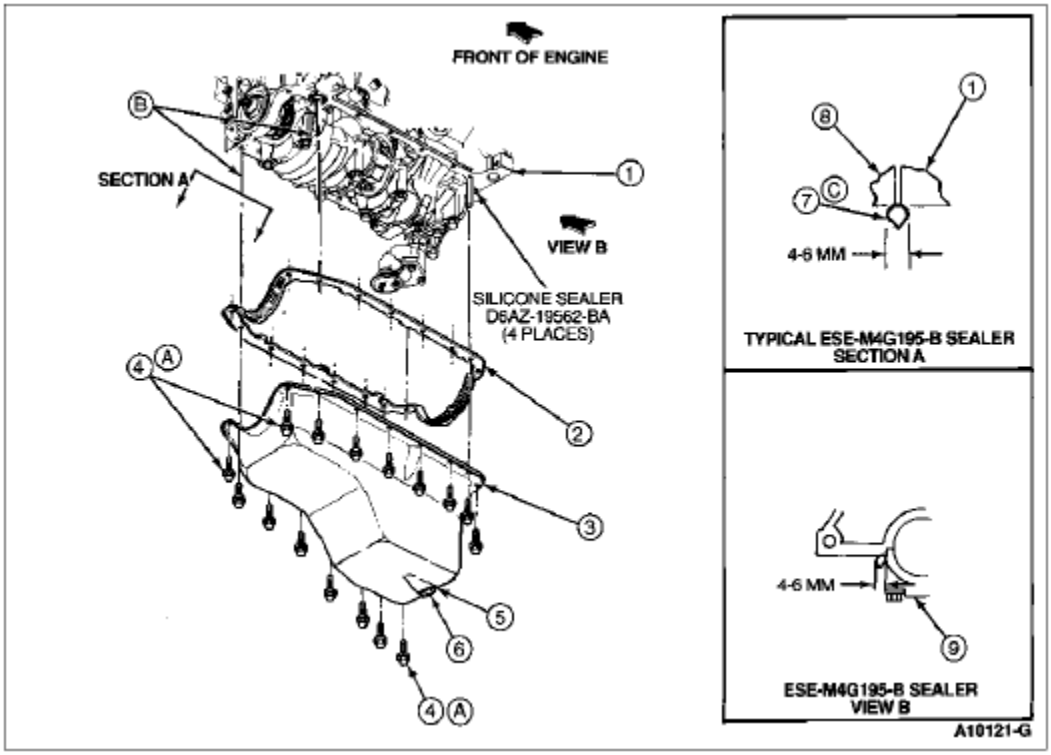
15. **NOTE: When battery has been disconnected and reconnected, some abnormal drive symptoms can occur while powertrain control module (PCM) (12A650) relearns its adaptive strategy. Vehicle may need to be driven 16 km (10 miles) or more to relearn strategy.**

    Connect battery ground cable.

16. Fill crankcase with correct viscosity and amount of engine oil.

17. Start engine and check for oil leaks.

Oil Pan Installation — Ranger



Item	Part Number	Description
1	6010	Cylinder Block
2	6710	Oil Pan Gasket
3	6675	Oil Pan
4	N803159-S	Screw and Washer
5	6734	Oil Pan Drain Plug Gasket
6	6730	Oil Pan Drain Plug
7	ESE-M4G195-B	Sealer
8	6059	Front Cover
9	—	Rear Main Bearing Cap (Part of 6010)

tomsn048@gmail.com

A	—	Tighten to 10-14 Nm (7-10 Lb-Ft)
B	D6AZ-19562-BA	Silicone Sealer — 4 Places
C	—	Stop Bead 3mm from Timing Chain Cavity

tomsn048@gmail.com

Oil Pan, Aerostar

Removal

1. Disconnect ground cable at battery and set aside.
2. Remove oil level dipstick (6750).
3. Raise vehicle.
4. Remove retainer clip at sensor, if equipped with a low oil level sensor (6C624). Remove electrical connector from sensor.
5. Drain crankcase.
6. Remove starter motor.
7. Remove transmission as outlined in Section 07-01A .
8. Remove oil pan retaining bolts. Remove oil pan (6675).
9. Remove old oil pan gasket (6710) and discard.

Installation

NOTE: Lightly oil all bolt threads before installation.

1. Clean the gasket surfaces on the cylinder blocks (6010) and oil pan.
2. **NOTE: When using silicone rubber sealer, assembly should occur within 15 minutes after sealer application. After this time, the sealer may start to set up, and its sealing effectiveness may be reduced.**

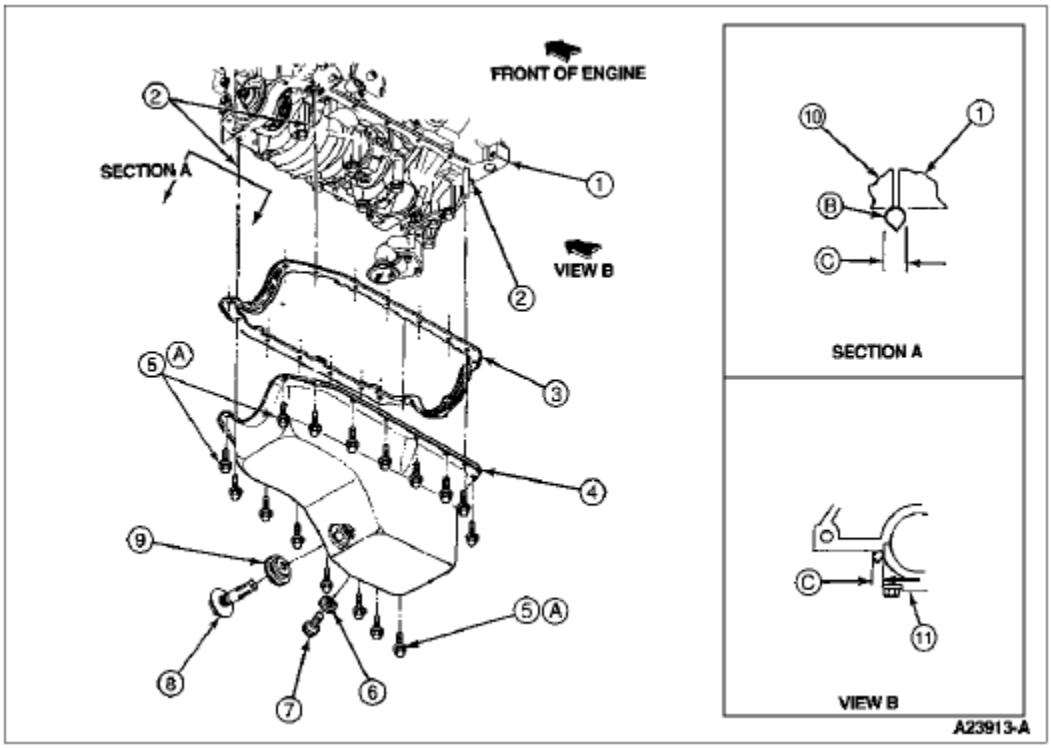
   Apply a 4.0-6.0mm (1/5-inch) bead of Silicone Sealer D6AZ-19562-AA or -BA or equivalent meeting Ford specification ESB-M4G9Z-A to the junction of the rear main bearing cap and cylinder block and junction of the front cover assembly and cylinder block. See following illustration.
3. Position oil pan gasket to cylinder blocks and secure with Gasket and Trim Adhesive D7AZ-19B508-B or equivalent meeting Ford specification ESE-M2G52-A.
4. Position oil pan to cylinder block.
5. Install oil pan attaching bolts and tighten to 10-14 Nm (7-10 lb-ft).
6. Install transmission as outlined in Section 07-01A .
7. Install starter motor and transmission inspection cover.
8. Install low oil level sensor connector to sensor and install retainer clip.

tomsn048@gmail.com

9. Lower vehicle.
10. Replace oil level dipstick.
11. Fill crankcase with correct viscosity and amount of engine oil.
12. **NOTE: When the battery has been disconnected and reconnected, some abnormal drive symptoms may occur while the powertrain control module (PCM) (12A650) relearns its adaptive strategy. The vehicle may need to be driven 16 km (10 miles) or more to relearn the strategy.**

    Connect ground cable at battery.
13. Start engine (6007) and check for engine oil leaks.

Oil Pan Installation — Aerostar



Item	Part Number	Description
1	6010	Cylinder Blocks
2	F1AZ-19562-A	RTV Sealer (4 Places)
3	6710	Oil Pan Gasket
4	6675	Oil Pan
5	N803159-S	Screw and Washer

tomsn048@gmail.com

6	6734	Oil Pan Drain Plug Gasket
7	6730	Oil Pan Drain Plug
8	6C624	Low Oil Level Sensor
9	6C626	Low Oil Level Sensor Washer
10	6019	Engine Front Cover
11	—	Rear Main Bearing Cap (Part of 6010)
A	—	Tighten to 27-41 Nm (20-30 Lb-Ft)

C	—	4-6mm (0.156-0.234 In.)

tomsn048@gmail.com

Oil Pump

Removal

1. Remove oil pan (6675) as outlined.
2. Remove retaining bolt and remove oil pump and intermediate shaft.

Installation

1. **NOTE: If replacing oil pump make sure to remove oil pump intermediate shaft (6A618) from oil pump.**

   If replacing oil pump (6600), insert oil pump intermediate shaft assembly into hex drive hole in oil pump until oil pump intermediate shaft retaining ring (6629) "clicks" into place.
2. Install oil pump with oil pump intermediate shaft through intermediate shaft hole in rear main bearing cap. Position oil pump over locating pins.
3. Install retaining bolt and tighten to 40-55 Nm (30-40 lb-ft).
4. Install oil pan as outlined.

tomsn048@gmail.com

Crankshaft

Removal

1. Remove engine (6007) from vehicle as outlined in this section, remove flywheel and engine rear plate, and install on a work stand.
2. Drain crankcase oil.
3. Remove spark plugs (12405).
4. Remove oil pan (6675) as outlined in In-Vehicle procedures in this section.
5. Remove engine front cover (6019) as outlined in In-Vehicle procedures in this section.
6. Check timing chain deflection as outlined in Section 03-00 .
7. Remove camshaft sprocket bolt (6279) and camshaft sprocket washer (6278).
8. Remove timing chain/belt (6268), camshaft sprocket (6256) and crankshaft sprocket (6306) as an assembly. Using one hand on the camshaft sprocket and the other on the crankshaft sprocket, pull assembly forward and off of camshaft (6250) and crankshaft (6303).
9. Rotate engine 180 degrees on engine stand. Remove oil pump retaining bolt and lift oil pump (6600) off of bearing cap.
10. **NOTE: All main bearing caps are marked with arrows. One arrow identifies No. 1 main bearing cap, two arrows identify No. 2 cap, etc. All connecting rods (6200) and caps are identified by matching correlation letters. Connecting rods are not identified to a cylinder number.**

    Remove connecting rod caps. Rotate crankshaft to position cap to be removed to bottom of stroke. Loosen and remove two retaining nuts per cap. Place retaining nuts so that they may be reinstalled on the same rod bolt.
11. Tap cap with a plastic mallet to separate from connecting rod bolt (6214). Remove cap from crankshaft. If lower bearing remained on crankshaft, carefully grasp both sides of bearing and pull straight up away from journal (oil acts as an adhesive between two precision fitted components). Place bearing back into cap and tag for cylinder position number.
12. Install protective rubber caps such as fuel hose onto connecting rod bolts. Using a wooden hammer handle or similar device, tap piston (6108) into cylinder bore while guiding connecting rod bolt away from crankshaft. Push assembly in far enough to prevent crankshaft rotation from hitting connecting rod bolt. Make sure upper connecting rod bearing is still seated in rod.
13. Perform above three steps for remaining connecting rod bolts.
14. Loosen and remove crankshaft main bearing cap bolts. Place retaining bolts so that they may be reinstalled in the original position.

tomsn048@gmail.com

15. Lift crankshaft straight up from cylinder blocks (6010). Make sure crankshaft bearing surfaces are not scratched or damaged by contact with cylinder block.

16. **NOTE: If crankshaft main bearings (6333) are to be reused, they should be identified to make sure that they are installed in their original positions.**

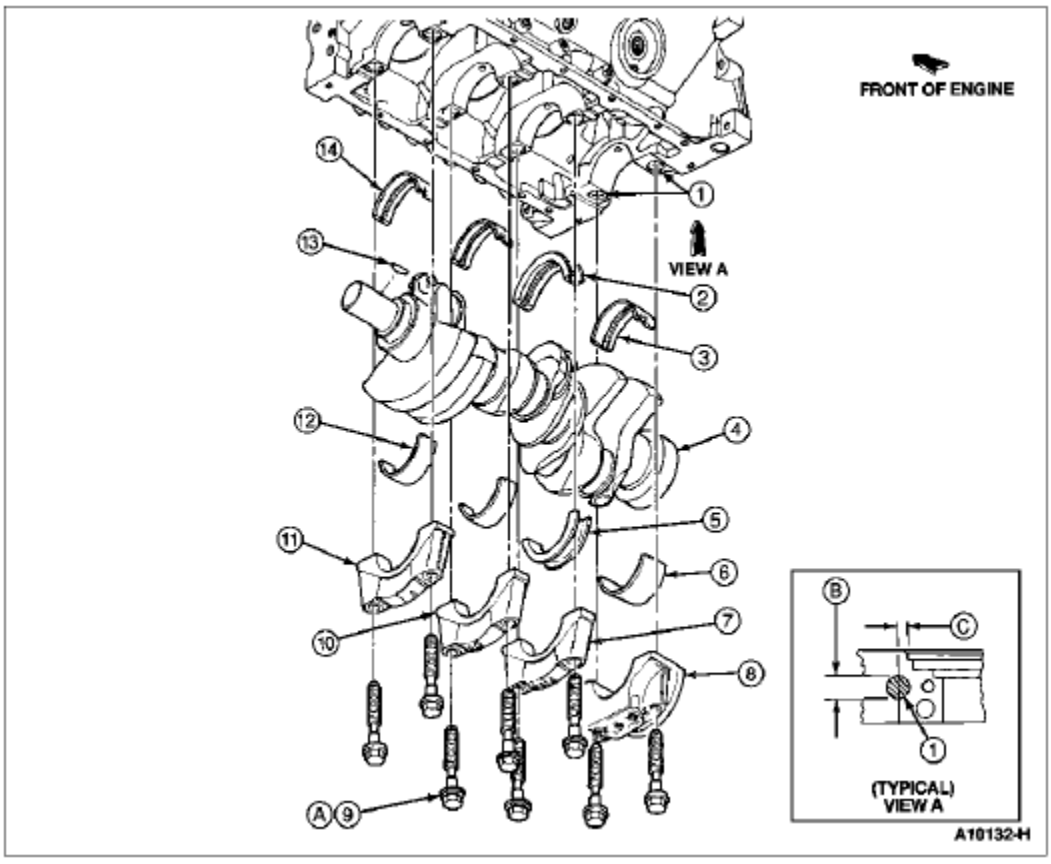
    Remove crankshaft main bearings from cylinder blocks and bearing caps.

17. Remove connecting rod bearing (6211) from the connecting rods and caps.

18. **CAUTION: Make sure bearing inserts and bearing bores are clean. Foreign material under the inserts will distort the bearing and cause a failure.**

    Inspect all machined surfaces on the crankshaft for nicks, scratches, scores, etc., which could cause premature bearing wear. Lightly stone all such surfaces.

Crankshaft and Bearing Installation



Item	Part Number	Description
1	E1FZ-19562-A	Sealer

tomsn048@gmail.com

2	6337	Crankshaft Thrust Main Bearing, Upper
3	6333	Crankshaft Main Bearing, Rear Upper
4	6303	Crankshaft
5	6337	Crankshaft Thrust Main Bearing, Lower

8	—	Rear Cap (Part of 6010)
9	6345	Crankshaft Main Bearing Cap Stud
10	—	Front Intermediate Cap (Part of 6010)
11	—	Front Cap. Assemble Caps with Arrows on Caps Pointing Forward. Caps Are Identified 1 Through 4 Front to Rear. (Part of 6010)
12	6333	Crankshaft Main Bearing, Lower
13	6B316	Crankshaft Key
14	6333	Crankshaft Main Bearing, Upper
A	—	Tighten to 75-85 Nm (55-63 Lb-Ft)
B	—	5-6mm (.20-.24 In.)
C	—	2mm (0.08 In.)

Installation

1. If the crankshaft main bearing journals have been refinished to a definite undersize, install the correct undersize crankshaft main bearings.

2. Place upper main bearing inserts in position in the bores with the tang fitted in the slot provided.

3. Install lower main bearing inserts in bearing caps.

4. Lower crankshaft into place carefully.

5. Check the clearance of each main bearing. Select fit the bearings for proper clearance. Refer to Section 03-00 .

6. **NOTE: Make sure that the main bearing caps are installed in their original positions and orientation.**

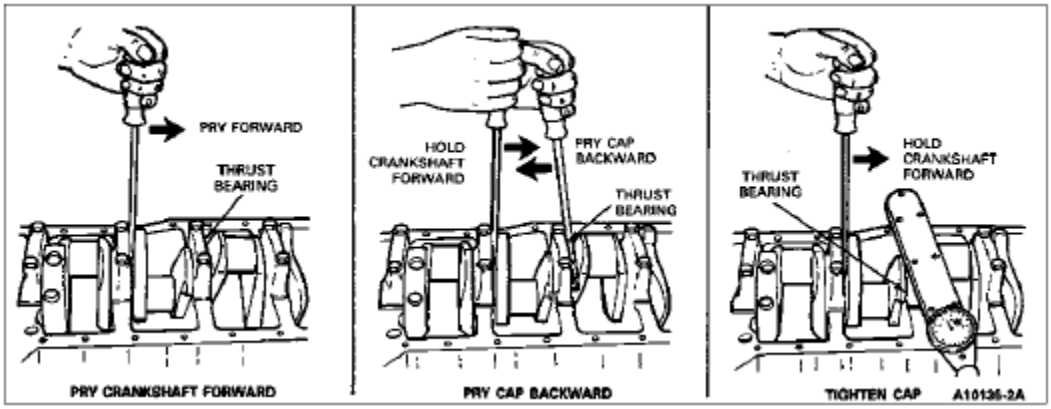
   After bearings have been fitted, apply a light coat of heavy engine oil, SAE 50, to the journal's bearings and rear seal surface. Install all bearing caps. Apply a 6mm (1/4-inch) dot of Gasket Eliminator E1FZ-19562-A or equivalent meeting Ford specification WSK-M2G348-A4 between rear cap and cylinder block (two places). Refer to the procedure in this section.

7. Lubricate the journal with engine oil and install the thrust bearing cap with the bolts finger-tight. Pry

tomsn048@gmail.com

the crankshaft forward against the thrust surface of the upper half of the bearing. Hold the crankshaft cap to the rear. This will align the thrust surfaces of both halves of the bearing. Retain the forward pressure on the crankshaft. Tighten the crankshaft main bearing cap stud (6345) to 75-85 Nm (55-63 lb-ft).

Thrust Bearings, Alignment



8. Check crankshaft end play. Refer to Section 03-00 .

9. If end play exceeds specification, replace upper and lower crankshaft thrust main bearing (6337). If the end play is less than specification, inspect the bearing and crankshaft thrust faces for damage, dirt or improper alignment. Install thrust bearing and align the faces. Recheck end play.

10. Install new connecting rod bearings in the connecting rods and caps. Check the clearance of each bearing. Refer to Section 03-00 .

11. If bearing clearances are to specification, apply a light coat of heavy engine oil, SAE 50, to the journals and bearings.

12. Turn the crankshaft throw to the bottom of the stroke. Push the piston, pin and ring (6102) all the way down until the rod bearings seat on the crankshaft journal.

13. Make sure connecting rod is seated on crankshaft journal and install connecting rod cap. Tighten attaching nuts to 31-39 Nm (23-28 lb-ft).

14. After piston, pin and ring and connecting rod assemblies have been installed, check connecting rod crankshaft journal.

15. Turn engine on the work stand so that the front end is up. Install timing chain/belt, crankshaft, crankshaft sprockets, engine front cover, new oil seal and crankshaft vibration damper as outlined in the In-Vehicle part of this section.

16. Turn engine on the work stand so that the rear end is up. Install crankshaft rear oil seal (6701).

17. Clean oil pan, oil pump and oil pump screen assembly.

18. Prime oil pump by filling the inlet opening with oil and rotating the pump shaft until oil emerges from the outlet opening. Install oil pump and oil pan as outlined.

tomsn048@gmail.com

19. Position flywheel (6375) on the crankshaft. Tighten to specification.
20. Install crankshaft pulley. Install and adjust drive belt to specification. Refer to Section 03-05 .
21. Remove engine from the work stand and install in vehicle.

---

tomsn048@gmail.com

Crankshaft Main Bearings

The main bearing inserts are a precision selective fit. To check the bearing clearances or to select fit a new bearing, refer to Section 03-00 .

Removal

1. Disconnect ground cable at battery and set aside.
2. Remove engine accessory drive belt (8620).
3. Remove oil pan (6675) as outlined in this section.
4. Remove oil pump (6600).
5. Replace one bearing at a time, leaving the other bearings securely fastened. Remove main bearing cap to which new bearings are to be installed.
6. **NOTE: Rotate remover against end of crankshaft main bearing (6333) opposite locating tang.**

   Insert Main Bearing Insert Tool TOOL-6331-E or equivalent in the oil hole in the crankshaft (6303).
7. Rotate crankshaft in the direction of the engine rotation to force the bearing out of the cylinder blocks (6010).
8. Clean crankshaft journals. Inspect journals and thrust faces (thrust bearings) for nicks, burrs, or bearing pickup that would cause premature bearing wear.
9. Refer to Crankshaft Rear Oil Seal in this section if the crankshaft rear oil seal (6701) is to be replaced.

Installation

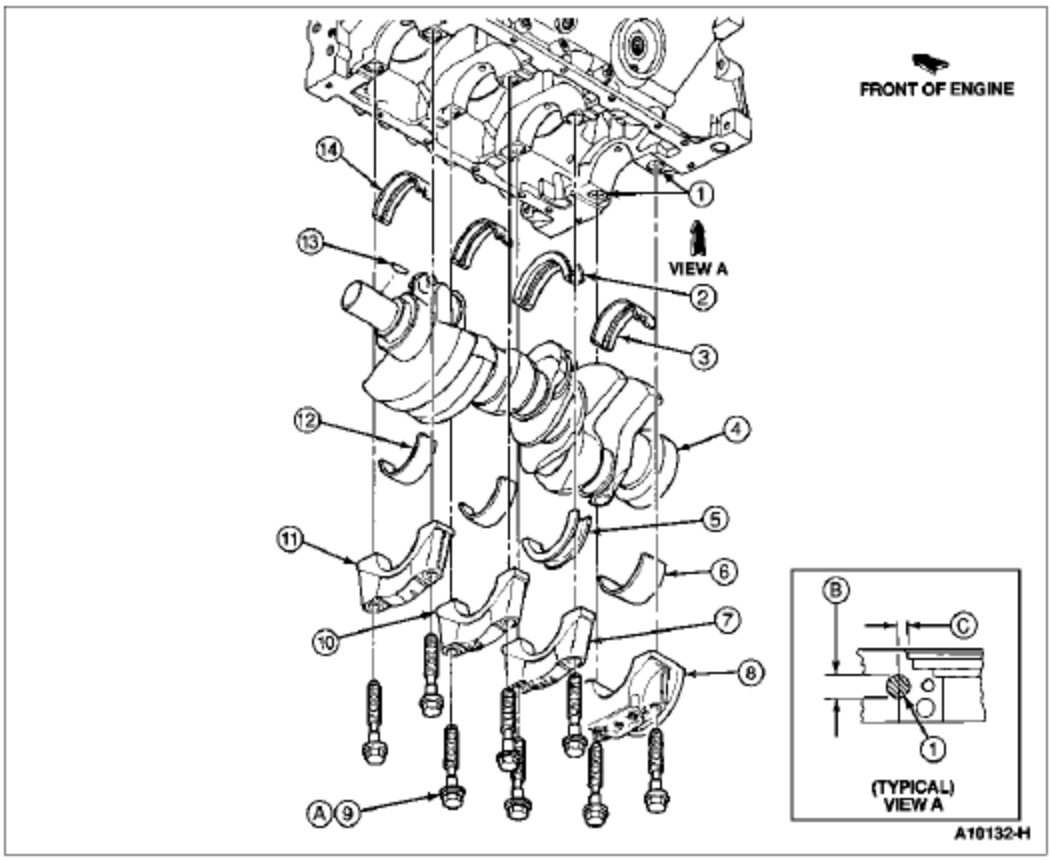
NOTE: Lightly oil all bolt and stud threads before installation.

1. Lubricate and position the upper crankshaft main bearing on the crankshaft journal with the plain end started into the side of the cylinder block with the locking tang slot. Line up the bearing tang with the slot in the block.
2. Install Main Bearing Insert Tool TOOL-6331-E or equivalent in the crankshaft journal oil hole.
3. With the bearing and tool in position, rotate the crankshaft so that the tool catches the edge of the bearing, pushes into position, and seats in the cylinder block. Remove tool.
4. Install bearing insert in the main cap.
5. If bearing insert clearance is to be checked, refer to Section 03-00 .
6. If No. 1 or No. 2 crankshaft main bearing was removed, lubricate the bearing surface with Engine Assembly Lubricant D9AZ-19579-D or equivalent meeting Ford specification ESR-M99C80-A. Install

tomsn048@gmail.com

main cap. Tighten attaching bolts to 80 Nm (60 lb-ft).

Crankshaft and Bearings



Item	Part Number	Description
1	E1FZ-19562-A	Sealer
2	6337	Crankshaft Thrust Main Bearing
3	6333	Crankshaft Main Bearing, Rear Upper
4	6303	Crankshaft
5	6337	Crankshaft Thrust Main Bearing, Lower
6	6333	Crankshaft Main Bearing, Rear Lower
7	6327	Rear Intermediate Cap (Part of 6010)
8	—	Rear Cap (Part of 6010)
9	6345	Crankshaft Main Bearing Cap Stud
10	—	Front Intermediate Cap (Part of 6010)

tomsn048@gmail.com

11	—	Front Cap. Assemble Caps with Arrows on Caps Pointing Forward. Caps Are Identified 1 Through 4 Front to Rear. (Part of 6010)
12	6333	Crankshaft Main Bearing, Lower
13	6B316	Crankshaft Key
14	6333	Crankshaft Main Bearing
A	—	Tighten to 80 Nm (60 Lb-Ft)
B	—	5-6mm (.20-.24 In.)
C	—	2mm (0.08 In.)

7. Perform the following if the rear main bearing cap was removed:

    a. Remove all traces of sealant from the main bearing cap to cylinder block parting line.
    b. Apply a 6mm (1/4-inch) dot of Gasket Eliminator E1FZ-19562-A or equivalent meeting Ford specification WSKM2G348-A4 between rear cap and cylinder blocks (two places). (See illustration.)
    c. Lubricate bearing surfaces with Engine Assembly Lubricant D9AZ-19579-B or equivalent meeting Ford specification ESR-M99C80-A. Install main bearing cap. Tighten attaching bolts to 75-85 Nm (55-63 lb-ft).

8. If the thrust bearing inserts were removed, perform the following:

    a. Lubricate bearing surface with Engine Assembly Lubricant D9AZ-19579-B or equivalent meeting Ford specification ESR-M99C80-A, and install the main bearing cap with bolts finger-tight.
    b. Pry crankshaft forward against the thrust surface on the upper bearing insert while holding the bearing cap to the rear. This aligns thrust rear surfaces on both halves of the bearing.
    c. While holding the crankshaft forward, tighten cap attaching bolts to 75-88 Nm (55-63 lb-ft).

9. Install oil pump.

10. Install oil pan and new oil pump as outlined.

11. Install engine accessory drive belt.

12. Connect ground cable to battery.

tomsn048@gmail.com

tomsn048@gmail.com

Pistons and Connecting Rods

Removal

NOTE: If more than one piston (6108) is being removed, identify the piston and connecting rod cap to the cylinder number. Caps are matched to connecting rods (6200) and are identified with matching correlation letters as illustrated. Each component should be installed in its original position during assembly.

1. **NOTE: On 3.0L Aerostar it is necessary to remove the engine (6007) from the vehicle to perform this procedure. Refer to Engine Assembly, Aerostar , Removal and Installation in this section.**

   Disconnect ground cable at battery and set aside.

2. Remove spark plugs and bring number 1 cylinder to top dead center of compression stroke.

3. Drain cooling system.

4. Perform all intake manifold removal steps as outlined in this section.

5. Remove cylinder heads (6049) as outlined in this section. If only one cylinder head is to be removed, remove spark plugs (12405) from remaining cylinder head.

6. Remove oil pan (6675) as outlined in this section.

7. Loosen and remove retaining bolt and remove oil pump (6600) and oil pump intermediate shaft (6A618).

8. Inspect the top of the cylinder bore(s) before removing the piston, pin and ring (6102) assembly. If a ridge has formed at the top of the cylinder, it must be removed before piston extraction. Remove ridge as follows:

   a. Turn crankshaft (6303) until the piston and connecting rod to be removed is at the bottom of the cylinder bore.
   b. Place a clean shop cloth over the piston head to collect cuttings.
   c. Remove ridge using a suitable ridge reamer following the manufacturer's instructions. Never cut into the piston ring travel more than 0.794mm (1/32 inch) when removing the ridge.

9. Loosen connecting rod cap retaining nuts.

10. Rotate crankshaft to place piston and connecting rod assembly at bottom of its travel in bore.

11. Remove connecting rod nuts (6212) from cap. Place connecting rod nut so that they may be reinstalled on the same rod bolt.

12. **CAUTION: Use extreme care to prevent scratching or nicking crankshaft journal.**

tomsn048@gmail.com

Tap cap with a plastic mallet to separate from connecting rod. Carefully remove cap from crankshaft. If lower bearing remained on crankshaft, carefully grasp both sides of connecting rod bearing (6211) and pull straight down away from crankshaft (oil acts as an adhesive between two precision fitted components).

13. **NOTE: If crankshaft journal inhibits safe removal of piston assembly, rotate crankshaft out of the way once protective caps are clear of journal.**

    NOTE: Protective caps may be made from rubber fuel hose.

    Install protective rubber caps onto connecting rod bolts to protect crankshaft journal contact from bolt threads.

14. **NOTE: If connecting rod bearing remained on crankshaft journal, carefully rotate bearing around journal and remove as lower bearing.**

    Push piston and connecting rod assembly up slightly using wooden end of hammer or similar device while guiding connecting rod from crankshaft journal. Remove upper connecting rod bearing from connecting rod.

15. **CAUTION: Do not push piston assembly out of bore too fast as damage to piston, pin and ring, cylinder bore, or crankshaft journal can result from contact to connecting rod.**

    Push connecting rod bearing and connecting rod up out of bore by tapping with wooden end of hammer or similar device while guiding connecting rod from crankshaft journal.

16. Install cap to connecting rod in original position and secure with retaining nuts.

17. Refer to Piston Disassembly in this section if piston, pin and ring is to be disassembled.

Installation

NOTE: Lightly oil all retaining bolts and stud threads before installation.

1. **CAUTION: When honing or cleaning cylinder wall(s), make sure crankshaft journals are protected by wrapping a clean shop cloth around the machined surfaces.**

   Inspect cylinder bore for excessive scratches. If new piston rings are to be installed, the cylinder wall should be honed to exhibit a visible cross-hatch pattern for proper ring seating. If honing is required, follow manufacturer's instructions. After honing, thoroughly clean cylinder bore using a detergent and water solution.

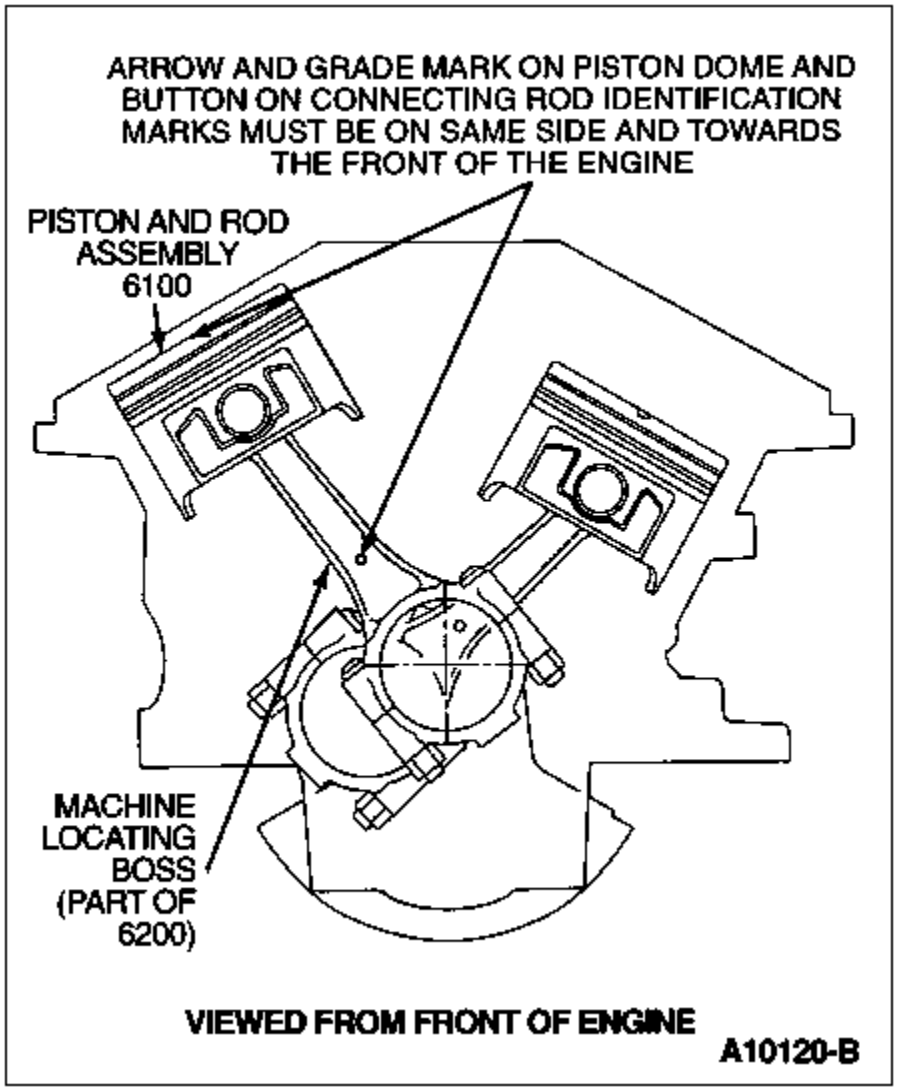
2. Install protective rubber caps on the connecting rod bolts.

3. Lubricate piston, pin and ring and cylinder walls with Engine Assembly Lubricant D9AZ-19579-D or equivalent meeting Ford specification ESR-M99C80-A.

4. Rotate crankshaft journal to bottom of its travel (if moved).

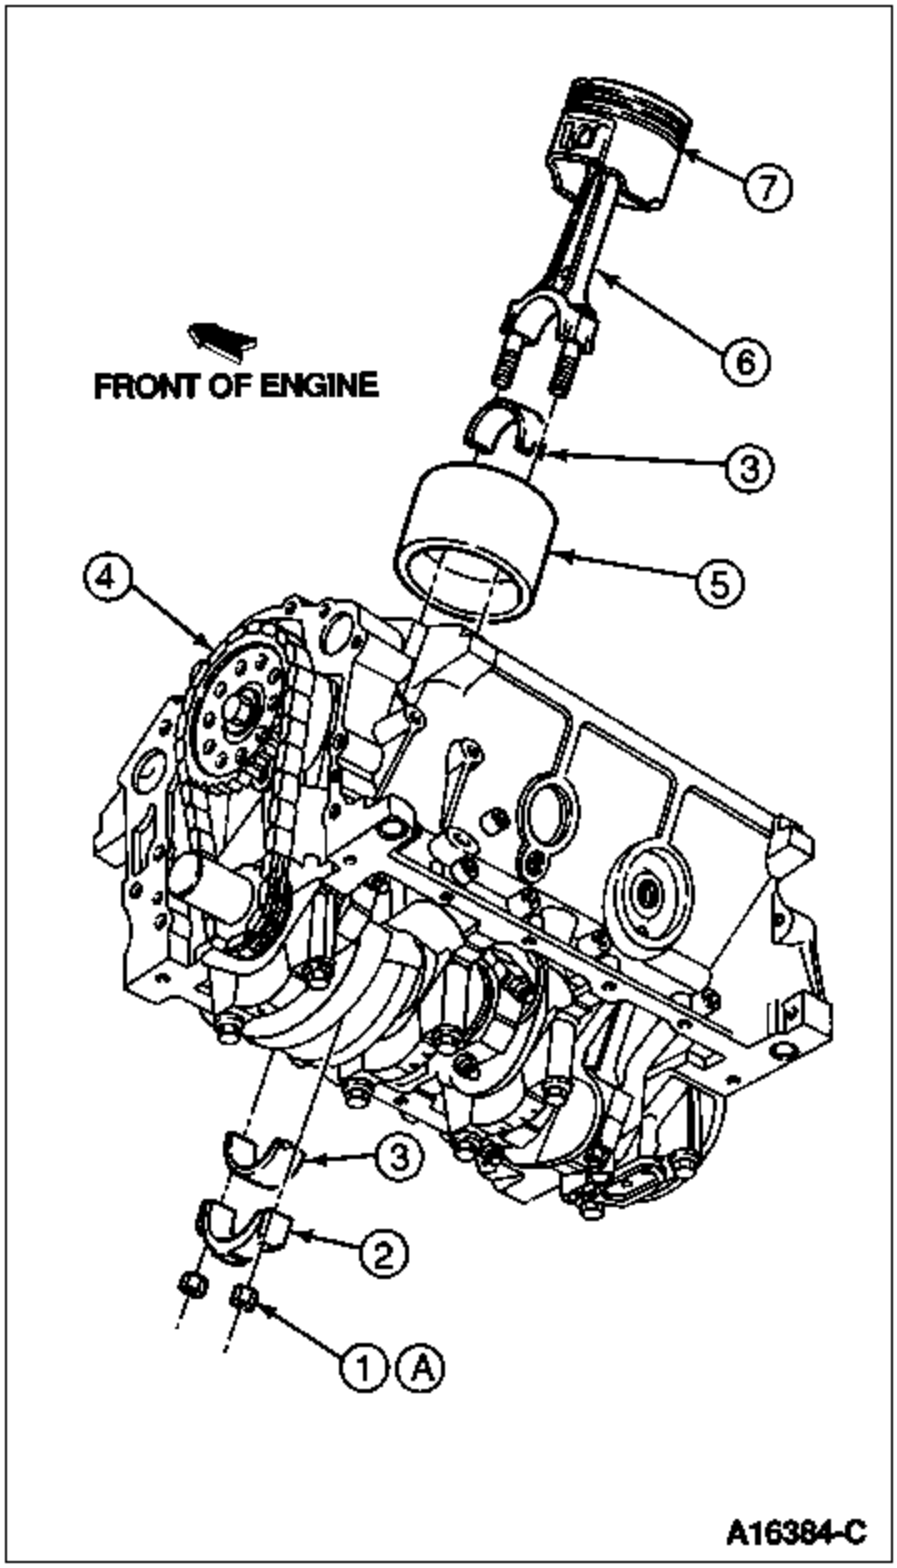
5. Arrange piston rings alternately around piston to prevent ring end gaps from aligning to each other.

tomsn048@gmail.com



6. Install piston ring compressor D81L-6002-C or equivalent to piston.

tomsn048@gmail.com



Item	Part Number	Description
1	6212	Connecting Rod Nut
2	6210	Rod Cap

tomsn048@gmail.com

3	6211	Connecting Rod Bearing
4	6010	Cylinder Blocks
5	D81L-6002-C	Piston Ring Compression Tool
6	6200	Connecting Rod
7	6108	Piston
A	—	Tighten to 31-39 Nm (23-29 Lb-Ft)

7. Install clean, dry upper connecting rod bearing.

8. Lubricate bearing surfaces and crankshaft journal with Engine Assembly Lubricant D9AZ-19579-D or equivalent meeting Ford specification ESR-M99C80-A engine oil, if clearances are within specification.

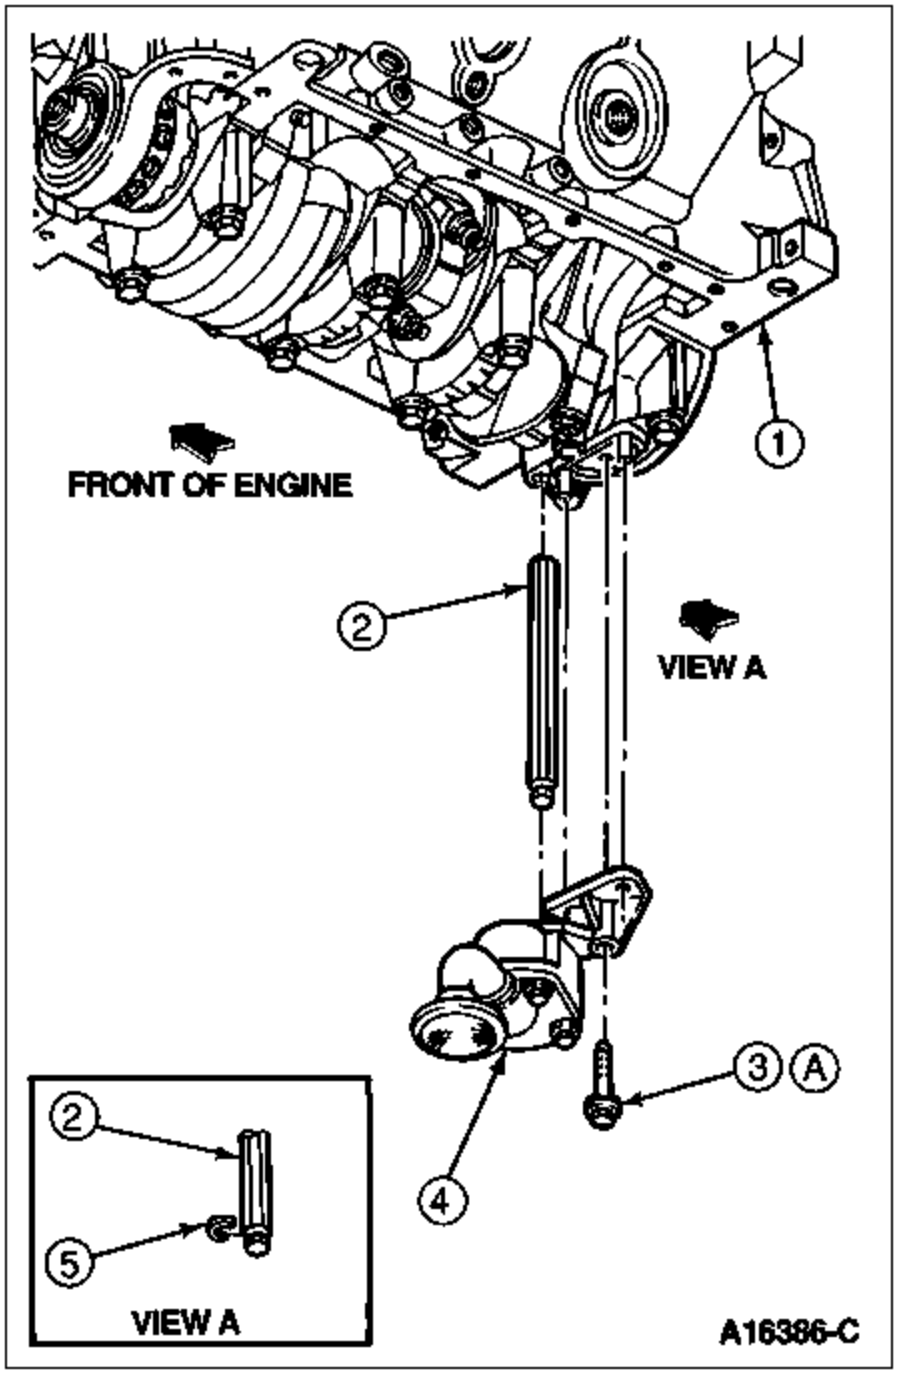
9. Carefully align piston to cylinder bore making sure piston dome notch and button on connecting rod face the front of engine. Install piston by tapping with wooden hammer handle or similar device while aligning connecting rod to crankshaft journal. Remove protective rubber caps and install cap with a clean, dry bearing.

10. Check connecting rod bearing and side clearances. Refer to Section 03-00 .

11. Make sure connecting rod is seated correctly on crankshaft journal. Install cap and lubricated bearing assembly. Tighten retaining nuts to 31-39 Nm (23-29 lb-ft).

12. Install oil pump and oil pump intermediate shaft. Tighten retaining bolt to 40-55 Nm (30-41 lb-ft).

tomsn048@gmail.com



Item	Part Number	Description
1	—	Bolt (Part of 6600)
2	6600	Oil Pump
3	6629	Oil Pump Intermediate Shaft Retaining Ring
4	6A618	Oil Pump Intermediate Shaft
5	6010	Cylinder Blocks
A	—	Tighten to 40-55 Nm (30-41 Lb-Ft)

tomsn048@gmail.com

13. Install oil pan as outlined in this section.

14. **CAUTION: If a new distributor or camshaft position sensor is installed, run engine at idle for five minutes before driving vehicle.**

    Dip entire distributor or camshaft position sensor drive gear in Engine Assembly Lubricant D9AZ-19579-D or equivalent meeting Ford specification ESR-M99C80-A.

15. Pour the rest of the pint of Engine Assembly Lubricant D9AZ-19579-D or equivalent meeting Ford specification ESR-M99C80-A through distributor hole onto cam drive gear.

16. For Ranger, install camshaft position sensor. Refer to Section 03-14 , Engine Controls, Electronic, for fuel injection timing.

17. Install cylinder heads as outlined in this section.

18. Install and perform intake manifold installation procedures as outlined in this section.

19. Fill crankcase with specified amount and viscosity of engine oil.

20. Fill and bleed cooling system.

21. **NOTE: When the battery has been disconnected and reconnected, some abnormal drive symptoms may occur while the powertrain control module (PCM) (12A650) relearns its adaptive strategy. The vehicle may need to be driven 16 km (10 miles) or more to relearn the strategy.**

    Connect ground cable at battery.

22. Start engine and check for oil, exhaust, coolant and vacuum leaks.

23. Check and set initial ignition timing.

---

tomsn048@gmail.com

tomsn048@gmail.com

Connecting Rod Bearings

The connecting rod bearings are a selective fit to provide for necessary operational clearances and oil pressure. Refer to Section 03-00 to measure bearing clearances and selection of the proper bearing insert.

NOTE: This operation is performed easiest with engine out of the vehicle. However, it can be performed with the engine in the vehicle.

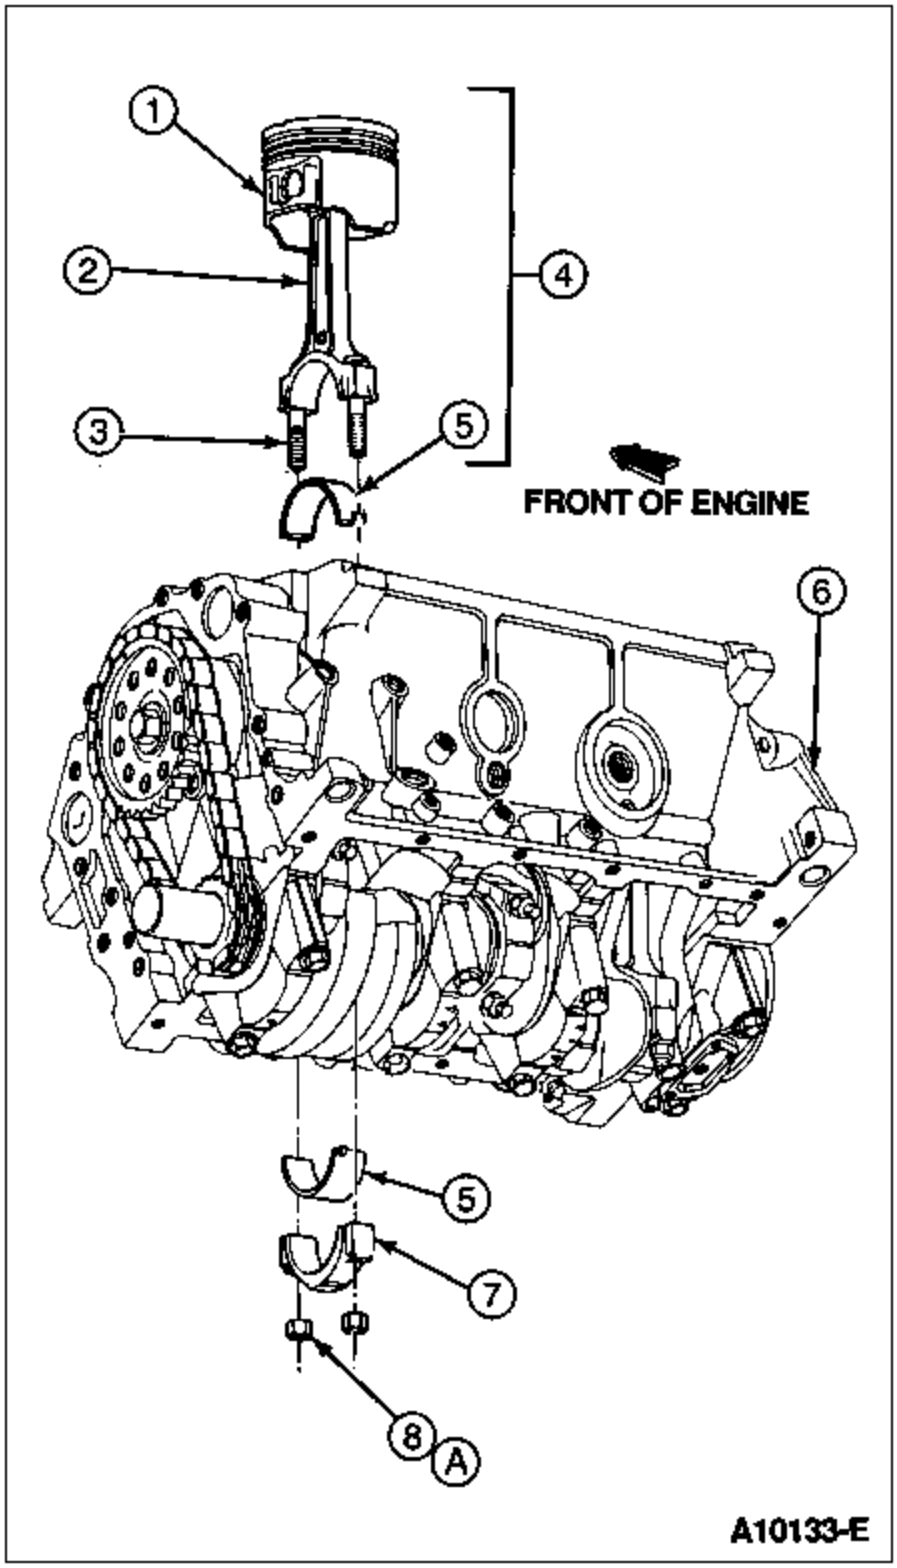
Removal

1. Disconnect ground cable at battery and set aside.
2. Remove all six spark plugs (12405) to allow for uninhibited crankshaft rotation.
3. Raise vehicle.
4. Remove oil pan (6675) as outlined in this section.
5. Remove oil pump (6600) if required as outlined in this section.
6. Turn connecting rod (6200) until crankshaft (6303) from which the bearings are to be removed is at the lowest point of travel.
7. Loosen retaining nuts and remove from cap. Place retaining nuts so that they may be reinstalled on the same rod bolt.
8. **CAUTION: Use extreme care to not scratch crankshaft journal.**

   Tap cap with a plastic mallet to separate from connecting rod. Carefully remove cap from crankshaft. If lower bearing remained on crankshaft, carefully grasp both sides and remove (oil acts as an adhesive between two precision fitted components).
9. **NOTE: Protective caps may be made from rubber fuel line.**

   Install protective rubber caps onto connecting rod bolts to protect crankshaft journal from bolt threads.
10. Push piston (6108) up into cylinder bore to provide clearance for removal. Remove upper connecting rod bearing (6211).
11. Inspect connecting rod bearings, crankshaft journal and connecting rod bearing surfaces for damage or wear.

tomsn048@gmail.com



Item	Part Number	Description
1	6102	Piston, Pin and Ring
2	6200	Connecting Rod

tomsn048@gmail.com

3	6214	Connecting Rod Bolt
4	6102	Piston, Pin, Ring and Connecting Rod Assembly
5	6211	Connecting Rod Bearing
6	6010	Cylinder Blocks
7	—	Connecting Rod Cap (Part of 6010)
8	6212	Connecting Rod Nut
A	—	Tighten to 31-39 Nm (23-29 Lb-Ft)

Installation

NOTE: Lightly oil all bolt and stud threads before installation.

1. **CAUTION: Contaminants allowed to remain on the cap or connecting rod bearing can distort the bearing or damage the crankshaft journals.**

   Thoroughly clean connecting rod bearings (including new bearings), connecting rod cap and connecting rod with solvent.

2. Clean crankshaft journal and lubricate with Engine Assembly Lubricant D9AZ-19579-B or equivalent meeting Ford specification ESR-M99C80-A. Make sure the entire journal is well lubricated.

3. Install upper connecting rod bearing in the connecting rod. Align locating tab with relief in connecting rod and seat fully into the rod. Lubricate bearing surface with Engine Assembly Lubricant D9AZ-19579-B or equivalent meeting Ford specification ESR-M99C80-A.

4. Pull connecting rod down until it seats onto the crankshaft journal.

5. Install connecting rod bearing into rod cap. Align locating tab to relief cap. Lubricate bearing surface with Engine Assembly Lubricant D9AZ-19579-B or equivalent meeting Ford specification ESR-M99C80-A.

6. Remove protective rubber caps from rod bolts.

7. **NOTE: Connecting rods and caps are matched to each other. Never mix connecting rod caps between other connecting rods. Match code letters stamped on the side of cap and connecting rod so that they are both on the same side.**

   Install connecting rod cap and the retaining nuts. Tighten retaining nuts to 31-39 Nm (23-29 lb-ft).

8. Install oil pump if removed. Align oil pump intermediate shaft (6A618) with camshaft position sensor, align pump with dowels and install retaining bolt. Tighten to 40-55 Nm (30-41 lb-ft).

9. Inspect and clean oil pump intake screen.

10. Install oil pan and new oil pan gasket (6710) as outlined.

11. Lower vehicle.

tomsn048@gmail.com

12. Install spark plugs. Tighten to 9-20 Nm (7-15 lb-ft).

13. Add correct amount and viscosity engine oil.

14. **NOTE: When the battery has been disconnected and reconnected, some abnormal drive symptoms may occur while the powertrain control module (PCM) (12A650) relearns its adaptive strategy. The vehicle may need to be driven 16 km (10 miles) or more to relearn the strategy.**

    Connect ground cable at battery.

15. Disconnect electrical connector at EDIS coil pack. Crank engine for 15 seconds to re-establish oil to oil pump and bearing surfaces then reconnect coil pack.

16. Start engine and check for oil leaks.

---

tomsn048@gmail.com

Flywheel

Removal

1. Remove transmission as outlined in the appropriate section in Group 07.
2. **NOTE: The engine rear plate can be removed.**

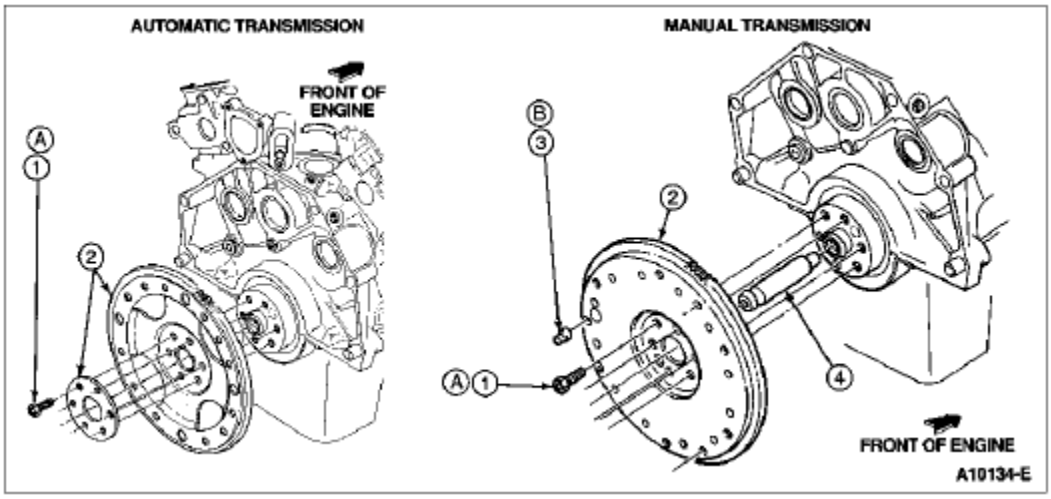
   Remove flywheel-to-crankshaft bolts (6379), flywheel reinforcing plate (6A366) (if equipped) and flywheel (6375).

Installation

All major rotating components including flex plate/flywheel are individually balanced to zero. Engine assembly balancing is not required. Balance weights should **NOT** be installed on new flywheels.

1. Install engine rear plate, if removed.
2. Position flywheel on the crankshaft, flywheel reinforcing plate (if equipped), and install attaching bolts. Tighten attaching bolts to 73-87 Nm (54-64 lb-ft) using the standard cross-tightening sequence.
3. Install transmission. See applicable section in Group 07.

Flywheel Installation



Item	Part Number	Description
1	6379	Flywheel-To-Crankshaft Bolt

tomsn048@gmail.com

2	6375	Flywheel
3	—	Dowel (3 Req'd) (Part of 6375)

Crankshaft Rear Oil Seal

SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
Jet Plug Remover	T77L-9533-B
Crankshaft Rear Seal Replacer	T88L-6701-A

Removal

1. Remove the flywheel. For additional information, refer to Flywheel in this section.
2. **CAUTION: Use care to avoid scratching or damaging the oil seal surface or leakage may occur.**

   Using a sharp awl, punch one hole into the crankshaft rear oil seal metal surface between the seal lip and the cylinder block.
3. Screw the threaded end of the special tool into the oil seal. Use the special tool to remove the crankshaft rear oil seal.

- A0034454

Installation

1. Lubricate the outer lips and the inner seal on the crankshaft rear oil seal with Super Premium SAE 5W-30 Motor Oil XO-5W-30-QSP or equivalent meeting Ford specification WSS-M2C153-G.
2. Using the special tool, install the crankshaft rear oil seal. Alternate bolt tightening to correctly seat the crankshaft rear oil seal.

- A0034391

3. Install the flywheel. For additional inforamtion, refer to Flywheel in this section.

tomsn048@gmail.com

tomsn048@gmail.com

Camshaft Rear Bearing Cover

SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
Impact Slide Hammer	T59L-100-B
Impact Slide Hammer	T50T-100-A

Removal

1. Remove transmission. Refer to the applicable section in Group 07.
2. Remove flywheel (6375). Refer to the Flywheel procedure in this section.
3. Using a sharp chisel or punch and hammer, cut a hole in the center of the camshaft rear bearing cover.
4. Remove the camshaft rear bearing cover using Impact Slide Hammer T59L-100-B or T50T-100-A. The plug can also be pried from the bore using a large punch. Use care to prevent damage to the plug bore.

Installation

Prior to installing camshaft rear bearing cover, the plug bore should be inspected for any damage that would interfere with the proper sealing of the plug. If the bore is damaged it will be necessary to true the surface by boring for the next specified oversize plug. Oversize plugs are identified by the "OS" stamped in the flat located on the cup side of the plug.

NOTE: Apply a light coating of Gasket Eliminator E1FZ-19562-A or equivalent meeting Ford specification WSK-M2G348-A4 to the sealing edge of the plug before installation.

1. Install camshaft rear bearing cover using a suitable driver.
2. Install flywheel. Refer to the Flywheel/Flex Plate procedure in this section. Tighten flywheel attaching to 73-87 Nm (54-64 lb-ft).
3. Install transmission. Refer to the applicable section in Group 07.

tomsn048@gmail.com

tomsn048@gmail.com

Oil Filter and/or Adapter

Removal

1. Raise vehicle on hoist. Refer to Section 00-02 .
2. Position drain pan beneath engine oil pan (6675).
3. Remove oil pan drain plug and drain.
4. Remove oil filter.

Installation

1. Install oil pan drain plug. Tighten to 20-34 Nm (15-25 lb-ft).
2. Lubricate oil filter gasket with fresh engine oil.
3. Thread oil filter onto adapter until gasket contacts cylinder blocks (6010) and then advance oil filter an additional one-half turn.
4. Lower vehicle.
5. Refill crankcase to proper level with specified engine oil.
6. Start engine and check for leaks.

tomsn048@gmail.com

tomsn048@gmail.com

Oil Level Indicator Tube

Removal

1. Remove oil level dipstick (6750) from oil level indicator tube (6754).
2. Remove oil level indicator tube retaining nut from exhaust manifold stud.
3. Remove oil level indicator tube from cylinder blocks (6010).

Installation

1. **NOTE: Using solvent, clean oil level indicator tube and cylinder block sealing surfaces before applying silicone sealer.**

   Apply a 3mm (1/8-inch) bead of Silicone Rubber D6AZ-19562-AA or equivalent meeting Ford specification ESB-M4G92-A or ESE-M4G-195-A to oil level indicator tube where oil level indicator tube mates with cylinder blocks.
2. Install oil level indicator tube into cylinder blocks.
3. Install oil level indicator tube bracket onto exhaust manifold stud. Install and tighten oil level indicator tube retaining nut to 16-20 Nm (12-15 lb-ft).
4. Install oil level dipstick into oil level indicator tube.

tomsn048@gmail.com

tomsn048@gmail.com

Oil Pressure Switch

Removal and Installation

1. **NOTE: The pressure switch-type unit used with the indicator lamp system is not interchangeable with the variable resistance-type unit called a sender, which is used with the gauge system. Refer to the Master Parts Catalog for proper parts usage. Installation of the wrong part will result in an inoperative oil pressure indicating system and a damaged switch unit or gauge.**

   Make sure the engine (6007) is turned off.

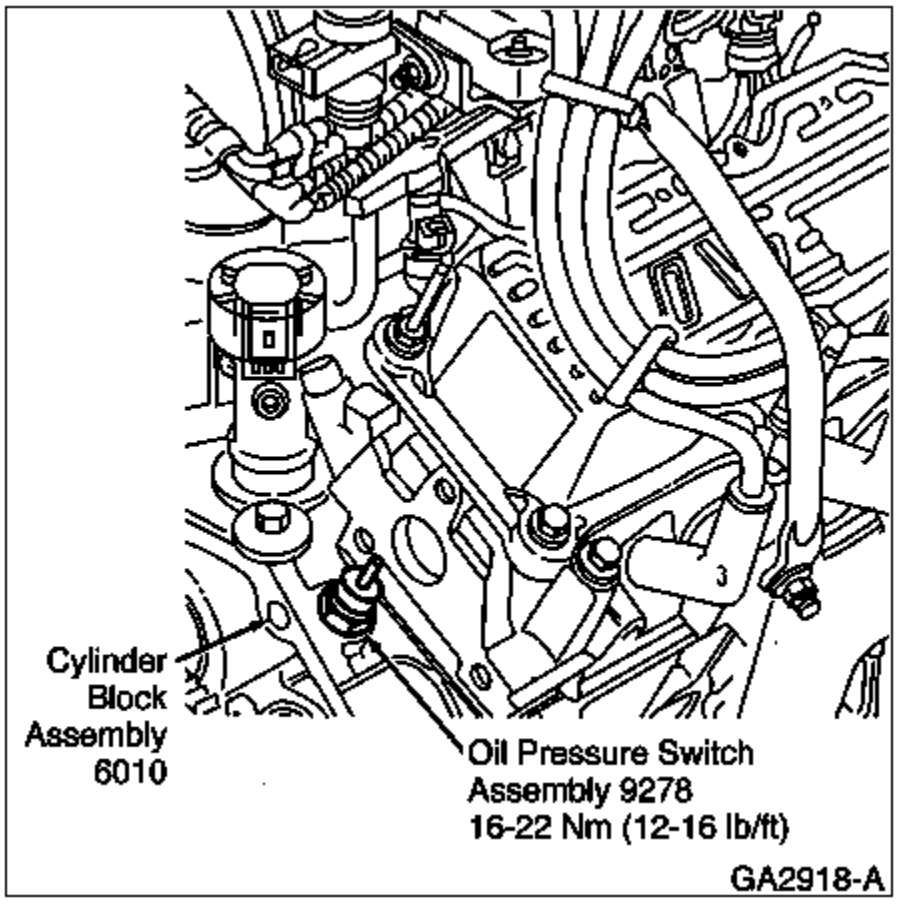
2. On Aerostar, remove inside engine cover.

3. Disconnect the wire at the switch unit terminal

4. Remove the oil pressure sensor (9278) from its mounting.

5. Apply Pipe Sealant with Teflon® D8AZ-19554-A or equivalent meeting Ford specification WSK-M2G350-A2 to new switch unit threads.

For installation follow removal procedures in reverse order. Tighten switch to 11-24 Nm (8-18 lb-ft).



tomsn048@gmail.com

tomsn048@gmail.com

Engine Assembly, Aerostar

SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
Fan Clutch Holding Tool	T84T-6312-C
Fan Clutch Nut Wrench	T84T-6312-D
Clutch Coupling Tool	T88T-70522-A

Removal

1. Disconnect positive and negative battery cables from battery terminals. Remove the retaining bolt from battery cable support-to-frame bracket at left front of engine. Secure cables to engine (6007).

2. Loosen radiator drain cock and drain coolant from radiator. Refer to Section 03-03 .

3. Disconnect PCV closure hose at engine air cleaner outlet tube. Release clips retaining air cleaner top. Loosen air cleaner outlet duct clamp at throttle body (9E926) and remove air cleaner top and air cleaner outlet tube together.

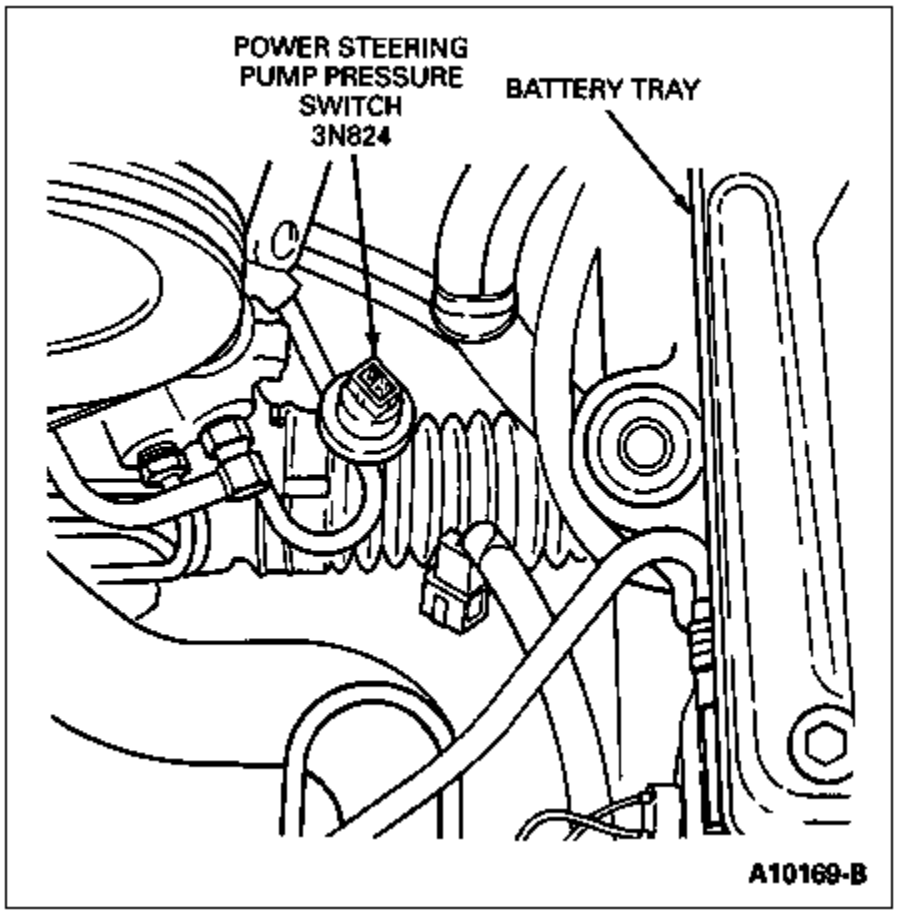
4. Remove vacuum supply hoses from:

    a. Power brake booster.
    b. Cruise control at check valve near throttle linkage (if equipped).
    c. Manifold absolute pressure sensor (MAP sensor).
    d. Heater and air conditioner supply hose at A/C vacuum check valve near A/C vacuum reservoir tank and bracket.

5. Secure vacuum hoses to engine.

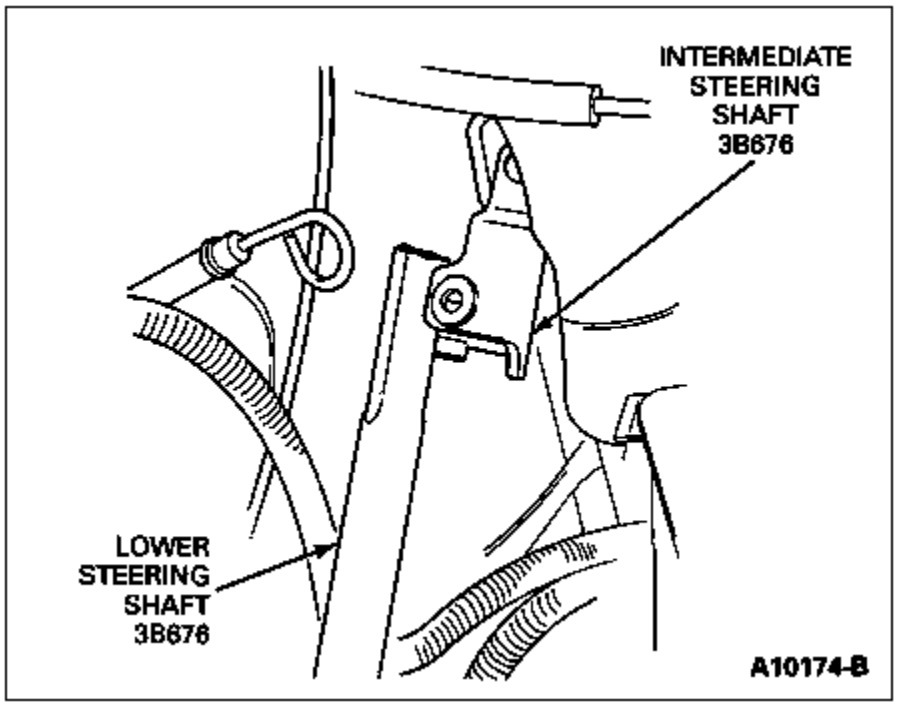
6. Remove upper radiator hose and lower radiator hose.

tomsn048@gmail.com



7. Disconnect power steering pressure switch (PSP switch).
8. Remove power steering pressure hose from clips in fan shroud.
9. Remove two screws holding fan shroud to radiator and pull fan shroud out of lower clips. Rest fan shroud on radiator fan.
10. Disconnect automatic transmission cooler lines from radiator.
11. Remove two radiator upper retaining bolts and lift radiator from core support.
12. Remove fan shroud from engine compartment.
13. Disconnect fuel charge wiring connectors at top center of dash panel.
14. Loosen clamps and disconnect heater water hoses at water pump (8501) and intake manifold fittings.

tomsn048@gmail.com



15. Loosen pinch bolt and disconnect steering column at intermediate shaft.

16. Follow the procedure as outlined in Section 12-00 to recover air conditioning system and recycle refrigerant.

17. **NOTE: All openings in the air conditioning system must be capped to keep dirt, foreign material, and excess moisture out of the system.**

    Disconnect air conditioner liquid line at condenser and suction line from accumulator.

18. Disconnect canister purge hose at evaporative emissions canister (EVAP canister purge solenoid under engine air cleaner base and secure to engine.

19. Release fuel system pressure as outlined in Section 03-04B .

20. Remove oil level dipstick (6750).

21. Raise vehicle.

22. Remove wheel hub bolt nuts and remove both front wheel and tire assemblies.

23. **NOTE: Place a piece of 4x4 wooden block or other suitable material between the rear of the engine cradle and the forward surface of the oil pan sump to keep the engine from tilting rearward and damaging components when removing the transmission.**

    Remove transmission as outlined in Section 07-01B .

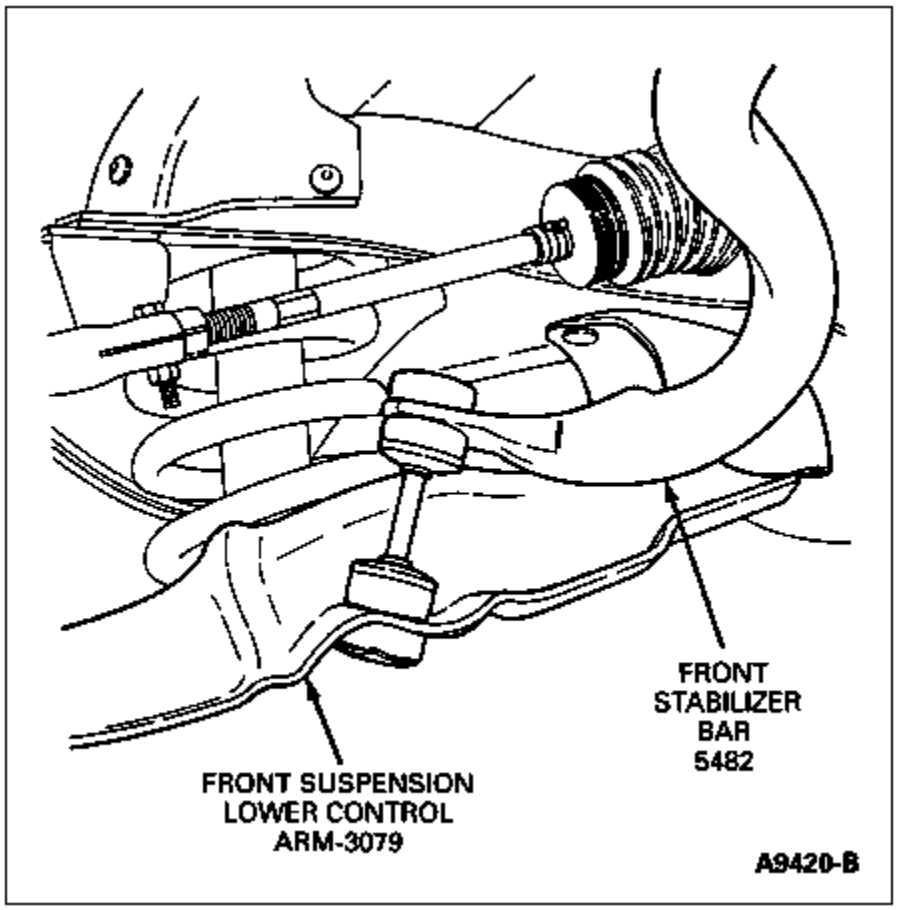
24. Loosen and remove exhaust manifold stud nuts. Remove bolts retaining three-way catalytic converter to muffler. Disconnect and remove muffler and three-way catalytic converter (TWC). Refer to Section 09-00 for specific removal and installation procedures.

25. Remove dash panel ground cables. One is located on cylinder head (6049) just behind power

tomsn048@gmail.com

steering pump. The other is located just above where exhaust manifold (9430) and three-way catalytic converter (TWC) connect.

26. Remove nuts and disconnect front stabilizer bar from front suspension lower arms. Discard nuts.

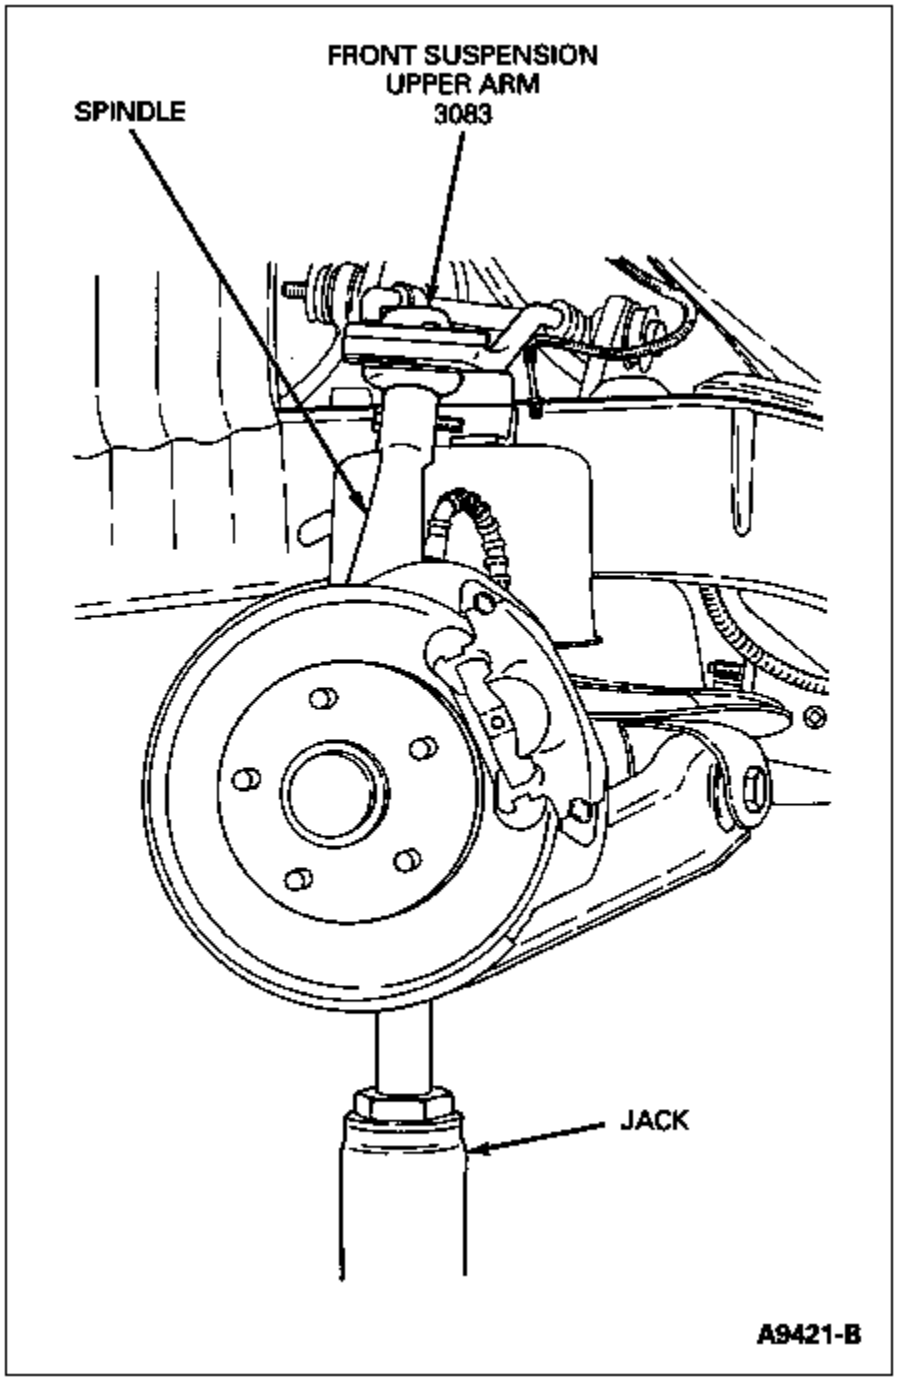


27. Remove disc brake calipers as outlined in Section 06-03 and secure to suspension upper arms.

28. Disconnect fuel lines along left frame rail near engine mounts as outlined in Section 03-04B .

29. Position a jack under front suspension lower arm and raise arm until tension is applied to front coil spring. Remove pinch bolt and nut retaining spindle to upper control arm ball joint. Slowly lower jack under front suspension lower arm to disconnect spindle from ball joint.

tomsn048@gmail.com

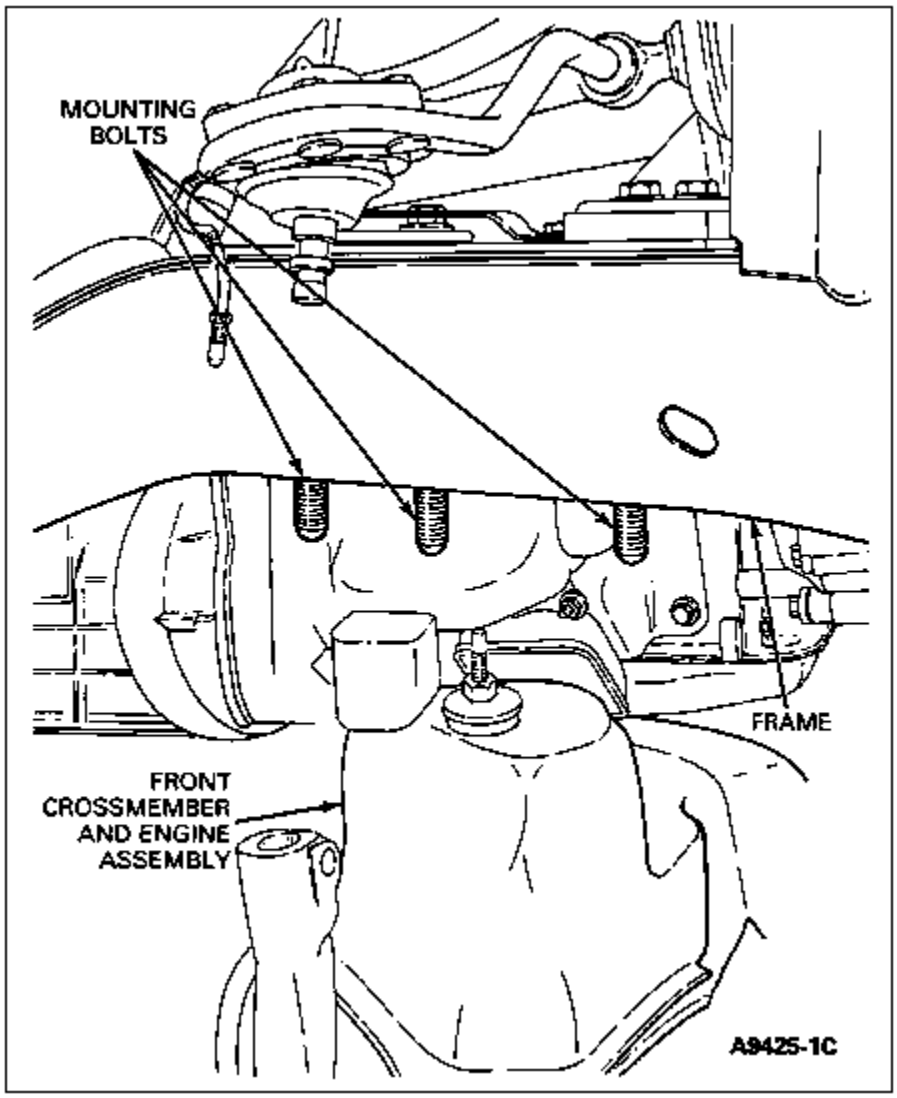


30. Position Powertrain Removal Lift 014-00765 or equivalent under crossmember and engine.

31. Lower vehicle until crossmember rests on removal lift. Place wood blocks under front crossmember and rear of cylinder blocks (6010) to keep engine and crossmember assembly level. Install safety chains around crossmember.

32. Remove three nuts from bolts that retain engine crossmember assembly to frame on each side of vehicle.

tomsn048@gmail.com



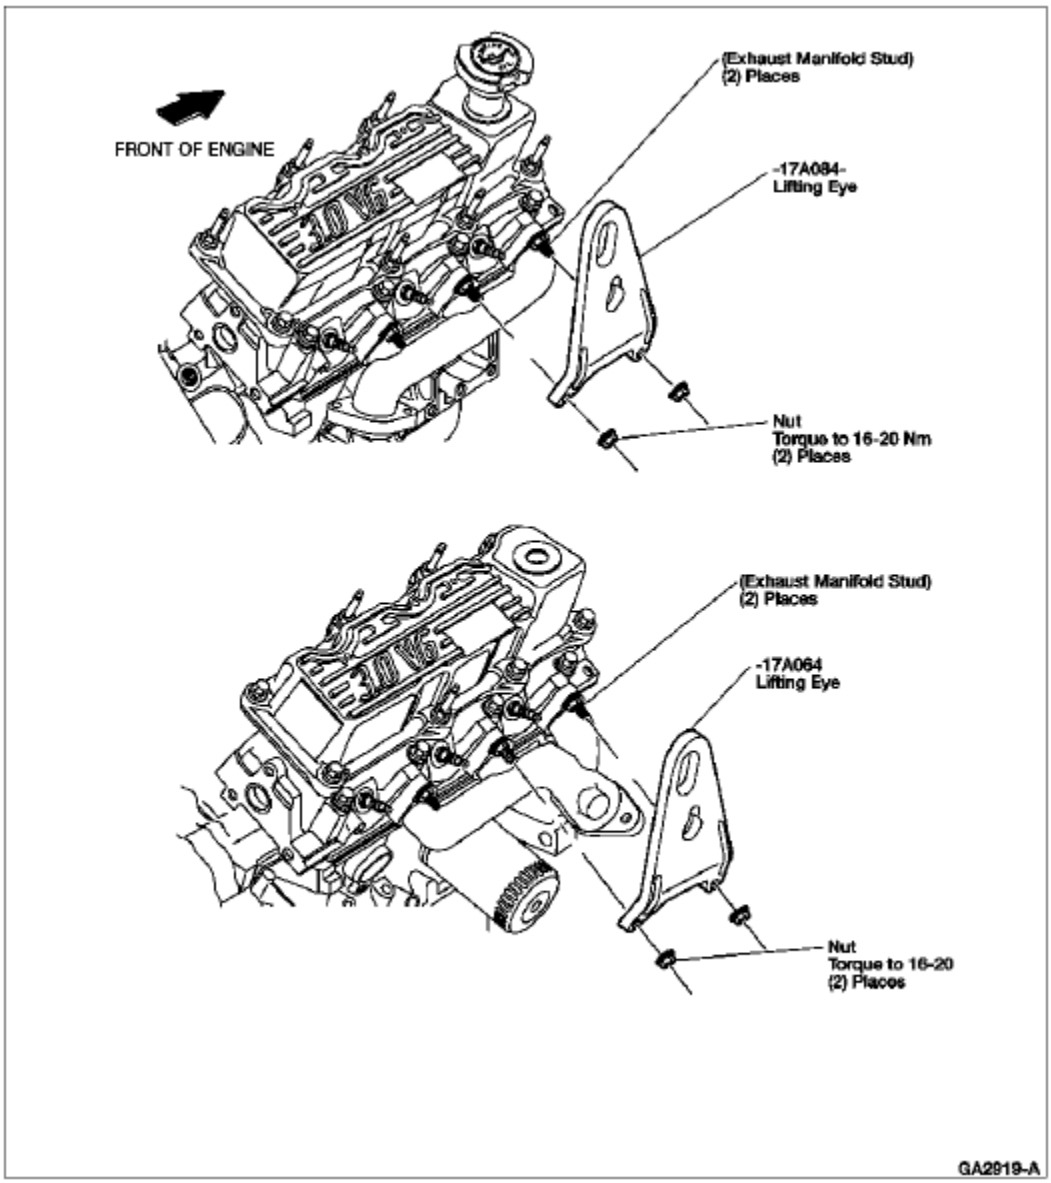
33. Lower engine and raise vehicle, making sure A/C compressor and wiring harnesses and hoses do not interfere with the process.

34. When engine and crossmember assembly are clear, roll lift out from under vehicle.

35. Attach Engine Lifting Eyes D81L-6001-D or equivalent to left rear cylinder head with a bolt.

36. The engine lifting eye should still be on the right cylinder head. If not, install a second lifting bracket.

tomsn048@gmail.com



37. **CAUTION: The support hook or chain must angle rearward to the rear attaching point. Damage will result if chain runs across throttle cable or throttle valve mechanism.**

    NOTE: When only two support points are used, the engine assembly will hang slightly down at the rear with the transmission attached. With the transmission removed, the engine assembly will hang slightly down at the front because of the weight of the accessories.

    To eliminate tilt:

    a. For forward tilt, attach a chain from the left (front) support bar to the stud on the No. 4 exhaust runner.
    b. For rearward tilt, attach a chain from the right (rear) support bar to the exhaust manifold between the No. 2 and No. 3 exhaust runner.

Installation

tomsn048@gmail.com

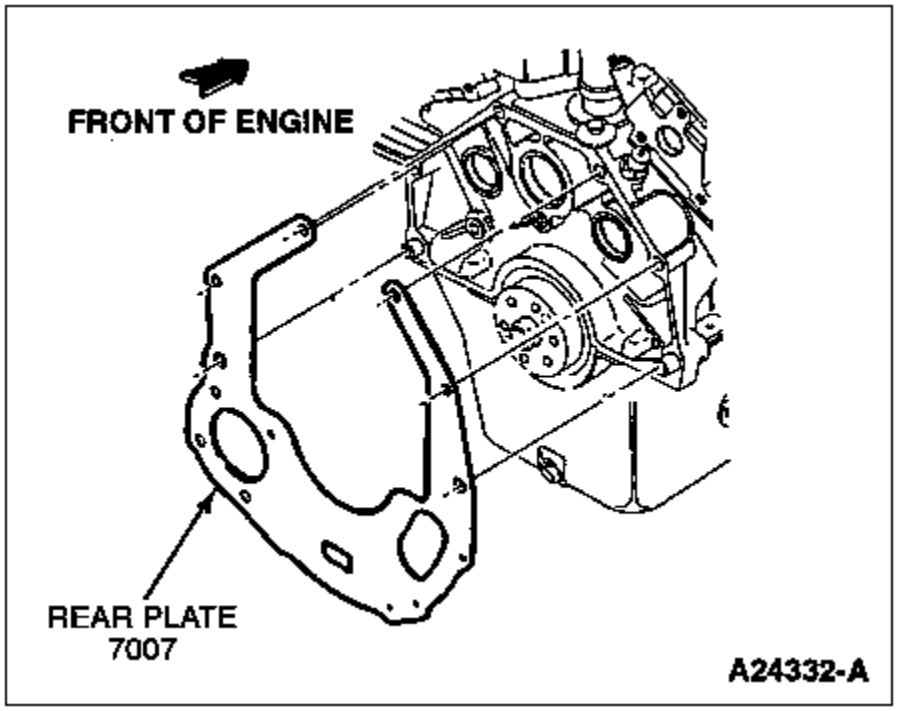
1. Install engine lifting eyes on engine, connect with a chain and attach to a floor crane.

2. Remove attaching bolts and remove engine from work stand.

3. **NOTE: Place a block of wood between the crossmember and the forward edge of the oil pan sump to keep engine level.**

   With front crossmember securely positioned on Powertrain Removal Lift 014-00265 or equivalent, slowly lower engine until engine mount studs are piloted in crossmember holes. Install retaining nuts and tighten to 96-127 Nm (71-94 lb-ft). Install safety chains.

4. Position engine rear plate on rear of engine.



5. Make sure vehicle is secured on hoist and maneuver Powertrain Removal Lift under vehicle. Align lift and engine/crossmember assembly so three mounting bolts on each side of frame are in alignment with holes in crossmember.

6. Lower vehicle slowly so bolts are piloted in crossmember holes. Raise engine lift or lower hoist so crossmember is against frame. Install nuts retaining crossmember to frame and tighten to 196-264 Nm (145-195 lb-ft).

7. Remove safety chain, raise vehicle and remove Powertrain Removal Lift.

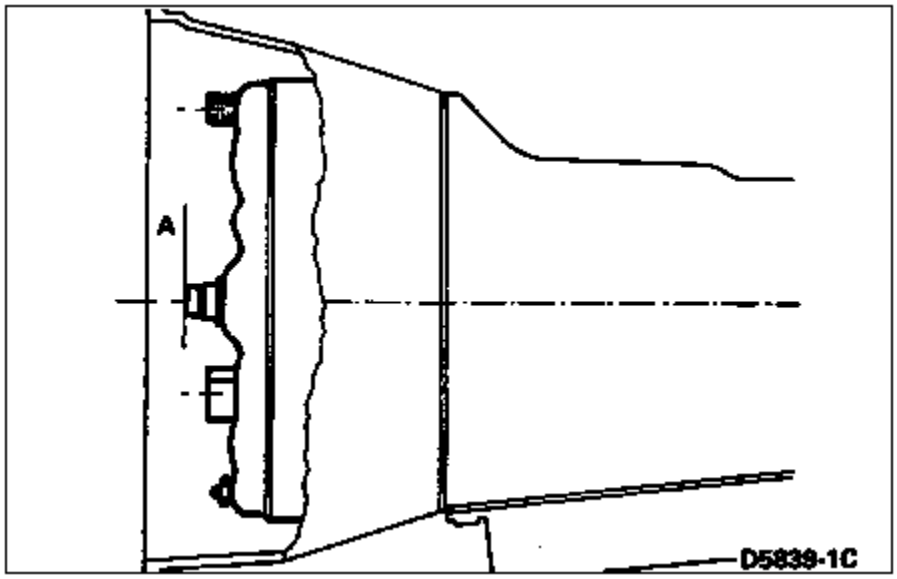
8. Install three-way catalytic converter (TWC) to exhaust manifolds (do not tighten bolts at this time). Install a new gasket between three-way catalytic converter and muffler inlet pipe, install nuts and bolts and tighten to 25-35 Nm (18-26 lb-ft).

9. **NOTE: Make sure torque converter rotates freely and is not bound up.**

   When the torque converter is fully installed, check dimension A: minimum 10.23mm (7/16 inch);

tomsn048@gmail.com

maximum: 14.43mm (9/16 inch).



If removed, position torque converter to transmission, making sure converter hub is fully engaged in front pump support and gear.

10. **CAUTION: Use care while moving transmission with torque converter installed. If transmission is tipped forward, the converter can slide out of the converter housing. It is best to secure the torque converter in the transmission case until the transmission is on a transmission jack and is ready to get bolted to the engine.**

    Once the converter is properly installed, place transmission on transmission jack and secure with a safety chain.

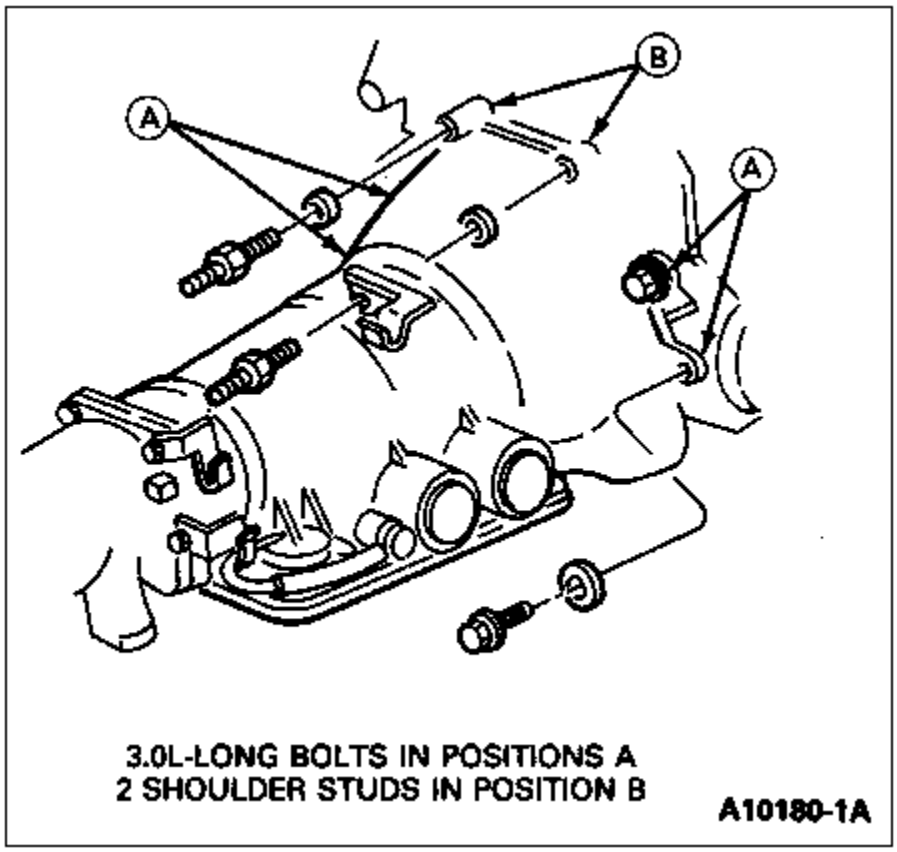
11. Rotate torque converter so drive studs are in alignment with holes in flywheel.

12. Move transmission forward into position, being careful not to damage flywheel or converter pilot. The converter house is piloted to the engine block with 2 dowel pins in the rear of the engine block.

13. Route transmission oil level dipstick tube up through engine compartment and insert in transmission.

14. Install converter housing to engine attaching fasteners. Ensure transmission oil level dipstick tube is secured by the torque converter bolt. Tighten to 44-60 Nm (33-44 lb-ft).

tomsn048@gmail.com



15. Connect transmission oil cooler lines to fittings on case and install oil cooler lines. Tighten cooler line flair nuts to 22-30 Nm (16-22 lb-ft).

16. If removed, install rear engine support insulator to transmission. Tighten bolts to 81-108 Nm (60-80 lb-ft).

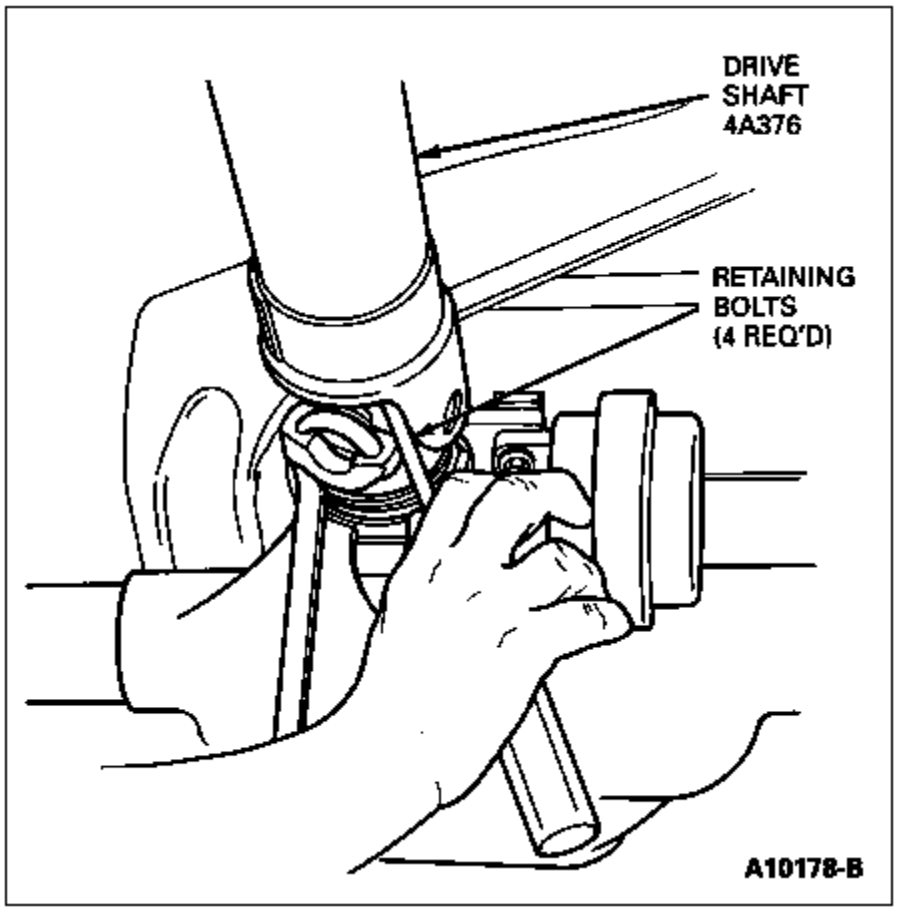
17. Position rear engine crossmember in 2 rear engine support brackets. Markings on rear engine support indicate direction of installation. Install nuts and bolts and tighten to 37-52 Nm (28-38 lb-ft). Refer to Section 02-03 for specific procedures.

18. Lower transmission slowly so studs are installed in proper slots in rear engine support. Install nuts and tighten to 97-127 Nm (74-94 lb-ft). Remove safety chain and remove transmission jack.

19. Tighten three-way catalytic converter to exhaust manifolds bolts to 34-46 Nm (25-34 lb-ft).

20. Connect driveshaft to transmission and rear axle, observing alignment marks made during removal. Install bolts securing rear cross-shaft to pinion flange. Tighten bolts to 95-129 Nm (70-95 lb-ft).

tomsn048@gmail.com



21. Position a 22mm socket and breaker bar on crankshaft damper bolt. Rotate crankshaft (6303) clockwise (as viewed from front) to gain access to each of the torque converter studs. Install a nut on each stud and tighten to 27-46 Nm (20-34 lb-ft).

22. Install converter housing lower cover to converter housing and tighten to 16-22 Nm (12-16 lb-ft).

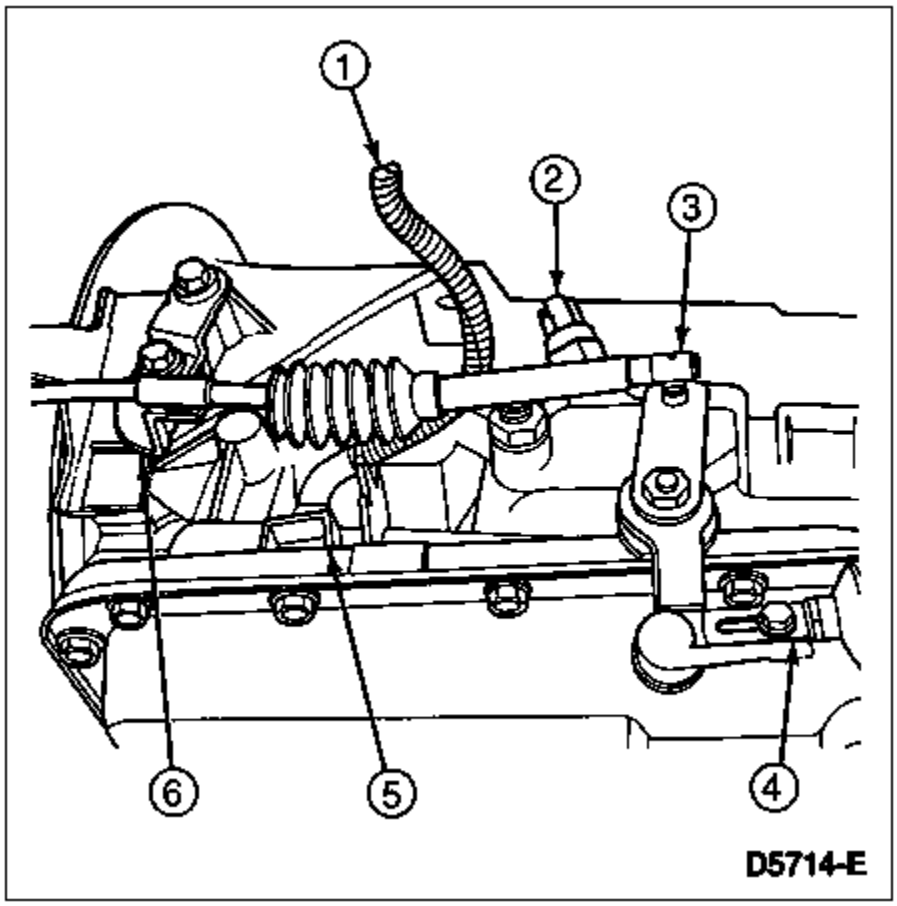
23. Install starter to transmission. Install dash panel ground cable and starter ground strap. Tighten starter bolts to 21-27 Nm (15-20 lb-ft). Connect starter relay cable and tighten nut and washer.

24. Position shifter cable in shifter cable bracket on transmission case. Press end of cable on ball stud on lower portion of manual valve detent lever. Refer to Section 07-05 to adjust shifter cable.

25. Install kickdown control cable in bracket and press end of cable on ball stud.

26. Connect neutral/start switch and converter clutch solenoid wiring connectors.

tomsn048@gmail.com

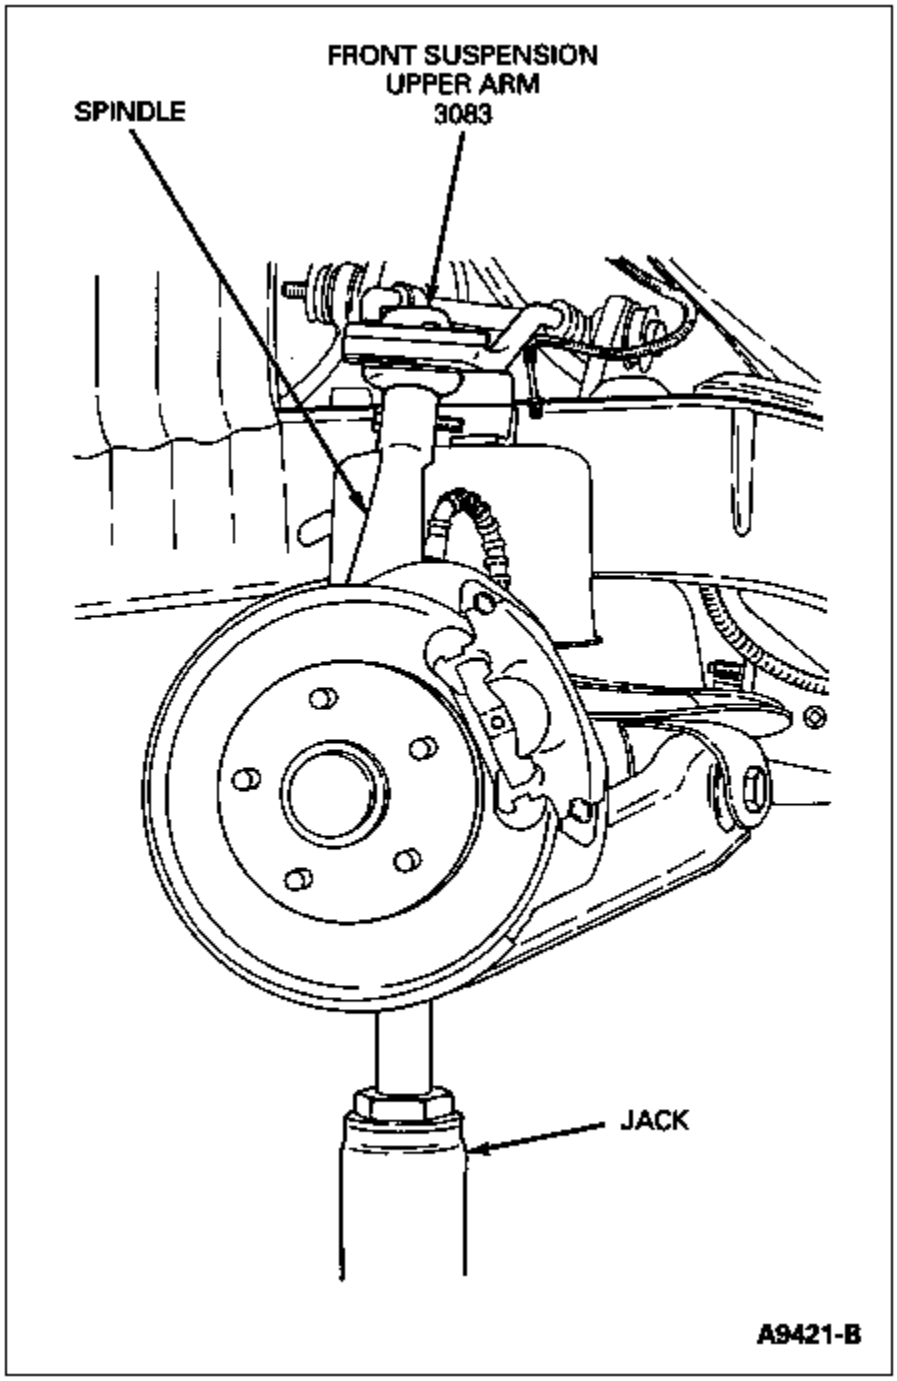


Item	Part Number	Description
1	—	Converter Clutch Solenoid Connect Wires
2	7A247	Park/Neutral Position Switch
3	7A187	Kickdown Control Shaft Rod
4	7E395	Shift Cable and Bracket
5	—	Converter Clutch Solenoid and 3-4 Shift Solenoid
6	7B229	Transmission Shift Cable Bracket

27. Insert speedometer gear and cable into transmission. Insert bolt through clamp and tighten to 2.25-2.82 Nm (20-25 lb-in).

28. Install a jack under the lower control arm. Slowly raise lower control arm until front coil spring is under tension. Continue to raise lower control arm until steering knuckle can be connected to the upper ball joint. Install pinch bolt and nut and tighten to 37-50 Nm (27-37 lb-ft).

tomsn048@gmail.com



29. Connect front stabilizer bar to lower control arms. Install new stabilizer bar link nuts and tighten to 16-24 Nm (12-18 lb-ft).

30. Reinstall front brake calipers to steering knuckle as outlined in Section 06-03 .

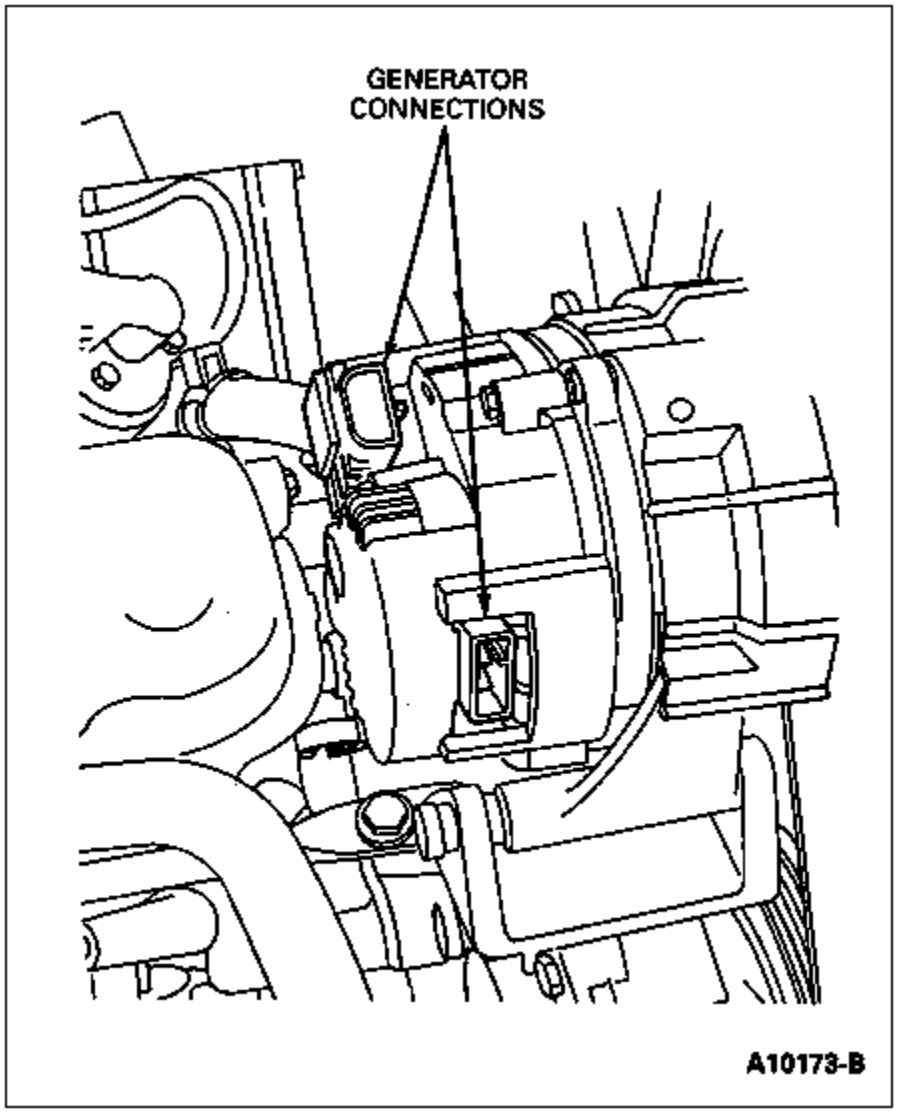
31. Reconnect fuel lines along left frame rail near engine mount as outlined in Section 03-04B .

32. Install front wheel and tire assemblies on rotors. Install and tighten wheel lug nuts to 115-155 Nm (85-114 lb-ft).

33. Connect electrical connector for heated oxygen sensor (HO2S).

tomsn048@gmail.com

34. Position 2 dash panel ground straps on engine and tighten 2 ground strap bolts.
35. Lower vehicle.
36. Connect oil pressure sensor electrical connector through cab area.
37. Install rear engine compartment cover inside vehicle.
38. From inside engine compartment, in front of vehicle connect 2 electrical connectors to generator.



39. Connect vacuum supply hose to power brake booster.
40. Reconnect cruise control vacuum at check valve and linkage to throttle shaft.
41. Connect barometric manifold absolute pressure sensor vacuum line located on dash panel.
42. Connect steering column at intermediate shaft. Install pinch bolt and tighten to 41-57 Nm (30-42 lb-ft).

tomsn048@gmail.com

43. Connect electrical connector to power steering pressure switch (PSP switch).

44. Reconnect heater water supply and return hoses.

45. **CAUTION: Fan clutch nut has left hand thread. Turn counterclockwise to tighten.**

    Install assembled fan blade and clutch and tighten to 41-135 Nm (30-100 lb-ft) using Fan Clutch Holding Tool T84T-6312-C and Fan Clutch Nut Wrench T84T-6312-D.

46. Install fan shroud over fan blade.

47. Install radiator (8005) by positioning 2 lower guide pins in grommets and securing at top with 2 retaining bolts. Tighten bolts to 17-27 Nm (13-20 lb-ft).

48. Reconnect transmission oil cooler lines to fittings in left radiator tank. Tighten cooling line flair nuts to 22-30 Nm (16-22 lb-ft).

49. Position fan shroud in retaining clips at bottom and secure with 2 bolts at top. Tighten screws to 6-8 Nm (53-71 lb-in).

Radiator Installation, Aerostar 3.0L

	Part	

tomsn048@gmail.com

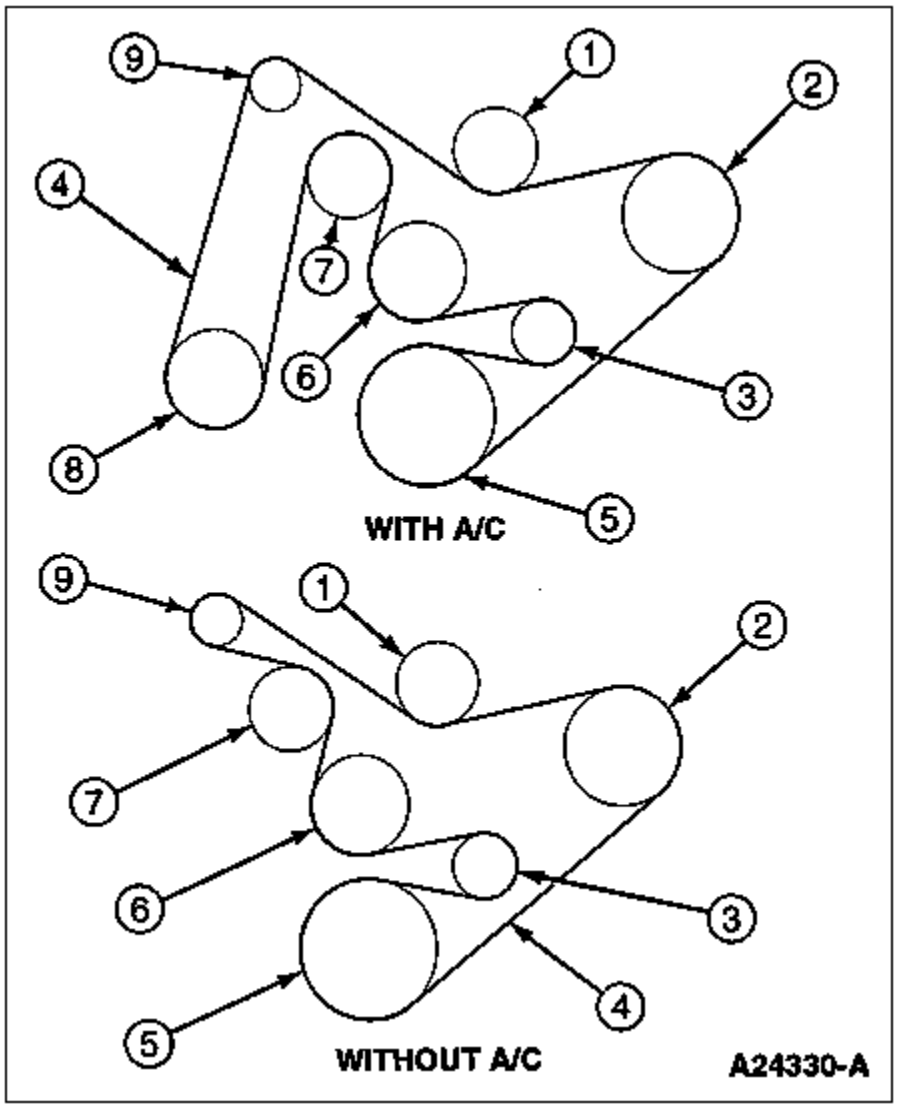
Item	Number	Description
1	N801731-S2	U-Nut
2	N804639-S2	U-Nut
3	N606692-S2	Screw and Washer Assembly
4	N606677-S2	Screw and Washer Assembly
5	8260	Upper Radiator Hose Install with Stripe at 12:00 O'Clock Position
6	8592	Water Hose Connection
7	8501	Water Pump
8	8286	Lower Radiator Hose Install with Stripe at 12:00 O'Clock Position
9	8146	Fan Shroud
10	8005	Radiator
11	17B613	Reservoir
12	8075	Radiator Overflow Hose
A	—	Tighten to 6-8 Nm (53-71 Lb-In)

50. Connect hose to evaporative emission canister purge valve (EVAP canister purge valve) (9C915).

51. Reconnect A/C suction hose to accumulator and discharge line to condenser. Evacuate and refill with refrigerant as outlined in Section 12-00 .

52. Route belt as illustrated but do not wrap over alternator pulley. With wrench, rotate engine drive belt tensioner clockwise and slide belt over alternator pulley.

tomsn048@gmail.com



Item	Part Number	Description
1	3F671	Power Steering Belt Idler Support
2	3A733	Power Steering Pump Pulley
3	6B209	Drive Belt Tensioner
4	8620	Drive Belt
5	6312	Crankshaft Pulley
6	8509	Water Pump Pulley
7	—	Idler (Part of 8A620)
8	19703	A/C Compressor
9	10300	Generator

53. Connect accelerator cable to ball stud located on throttle body. Connect cruise control cable if equipped. Install accelerator control splash shield.

tomsn048@gmail.com

54. Connect upper and lower radiator hoses at radiator.

55. Install engine air cleaner outlet tube at throttle body and engine air cleaner.

56. Install PCV closure hose at air cleaner outlet tube and valve cover.

57. **NOTE: When the battery has been disconnected and reconnected, some abnormal drive symptoms may occur while the powertrain control module (PCM) (12A650) relearns its adaptive strategy. The vehicle may need to be driven 16 km (10 miles) or more to relearn the strategy.**

    Connect ground cable at battery.

58. Fill cooling system to specified level. Refer to Section 03-03 .

59. Check and adjust all fluid levels. Refer to appropriate sections.

60. Start and run engine to check for proper operation and leaks. Service as required.

61. Check and, if required, align front suspension. Refer to Section 04-00 .

tomsn048@gmail.com

3.0L Engine, Ranger

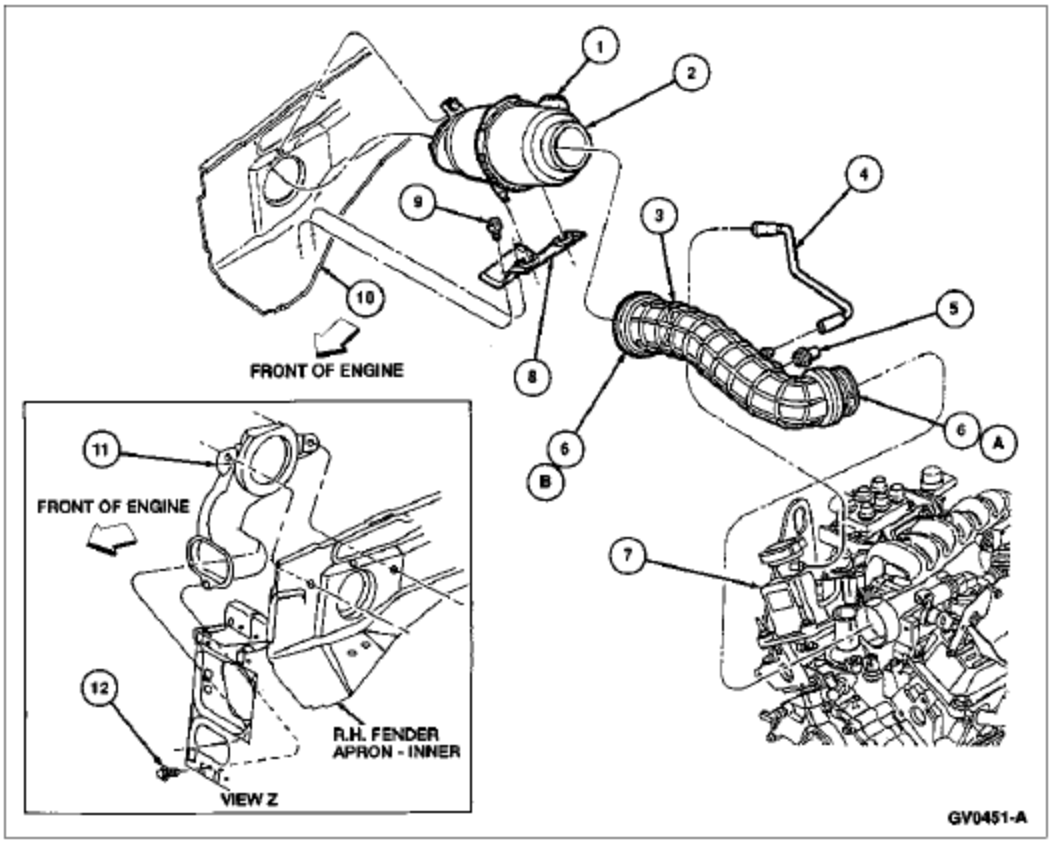
SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
Fan Clutch Holding Tool	T84T-6312-C
Fan Clutch Nut Wrench	T84T-6312-C
Clutch Coupling Tool	T88T-70522-A
Strap Wrench	D85L-6000-A
Fuel Pressure Gauge	T80L-9974-B
Spring Lock Coupling Disconnect Tool (3/8 inch)	T81P-19623-G1
Spring Lock Coupling Disconnect Tool (1/2 inch)	T81P-19623-G2
Spring Lock Coupling Disconnect Tool (5/8 inch)	T83P-19623-C
Spring Lock Coupling Disconnect Tool (3/4 inch)	T85L-19623-A
Spreader Bar	D93P-6001-A3
Teflon® Seal Replacer Set	D90P-3517-A

Removal

1. Disconnect the negative battery cable. Refer to Section 14-01 .
2. Drain the cooling system. Refer to Section 03-03 .
3. Discharge and recover the refrigerant from the A/C system. Refer to Section 12-03A .
4. Drain the power steering fluid.
5. Disconnect the hood light connector and locator from the hood. Unclip the ground strap from the right side of the hood. Mark the location of the hood hinges, remove the four bolts, and remove the hood.
6. Disconnect the crankcase ventilation hose from the air cleaner outlet tube. Disconnect the electrical connectors from the mass air flow (MAF) sensor and the intake air temperature (IAT) sensor. Disconnect the harness locator from the air cleaner outlet tube. Loosen the clamp at the throttle body, unsnap the air cleaner cover from the air cleaner housing. Remove the air cleaner cover and air cleaner outlet tube as an assembly.

tomsn048@gmail.com

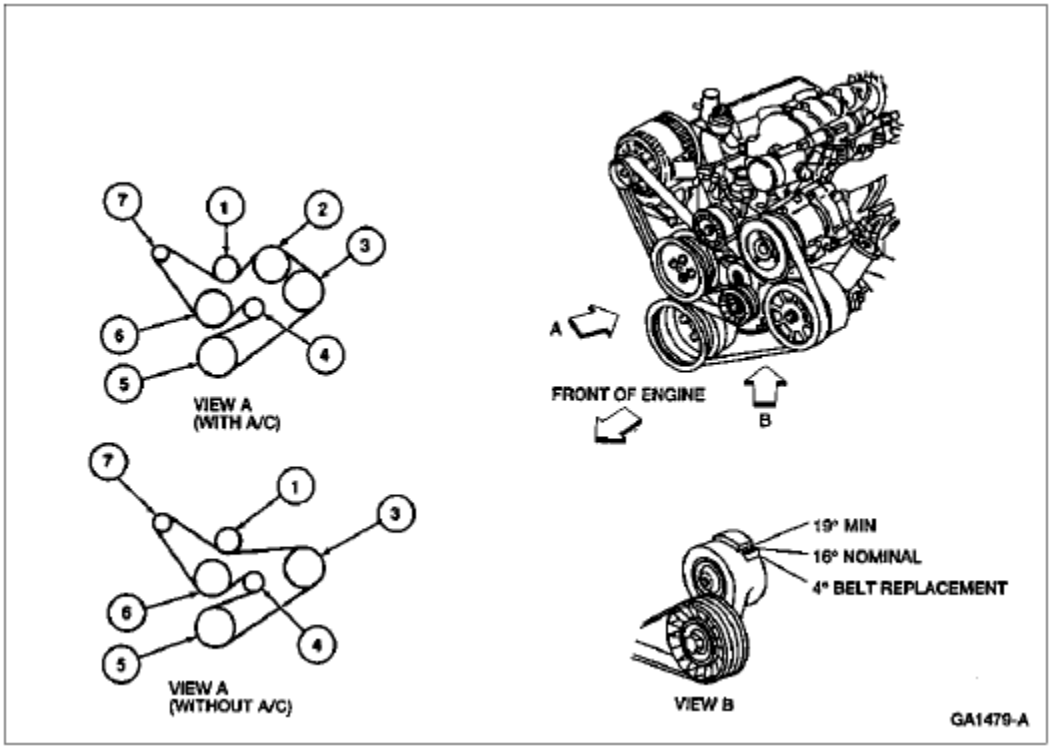


Item	Part Number	Description
1	12B579	Mass Airflow Sensor
2	9600	Engine Air Cleaner
3	9B659	Air Cleaner Outlet Tube
4	6853	Crankcase Ventilation Hose
5	12A697	Intake Air Temperature Sensor
6	—	Clamp (Part of 9B659)
7	6582	Valve Cover
8	9626	Engine Air Cleaner Mounting Bracket
9	N606675-S310	Screw, 1 x 16.5 (2 Req'd)
10	16006	Front Fender, Inner (RH)
11	9B660	Air Inlet Tube
12	N605894	Bolt (3 Req'd)
A	—	Tighten to 2-3 Nm (18-27 Lb-In)
B	—	Tighten to 1-2 Nm (9-18 Lb-In)

7. Compress and position the clamps on the upper radiator hose and remove the hose.
8. Lift the drive belt tensioner by rotating it and remove the accessory drive belt. Position the accessory

tomsn048@gmail.com

drive belt over the radiator.



Item	Part Number	Description
1	3F671	Belt Idler Pulley
2	19D629	A/C Compressor
3	3D673	Power Steering Pump Pulley
4	6B209	Drive Belt Tensioner
5	6312	Crankshaft Pulley
6	8A528	Water Pump Pulley
7	10300	Generator

9. Remove the fan shroud retaining bolts. Using Strap Wrench D85L-6000-A or equivalent to hold the water pump pulley, remove the fan blade and fan clutch assembly. Remove the fan blade and fan shroud as an assembly.

10. Remove the radiator overflow hose from the radiator and position it out of the way. Remove the accessory drive belt.

11. Compress the clamp on the lower radiator hose and disconnect the hose from the radiator.

12. Disconnect the automatic transmission oil cooling lines from the radiator fittings. Install protective caps over the lines.

13. Remove the radiator bolts. Tilt the radiator back and lift it directly upward, clear of the radiator support bracket.

tomsn048@gmail.com

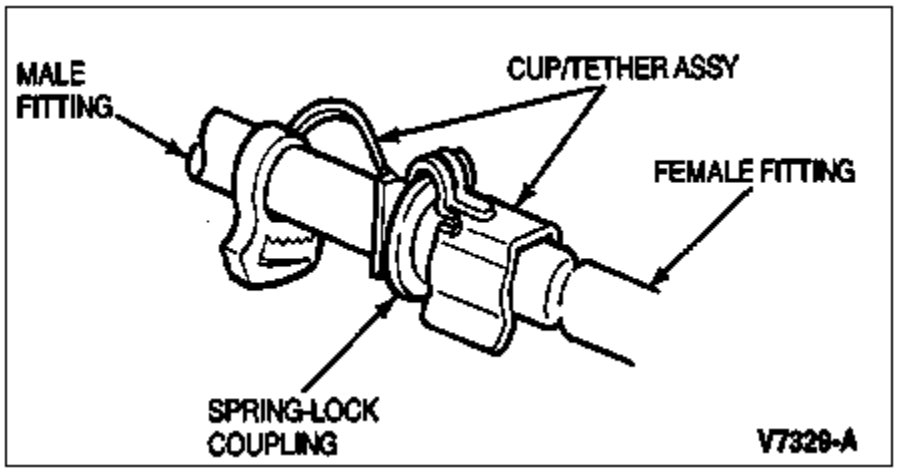
14. **CAUTION: When disconnecting the speed control cable from the ball stud, use a screwdriver (or similar tool) close to the stud and pry slowly. Pulling by hand can damage the cable.**

    Remove the accelerator control splash shield pushpins and the shield. Disconnect the accelerator and speed control cables from the ball stud at the throttle body. Remove the speed control cable from the locator at the exhaust gas recirculation (EGR) transducer bracket. Remove the bolts retaining the accelerator cable bracket to the intake manifold. Remove the speed control cable from the locator. Position the bracket and cables out of the way.

15. **WARNING: FUEL SUPPLY LINES ON VEHICLES EQUIPPED WITH FUEL INJECTED ENGINES REMAIN PRESSURIZED FOR LONG PERIODS OF TIME AFTER ENGINE SHUTDOWN. FUEL SYSTEM PRESSURE MUST BE RELIEVED PRIOR TO FUEL SYSTEM SERVICE, TO PREVENT POSSIBLE INJURY.**

    Remove the protective cap from the fuel pressure relief valve. Connect Multiport Fuel Injection (MFI) Fuel Pressure Gauge (EFI/CFI) T80L-9974-B to the fuel pressure relief valve on the fuel injection supply manifold. Place the end of the adapter in a suitable container. Open the manual valve of the tool to relieve the pressure. Close the manual valve and disconnect the tool from the relief valve. Remove the container and install the protective cap on the relief valve.

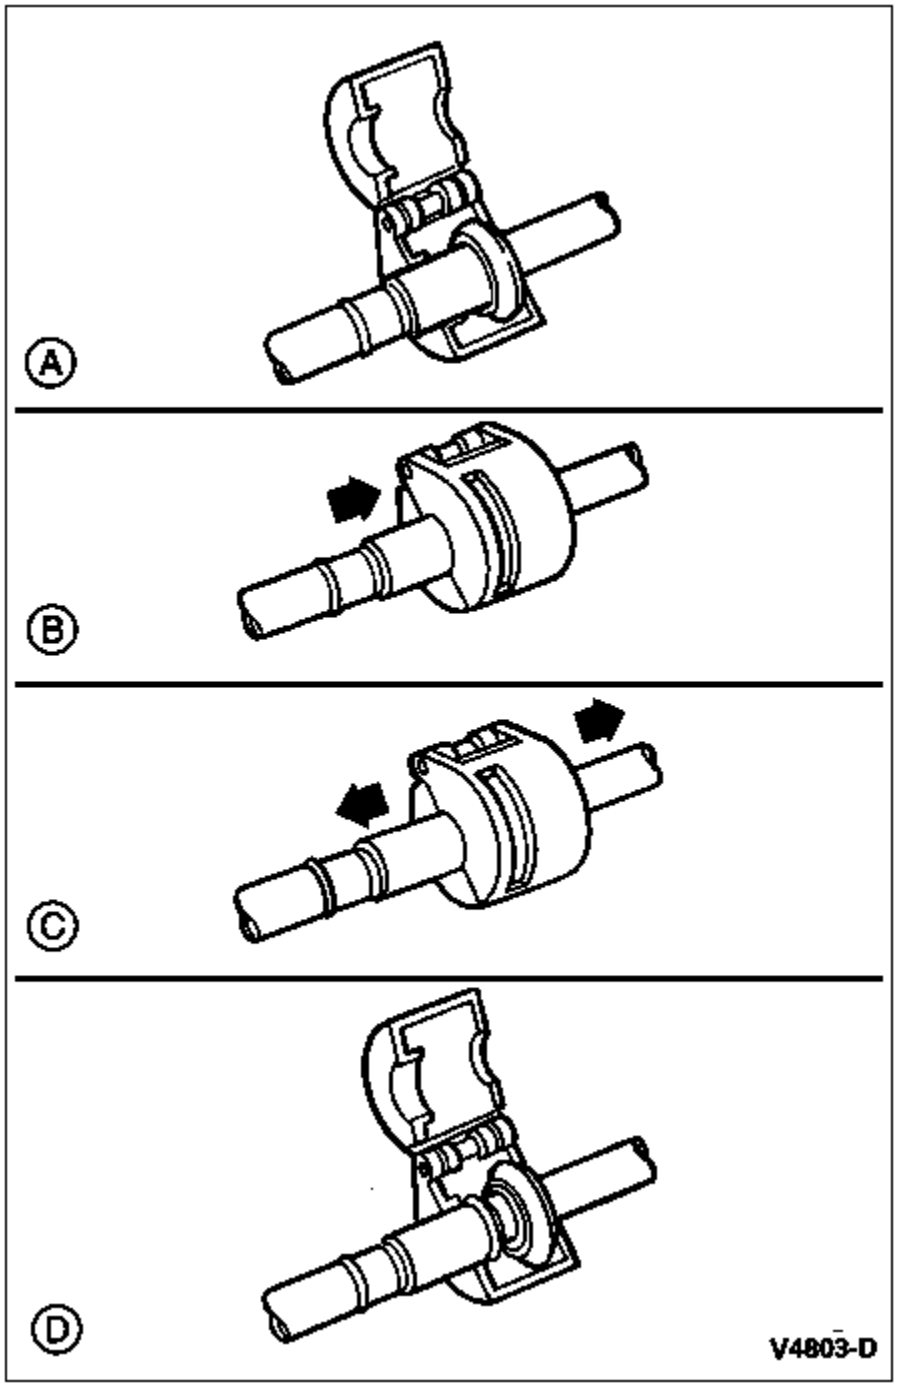
16. Remove the safety clips from the pressure and return fuel line spring lock couplings at the chassis-to-engine connections (lower left side of the engine).



17. **NOTE: Inspect the couplings for missing or damaged O-rings. If either O-ring is damaged, both O-rings must be replaced. Replace the O-rings or garter springs only with the appropriate replacement parts.**

    Position a Spring Lock Coupling Disconnect Tool D87L-9280-A (3/8-inch), D87L-9280-B (1/2-inch) on the couplings. Push the tool into the cage opening to release the fitting from the garter spring. Remove the tool and pull the coupling apart. Install protective caps over the fuel lines.

tomsn048@gmail.com



18. Remove the fuel line bracket nut from the A/C compressor/power steering bracket stud. Remove the lines and bracket. Position them out of the way.

19. Disconnect the electrical connector from the A/C pressure cutoff switch. Remove the nut retaining the A/C line to the water pump studded bolt.

20. Remove the A/C safety clips at the condenser tube and at the suction accumulator/drier. Install Spring Lock Coupling Disconnect Tool T81P-19623-G1, T81P-19623-G2, T83P-19623-C, or T85L-19623-A to the couplings. Close the tool and push it into the open side of the cage, to expand the garter spring. Release the fitting, remove the tool, and disconnect the fittings. Install protective caps.

tomsn048@gmail.com

21. Disconnect the electrical connector from the A/C compressor clutch and two wire locators from the rear of the compressor. Remove the bolt retaining the A/C manifold and tube to the compressor.

22. Remove the bolts retaining the compressor to the bracket. Separate the A/C manifold and tube from the compressor and remove the compressor. Install protective caps into the compressor. Remove the A/C manifold and tube and install caps.

23. Compress and position the clamps on the heater hoses at the water pump and intake manifold. Remove the hoses and position them out of the way.

24. Disconnect the electrical connections from the generator (GEN) and the wire locator from the generator (GEN) bracket. Position the harness out of the way.

25. Remove the Torx® bolt retaining the accessory drive belt tensioner and remove the tensioner.

26. Disconnect the power steering pressure line from the power steering pump. Install a protective cap over the fitting.

27. Remove the bolts retaining the A/C compressor/power steering pump bracket. Position the bracket and pump forward. Compress and position the clamp on the power steering return hose and disconnect from the power steering pump. Remove the bracket and pump assembly.

28. Disconnect the vacuum hose from the purge valve at the left wheel well. Disconnect the vacuum reservoir vacuum hose from the vacuum connector, located at the right valve cover.

29. Compress the clamp and disconnect the power brake booster vacuum hose from the vacuum tree. Position the hose out of the way.

30. Loosen the bolt of the 42-pin connector at the rear of the left valve cover and separate the connector. Position the connector out of the way.

31. Remove the nut retaining the ground strap to the windshield wiper motor retaining stud and position the ground strap out of the way.

32. Loosen the bolt and disconnect the powertrain control module (PCM) connector. Remove the nut retaining the PCM wiring harness bracket to the bulkhead. Remove the studded bolt retaining the ground wire to the bulkhead. Position the harness over the engine.

33. Disconnect the two 16-pin transmission connectors from the rear of the right cylinder head. Disconnect the right hand heated oxygen sensor (HO2S) connector.

34. **NOTE: The right hand bolt retains the upper filler tube.**

    Remove the two upper converter housing-to-engine retaining bolts and remove the upper filler tube.

35. **NOTE: If the engine is not going to be reinstalled, the replacement engine must now be mounted to an engine stand.**

    Install Engine Lifting Eyes D81L-6001-D or equivalent to the right hand and left hand exhaust manifolds.

36. Raise the vehicle. Refer to Section 00-02 .

37. Drain the engine oil.

tomsn048@gmail.com

38. Remove the bolt and nut retaining the oil filter drain funnel. Remove the starter motor bolts and secure the starter out of the way. Remove the drain funnel.

39. Remove the torque converter dust cover retaining bolts and remove the cover.

40. **NOTE: Use the crankshaft pulley bolt to rotate the converter. Mark the converter stud and flexplate to aid during assembly.**

    Remove and discard the converter-to-flexplate nuts.

41. Remove the exhaust manifold-to-exhaust pipe nuts.

42. Remove the studded bolt retaining the ground cable to the left side of the engine block and position the cable aside.

43. Remove the bolt retaining the transmission oil cooler line bracket to the right rear of the cylinder block.

44. Remove the remaining converter housing-to-engine retaining bolts.

45. Lower the vehicle.

46. Remove the engine mount retaining nuts.

47. **NOTE: Position a block of wood on a floor jack, to protect the transmission.**

    Position the floor jack under the front of the transmission and slightly raise it.

48. Position and connect Floor Crane 077-00043 or equivalent and Modular Engine Lifting Bar 014-00073 or equivalent to the lifting brackets. Slightly raise the engine. Carefully separate the engine from the transmission. Carefully lift the engine out of the engine compartment.

Installation

1. Position the paint marks at the 12 o'clock position on both the torque converter and flexplate.

2. **NOTE: Make sure the studs on the torque converter align with the holes in the flexplate. Make sure the dowels in the cylinder block engage the transmission housing.**

   Carefully lower the engine into the engine compartment. Align the torque converter studs with the holes in the flexplate. Fully engage the engine to the transmission. Lower the engine and position the engine mounts. Disconnect the floor crane and balance bar from the lifting brackets and position them out of the way.

3. Install the upper LH converter housing-to-engine retaining bolt. Lower and remove the floor jack.

4. Install both engine mount retaining nuts. Tighten to 95 Nm (70 lb-ft).

5. Raise the vehicle.

6. Install the remaining converter housing-to-engine retaining bolts. Tighten to 40 Nm (30 lb-ft).

tomsn048@gmail.com

7. **NOTE: Use the crankshaft pulley bolt to rotate the converter.**

   Install new torque converter-to-flexplate nuts. Tighten to 40 Nm (30 lb-ft).

8. Install the torque converter dust cover and retaining bolts. Tighten to 14 Nm (10 lb-ft).

9. Position the transmission oil cooler line bracket to the right rear of the engine block and install the retaining bolt. Tighten to 23 Nm (17 lb-ft).

10. Position the exhaust system and install the manifold-to-exhaust pipe retaining nuts. Tighten to 40 Nm (30 lb-ft).

11. Install the ground cable to the left rear area of the engine block. Tighten to 23 Nm (17 lb-ft).

12. Position the oil filter drain funnel. Install the starter motor and retaining bolts. Tighten to 25 Nm (18 lb-ft). Install and securely tighten the drain funnel retaining bolt and nut.

13. Lower the vehicle.

14. Remove the engine lifting eyes from the exhaust manifolds.

15. Connect the two 16-pin transmission connectors to the rear of the right hand cylinder head. Connect the right hand HO2S connector.

16. **NOTE: The RH bolt retains the upper filler tube. Inspect the O-ring on the filler tube and replace as necessary.**

    Install the upper filler tube into the lower filler tube. Install the RH upper converter housing-to-engine retaining bolt. Tighten both upper bolts to 45 Nm (33 lb-ft).

17. Install the ground strap to the wiper motor studded bolt. Tighten to 10 Nm (89 lb-in).

18. Connect the 42-pin connector to the rear of the left valve cover. Tighten to 6 Nm (53 lb-in).

19. Connect the power brake booster vacuum hose to the vacuum tree and position the clamp. Connect the vacuum hose to the purge flow (PF) sensor at the left wheel well. Connect the vacuum reservoir vacuum hose at the vacuum connector above the right hand valve cover.

20. Position and install the harness to the PCM and tighten the bolt to 6 Nm (53 lb-in). Install the ground wire to the bulkhead and tighten to 10 Nm (89 lb-in). Install the harness locator onto the studded bolt and securely tighten the nut.

21. Position the generator and A/C compressor wiring harness in place and connect the generator connections. Tighten to 10 Nm (89 lb-in).

22. Install the heater hoses to the intake manifold and the water pump. Compress and position the hose clamps.

23. Position the A/C compressor/power steering pump bracket with the pump attached to the steering gear box. Remove the protective cap, install the power steering return hose, and position the hose clamp. Install the bracket and power steering pump assembly. Tighten to 45 Nm (33 lb-ft).

24. Remove the protective cap from the power steering pressure line, using Teflon® Seal Replacer Set D90P-3517-A or equivalent. Install a new Teflon® seal onto the line and install the line to the power steering pump. Tighten to 45 Nm (33 lb-ft).

tomsn048@gmail.com

25. Install the accessory drive belt tensioner and the Torx® retaining bolt. Tighten to 45 Nm (33 lb-ft).

26. **NOTE: Inspect the O-ring seals, replace as necessary. Make sure the fuel lines and bracket are positioned between the compressor and A/C line.**

    Remove the protective caps from the A/C manifold and tube. Position the manifold and tube and install the retaining nut at the water pump studded bolt. Tighten to 12 Nm (9 lb-ft).

27. Remove the protective caps from the A/C compressor. Position the compressor and align the manifold lines to the compressor. Install the compressor retaining bolts and tighten to 45 Nm (33 lb-ft).

28. Install the A/C manifold and tube retaining bolt. Tighten to 27 Nm (20 lb-ft).

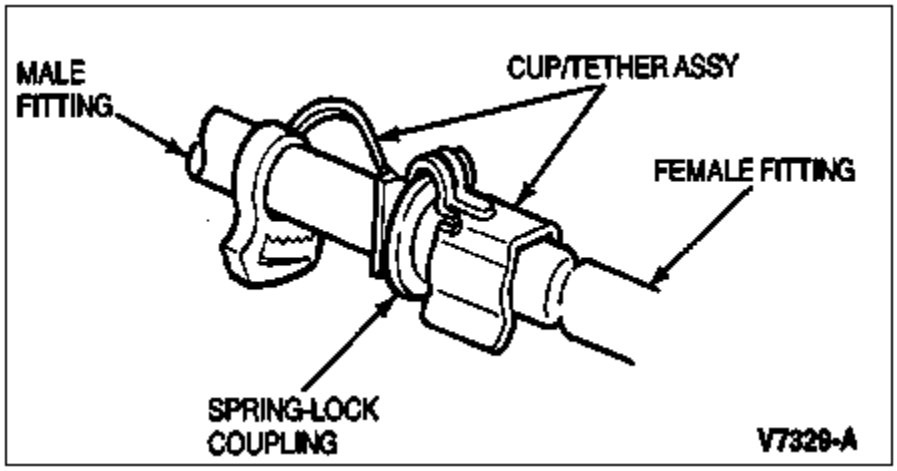
29. Connect the A/C manifold and tube to the condenser tube and the suction accumulator/drier. Install the safety clips.

30. Connect the electrical connector to the A/C pressure cutoff switch and the A/C compressor clutch. Connect the wire locators to the rear of the compressor.

31. Install the accelerator and speed control cables, with the bracket, to the intake manifold. Tighten to 10 Nm (89 lb-in). Connect the cables to the ball stud and the speed control cable to the locator at the EGR transducer bracket.

32. Install the fuel line bracket onto the studded bolt on the A/C compressor/power steering bracket. Tighten to 50 Nm (37 lb-ft).

33. Remove the protective caps and connect the fuel lines to the chassis (lower left side of the engine). Install the safety clips.



34. Install the accelerator control splash shield and the pushpin retainers.

35. Carefully lower the radiator into the vehicle, guiding the locators into the grommets. Install the retaining bolts and tighten to 12 Nm (9 lb-ft).

36. Install the lower radiator hose. Position the clamp.

tomsn048@gmail.com

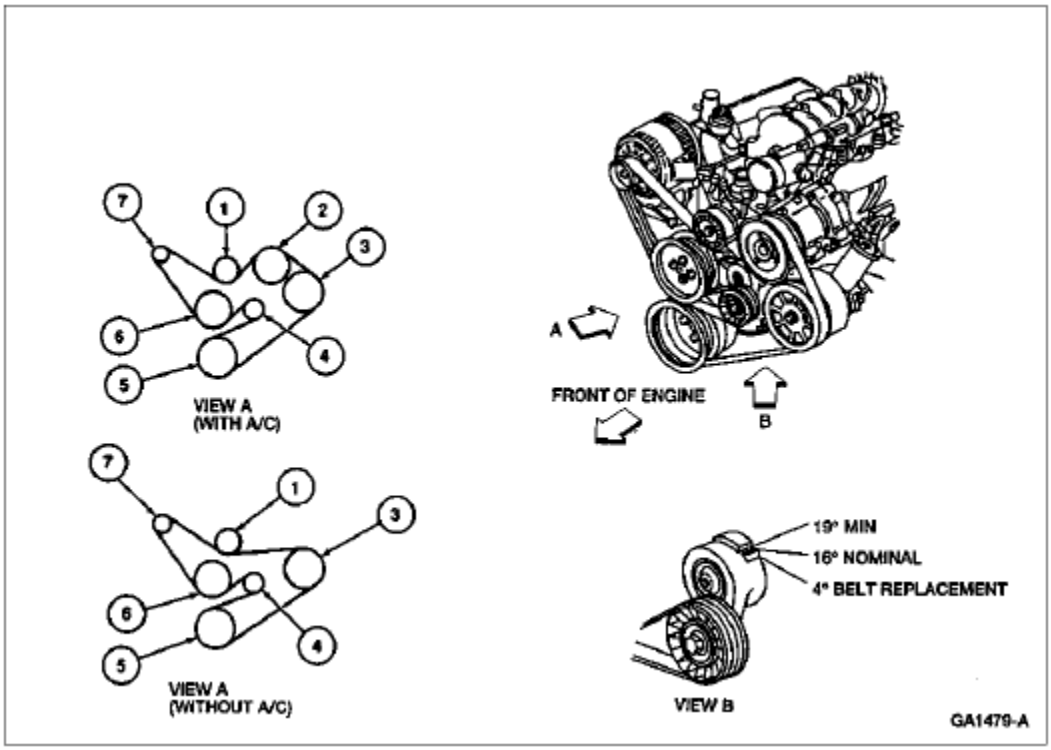
37. Remove the protective caps and connect the automatic transmission oil cooling lines to the radiator connectors. Tighten to 20 Nm (15 lb-ft).

38. **NOTE: The fan clutch has left-hand threads, so it must be turned counterclockwise for installation and tightening.**

    Position the accessory drive belt over the front of the engine. Carefully lower the fan shroud and the fan and clutch assembly into the vehicle. Using Strap Wrench D85L-6000A or equivalent, install the fan clutch assembly. Tighten the fan to 53 Nm (39 lb-ft).

39. Position the fan shroud into the lower retainers and install the upper retaining bolts. Tighten to 7 Nm (62 lb-in).

40. Install the accessory drive belt.



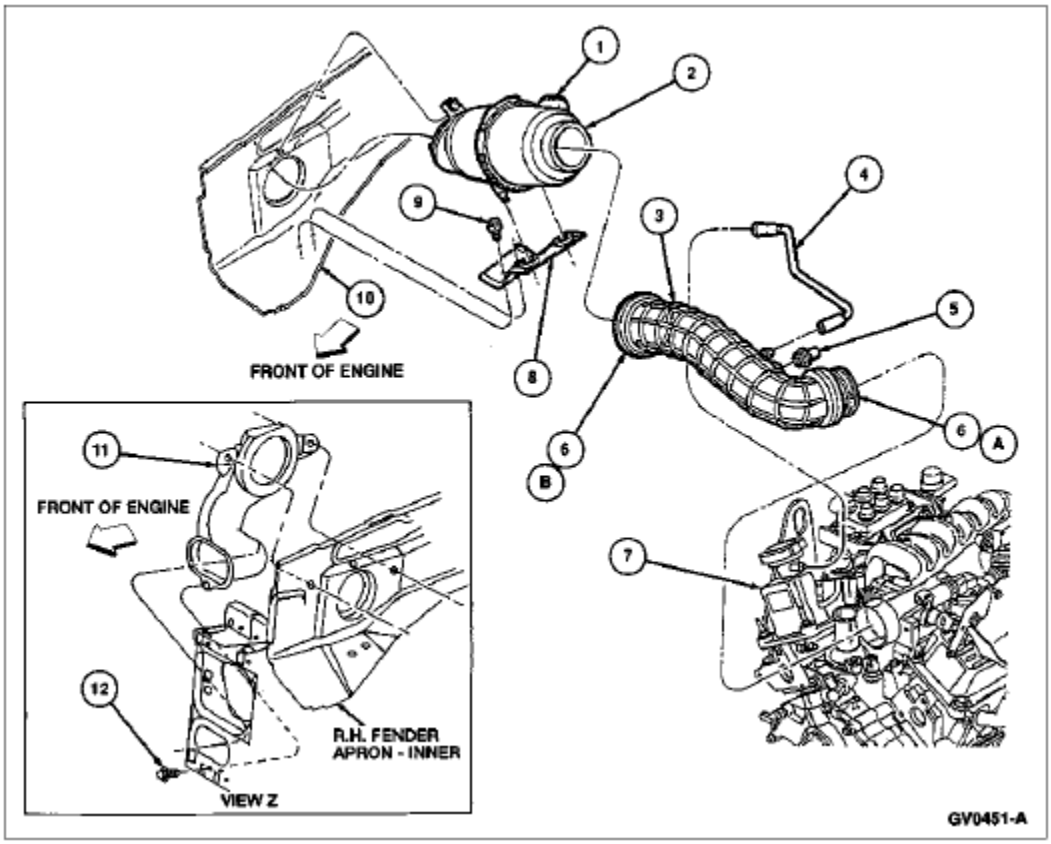
Item	Part Number	Description
1	3F671	Belt Idler Pulley
2	19D629	A/C Compressor
3	3D673	Power Steering Pump Pulley
4	6B209	Drive Belt Tensioner
5	6312	Crankshaft Pulley
6	8A528	Water Pump Pulley
7	10300	Generator

41. Install the radiator overflow hose to the radiator. Install the upper radiator hose and position the

tomsn048@gmail.com

clamps.

42. Position the air cleaner cover assembly. Connect the air cleaner outlet tube to the throttle body and securely tighten the clamp. Snap the air cleaner cover to the air cleaner housing. Connect the electrical connections to the MAF sensor and the IAT sensor. Connect the wire locators to the air cleaner and outlet tube. Connect the crankcase ventilation hose to the air cleaner outlet tube.



Item	Part Number	Description
1	12B579	Mass Airflow Sensor
2	9600	Engine Air Cleaner
3	9B659	Air Cleaner Outlet Tube
4	6853	Crankcase Ventilation Hose
5	12A697	Intake Air Temperature Sensor
6	—	Clamp (Part of 9B659)
7	6582	Valve Cover
8	9626	Engine Air Cleaner Mounting Bracket
9	N606675-S310	Screw, 1 x 16.5 (2 Req'd)
10	16006	Front Fender, Inner (RH)
11	9B660	Air Inlet Tube
12	N605894	Bolt (3 Req'd)

tomsn048@gmail.com

A	—	Tighten to 2-3 Nm (18-27 Lb-In)
B	—	Tighten to 1-2 Nm (9-18 Lb-In)

43. Install and align the hood. Tighten to 9 Nm (80 lb-in). Connect the hood light connector and locator pin to the hood. Clip the ground strap to the hood on the right hand side.
44. Install the negative battery cable.
45. Fill the cooling system.
46. Fill the engine with oil.
47. Fill the power steering system.
48. Evacuate, pressurize, leak test, and recharge the A/C system.
49. Check the operation of the engine.

tomsn048@gmail.com

Camshaft Bearings

SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
Camshaft Bearing Set	T65L-6250-A

Removal

1. Remove engine (6007) from vehicle as outlined in this section.
2. Place engine on work stand and remove camshaft (6250), crankshaft (6303) and camshaft rear bearing cover.
3. Remove camshaft bearing with Camshaft Bearing Set T65L-6250-A.
4. Select proper size expanding collet and backup nut, and assemble on the expanding mandrel. With the expanding collet collapsed, install collet assembly in the camshaft bearing, and tighten backup nut on the expanding mandrel until the collet fits the camshaft bearing.
5. Assemble puller screw and extension, if necessary, and install on the expanding mandrel. Wrap a cloth around the threads of the puller screw to protect the bearing or journal. Tighten the puller nut against the thrust bearing and pulling plate to remove camshaft bearing. Be sure to hold the end of the puller screw to prevent it from turning.
6. Repeat above step for each bearing. To remove the camshaft bearing, install the puller from the rear of the cylinder blocks (6010).

Installation

The camshaft bearings are available pre-finished to size and require no reaming for standard and 0.38mm (0.015 inch) undersize journal diameters.

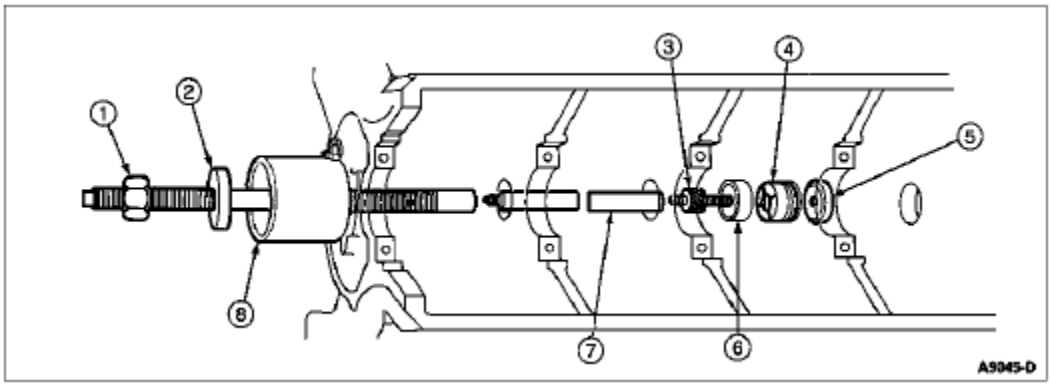
CAUTION: Failure to use the correct expanding collet can cause severe bearing damage.

1. **NOTE: Align the oil holes in the bearings with the oil holes in the cylinder block before pressing bearings into place. Make sure the front bearing is installed 0.51-0.89mm (0.020-0.035 inches) below the front face of the cylinder block.**

   Position new bearings at the bearing bores and press them in place with Camshaft Bearing Set T65L-6520-A. Be sure to center the pulling plate and puller screw to avoid damage to the bearing.
2. Install camshaft rear bearing bore plug as outlined in this section.
3. Install camshaft, crankshaft, flywheel (6375) and related parts. It is not necessary to check connecting rod and main bearing clearances as part of camshaft bearing replacement.
4. Install engine in vehicle as outlined in this section.

tomsn048@gmail.com

Camshaft Bearings, Removal/Installation



Item	Part Number	Description
1	—	Pulling Screw (Part of T65L-6250-A)
2	—	Pulling Plate (Part of T65L-6250-A)
3	—	Expanding Mandrel (Part of T65L-6250-A)
4	—	Expanding Collet (Part of T65L-6250-A)
5	—	Backup Nut (Part of T65L-6250-A)
6	6262	Bearing, Camshaft (Part Number Given Is for Reference Only)
7	—	Puller Screw Extension (Part of T65L-6250-A)
8	—	Front Spacer (Part of T65L-6250-A)

tomsn048@gmail.com

tomsn048@gmail.com

Oil Pan, Ranger 4x4

Removal

1. Remove the engine (6007) from the vehicle as outlined in this section.
2. Remove the oil pan bolts.
3. Remove the oil pan (6675) from the engine.
4. Remove oil pan gasket (6710) and discard.

Installation

1. Lightly oil all bolt threads before installation.
2. **NOTE: When using silicone rubber sealer, assembly should occur within 15 minutes after sealer application. After this time, the sealer may start to set up, and its sealing effectiveness may be reduced.**

   Apply a 4.0-6.0mm (1/5-inch) bead of Silicone Rubber D6AZ-19562-AA or equivalent meeting Ford specification ESB-M4G92-A or ESE-M4G195-A to the junction of the rear main bearing cap and cylinder blocks (6010) and junction of the front cover assembly and cylinder blocks.
3. Position oil pan gasket to cylinder blocks and secure with Gasket and Trim Adhesive D7AZ-19B508-B or equivalent meeting Ford specification ESE-M2G52-A.
4. Position oil pan to cylinder blocks.
5. Install oil pan attaching bolts and tighten to 12 Nm (9 lb-ft).
6. Install engine in vehicle as described in this section.

tomsn048@gmail.com

tomsn048@gmail.com

Engine

Disassembly

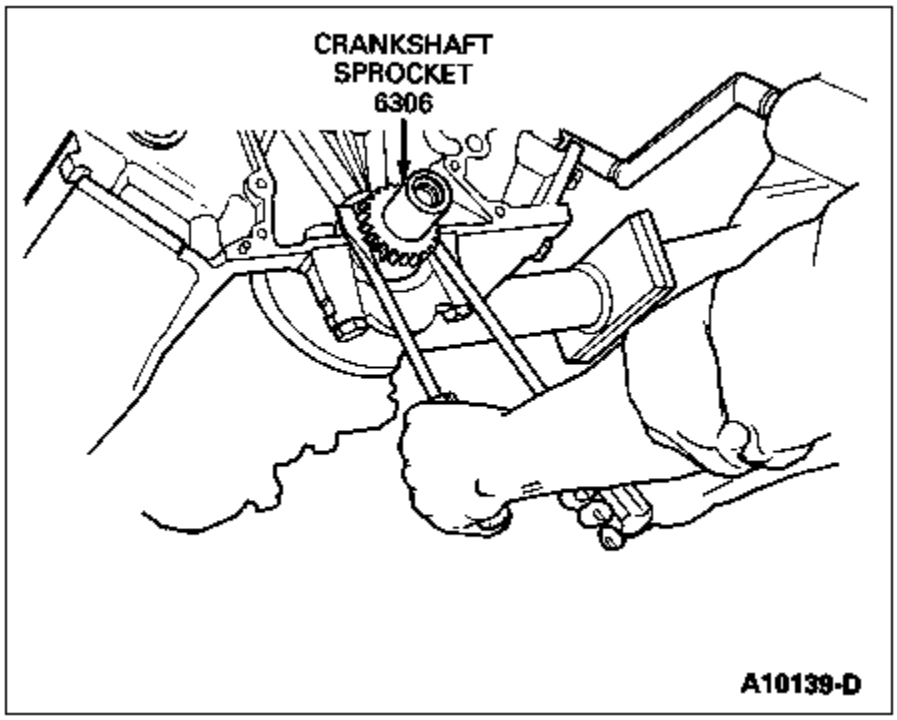
1. Remove throttle body (9E926) as outlined in Section 03-04B .
2. Remove spark plugs (12405).
3. Remove right exhaust manifold (9430) and left exhaust manifold as outlined in this section.
4. Remove intake manifold (9424) as outlined in this section.
5. Before attempting to remove the intake manifold, break the seal between the intake manifold and the cylinder blocks (6010). Wedge a large screwdriver between the manifold and the block. Pry downward on the screwdriver using the lug on the water pump (8501) as a leverage point. Use care to prevent damage to machined surfaces.
6. Loosen rocker arm fulcrum attaching bolts enough to allow the rocker arm (6564) to be lifted off the push rod (6565) and rotated to one side.
7. Remove push rods. Identify the position of each rod. The push rods should be installed in their original position during reassembly.
8. Loosen roller tappet guide plate retainer bolts (2). Remove water pump from tappet valley.
9. Remove tappet guide plate retainers from valve tappets (6500) by lifting straight up.
10. **NOTE: If a valve tappet is stuck in its bore due to excessive varnish or gum deposits, it may be necessary to use a claw-type tool to aid removal. Work the valve tappet up and down in the bore to loosen it from the deposits.**

    To remove, grasp each valve tappet and pull in line with bore.
11. Remove cylinder heads (6049) as outlined in this section.
12. Remove crankshaft pulley and crankshaft vibration damper as outlined. Use Crankshaft Damper Remover T58P-6316-D and Vibration Damper Remover Adapter T82L-6316-B to remove vibration damper.
13. Remove flywheel (6375) and engine rear plate.
14. Remove engine front cover (6019) and water pump as outlined. Water pump may be removed with timing cover as an assembly if desired. Refer to Engine Front Cover Removal and Installation in this section.
15. Remove camshaft sprocket bolt (6279) and camshaft sprocket washer (6278).
16. **NOTE: If the crankshaft sprocket (6306) is difficult to remove, it can be pried off using two**

tomsn048@gmail.com

large screwdrivers. Use care to prevent damage to finished areas on the crankshaft (6303).

Remove timing chain/belt (6268), camshaft sprocket (6256) and camshaft (6250) as an assembly.



17. Remove camshaft thrust plate bolts and camshaft thrust plate (6269).

18. Remove camshaft. Use care to prevent damage to camshaft bearing surfaces and lobes.

19. Rotate engine (6007) 180 degrees.

20. Remove oil pump (6600).

21. **NOTE: The cylinder number is stamped on the top of each piston (6108). Matched letters are stamped on the sides of corresponding rod and cap.**

    NOTE: Before removing the pistons, inspect the top of the cylinder bores. If necessary, remove the ridge and/or carbon deposits from each cylinder using a suitable ridge remover. Before the ridge or deposits are removed turn the crankshaft until the piston, pin and ring (6102) is at the bottom of the bore. Cover the piston with a clean shop towel to collect the cuttings. After the cutting operation, turn thecrankshaft until the piston is at the top of bore and remove the shop towel and the cuttings. Never cut into the ring travel area in excess of 0.794mm (0.03125 inch).

    Remove connecting rod nuts and tap out piston, pin and ring and connecting rod (6200) with a wooden hammer handle. Nuts should go on the same stud they were removed from. Make sure caps are reinstalled on same rod and orientated correctly.

22. The location of each piston, connecting rod bearing (6211), and rod cap should be noted. When the engine is assembled, each component should be installed in its original position.

tomsn048@gmail.com

23. Remove crankshaft rear oil seal (6701).

24. **NOTE: The location of the main bearings and caps should be noted. When the engine is reassembled, each bearing and cap should be installed in its original position.**

    Remove main bearing caps and crankshaft as outlined in this section.

25. For cleaning purposes, oil gallery and cooling jacket plugs can be removed.

Assembly

Lightly oil attaching bolt and stud threads before installation except those specifying special sealant.

1. Install oil gallery and cooling jacket plugs. Tighten plugs to 16-24 Nm (12-17 lb-ft). Before installation, coat plug threads with Pipe Sealant with Teflon® D8AZ-19554-A or equivalent meeting Ford specification WSK-M2G350-A2.

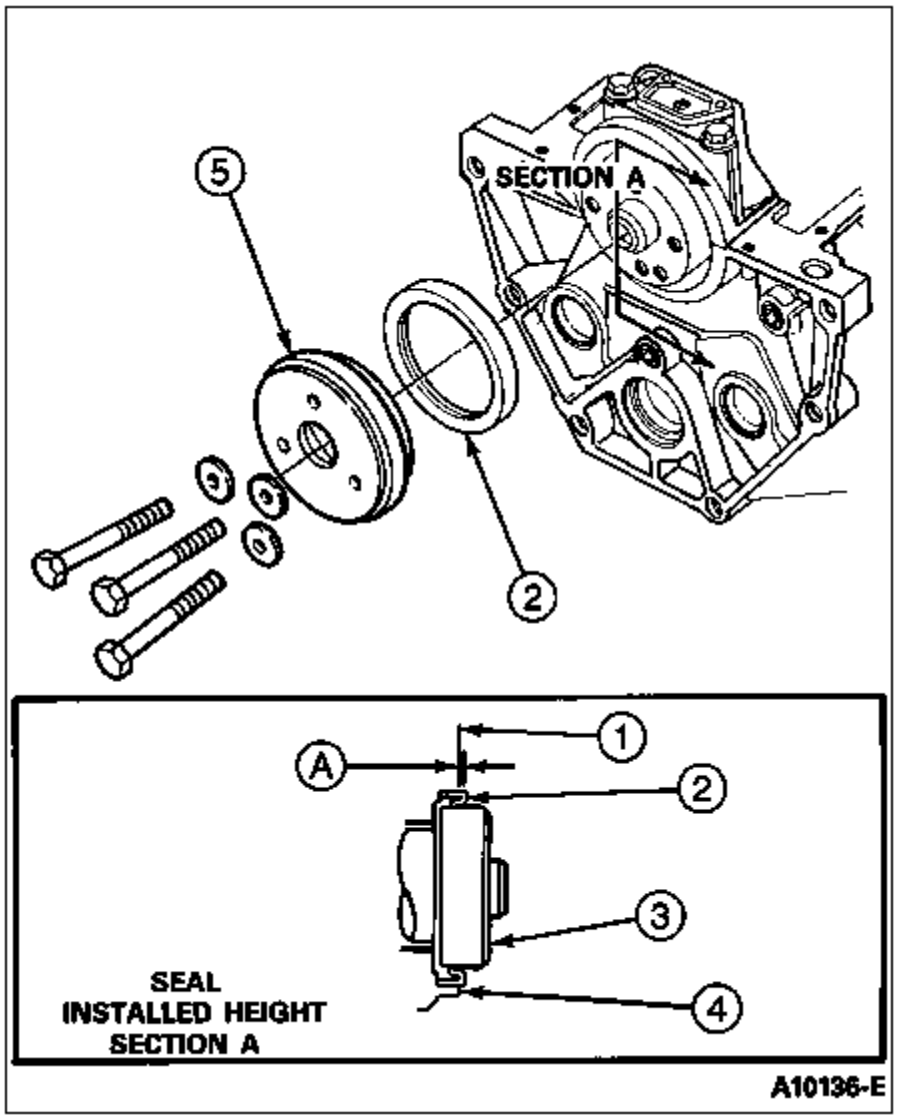
2. **NOTE: Scratching of the crankshaft journal can be prevented by covering the connecting rod bolts with spark plug boots.**

   Install crankshaft as follows:

   a. Install main bearing inserts in the cylinder block. Note that third bearing from front is the thrust bearing.
   b. Lubricate bearing inserts with Engine Assembly Lubricant D9AZ-19579-D or equivalent meeting Ford specification ESR-M99C80-A heavy engine oil, and carefully lower the crankshaft into place. Use care to prevent damage to bearing surfaces.
   c. Apply a 6mm (1/4-inch) dot of Gasket Eliminator E1FZ-19562-A or equivalent meeting Ford specification WSK-M2G348-A4 between rear cap and cylinder block (two places).
   d. Install crankshaft main bearing (6333) and crankshaft thrust main bearing (6337) in the main caps and install caps. Note that caps are numbered with arrow heads. No. 1 is located at front of engine with arrow heads facing front of engine.
   e. Install crankshaft main bearing cap studs (6345).
   f. Wedge a large screwdriver between cylinder block web and crankshaft cheek located in front of the No. 3 main bearing before tightening bearing cap attaching bolts. Do not jam the screwdriver into place. Tap into position only enough to hold the crankshaft forward while the cap bolts are tightened.
   g. Tighten crankshaft main bearing cap studs to 75-85 Nm (55-63 lb-ft) and remove screwdriver.

3. Install crankshaft rear oil seal as outlined and check for crankshaft end play. Refer to Section 03-00 .

tomsn048@gmail.com

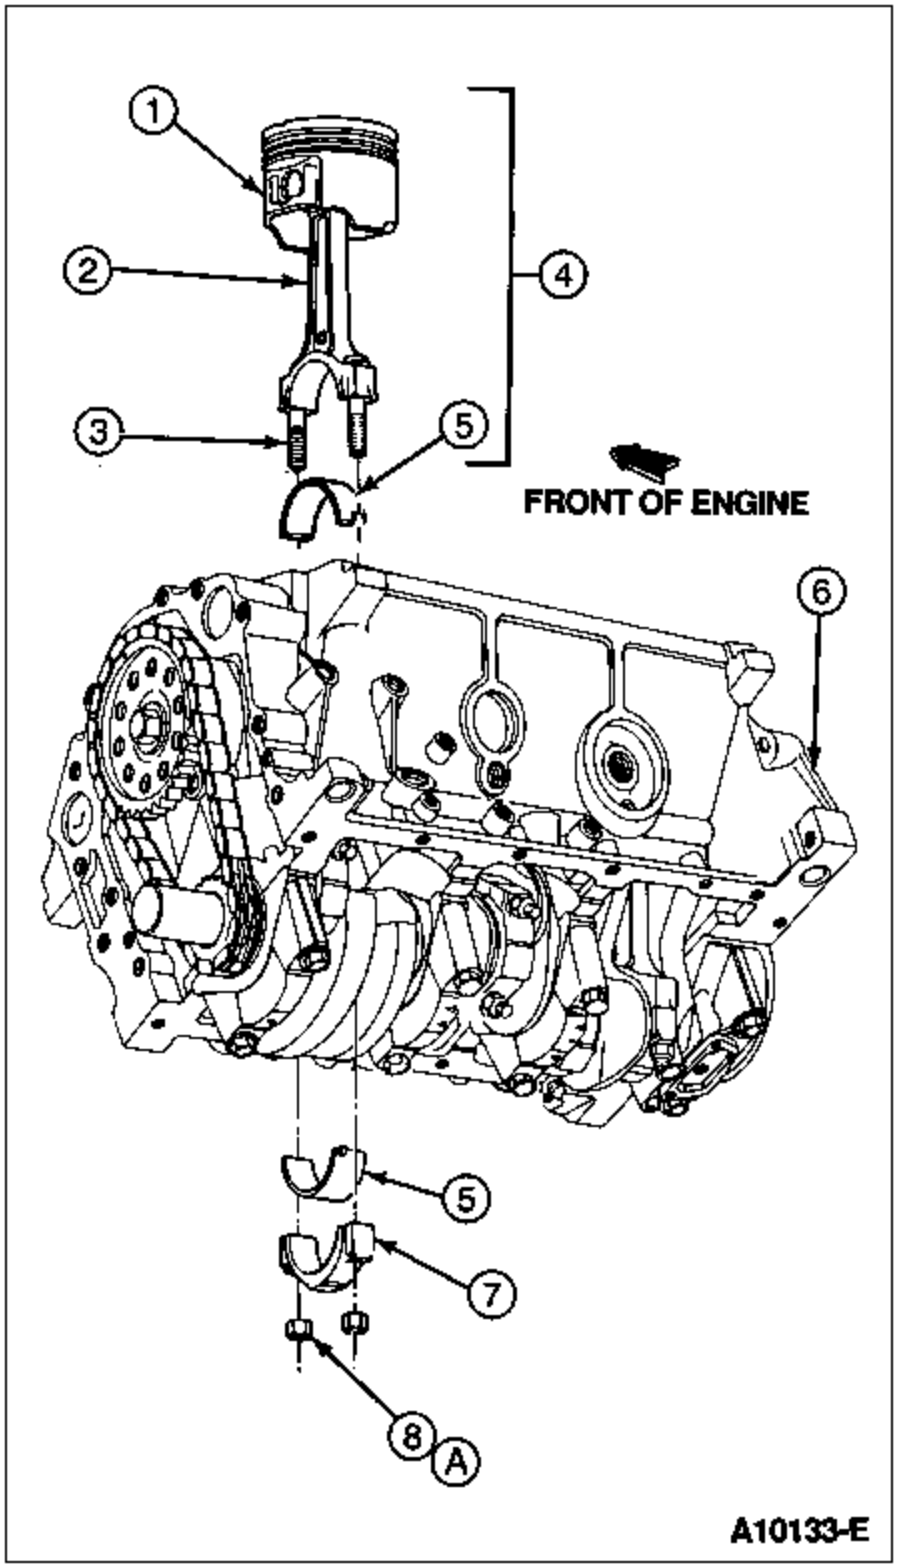


Item	Part Number	Description
1	6010	Cylinder Blocks
2	6701	Crankshaft Rear Oil Seal
3	6303	Crankshaft
4	—	Rear Main Bearing Cap (Part of 6010)
5	T88L-6701-A	Rear Main Seal Installer
A	—	.5mm (.019 Inch) (Do Not Bottom)

4. Install the piston, pin and ring as follows:

    a. Install connecting rod bearings in the connecting rods and the connecting rod caps.

tomsn048@gmail.com

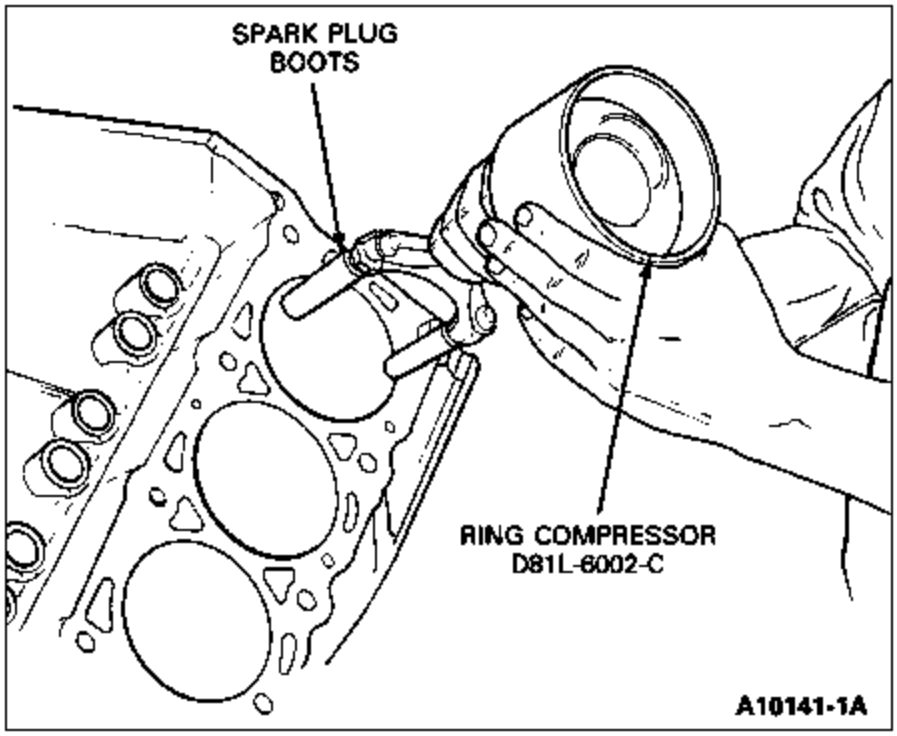


Item	Part Number	Description
1	6102	Piston, Pin and Ring
2	6200	Connecting Rod

tomsn048@gmail.com

3	6214	Connecting Rod Bolt
4	6102	Piston, Pin, Ring and Connecting Rod Assembly
5	6211	Connecting Rod Bearing
6	6010	Cylinder Blocks
8	—	Connecting Rod Cap (Part of 6200)
9	6212	Connecting Rod Cap
A	—	Tighten to 31-39 Nm (23-29 Lb-Ft)

b. Arrange piston ring gaps around the piston, pin and rings.
c. Install piston, pin and rings using a Piston Ring Compressor D81L-6002-C (ESR-M99C80-A) or equivalent. The notch in the piston dome has to face the front of the engine.

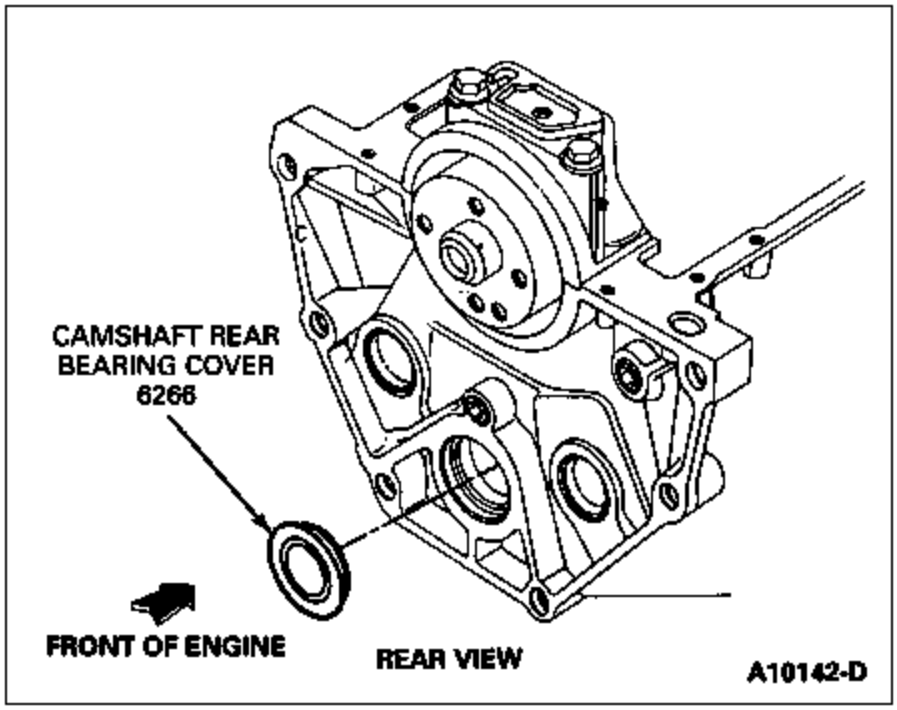


Lubricate the piston, pin and ring and cylinder walls with Engine Assembly Lubricant D9AZ-19579-D or equivalent meeting Ford specification ESR-M99C80-A before installation.
d. Install connecting rod caps and connecting rod nuts (6212). Tighten attaching nuts to 31-39 Nm (23-28 lb-ft).

5. Check connecting rod side clearance as outlined.

6. Install camshaft rear bearing cover using a suitable driver. Coat the sealing edge of the plug with Gasket Eliminator E1FZ-19562-A or equivalent meeting Ford specification WSK-M2G348-A4 before installation.

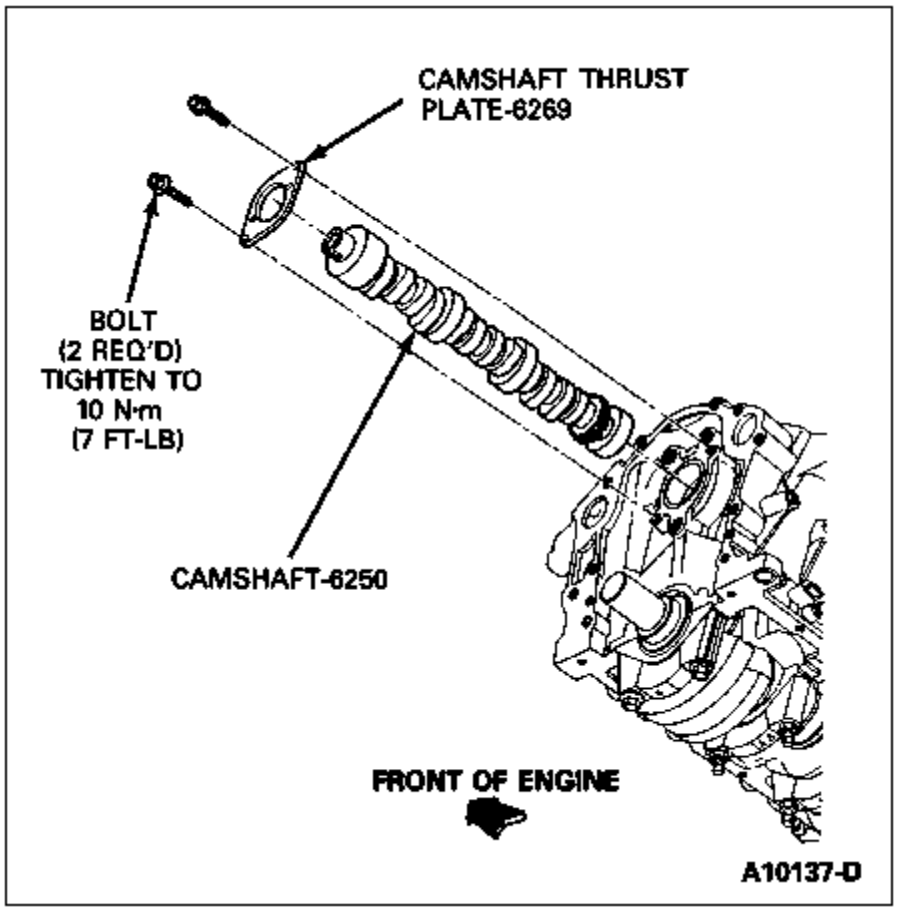
tomsn048@gmail.com



7. Coat camshaft lobes with Engine Assembly Lubricant D9AZ-19579-D or equivalent meeting Ford specification ESR-M99C80-A, and lubricate the camshaft bearings with heavy oil SG. Install camshaft. Use care to prevent damage to bearing surface.

8. Lubricate camshaft thrust plate with Engine Assembly Lubricant D9AZ-19575-D or equivalent meeting Ford specification ESR-M99C80-A and install with two retaining bolts. Tighten bolts to 8-12 Nm (6-8 lb-ft).

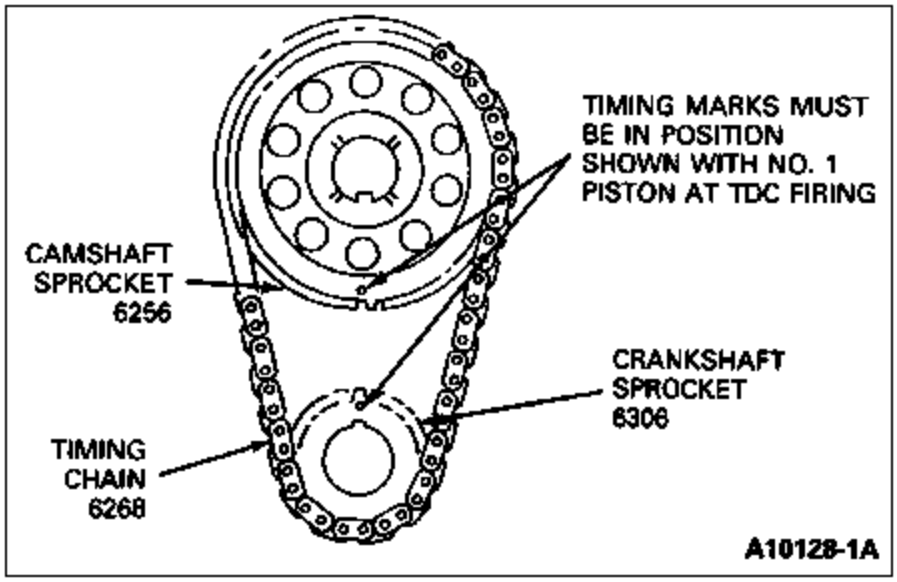
tomsn048@gmail.com



9. Lubricate timing chain with clean engine oil.

    - Rotate crankshaft, as necessary, to position the crankshaft sprocket timing mark in the 6 o'clock position with No. 1 piston at top dead center firing.
    - Install camshaft sprocket (with timing mark in the 12 o'clock position), crankshaft sprocket and timing chain.
    - Make sure the crankshaft keyway, cam sprocket timing mark, and crank sprocket timing mark are properly aligned after installation.

tomsn048@gmail.com



10. Install camshaft sprocket bolt and tighten to 55-70 Nm (41-52 lb-ft). Check the drilled oil passages of the attaching bolt to make sure they are not plugged.

Fastener and Hole No.	Fasteners			
	Part No.	Size	Nm	Lb-Ft
1 [a]	N804215	M8 x 1.25 x 72.25	20-30	15-22
2 [a]	N804215	M8 x 1.25 x 72.25	20-30	15-22
3 [a]	N804811-S8	M8 x 1.25 x 73.0	20-30	15-22
4	N804811-S8	M8 x 1.25 x 73.0	20-30	15-22
5	N605909-S8	M8 x 1.25 x 73.0	20-30	15-22
6	N807515	M8 x 1.25 x 104.3	20-30	15-22
7	N804811-S8	M8 x 1.25 x 73.0	20-30	15-22
8	N804811-S8	M8 x 1.25 x 73.0	20-30	15-22
9	N804811-S8	M8 x 1.25 x 70.0	20-30	15-22
10	N606543-S2	M8 x 1.25 x 52.0	20-30	15-22
11	N804576-S8	M6 x 1.0 x 28.5	8-12	6-8
12	N804576-S8	M6 x 1.0 x 28.5	8-12	6-8
13	N804576-S8	M6 x 1.0 x 28.5	8-12	6-8
14	N804576-S8	M6 x 1.0 x 28.5	8-12	6-8
15	N804576-S8	M6 x 1.0 x 28.5	8-12	6-8

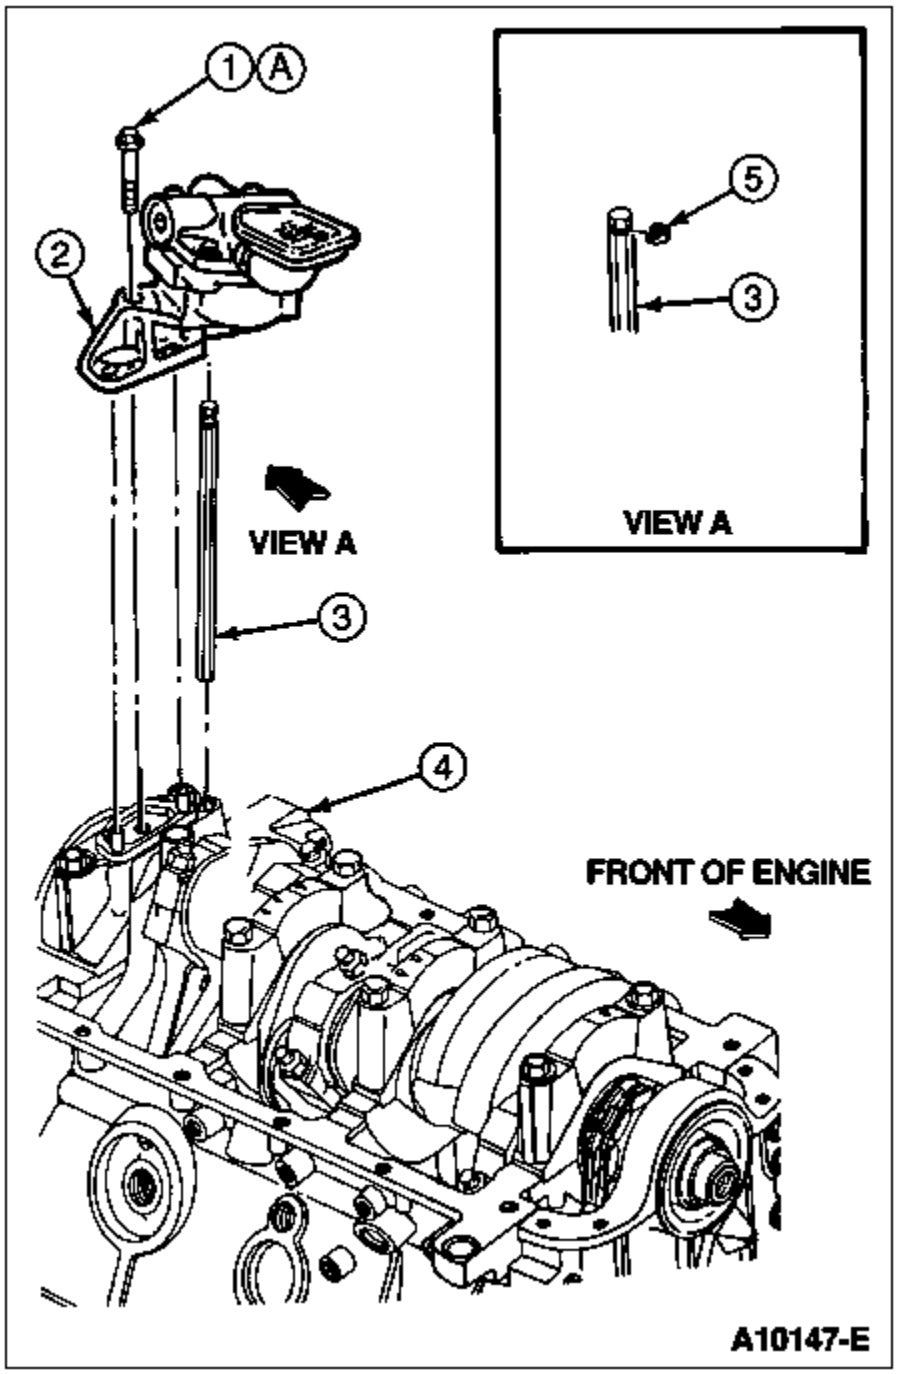
[a] Apply Pipe Sealant with Teflon D8AZ-19554-A or equivalent meeting Ford specifications WSK-M2G350-AZ and ESR-M18P7-A to fastener threads.

11. Assemble oil pump intermediate shaft retaining ring (6629) on end of oil pump intermediate shaft (6A618) and insert shaft into hole in oil pump until retainer clicks into place.

tomsn048@gmail.com

12. Pilot oil pump withoil pump intermediate shaft through hole in rear main bearing cap, position pump over pins.

13. Install oil pump attaching bolts and tighten to 40-55 Nm (30-40 lb-ft).



Item	Part Number	Description
1	—	Bolt (Part of 6600)

tomsn048@gmail.com

2	6600	Oil Pump
3	6A618	Oil Pump Intermediate Shaft
4	6010	Cylinder Blocks
5	6629	Oil Pump Intermediate Shaft Retaining Ring
A	—	Tighten to 40-55 Nm (30-40 Lb-Ft)

14. Install the oil pan gasket (6710) as follows:

    a. Using a small-bladed screwdriver, remove any sealer which may have been squeezed into the oil pan sealing area when the rear main bearing cap was installed. Place a 6.35mm (1/4-inch) drop of sealer into seal groove where the bearing cap meets the block.
    b. Apply a 3.0-4.0mm (1/8-inch) bead of Silicone Rubber D6AZ-19562-BA or equivalent meeting Ford specifications ESB-M4G92-A and ESE-M4G195-A to the seams where the engine front cover meets with the cylinder blocks and to each end of the pan end seal.
    c. Locate oil pan gasket-to-cylinder block pan rail and secure retaining features.
    d. Install oil pan (6675) and tighten attaching bolts to 10-14 Nm (7-10 lb-ft).

15. Lubricate oil filter gasket with engine oil and install oil filter.

16. Lubricate valve tappets with Engine Assembly Lubricant D9AZ-19579-D or equivalent meeting Ford specification ESR-M99C80-A or equivalent and install.

17. **NOTE: Install valve tappet guide plate (6K512) with the word "UP" and button visible.**

    Align tappet flats and install valve tappet guide plates.

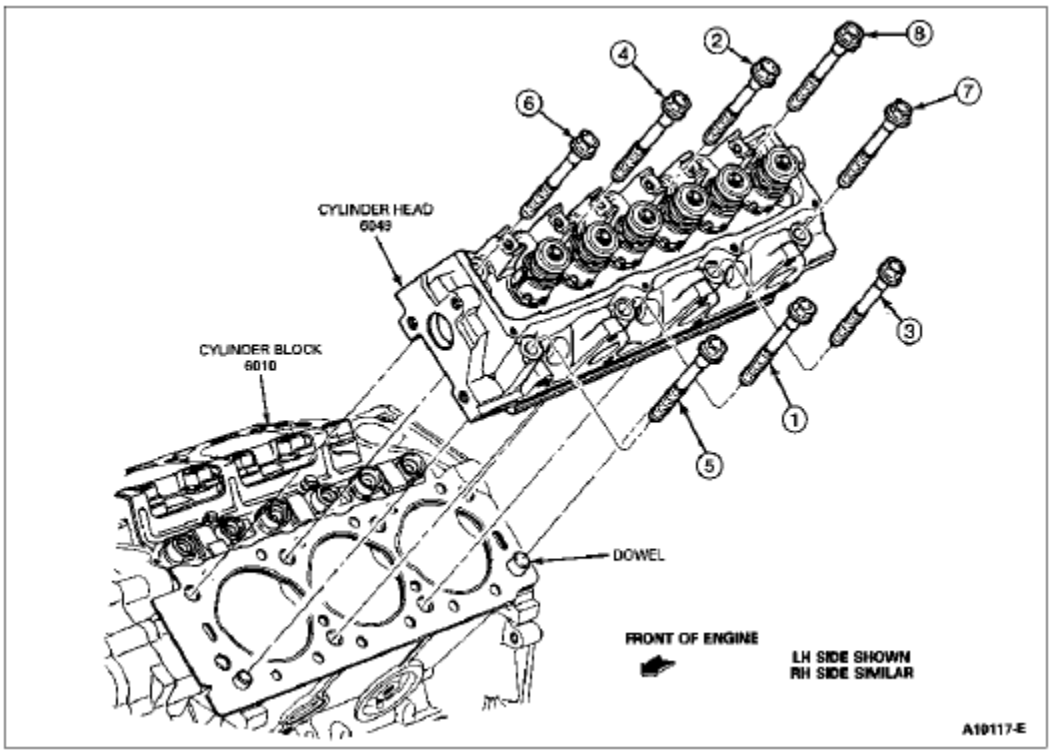
18. Install retainer over valve tappet guide plates. Retainer orientation is not important. Hand-start two retaining bolts then tighten to 10-14 Nm (7-10 lb-ft).

19. Install new head gasket (6051) using the dowels to align the gasket.

20. Tighten the cylinder head attaching bolts in two tightening steps in the sequence as shown to 50 Nm (37 lb-ft), then 85-99 Nm (63-73 lb-ft).

Cylinder Head Attaching Bolts, Installation

tomsn048@gmail.com



21. Rotate engine so camshaft is in Position A, as shown, with camshaft sprocket timing mark and crankshaft sprocket timing mark at top center.

22. **NOTE: Lubricate eachpush rod,rocker arm, and rocker arm fulcrum with Engine Assembly Lubricant D9AZ-19579-D or equivalent meeting Ford specification ESR-M99C80-A before installing.**

    Install push rod, rocker arm, rocker arm fulcrum, and rocker arm bolt for valves:

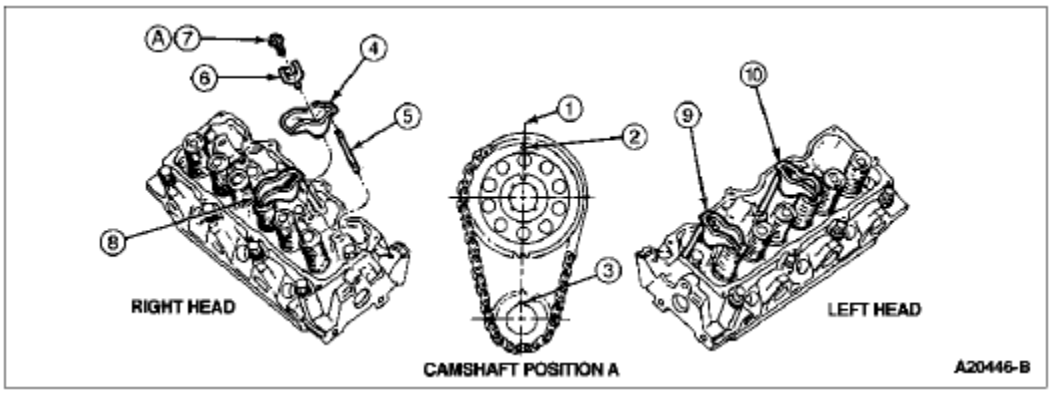
    - Cylinder No. 1 Intake
    - Cylinder No. 2 Exhaust
    - Cylinder No. 4 Intake
    - Cylinder No. 5 Exhaust

    Tighten rocker arm bolts (6A527) to 11 Nm (8 lb-ft).

23. For valves in above step, check rocker arm-to-valve clearance. Clearance should be 2.15-4.69mm (0.084-0.184 in.).

Camshaft Position A — Rocker Arm, Push Rod, and Fulcrum Installation

tomsn048@gmail.com



Item	Part Number	Description
1	—	Centerline of Keyway Vertical Within Five Degrees
2	—	Camshaft Sprocket Timing Mark at Top Center
3	—	Crankshaft Sprocket Timing Mark at Top Center
4	6564	Rocker Arm, No. 1 Intake
5	6565	Push Rod
6	6A528	Rocker Arm Seat
7	6A527	Rocker Arm Bolt
8	6564	Rocker Arm, No. 2 Exhaust
9	6564	Rocker Arm, No. 4 Intake
10	6564	Rocker Arm, No. 5 Exhaust

24. Rotate engine so camshaft is in Position B, as shown, with camshaft sprocket timing mark at two o'clock position and crankshaft sprocket timing mark at 4:30 position.

25. **NOTE: Lubricate each push rod, rocker arm, and rocker arm fulcrum with Engine Assembly Lubricant D9AZ-19579-D or equivalent meeting Ford specification ESR-M99C80-A before installing.**

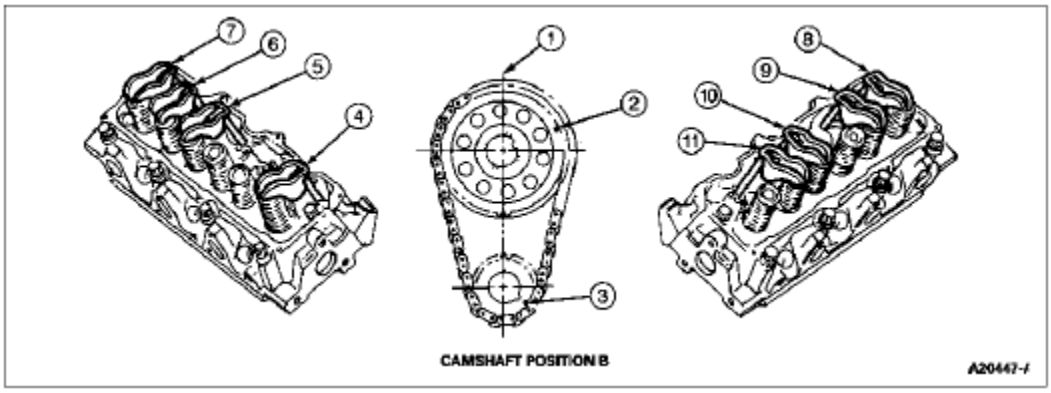
    Install push rod, rocker arm, rocker arm fulcrum and rocker arm bolt for valves:

    - Cylinder No. 1 Exhaust
    - Cylinder No. 2 Intake
    - Cylinder No. 3 Exhaust
    - Cylinder No. 3 Intake
    - Cylinder No. 4 Exhaust
    - Cylinder No. 5 Intake
    - Cylinder No. 6 Exhaust
    - Cylinder No. 6 Intake

26. For valves in above step, check rocker arm-to-valve clearance. Clearance should be 2.15-4.69mm (0.084-0.184 in.).

tomsn048@gmail.com

Camshaft Position B — Rocker Arm, Push Rod, and Fulcrum Installation

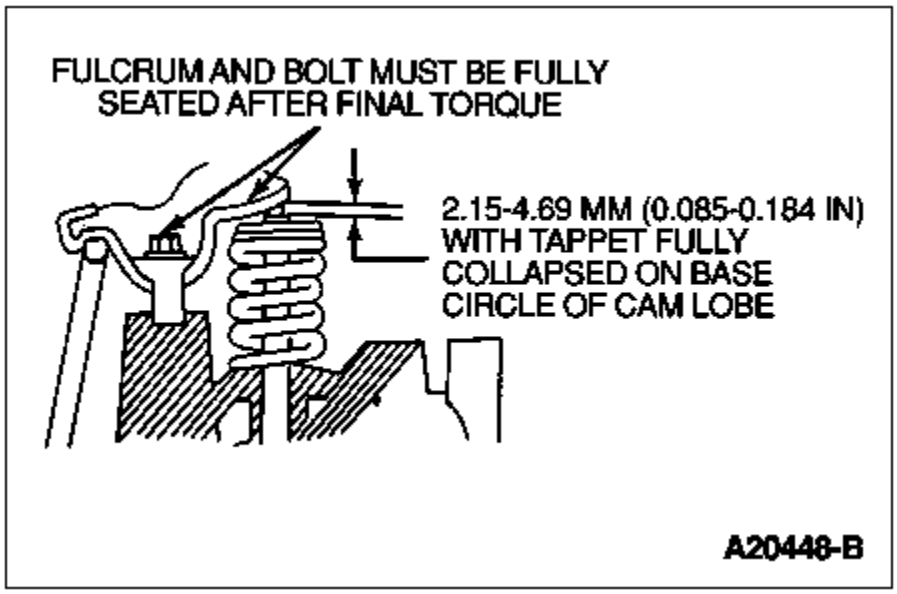


Item	Part Number	Description
1	—	Centerline
2	—	Camshaft Timing Mark at Two o'Clock Position
3	—	Crankshaft Sprocket Timing Mark at 4:30 Position
4	—	No. 1 Exhaust Rocker Arm and Parts
5	—	No. 2 Intake Rocker Arm and Parts
6	—	No. 3 Exhaust Rocker Arm and Parts
7	—	No. 3 Intake Rocker Arm and Parts
8	—	No. 6 Exhaust Rocker Arm and Parts
9	—	No. 6 Intake Rocker Arm and Parts
10	—	No. 5 Intake Rocker Arm and Parts
11	—	No. 4 Exhaust Rocker Arm and Parts

27. **CAUTION: Rocker arm fulcrum must be fully seated into cylinder head and push rod must be fully seated into lifter sockets before final tightening.**

Final-tighten bolts to 26-38 Nm (19-28 lb-ft). Camshaft may be in any position.

tomsn048@gmail.com



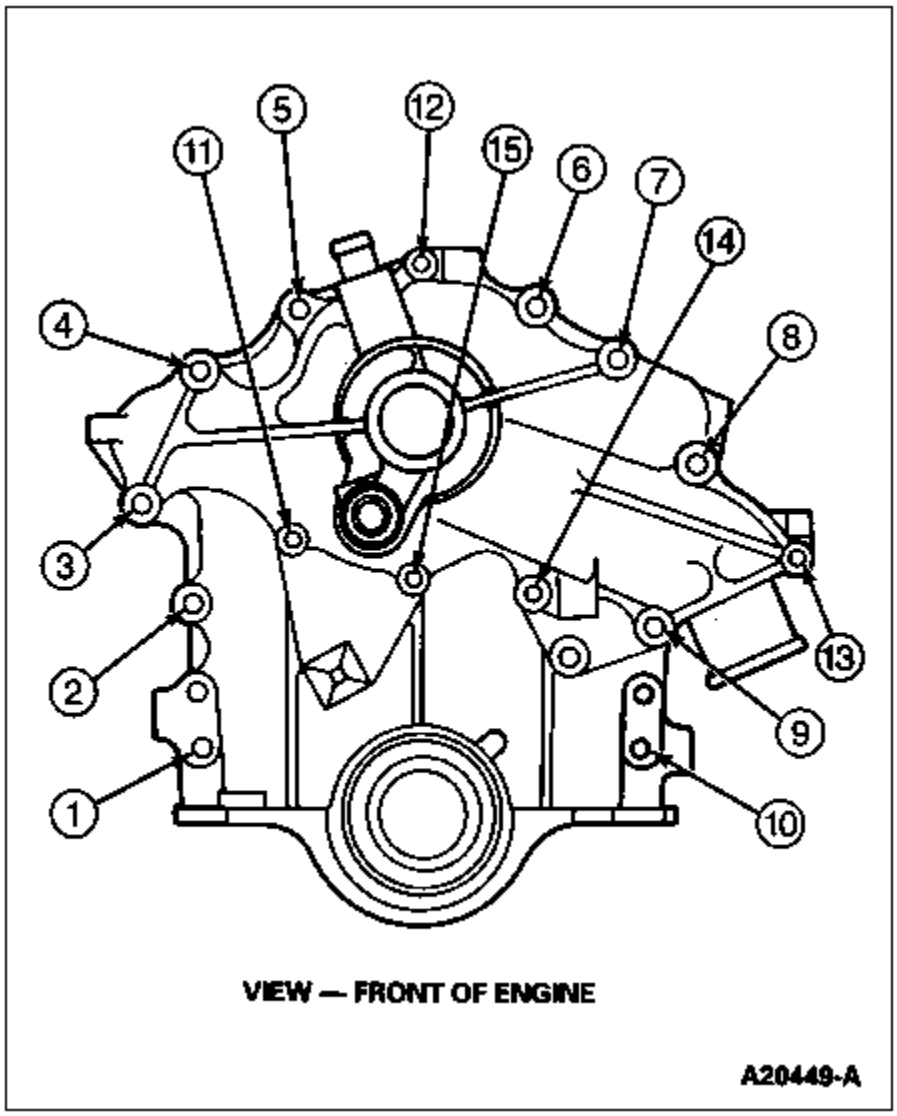
28. Position a new water pump housing gasket (8507) on the engine front cover and install water pump if the water pump was removed from the engine front cover during the engine disassembly.

29. **NOTE: The threads of cover attaching bolts must be covered with Pipe Sealant with Teflon® D8AZ-19554-A or equivalent meeting Ford specification WSK-M2G350-A2 before installation.**

    Tighten water pump attaching bolts according to accompanying chart.

30. Position an engine front cover gasket (6020) on engine. Install engine front cover. Tighten attaching bolts according to accompanying chart.

tomsn048@gmail.com

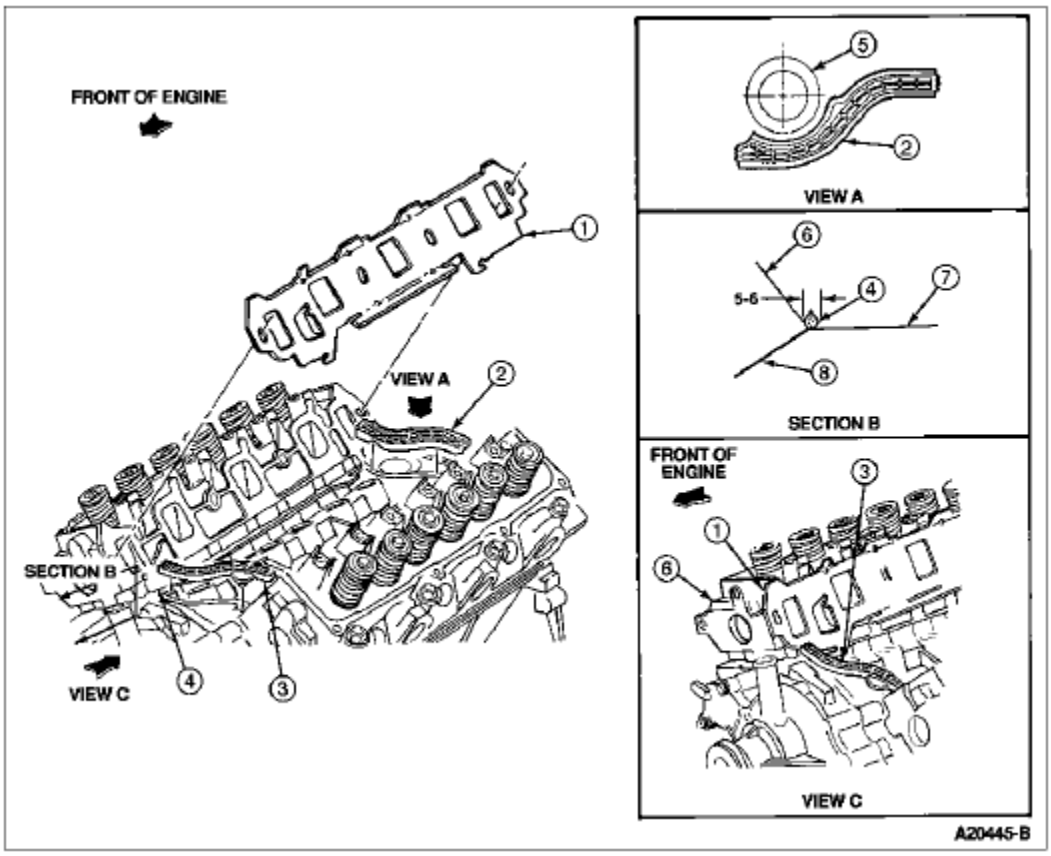


31. Install intake manifold as follows: Use a suitable solvent to clean the intake manifold, cylinder head and cylinder block mating surfaces, as these should be clean and free of old silicone rubber sealer.

32. Apply Silicone Rubber Sealer D6AZ-19562-AA or equivalent meeting Ford specification ESB-M4G92-A or ESE-M4G195-A to intersection of cylinder blocks and cylinder head at four corners, as shown.

Intake Manifold Gasket, Installation

tomsn048@gmail.com



Item	Part Number	Description
1	9439	Intake Manifold Gasket
2	—	Seal, Intake Manifold, Rear Distributor Hole (Part of 9439)
3	—	Seal, Intake Manifold, Front (Part of 9439)
4	WSE-M4G323-A3	Sealer (4 Places)
5	—	Distributor Hole (Part of 6010)
6	6049	Cylinder Head
7	6010	Cylinder Blocks
8	6051	Head Gasket

33. Install front and rear intake manifold seal. Secure with retaining features.

34. Position intake manifold gaskets (9439) in place and insert locking tabs over tabs on head gaskets as shown.

35. Apply Silicone Rubber D6AZ-19562-AA or equivalent meeting Ford specifications ESB-M4G92-A or ESE-M4G195-A over intake manifold gaskets.

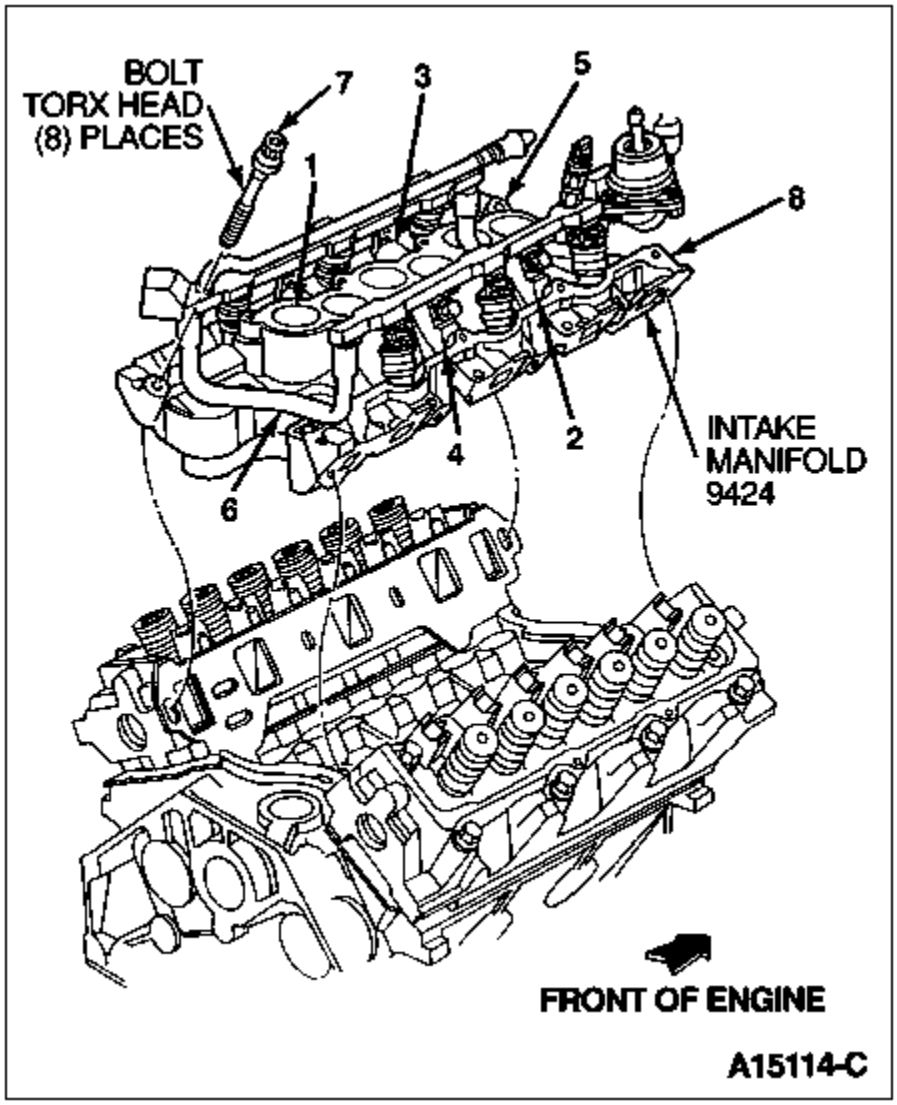
36. Carefully lower intake manifold into position on cylinder blocks and cylinder heads to prevent disturbing the silicone sealer and causing gasketing voids.

tomsn048@gmail.com

37. Install bolts and tighten, in the numerical sequence shown, to the following specifications in two steps:

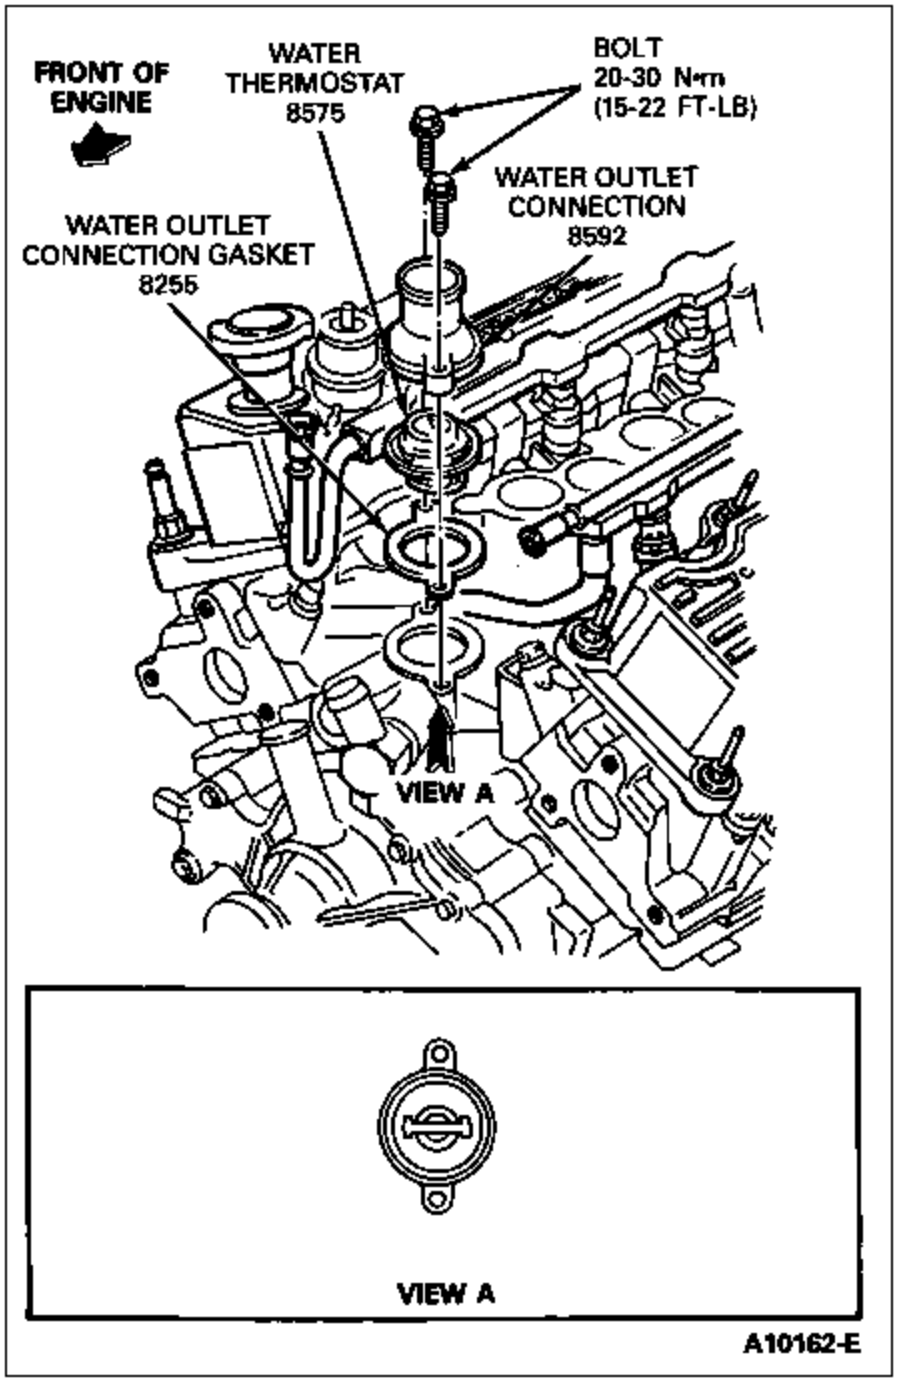
    - 15 Nm (11 lb-ft)
    - 26-32 Nm (19-24 lb-ft)

Intake Manifold Assembly Bolts, Installation



38. Install water thermostat (8575) into water hose connection. Rotate water thermostat into water outlet in a clockwise direction to secure thermostat to connector. Install water hose connection and water outlet connection gasket. Tighten attaching bolts to 20-30 Nm (15-22 lb-ft).

tomsn048@gmail.com



39. Install spark plugs. Tighten to 27 Nm (20 lb-ft).

40. Clean valve cover and cylinder head sealing surfaces with solvent to remove all gasket material and dirt.

41. Apply Silicone Rubber D6AZ-19562-AA or equivalent meeting Ford specification ESB-M4G92-A or ESE-M4G195-A to intersection of cylinder head and intake manifold.

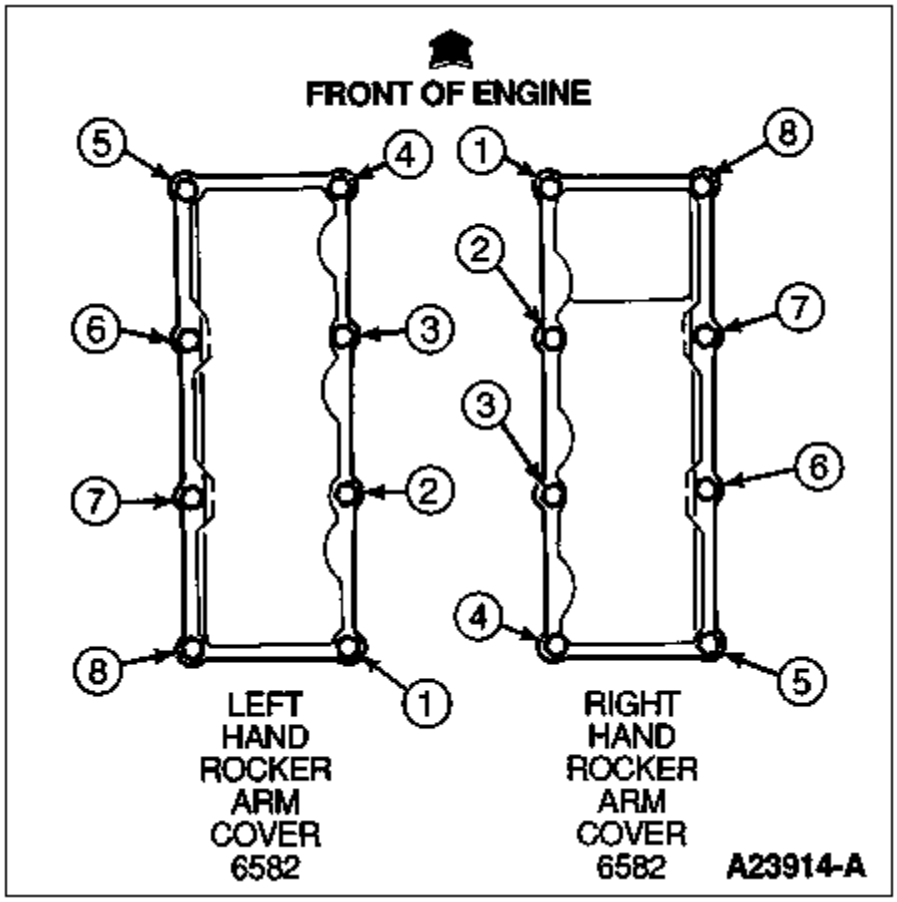
42. Install valve cover gasket and secure with retaining features.

43. Install valve cover. Install screw and washer assemblies and stud assemblies. Tighten to 10-14 Nm

tomsn048@gmail.com

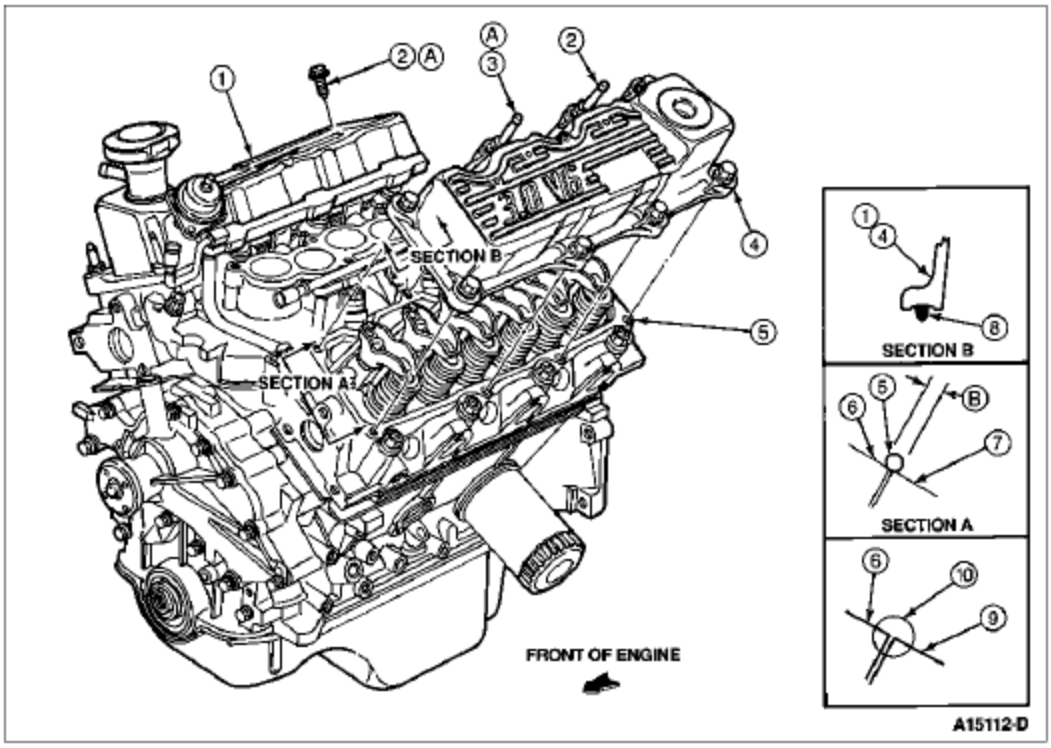
(7-10 lb-ft).

Rocker Arm Cover Stud and Bolt Usage



Valve Cover Installation

tomsn048@gmail.com



Item	Part Number	Description
1	6582	Valve Cover, Right
2	N803298-S	Screw and Washer
3	N803262-S	Stud
4	6582	Valve Cover, Left
5	ESE-M4G195-B	Sealer
6	9424	Intake Manifold
7	6049	Cylinder Head
8	—	Gasket (Part of 6582)
9	6049	Cylinder Head
10	—	Intersection of Head and Intake Manifold Must Be Flush to Within ± 1mm (0.04 In.). Gasket Must Not Protrude Above Highest Surface
A	—	Tighten to 10-14 Nm (7-10 Lb-Ft)
B	—	4-6mm (.15-.23 In.)

44. **CAUTION: If a new distributor or camshaft position sensor is installed, run engine at idle for five minutes before driving vehicle.**

Dip entire camshaft position sensor drive gear in Engine Assembly Lubricant D9AZ-19579-D or equivalent meeting Ford specification ESR-M99C80-A.

tomsn048@gmail.com

45. If a new camshaft position sensor, pour the rest of the pint of Engine Assembly Lubricant D9AZ-19579-D or equivalent meeting Ford specification ESR-M99C80-A through distributor hole onto cam drive gear.

46. Install camshaft position sensor. Refer to Section 03-14 , Engine Controls, Electronic, for fuel injection timing.

47. Install crankshaft vibration damper using Vibration Damper and Seal Replacer T82L-6316-A and Front Cover Seal Installer T70P-6B070-A. Tighten crankshaft pulley bolt (6A340) to 125-165 Nm (92-122 lb-ft).

48. Connect spark plug wire set (12281) to the spark plugs.

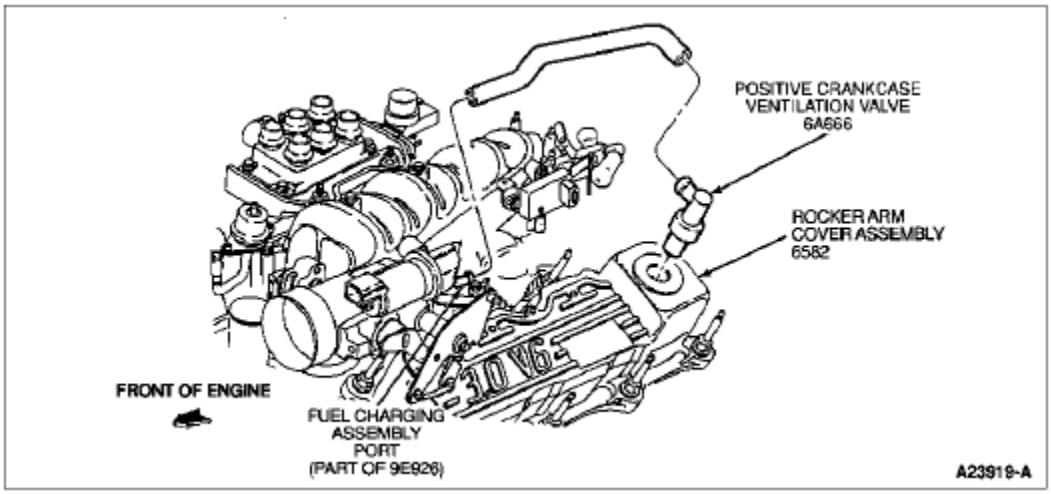
49. Install the following PCV system components:

    - Positive crankcase ventilation valve (PCV valve) (6A666) and crankcase ventilation grommet.
    - PCV closure hose.
    - Oil filler cap (Ranger).

50. Install oil filler cap. Note the location of the oil dipstick tube support bracket. Tighten exhaust manifold attaching bolts to 20-30 Nm (15-22 lb-ft).

51. Install flywheel. Tighten the attaching bolts to 73-87 Nm (54-64 lb-ft) in the standard cross-tightening sequence.

PCV System Components, Installation, Ranger



tomsn048@gmail.com

Cylinder Head

Disassembly

1. Remove rocker arm bolt (6A527), rocker arm seat (6A528) and rocker arms (6564).
2. Clean carbon out of the cylinder head combustion chambers before removing the valves.
3. **NOTE: Keep valves and springs together and store so each valve may be returned to its respective guide.**

   Compress valve spring (6513) using Valve Spring Compressor T81P-6513-A. Remove valve spring retainer key (6518) and release valve spring.
4. Remove valve spring retainer (6514), valve spring, valve stem seal (6571) and exhaust valve (6505) or intake valve (6507). Discard valve stem seal. Identify all valve parts as to which cylinder they were removed from and whether intake or exhaust. Repeat Steps 3 and 4 for the rest of the valves.
5. Clean, inspect and service the cylinder head (6049), as required, or prepare to transfer all usable parts to a new cylinder head.

Assembly

All valves, valve stems and valve guides are to be lubricated with heavy oil SF. Apply Ford Multi-Purpose Grease D0AZ-19584-AA or equivalent meeting Ford specification ESR-M1C159-A to the valve tips before installation.

1. Install each exhaust valve or intake valve in the port from which it was removed or to which it was fitted.
2. Install valve stem seal. Use a 5/8-inch deep-well socket and a light mallet or hammer to seat seal on valve stem. Make sure intake seals and exhaust seals are on proper stem.
3. Install valve spring over exhaust valve or intake valve and then install valve spring retainer. Compress valve spring and install valve spring retainer key.
4. **CAUTION: Do not install valve spring spacers unless necessary. Use of spacers in excess of recommendations will result in overstressing the valve springs and overloading the camshaft lobes which could lead to spring breakage and/or worn camshaft lobes.**

   Measure the assembled height of the valve spring from the top of the spring seat to the underside of the valve spring retainer with dividers. Check the dividers against a scale. If the assembled height is greater than specification, install the necessary 0.030-inch thick spacer(s) between the cylinder head spring pad and the valve spring to bring the assembled height to the recommended height.
5. Position rocker arms and rocker arm fulcrums on cylinder head and install rocker arm bolts. **Do not tighten bolts.** The bolts must be loose enough to allow the rocker arm to be rotated to the side.

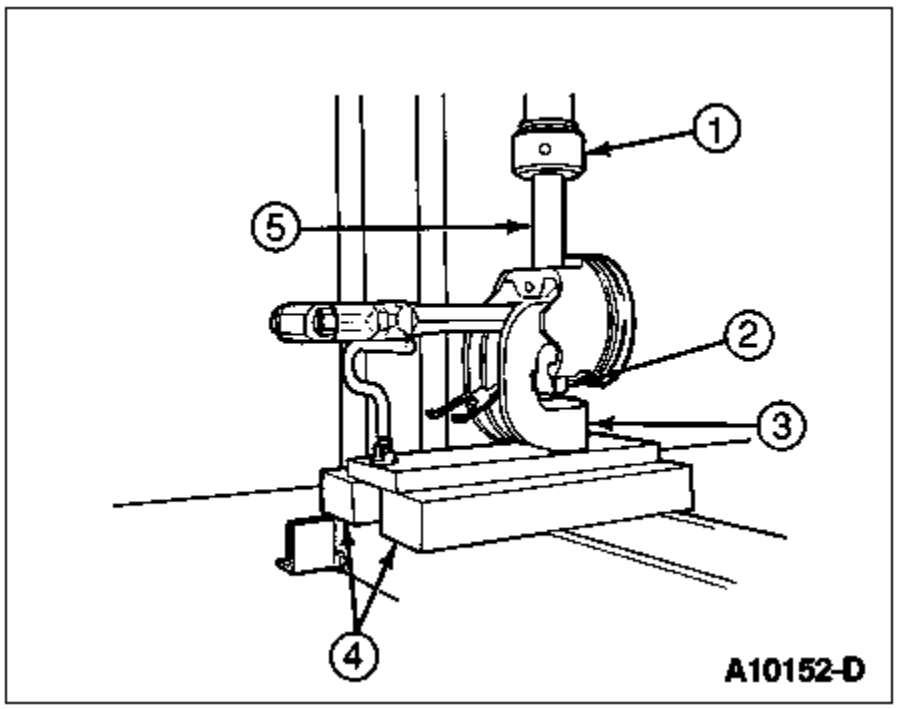
Pistons and Connecting Rods

Disassembly

1. Remove connecting rod bearing (6211) from connecting rod (6200) and cap.
2. Remove partial piston ring set using a suitable piston ring expander.
3. Mark connecting rod and cap to ensure assembly with the same piston (6108) and installation in the same cylinders from which they were removed.
4. Using an arbor press and Piston Pin Removal and Replacer T68P-6135-A, press the piston pin from the piston and connecting rod.



Item	Part Number	Description
1	—	Press Ram (Part of T68P-6135-A)
2	6135	Piston Pin
3	—	Receiving Tube

tomsn048@gmail.com

		(Part of T68P-6135-A)
4	—	Press Plates (Part of T68P-6135-A)
5	—	Pin Pusher (Part of T68P-6135-A)

Assembly

Check the fit of a new piston, pin and ring (6102) in the cylinder bore before assembling the piston pin (6135) and piston, pin and ring to the connecting rod as outlined in Section 03-00 .

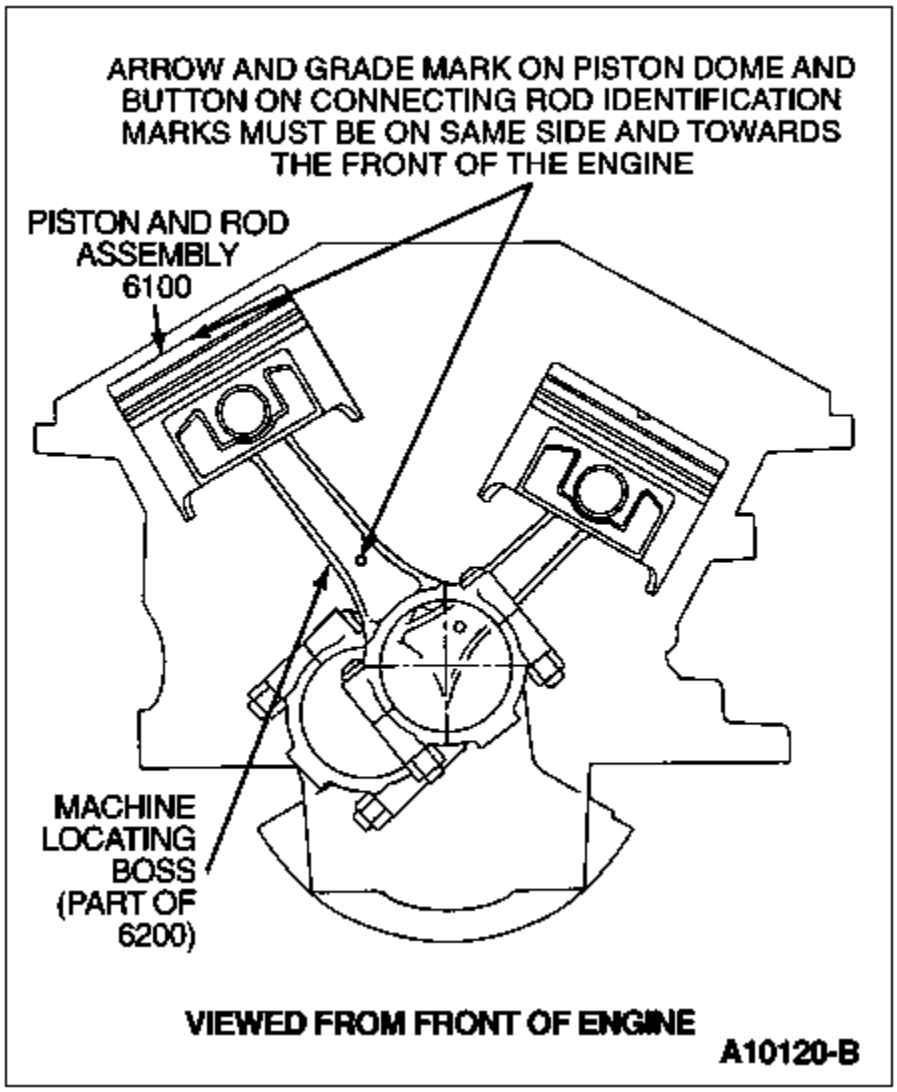
The piston pin bore of a connecting rod and the diameter of the piston pin must be within specification.

1. Check the ring side clearance of the compression rings with Feeler Gauge D81L-4201-A or equivalent by inserting it between the ring and its lower land. The gauge should slide freely around the entire ring circumference without binding. Any wear that occurs will form a step at the inner portion of the lower land. If the lower lands have high steps, the piston should be replaced.

2. Apply a light coat of engine oil to all parts.

3. Assemble the piston, pin and ring to the connecting rod, putting the notch in the piston dome and the connecting rod on the same side.

tomsn048@gmail.com

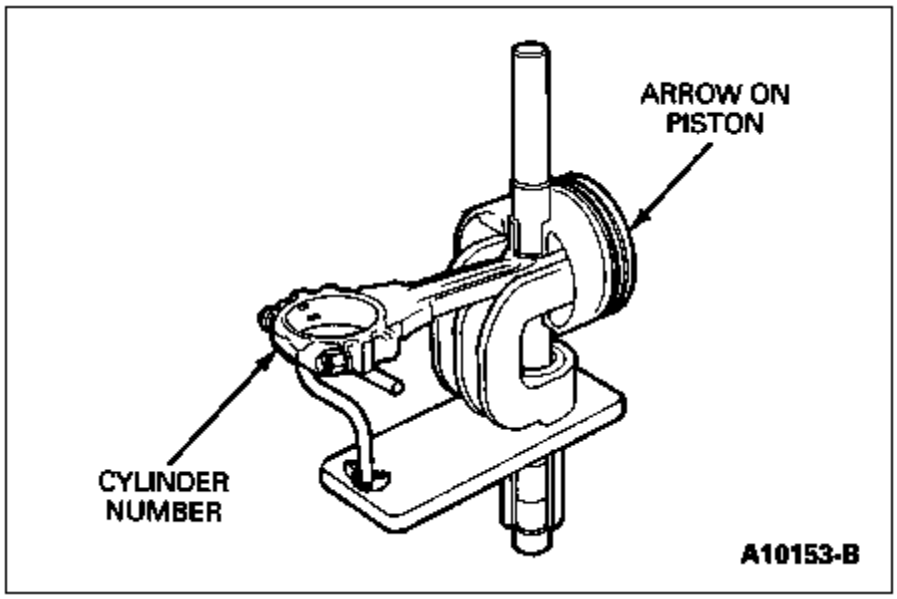


- On V-6 engines with one rod per pin, both sides of rod have larger chamfers.

4. **NOTE: Make certain piston floats during installation operation.**

   Start the piston pin in the piston and connecting rod (this may require a very light tap with a mallet). Using an arbor press and Piston Pin Remover/Replacer T68P-6135-A, press the piston pin through the piston until the piston pin is centered in the piston.

tomsn048@gmail.com



5. Check the end gap of all piston rings. It must be within specification. Follow the instructions contained on the piston ring package and install the partial piston ring sets.

6. Make sure connecting rod bearings and the bearing bore in the connecting rod and cap are clean. Foreign material under the inserts will distort the bearing and cause a failure. Install the connecting rod bearings in the connecting rod and cap with the tangs fitting in the slots provided.

tomsn048@gmail.com

Valve Tappet, Hydraulic

The internal parts of each hydraulic valve tappet (6500) are matched sets. Do not intermix the parts. Keep the valve tappets intact until they are to be cleaned. Valve tappets should always be tested after assembly. Refer to the cleaning, inspection and test procedures in Section 03-00 .

Disassembly

Disassemble and assemble each valve tappet separately. Identify the valve tappets so they can be installed in their original bores.

1. Grasp the lock ring with needlenose pliers to release it from the groove. It may be necessary to depress the plunger to fully release lock ring.
2. Remove the push rod cup, metering valve (disc), plunger and spring.
3. Remove the plunger, the check valve and the check valve retainer and plunger spring. Carefully remove the plunger spring, the check valve retainer and the check valve disc from the plunger.

Assembly

1. Place the plunger upside down on a clean work bench.
2. Place the check valve (disc or ball check) in position over the oil hole on the bottom of the plunger. Set the check valve spring on top of the check valve (disc or ball check).
3. Position the check valve retainer over the check valve and spring and push the retainer down into place on the plunger.
4. Place the plunger spring, and then the plunger (open end up) into the valve tappet body.
5. Position the metering valve (disc) in the plunger, and then place the push rod cup in the plunger.
6. Depress the plunger, and position the closed end of the lock ring in the groove of the valve tappet body. With the plunger still depressed, position the open ends of the lock ring in the groove. Release the plunger, and then depress it again to fully seat the lock ring.
7. Use the Hydraulic Tappet Leak-Down Tester TOOL-6500-E or equivalent to fill the valve tappets with test fluid.

Cylinder Block Assembly

Disassembly

1. Mount the engine (6007) in a work stand and remove all parts not furnished with the new cylinder blocks (6010), following the procedures in Removal and Installation .
2. Remove the four cylinder head to block dowels (6A008) and the cylinder block drain plugs.
3. Remove the used cylinder blocks from the work stand.

Assembly

1. Clean the gasket and seal surfaces of all serviceable parts and assemblies.
2. Position the new cylinder blocks in a work stand and install the cylinder head to block dowels and block cylinder drain plugs.
3. Transfer all serviceable parts removed from the used cylinder blocks, following the procedures in Removal and Installation .
4. Check all assembly clearances and correct as necessary.

tomsn048@gmail.com

Cylinder Block, Bare

Before replacing a cylinder blocks (6010), determine if it is serviceable. If so, make the necessary service. Refer to Section 03-00 .

Disassembly

1. Completely disassemble the used engine, following the procedures in Removal and Installation .
2. Remember to ridge ream the cylinder bores before removing pistons (6108).
3. Remove the cylinder head to block dowels (6A008) and the cylinder block drain plugs.

Assembly

1. Clean the gasket and seal surfaces of all serviceable parts and assemblies.
2. Position the new cylinder blocks in a work stand and install the cylinder head to block dowels and the cylinder block drain plugs.
3. Transfer all serviceable parts removed from the used cylinder blocks, following the procedures in Removal and Installation .
4. Check all assembly clearances and correct as necessary.

tomsn048@gmail.com

Valve Clearance

1. With No. 1 piston on TDC at the end of compression stroke (Position No. 1 in the illustration) check the following valves:

   Position 1

   No. 1 exhaust valve (6505) No. 1 intake valve (6507)

   No. 3 exhaust valve No. 2 intake valve

   No. 6 exhaust valve No. 4 intake valve

2. Rotate crankshaft 360 degrees to position No. 2 and check the following valves:

   Position 2

   No. 2 exhaust valve No. 3 intake valve

   No. 4 exhaust valve No. 5 intake valve

   No. 5 exhaust valve No. 6 intake valve

tomsn048@gmail.com

Valve Cover and Gasket, Ranger

Removal

1. Disconnect negative battery cable.
2. Drain cooling system.
3. Disconnect the wiring connectors and locator from the intake air temperature (IAT) and mass air flow (MAF) sensors. Remove the breather hose from the RH valve cover and remove the air cleaner tube.
4. Remove the accelerator control splash shield. Disconnect the accelerator and speed control cables from the throttle body. Remove the accelerator control bracket with cables attached and position aside.
5. Disconnect the idle air control (IAC), differential pressure feedback EGR (DPFE) transducer, throttle position sensor (TPS), EGR vacuum regulator (EVR) solenoid electrical connectors and vacuum hoses.
6. Disconnect the brake booster vacuum hose, vacuum connectors from the upper intake manifold and the positive crankcase ventilation (PCV) valve from the LH valve cover.
7. Disconnect the 42-pin connector and the powertrain control module (PCM) harness locator from the bracket mounted to the under side of intake manifold.
8. Disconnect the ignition coil electrical connector, locator, and the noise suppressor electrical connector. Disconnect the ignition wires from the spark plugs.
9. Disconnect the vent line from under the throttle body.
10. Disconnect the spark plug wires from the seven retaining clips. Remove the two ignition coil bolts from the upper intake manifold and one bolt from RH exhaust manifold. Remove the coil pack with ignition wires as an assembly.
11. Disconnect the vacuum hose from the EGR valve. Disconnect the EGR tube flange nut from the EGR valve. Remove the EGR valve and gasket. Discard the gasket.
12. Remove the oil level indicator tube bracket nut and remove the oil level indicator tube and indicator.
13. Remove the stud retaining the EGR outlet tube bracket to the exhaust manifold. Remove the upper intake manifold and gasket. Discard the gasket. Tape the lower intake manifold openings.
14. Disconnect the wiring connector from the oil pressure-sending unit and locators. Position harness aside.
15. Disconnect the upper radiator hose from the thermostat housing. Disconnect the heater hose from the intake manifold. Position the hoses aside.
16. Remove the LH valve cover (with gasket). Discard the gasket.

tomsn048@gmail.com

17. Remove the RH valve cover (with gasket). Discard the gasket.

18. Clean both valve covers.

Installation

1. **NOTE: Apply Silicone Gasket and Sealant F6AZ-19562-AA or equivalent meeting Ford specifications WSE-M4G323-A6 to the intake manifold-to-cylinder head parting seams.**

   Install the LH and RH valve cover gaskets.

2. Install the LH valve cover. Tighten the bolts to 10 Nm (89 lb-in).

3. Install the RH valve cover. Tighten the bolts to 10 Nm (89 lb-in).

4. Position harness, and connect the oil pressure-sending unit and locators.

5. Remove the tape from the lower intake manifold. Install new upper intake manifold seals. Install the upper intake manifold with the EGR outlet tube attached. Tighten the nuts to 20 Nm (15 lb-ft).

6. Install the EGR outlet tube to exhaust manifold. Tighten stud to 40 Nm (30 lb-ft).

7. Install the oil level indicator tube bracket to EGR bracket stud. Tighten the nut to 20 Nm (15 lb-ft). Install the oil indicator.

8. Connect the upper radiator hose to the thermostat housing. Connect the heater hose to the intake manifold.

9. Install the EGR valve with a new gasket to outlet tube bracket. Connect the EGR vacuum line and the inlet tube from the exhaust manifold. Tighten the EGR valve bolts to 20 Nm (15 lb-ft). Tighten the tube nut to 34 Nm (25 lb-ft).

10. Install the coil pack with ignition wires as an assembly. Tighten the two ignition coil bolts to the upper intake manifold and one bolt on right exhaust manifold to 20 Nm (15 lb-ft). Connect the ignition wires to the seven retaining clips and spark plugs.

11. Connect the ignition coil electrical connector, locator, and the noise suppressor electrical connector.

12. Connect the vent line under the throttle body.

13. Connect the 42-pin connector and the PCM harness locator to the bracket mounted to the under side of intake manifold.

14. Connect the TPS electrical connector and hoses to the DPFE transducer.

15. Connect the vacuum hoses to the brake booster, upper intake manifold and the PCV valve to the LH valve cover.

16. Connect the IAC valve, EVR solenoid wiring connectors and vacuum hoses.

17. Install the accelerator control bracket to throttle body. Tighten the bolts to 13 Nm (10 lb-ft). Connect the accelerator and speed control cables to the throttle body. Install the accelerator splash shield.

18. Install the breather hose to the RH valve cover and to the inlet tube and install the assembly. Connect

tomsn048@gmail.com

the electrical connectors to the IAT and MAF sensors.

19. Connect the negative battery cable.
20. Fill the cooling system.
21. Start the engine and check for leaks.

---

tomsn048@gmail.com

Valve Cover and Gasket, Aerostar

Removal

1. Disconnect battery ground cable (14301) and remove intake shield and air cleaner outlet tube (9B659).
2. Remove inside engine cover.
3. For right valve cover, remove oil fill pipe (6A868), oil level indicator tube (6754), and transmission oil filler tube (7A228).
4. Remove generator (GEN) (10346) and ignition coil (12029) and assembled bracket. Refer to Section 03-07C .
5. Remove spark plug wires from clips on valve cover (6582).
6. For left valve cover, remove upper intake manifold as outlined in this section.
7. Remove left valve cover bolts, rocker arm cover flange plate (6A523) and valve cover.
8. Remove A/C compressor (19703) from A/C compressor mounting bracket (2882) and set out of the way. Do not disconnect hoses from A/C compressor.
9. Remove right valve cover bolts, rocker arm cover flange plates, and valve cover.

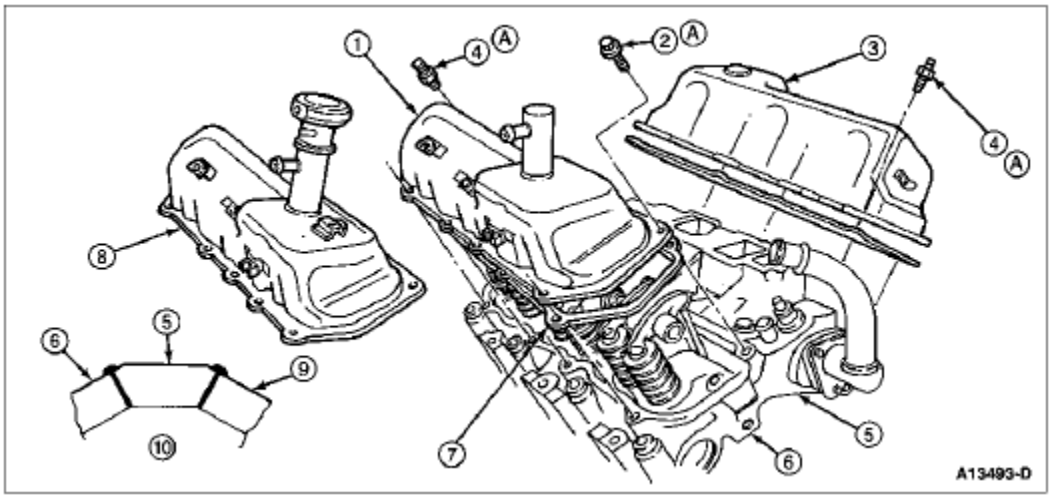
Installation

1. Clean valve cover, cylinder head (6049), and intake manifold gasket surfaces.
2. Locate valve cover gaskets (6584) on valve covers.
3. **NOTE: Since silicone rubber will set up within 15 minutes, if you are installing both covers, apply only to one side at a time.**

   Apply Silicone Rubber D6AZ-19562-BA or equivalent meeting Ford specifications ESB-M4G92-A and ESE-M4G195-A, to left intake manifold-to-cylinder head parting seam.
4. Install right valve cover, rocker arm cover flange plates, and bolts. Snug bolts starting from center bolts and working in crisscross pattern to end bolts. Tighten in same pattern to 6-8 Nm (4.5-5.9 lb-ft).

Rocker Arm Cover and Gasket, Installation

tomsn048@gmail.com



Item	Part Number	Description
1	6582	Valve Cover — Aerostar (RH)
2	E800390-S72	Screw, M 6 x 22 Flange Head
3	6582	Valve Cover (LH)
4	W701041	Stud
5	9424	Intake Manifold
6	6049	Cylinder Head (RH)
7	6584	Valve Cover Gasket
8	6582	Valve Cover — Ranger (RH)
9	6049	Cylinder Head (LH)
10	6010	Cylinder Blocks
A	—	Tighten to 8-10 Nm (71-89 Lb-In)

5. Install A/C air register impingement screen on A/C compressor mounting bracket and tighten compressor bolts to 24-30 Nm (18-23 lb-ft).
6. Snap spark plug wires into clips on valve cover.
7. Install upper intake manifold as described in this section.
8. Apply Silicone Rubber D6AZ-19562-BA or equivalent meeting Ford specifications ESB-M4G92-A and ESE-M4G195-A to right intake manifold-to-cylinder head parting seam.
9. Install left valve cover, bolts, and rocker arm cover flange plates and snug bolts starting from center bolts and working in crisscross pattern to end bolts. Tighten in same pattern to 6-8 Nm (4.5-5.9 lb-ft).
10. Install ignition coil and assembled bracket and generator. Refer to Section 03-07C .
11. Snap spark plug wires into clips on valve cover.
12. Install oil fill pipe, oil level indicator tube, and transmission oil filler tube.

tomsn048@gmail.com

13. Install air cleaner outlet tube and shield.

14. **NOTE: When the battery has been disconnected and reconnected, some abnormal drive symptoms may occur while the powertrain control module (PCM) (12A650) relearns its adaptive strategy. The vehicle may need to be driven 16 km (10 miles) or more to relearn the strategy.**

    Connect battery ground cable, start engine and check for leaks.

15. Install engine cover and close hood.

---

tomsn048@gmail.com

Rocker Arm

Removal

1. Remove valve covers (6582) as outlined in this section.

2. **CAUTION: If the rocker arm shafts (6563) are not loosened gradually, the shaft may become bent or damaged during removal.**

   Remove the rocker arm shafts by loosening the rocker arm shaft support bolts two turns at a time until the shaft can be removed.

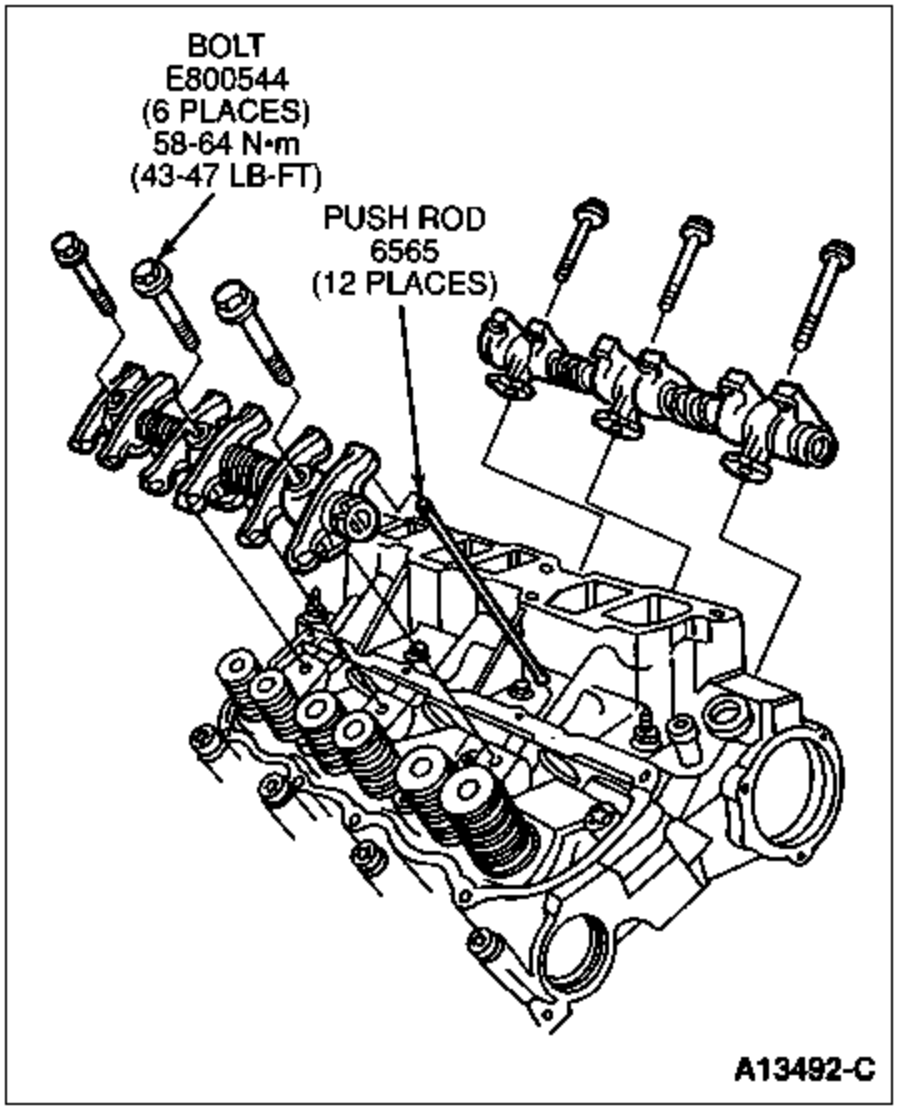
Installation

1. Lubricate all rocker arm assemblies with Engine Assembly Lubricant D9AZ-19579-D or equivalent meeting Ford specification ESR-M99C80-A.

2. Install the rocker arm shaft assemblies and draw the shaft support bolts down evenly, two turns at a time, until the rocker shaft assemblies are fully down. Tighten shaft support bolts to 32 Nm (24 lb-ft). Then torque again an additional 90°.

3. Install valve covers as outlined in this section.

tomsn048@gmail.com



tomsn048@gmail.com

tomsn048@gmail.com

Valve Spring, Retainer and Valve Stem Seal

SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
Valve Spring Compressor	T86L-6565-A
Valve Spring Compressor Bar	T74P-6565-B
Valve Stem Seal Replacer	T90T-6571-A

NOTE: Broken valve springs (6513) or leaking valve stem seals (6571) and retainer may be replaced without removing the cylinder head (6049), provided damage to the intake valve (6507) or valve seat has not occurred.

Removal

1. Remove the valve cover (6582) and valve rocker arm shaft (6563) as described under Valve Cover, Aerostar or Valve Cover, Ranger and Rocker Arm . Remove the applicable spark plug (12405).

2. Remove both push rods (6565) and valve tappets (6500) of the cylinder to be serviced.

3. **CAUTION: Engine may turn over when air pressure is applied. Remove all objects from fan area (lights, extension cords, etc.).**

   Install an air line with an adapter in the spark plug hole.

4. **NOTE: If air pressure fails to hold the valve in the closed position when removing retainers, it can be presumed that the intake valve is not seating or is damaged. If this condition occurs, remove the cylinder head for further inspection.**

   Turn on the air supply. **Air pressure may turn the crankshaft until the piston reaches the bottom of the stroke.**

5. Using the Valve Spring Compressor T86L-6565-A and Valve Spring Compressor Bar T74P-6565-B compress the valve spring and remove the valve spring retainer keys (6518), valve spring retainer (6514) and the valve spring.

6. Remove the valve stem seal. If air pressure has forced the piston to the bottom of the cylinder, any removal of air pressure will allow the intake valves or exhaust valves (6505) to fall into the cylinder. A rubber band, tape or string wrapped around the end of the valve stem will prevent this condition and will still allow enough travel to check the intake valve or exhaust valve for binds.

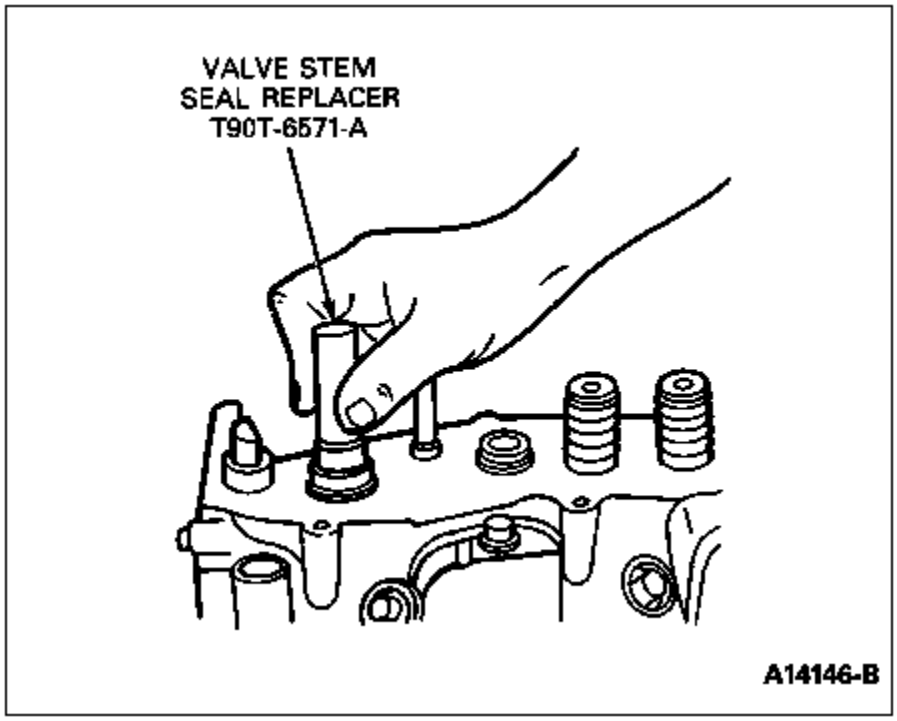
Installation

1. Lubricate a new valve stem seal with engine oil XO-5W30-QSP or equivalent meeting Ford specification WSE-M2903-A1 or SAE 5W-30 Service SG and install on valve stem using Valve Stem Seal Replacer T90T-6571-A.

2. Position the rocker arm shaft spring (6587) over the intake valve or exhaust valve. Install the valve spring retainer. Using Valve Spring Compressor Bar T74P-6565-B and Valve Spring Compressor

tomsn048@gmail.com

T86L-6565-A, compress the valve spring and install the valve spring retainer keys.



3. Apply SAE 50 Service SG oil or equivalent meeting Ford specification ESE-M2C39-F to both ends of the push rods, the valve tips and both ends of the rocker arms (6564). Install the valve tappets, making sure the lower end of the rod is positioned in the tappet push rod cup.

4. Turn off the air and remove the air line and adapter. Install the spark plug.

5. Clean the valve cover and cylinder head gasket surfaces. Install the valve cover as outlined in this section.

6. Run the engine (6007) at fast idle and check for oil and fuel leaks.

tomsn048@gmail.com

tomsn048@gmail.com

Valve Tappet, Hydraulic

NOTE: Before removing a valve tappet (6500) for noisy operation, make sure the noise is not caused by improper valve-to-rocker arm clearance or by worn rocker arms (6564) or push rods (6565). Refer to Section 03-00 for diagnosis and testing procedures.

Removal

1. Remove cylinder head (6049) assembly as outlined in this section.

2. Remove the valve tappets. Note the location of each valve tappet so each one can be installed in the original position.

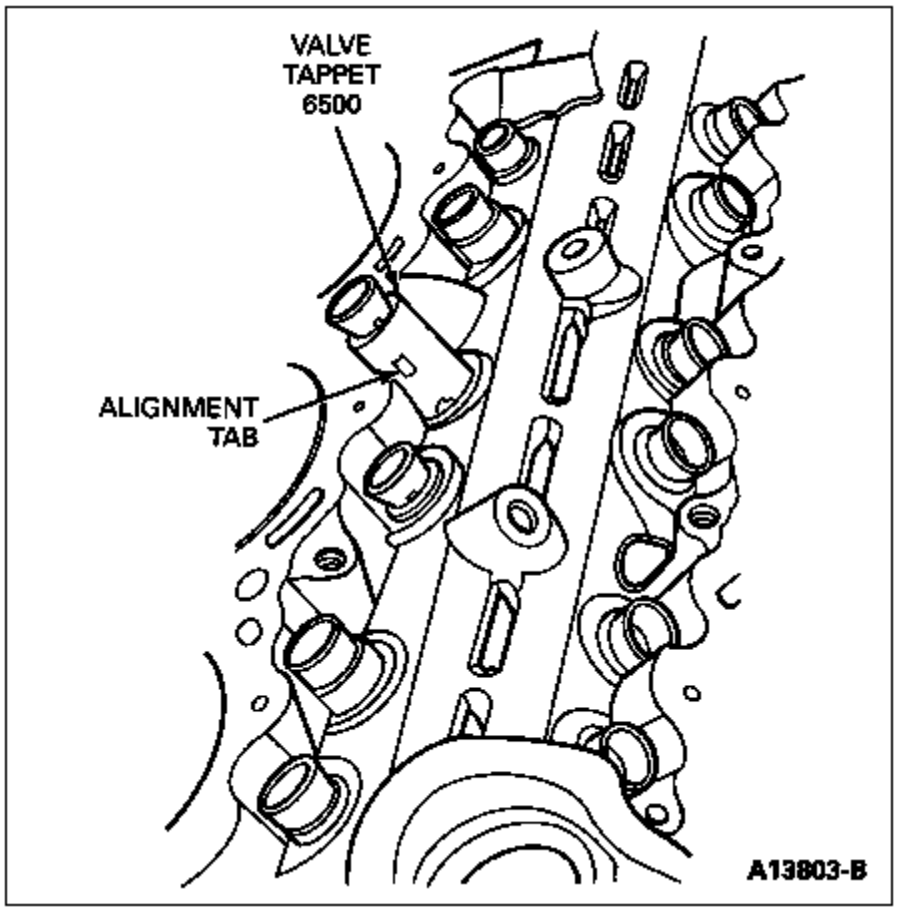
Installation

1. **NOTE: Lightly oil all bolt and stud threads before installation, except those specifying special sealant. Using solvent, clean the intake manifold, cylinder head and valve rocker arm cover sealing surfaces.**

   Lubricate each tappet and bore with Engine Assembly Lubricant D9AZ-19579-D or equivalent meeting Ford specification ESR-M99C80-A or engine oil SAE 50 Service SG ESE-M2C39-F.

2. Install each valve tappet in the bore from which it was removed with the alignment tab in the locating groove of the bore. If new valve tappets are being installed, check for free fit in the bore.

tomsn048@gmail.com



3. Install cylinder head assembly as outlined in this section.

tomsn048@gmail.com

Intake Manifold, Upper

Removal

NOTE: The procedure for removal and installation of the upper intake manifold (9424) has been changed. After removing the ignition coil and bracket assembly, the EGR valve (EGR valve) (9D475), the intake manifold to EGR valve tube, and the EGR transducer vacuum lines must be removed. Refer to Section 03-08 .

NOTE: The intake manifold is a four-piece assembly consisting of the upper intake manifold, the throttle body (9E926), the fuel injection supply manifold (9D280) and the lower intake manifold. For servicing of the throttle body and fuel injection supply manifold, refer to Section 03-04C .

WARNING: RESIDUAL PRESSURE REMAINS IN FUEL SYSTEM AFTER ENGINE IS SHUT OFF. THIS COULD RESULT IN INJURY OR FIRE WHEN FUEL LINES ARE DISCONNECTED. DISCONNECT INERTIA FUEL SHUTOFF SWITCH AND CRANK ENGINE UNTIL FUEL IN LINES IS USED UP. REFER TO SECTION 03-04C.

1. Disconnect the battery ground cable (14301) at the battery.
2. Disconnect the intake air temperature (IAT) electrical connector and crankcase ventilation hose from air cleaner outlet tube.
3. Loosen clamps and remove air cleaner outlet tube from vehicle.
4. Remove the accelerator control splash shield and disconnect the throttle cable, and if equipped, speed control cable from the upper intake.
5. Disconnect vacuum hoses from the brake booster and upper intake.
6. Disconnect the exhaust feed hoses from the differential pressure feedback EGR (DPFE) sensor.
7. Disconnect the PCV ventilation hose from the upper intake manifold.
8. Disconnect the electrical connectors from the DPFE, idle air control (IAC), throttle position (TP) sensor and EGR transducer.
9. Remove the anti-lock electronic control module. Refer to procedure in Section 06-09A .
10. Remove floor mount cup holder and remove the interior engine access cover.
11. Disconnect heater hose locating bracket and unbolt transmission filler tube and position aside.
12. Disconnect spark plug wires from the ignition coil pack and disconnect fuel charging wiring from ignition coil pack.
13. Remove the retaining nut on the engine oil level indicator dipstick tube and remove tube.

tomsn048@gmail.com

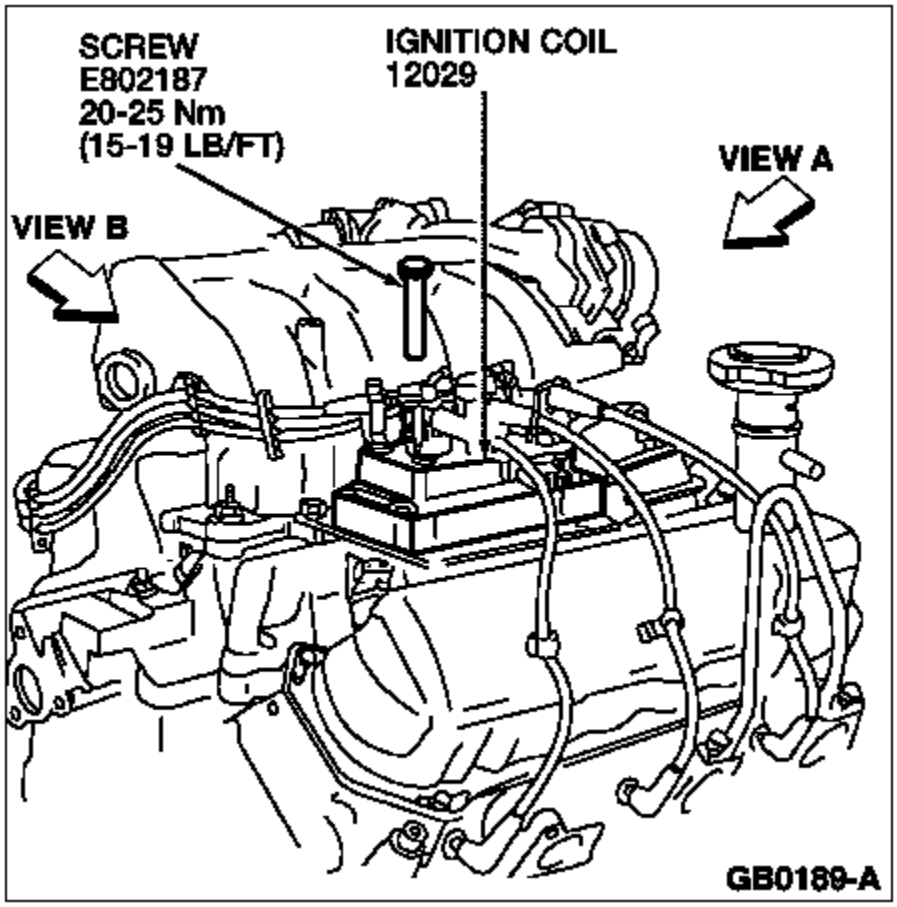
14. Remove the EGR tube retaining bolts and release EGR tube from upper intake.
15. Disconnect the mass air flow (MAF) sensor electrical connector.
16. Disconnect the bulkhead wiring harness, remove pushpin locators and position wiring harness aside.
17. Remove the three bulk head bracket bolts and remove bracket.
18. Remove the two EGR transducer retaining bolts and remove transducer from the upper intake manifold.
19. Remove the six nuts securing the upper intake manifold and remove the upper intake manifold.
20. Remove and discard upper intake manifold gaskets.

Installation

1. Replace intake manifold gaskets and install the upper intake manifold.
2. Tighten the upper manifold nuts to 20-25 Nm (15-18 lb-ft) using intake the center-out sequence.
3. Install EGR transducer on upper intake manifold with the retaining two bolts.
4. Fit bulkhead wiring harness bracket and install the three retaining bolts.
5. Connect the bulkhead wiring harness, install pushpin locators and position wiring.
6. Connect the MAF sensor electrical connector.
7. Install the EGR tube into upper intake manifold and tighten retaining bolts.
8. Install the engine oil level indicator dipstick tube and tighten the retaining nut.
9. Connect spark plug wires on ignition coil pack and connect fuel charging wiring to ignition coil pack.
10. Install transmission filler tube and connect heater hose locating bracket.
11. Install interior engine access cover and floor mount cup holder.
12. Install the anti-lock electronic control module; refer to procedure in Section 06-09A .
13. Connect electrical connections at the DPFE, IAC, TP sensor and EGR transducer.
14. Connect vacuum hose at the brake booster and the PCV ventilation hose at the upper intake manifold.
15. Connect the exhaust feed hoses to the DPFE.
16. Install the throttle cable, and if equipped, the speed control cable on to the upper intake.
17. Install the accelerator control splash shield to the throttle body.

tomsn048@gmail.com

18. Install air cleaner outlet and tighten the two clamps.
19. Connect the IAT electrical connector and crankcase ventilation hose to the air cleaner outlet tube.
20. Connect the ground cable at the battery.



tomsn048@gmail.com

tomsn048@gmail.com

Intake Manifold, Lower

Removal

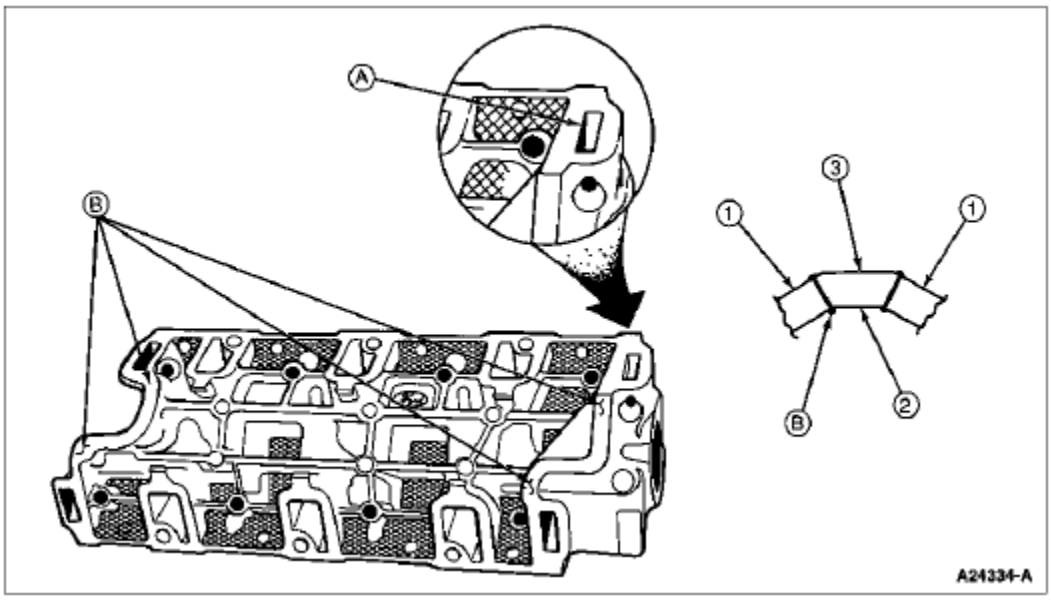
1. Remove the upper intake manifold as outlined in this section.
2. Remove the valve covers as outlined in this section.
3. Disconnect the fuel supply and return lines at the fuel supply manifold as outlined in Section 03-04C .
4. Drain the coolant from the cooling system.
5. Remove the lower intake manifold retaining bolts. Tap the intake manifold lightly with a plastic mallet to break the gasket seal and lift off the lower intake manifold.
6. Remove all old gasket material and sealing compound; make certain that no material is left in the intake ports or lifter valley.

Installation

1. **NOTE: Once applied, the silicone sealer will set up in approximately 15 minutes. The intake manifold must be installed immediately after the sealer is applied.**

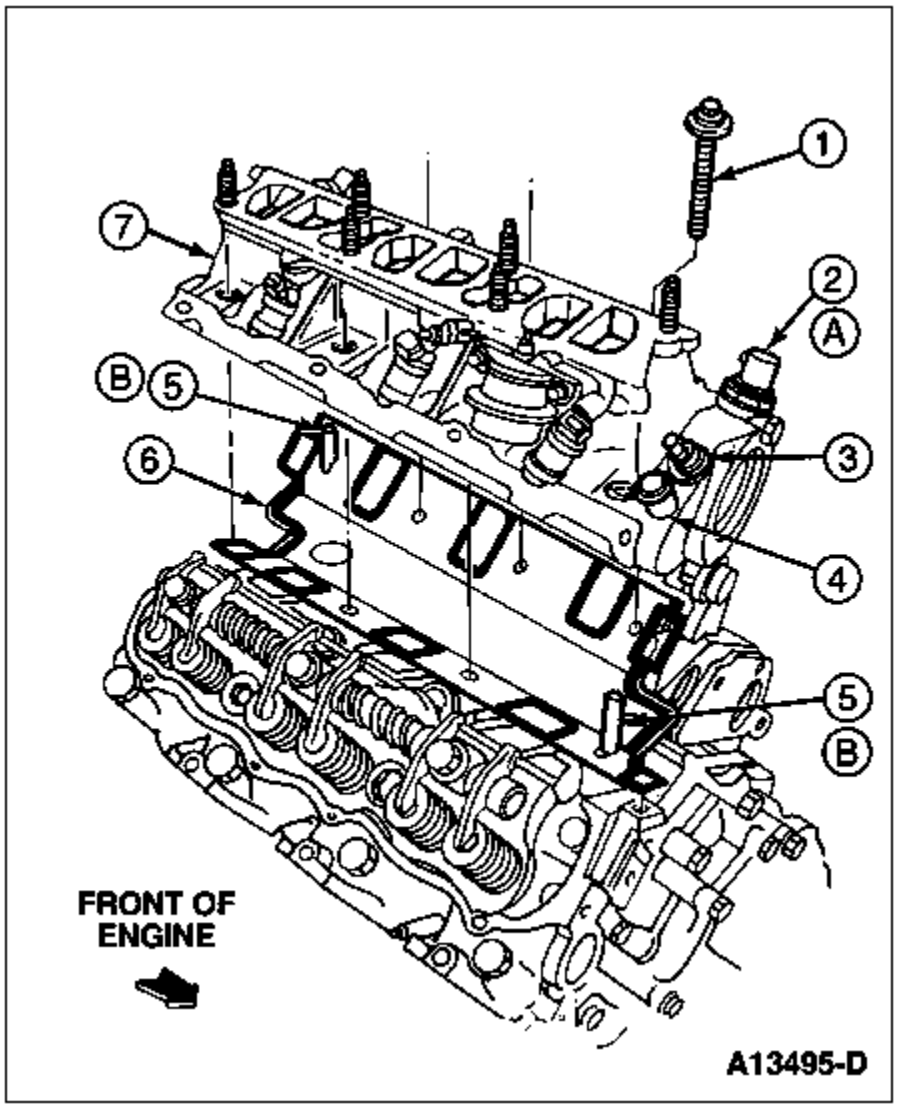
   Apply Silicone Rubber D6AZ-19562-BA or equivalent meeting Ford specifications ESB-M4G92-A and ESE-M4G195-A to the block and cylinder head mating surfaces at the four corners shown. Install the intake manifold gasket (9439) and again apply sealer to the four corner locations.

tomsn048@gmail.com



Item	Part Number	Description
1	6049	Cylinder Head
2	9439	Intake Manifold Gasket
3	9424	Intake Manifold
A	—	Examine Closely for Erosion, Corrosion, or Pitting on This Surface
B	—	Silicone Sealer — 4 Places

tomsn048@gmail.com

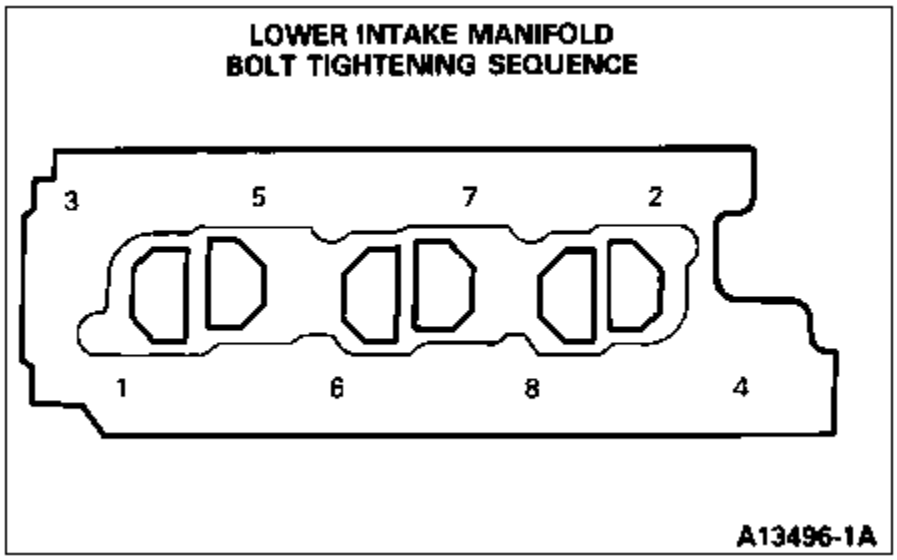


Item	Part Number	Description
1	W702301S309M	Bolt with Captive Washer (8)
2	12A648	Engine Coolant Temperature Sensor
3	10884	Water Temperature Indicator Sender Unit
4	8501	Water Pump
5	—	Stud (2) (Part of 9424)
6	9439	Intake Manifold Gasket
7	9424	Intake Manifold
A	—	Tighten to 16 Nm (12 Lb-Ft)
B	—	Used to Locate Lower Intake Manifold Only

2. Position the intake manifold with the aid of two guide studs located in position 3 and 4 below, and install the bolts hand-tight. Then remove the two guide studs and replace with bolts. Tighten the intake manifold bolts in three stages following the sequence shown.

tomsn048@gmail.com

a. 8 Nm (6 lb-ft)
b. 15 Nm (11 lb-ft)
c. 22 Nm (16 lb-ft)



3. Apply Silicone Rubber D6AZ-19562-BA or equivalent meeting Ford specifications ESB-M4G92-A and ESE-M4G195-A to the four locations at the joint where the intake manifold and the cylinder heads (6049) meet (as shown).

4. Install valve covers (6582) as outlined in this section.

5. Connect the fuel supply and return lines at the fuel supply manifold as outlined in Section 03-04C .

6. Install upper intake manifold as outlined in this section.

7. **NOTE: It is important to follow the coolant filling procedure described in Section 03-03 .**

   Fill and bleed the cooling system as detailed in Section 03-03 .

8. Check the fuel system for leaks as outlined.

---

tomsn048@gmail.com

tomsn048@gmail.com

Cylinder Head(s)

Removal

WARNING: RESIDUAL PRESSURE REMAINS IN FUEL SYSTEM AFTER ENGINE IS SHUT OFF. THIS COULD RESULT IN INJURY OR FIRE WHEN FUEL LINES ARE DISCONNECTED. DISCONNECT INERTIA FUEL SHUTOFF SWITCH AND CRANK ENGINE A MINIMUM OF 15 SECONDS TO DEPRESSURIZE SYSTEM. REFER TO SECTION 03-04C.

NOTE: In 1996, the cylinder heads (6049) removal and installation procedure changed. Before removal of the LH exhaust manifold (9430), the EGR valve to exhaust manifold tube must be removed. Refer to Section 03-08 .

1. Disconnect the battery ground cable (14301) and secure out of the way.
2. Drain the cooling system.
3. Remove the upper and lower intake manifolds and valve covers (6582) as outlined in this section.
4. If left cylinder head is being remove, perform the following steps:
    a. Lift drive belt tensioner (6B209) by rotating it counterclockwise and remove drive belt (8620).
    b. Remove four bolts securing air conditioning compressor to bracket and one screw securing air conditioner manifold tube to upper intake manifold and set compressor to one side.
    c. Remove A/C compressor mounting bracket (2882) with assembled power steering pump (3A674) and position to one side.
    d. Remove the spark plugs (12405).
5. If the right cylinder head is being removed, perform the following steps:
    a. Lift drive belt tensioner by rotating it counterclockwise and remove drive belt.
    b. Remove the generator (GEN) (10346) and generator mounting bracket (10153).
    c. Remove the ignition coil (12029) and assembled bracket.
    d. Remove the spark plugs.
6. Remove the exhaust inlet pipe, exhaust manifold, RH and exhaust manifold, LH.
7. Remove the rocker arm shaft assembly as outlined in this section. Remove the valve tappets (6500), and place them in a rack for installation in the same position.
8. Remove the cylinder head attaching bolts and discard.
9. Remove the cylinder heads.
10. Remove and discard the head gasket (6051).

tomsn048@gmail.com

Installation

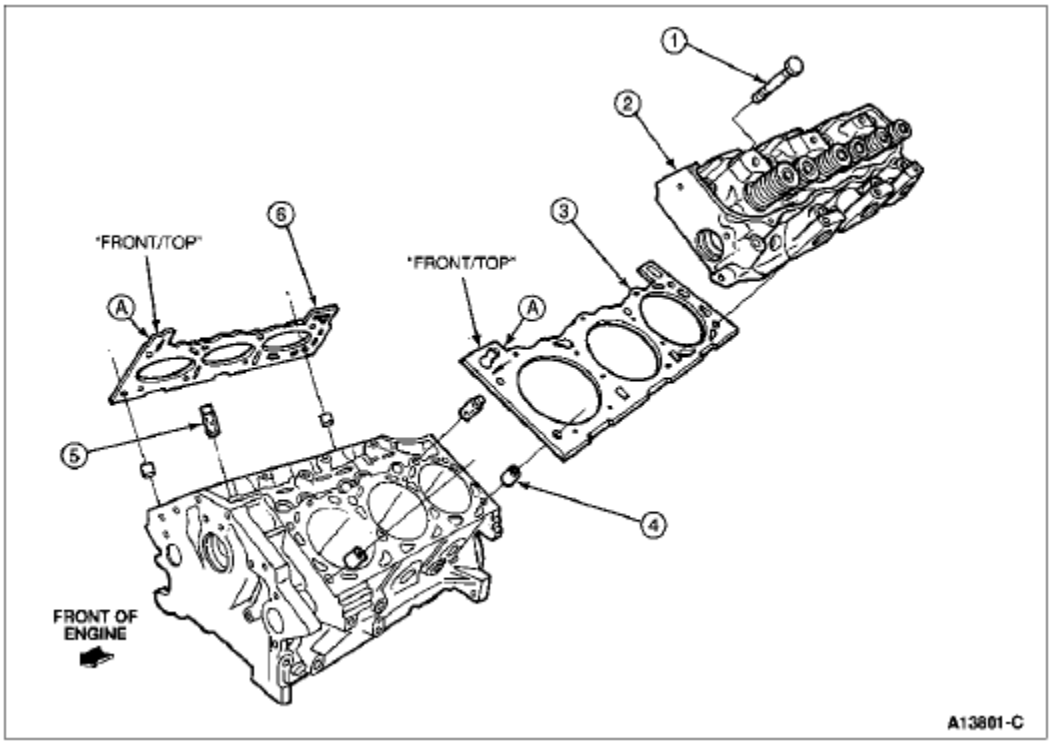
CAUTION: The 4.0L engine should always be assembled using new cylinder head bolts.

NOTE: If cylinder heads were completely disassembled, refer to Cylinder Head Disassembly and Assembly in this section.

NOTE: Head gaskets are not interchangeable, they are either right- or left-hand side.

NOTE: The cylinder heads and intake manifold installation procedure has changed. The cylinder head bolts and intake manifold bolts are tightened alternately and in sequence to ensure correct fit and gasket crush. Failure to follow complete sequence will cause follow-up repair. The following steps provide the new tightening procedure for cylinder head and intake manifold bolts.

Cylinder Head, Installation



Item	Part Number	Description
1	6065	Cylinder Head Bolt
2	6049	Cylinder Head
3	6051	Head Gasket (LH)

tomsn048@gmail.com

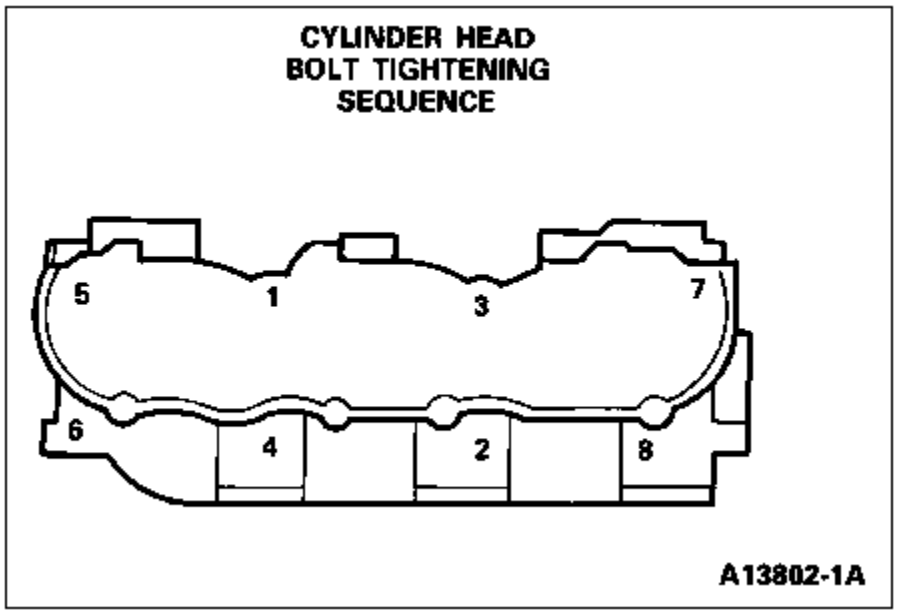
4	6A008	Cylinder Head to Block Dowel
5	6500	Valve Tappet
6	6051	Head Gasket (RH)
A	—	Installation Arrows (on Top) Must Point to Front of Engine

1. Clean mating surfaces to ensure they are free of oil and dirt. Install cylinder head locating dowels.

2. Position cylinder head gaskets on cylinder blocks (6010). The installation arrows on the head gaskets must be pointing to the front of the engine (6007).

3. Install and tighten cylinder head bolts in the sequence shown, in the following steps.

   - Step 1 — 30-35 Nm (22-26 lb-ft)
   - Step 2 — 70-75 Nm (52-56 lb-ft)
   - Step 3 — rotate bolts 90 degrees



4. **NOTE: Once applied, the silicone sealer will set up in approximately 15 minutes. The intake manifold must be installed immediately after the sealer is applied.**

   Apply Silicone Rubber D6AZ-19562-BA or equivalent meeting Ford specifications ESB-M4G92-A and ESE-M4G195-A to the block and cylinder head mating surfaces at the four corners shown. Install the intake manifold gasket (9439) and again apply sealer to the four corner locations.

Item	Part Number	Description
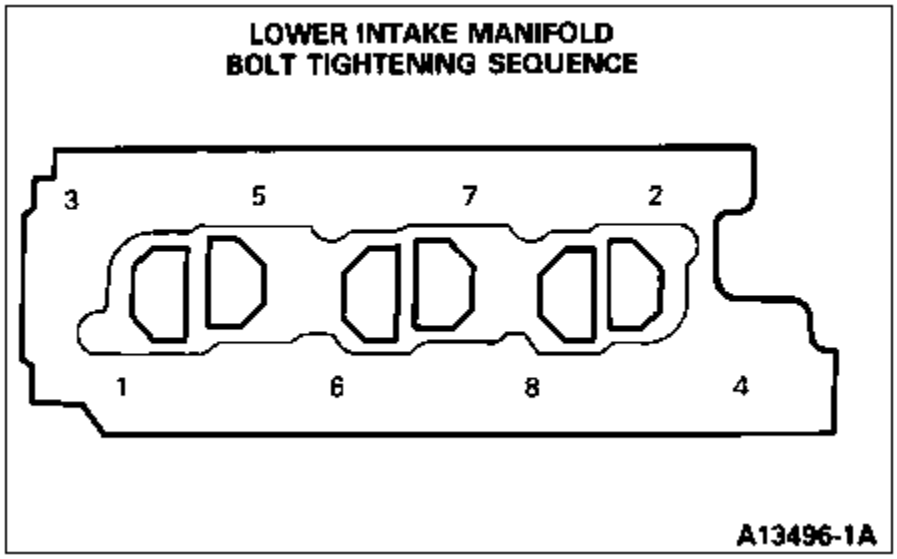
1	W702301S309M	Bolt with Captive Washer (8)
2	12A648	Engine Coolant Temperature Sensor
3	10884	Water Temperature Indicator Sender Unit
4	8501	Water Pump
5	—	Stud (2) (Part of 9424)
6	9439	Intake Manifold Gasket
7	9424	Intake Manifold
A	—	Tighten to 16 Nm (12 Lb-Ft)
B	—	Used to Locate Lower Intake Manifold Only

5. Position the intake manifold with the aid of two guide studs located in position 3 and 4 below, and install the bolts hand-tight. Then remove the two guide studs and replace with bolts. Tighten the intake manifold bolts in three stages following the sequence shown.

tomsn048@gmail.com

a. 8 Nm (6 lb-ft)
b. 15 Nm (11 lb-ft)
c. 22 Nm (16 lb-ft)



6. Install valve tappets. Install rocker arms (6564) as outlined in this section.
7. Apply Silicone Rubber D6AZ-19562-BA or equivalent meeting Ford specifications ESB-M4G92-A and ESE-M4G195-A to the four locations at the joint where the intake manifold and the cylinder heads meet (as shown).
8. Install valve covers as outlined in this section.
9. Connect the fuel supply and return lines at the fuel supply manifold as outlined in Section 03-04C .
10. Install upper intake manifold as outlined in this section.
11. Install air conditioner compressor on bracket and screw retaining air conditioner manifold tube to upper intake manifold. Tighten compressor bolts to 21-29 Nm (15-21 lb-ft).
12. Install the exhaust inlet pipe, RH exhaust manifold and LH exhaust manifold.
13. Install the spark plugs.
14. Install the generator.
15. Install drive belt over pulleys. Make sure that all V-grooves make proper contact with pulleys.
16. Lift tensioner and slide drive belt under drive belt tensioner. Release tensioner to rest pulley on drive belt.
17. Install the A/C compressor mounting bracket with assembled power steering pump to the cylinder heads.
18. Install the A/C compressor (19703) (if equipped).

tomsn048@gmail.com

19. Fill and bleed the cooling system as detailed in Section 03-03 .

20. **NOTE: When the battery has been disconnected and reconnected, some abnormal drive symptoms may occur while the powertrain control module (PCM) (12A650) relearns its adaptive strategy. The vehicle may need to be driven 16 km (10 miles) or more to relearn the strategy.**

    Connect the battery ground cable at the battery.

tomsn048@gmail.com

Crankshaft Pulley/Damper/Front Oil Seal

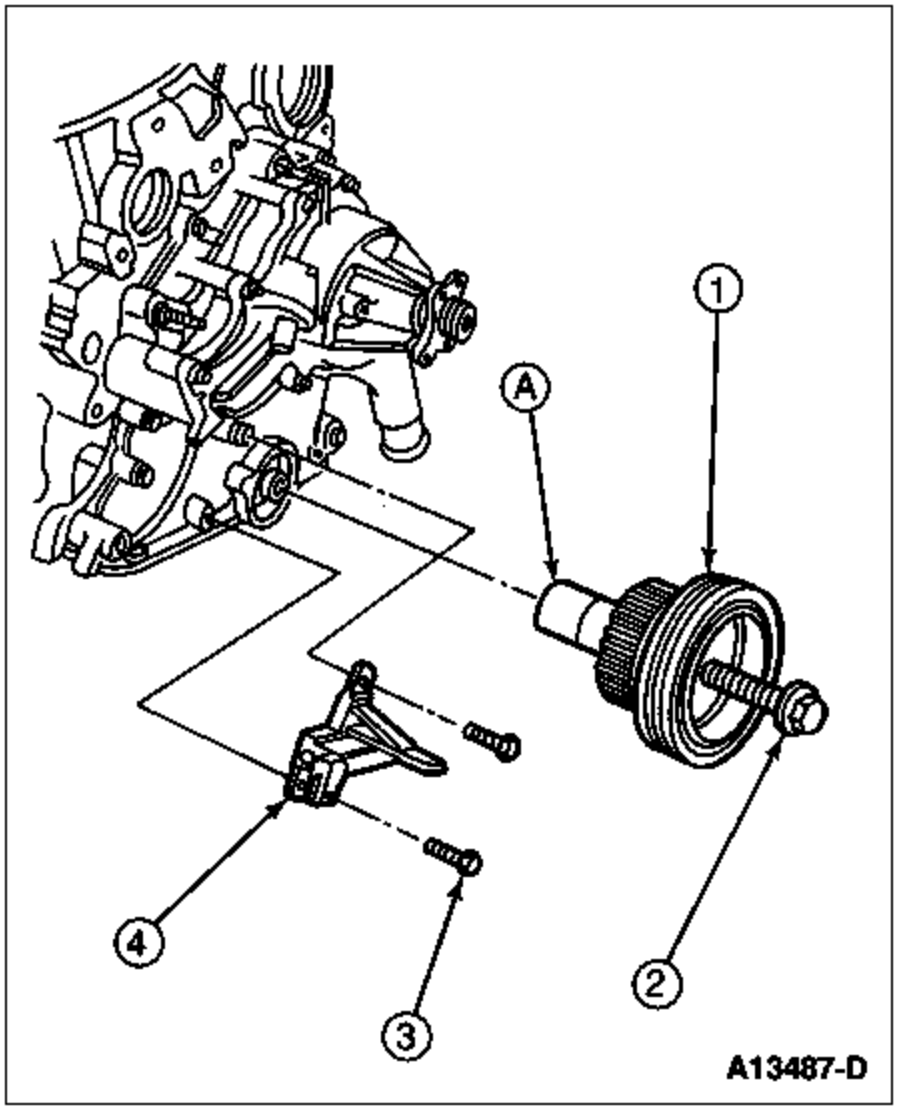
SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
Crankshaft Damper Remover	T74P-6316-A
Front Cover Aligner	T74P-6019-A

Removal

1. Lift drive belt tensioner (6B209) by rotating it clockwise. Remove drive belt (8620).
2. Remove crankshaft pulley bolt.
3. Remove crankshaft vibration damper and pulley from crankshaft (6303) using Crankshaft Damper Remover T74P-6316-A.
4. Pry crankshaft front seal (6700) from engine front cover (6019) with a flat-bladed screwdriver or other similar tool. Use care to prevent damage to engine front cover and crankshaft.

tomsn048@gmail.com



Item	Part Number	Description
1	6312	Crankshaft Pulley
2	E800611	Crankshaft Pulley Bolt
3	E602164	Screw
4	6C315	Crankshaft Position Sensor
A	—	Lubricate with Engine Oil

Installation

1. Inspect engine front cover and shaft seal surface of the crankshaft damper for damage, nicks, burrs or other roughness which may cause the new seal to fail. Service or replace components as necessary.

2. **CAUTION: Do not drive damper on with a hammer.**

tomsn048@gmail.com

Lubricate seal lip with clean engine oil XO-5W30-QSP or equivalent meeting Ford specification ESE-M2C153-E or SAE 5W-30 Service SG engine oil and install crankshaft front seal using Front Cover Aligner T74P-6019-A and Crankshaft Front Seal Installer T90T-6701-A.

3. Coat crankshaft damper sealing surface with clean engine oil XO-5W30-QSP or equivalent meeting Ford specification ESE-M2C153-E or SAE 5W-30 Service SG engine oil. Apply RTV using Rotunda RTV Dispenser or equivalent to keyway of damper prior to installation. Install damper using Crankshaft Damper Replacer T74P-6316-B. Install damper attaching bolt and tighten to 40-50 Nm (30-37 lb-ft), then turn bolt an additional 80-90 degrees tighter.

4. Install accessory drive belt over pulleys. Make sure that all V-grooves make proper contact with pulley.

5. Lift tensioner and slide belt under tensioner pulley. Release tensioner to rest pulley on belt.

6. Start engine and check for oil leaks.

---

tomsn048@gmail.com

Front Cover Oil Seal

SPECIAL SERVICE TOOL(S) REQUIRED

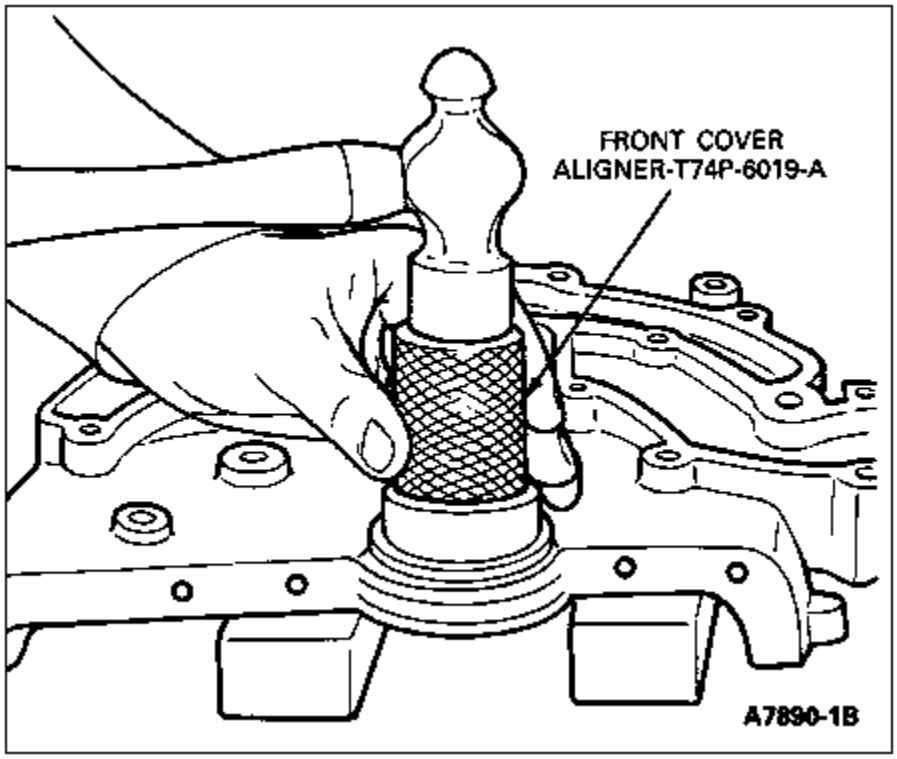
Description	Tool Number
Front Cover Aligner	T74P-6019-A
Front Crank Seal Replacer	T90T-6701-A

Removal

1. Support the front cover to prevent damage while driving out seal.
2. Drive out seal from front cover with Front Cover Aligner T74P-6019-A or with Front Crank Seal Replacer T90T-6701-A.

Installation

1. Support the front cover to prevent damage while installing seal.
2. Coat the new front cover oil seal with SAE 50 Service SG engine oil. Install the new seal in the front cover as shown with Front Cover Aligner T74P-6019-A.



tomsn048@gmail.com

tomsn048@gmail.com

Water Pump

Removal

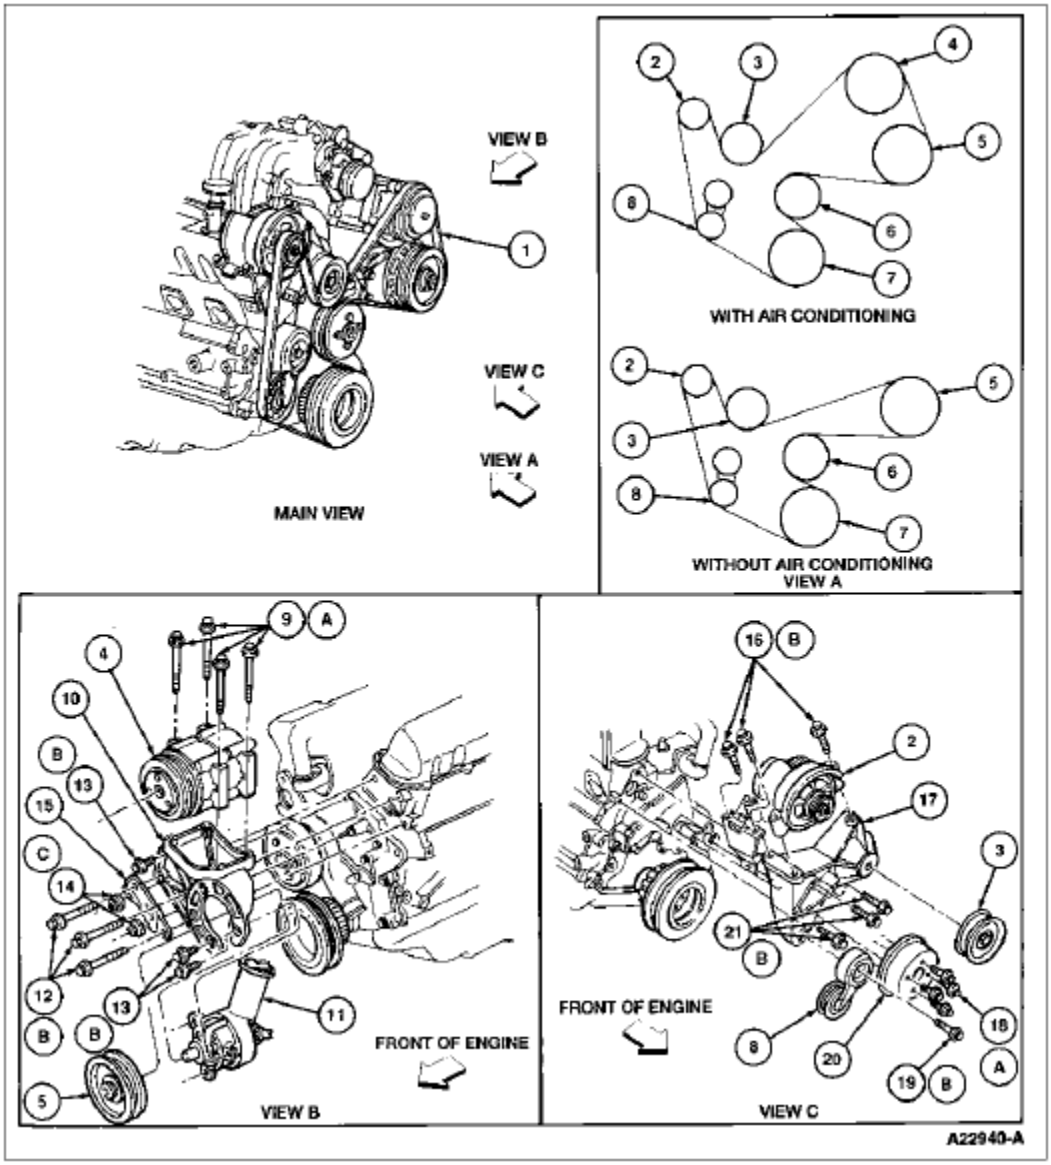
SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
Fan Clutch Holding Tool	T84T-6312-C
Fan Clutch Nut Wrench	T84T-6312-D

NOTE: The drive belt routing, drive belt tensioner (6B209), and idler pulley have changed. The following illustration shows current accessory drive configuration.

Engine Accessory Drive

tomsn048@gmail.com



Item	Part Number	Description
1	8620	Drive Belt
2	10300	Generator
3	8678	Belt Idler Pulley
4	19703	A/C Compressor
5	3A733	Power Steering Pump Pulley
6	8501	Water Pump
7	6312	Crankshaft Pulley
8	6B209	Drive Belt Tensioner
9	N806020-S309	A/C Compressor Bolts (4 Req'd)
10	2882	A/C Compressor Mounting Bracket

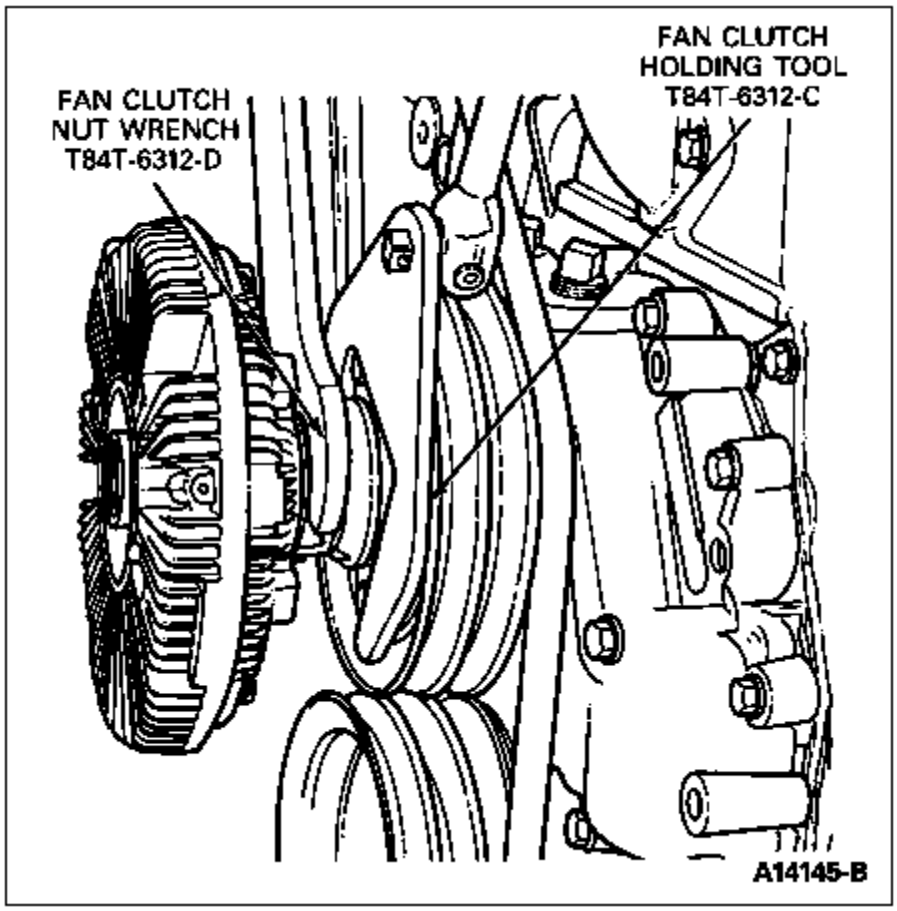
tomsn048@gmail.com

11	3A674	Power Steering Pump
12	N606572-S2	A/C Compressor Mounting Bracket Bolts (3 Req'd)
13	N800199-S309	Power Steering Pump Bolts (3 Req'd)
14	N620481-S2	A/C Compressor Mounting Bracket Brace Nuts (2 Req'd)
15	3C718	A/C Compressor Mounting Bracket Brace
16	N606068-S2	Generator Bolts (3 Req'd)
17	10153	Generator Mounting Bracket
18	N802096-S2	Water Pump Pulley Bolts (4 Req'd)
19	N605805-S2	Drive Belt Tensioner Bolt
20	8509	Water Pump Pulley
21	N606068-S2	Generator Mounting Bracket Bolts (3 Req'd)
A	—	Tighten to 22-28 Nm (17-20 Lb-Ft)
B	—	Tighten to 40-55 Nm (30-40 Lb-Ft)

1. Drain the coolant. Detach the lower radiator hose (8286) and the heater return hose from the water pump (8501). Refer to Section 03-03 .

2. Remove fan blade (8600) and fan clutch (8A616) assembly using Fan Clutch Holding Tool T84T-6312-C and Fan Clutch Nut Wrench T84T-6312-D.

tomsn048@gmail.com



3. Lift drive belt tensioner by rotating it counterclockwise and remove drive belt (8620).
4. Without disconnecting lines, remove A/C compressor mounting bracket (2882) and brace with assembled A/C compressor (19703) and power steering pump (3A674) and set to one side.
5. Remove two bolts and drive belt tensioner.
6. Remove three bolts and generator mounting bracket (10153) with assembled generator (GEN) (10346) and set to one side.
7. Remove the water pump pulley (8509).
8. Remove the water pump assembly attaching bolts and remove water pump.

Installation

1. Remove all gasket material from the sealing surfaces on engine front cover (6019) and water pump assembly. Apply sealer to both sides of the new water pump housing gasket (8507) and place the water pump housing gasket on the water pump.
2. Position the water pump to the front cover with two bolts finger-tight. Tighten all water pump assembly attaching bolts to 8.5-12 Nm (6-9 lb-ft).

tomsn048@gmail.com

3. Install water pump pulley. Tighten bolts to 22-28 Nm (16-20 lb-ft).

4. Install generator mounting bracket with assembled generator. Tighten bracket-to-cylinder head bolts to 40-55 Nm (30-40 lb-ft).

5. Install drive belt tensioner. Tighten bolts to 40-55 Nm (30-40 lb-ft).

6. Install A/C compressor mounting bracket and brace with assembled power steering pump and A/C compressor. Tighten three bracket-to-cylinder head bolts and two bracket-to-front cover nuts to 40-55 Nm (30-40 lb-ft).

7. Install fan blade and fan clutch assembly using Fan Clutch Holding Tool T84T-6312-C and Fan Clutch Nut Wrench T84T-6312-D. Tighten to 40-135 Nm (30-100 lb-ft).

8. Start the engine (6007) and check for leaks.

---

tomsn048@gmail.com

Engine Front Cover

Removal

SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
Fan Clutch Holding Tool	T84T-6312-C
Fan Clutch Nut Wrench	T84T-6312-D
Crankshaft Damper Remover	T74P-6316-A
Crankshaft Front Seal Replacer	T90T-6701-A

1. **NOTE: It is necessary to remove oil pan to properly reseal front cover to oil pan. For Ranger it is necessary to remove engine to remove oil pan. For Aerostar it is necessary to remove transmission to reseal oil pan.**

   On Ranger, remove engine (6007) as outlined in this section.

2. On Aerostar:

   a. Open hood and remove air cleaner outlet tube (9B659).
   b. Drain coolant. Lift drive belt tensioner (6B209) by rotating it counterclockwise and remove drive belt (8620).
   c. Remove fan clutch (8A616) and fan blade (8600) using Fan Clutch Holding Tool T84T-6312-C and Fan Clutch Nut Wrench T84T-6312-D.
   d. Remove four screws and fan shroud (8146).
   e. Without disconnecting lines, remove A/C compressor mounting bracket (2882) and brace with assembled A/C compressor (19703) and power steering pump (3A674) and set to one side.
   f. Remove two bolts and drive belt tensioner.
   g. Remove three bolts and generator mounting bracket (10153) with assembled generator (GEN) (10346) and set to one side.
   h. Raise vehicle and remove transmission as outlined in Group 07.

3. Remove water pump pulley (8509).

4. Remove lower radiator hose (8286).

5. **NOTE: Engine front cover (6019) may be removed with water pump (8501) attached.**

   Remove water pump if necessary.

6. Remove bolt and, using Crankshaft Damper Remover T74P-6316-A, remove crankshaft vibration damper and pulley (6B321).

7. Remove crankshaft position sensor (CKP sensor) (6C315).

8. Remove engine front cover. Note location of different length bolts as you remove cover.

tomsn048@gmail.com

9. Remove oil pan (6675) as outlined in this section.

Installation

1. Remove gasket material and sealer from gasket surfaces. Inspect engine front cover and damper seal surface for nicks, burns, or other roughness which could cause a gasket or seal to fail.
2. Apply sealing compound to cylinder block sealing surfaces.
3. Apply sealing compound to front cover gasket surface and position engine front cover gasket (6020) on front cover.
4. If necessary, replace crankshaft front seal (6700) using Crankshaft Front Seal Replacer T90T-6701-A.
5. Place outer timing belt cover on engine and start all retaining bolts two or three turns. Make sure to get different length bolts back in their proper holes.
6. Position engine front cover to the center of the crankshaft (6303) and to oil pan sealing face of the cylinder blocks (6010).
7. Tighten front cover bolts to 17-21 Nm (13-15 lb-ft).
8. Install crankshaft position sensor.
9. Install oil pan as outlined in this section.
10. Lubricate seal lip with clean engine oil X0-5W30-QSP or equivalent meeting Ford specification ESE-M2C153-E or SAE 5W-30 Service SG engine oil and install crankshaft front seal using Crankshaft Front Seal Installer T90T-6701-A.
11. Coat crankshaft damper sealing surface with clean engine oil X0-5W30-QSP or equivalent meeting Ford specification ESE-M2C153-E or SAE-5W-30 Service SG engine oil.
12. Apply Silicone Rubber D6AZ-19562-BA or equivalent meeting Ford specifications ESB-M4G92-A and ESE-M4G195-A to keyway of crankshaft vibration damper and pulley prior to installation.
13. **CAUTION: Do not drive damper on with a hammer.**

    Install crankshaft vibration damper and pulley using Crankshaft Damper Replacer T74P-6316-B. Install crankshaft pulley bolt and tighten to 40-50 Nm (30-37 lb-ft), then turn bolt an additional 80-90 degrees tighter.
14. If water pump was removed from engine front cover:
    a. Install water pump housing gasket (8507) on the water pump.
    b. Position water pump on engine front cover with two bolts finger-tight. Tighten all water pump bolts to 8.5-12 Nm (6-9 lb-ft).
15. On Ranger, install engine as outlined in this section.

tomsn048@gmail.com

16. On Aerostar:

    a. Install transmission as outlined in Group 07.
    b. Install lower radiator hose.
    c. Install water pump pulley. Tighten bolts to 22-28 Nm (17-21 lb-ft).
    d. Install generator mounting bracket with assembled generator. Tighten bracket-to-cylinder head bolts to 40-50 Nm (30-37 lb-ft).
    e. Install drive belt tensioner. Tighten bolts to 40-50 Nm (30-40 lb-ft).
    f. Install A/C compressor mounting bracket and brace with attached power steering pump and A/C compressor. Tighten three bracket-to-cylinder head bolts and two bracket-to-front cover nuts to 40-55 Nm (30-40 lb-ft).
    g. Install fan shroud.
    h. Install fan blade and fan clutch assembly using Fan Clutch Holding Tool T84T-6312-C and Fan Clutch Nut Wrench T84T-6312-D. Tighten to 40-135 Nm (30-100 lb-ft).

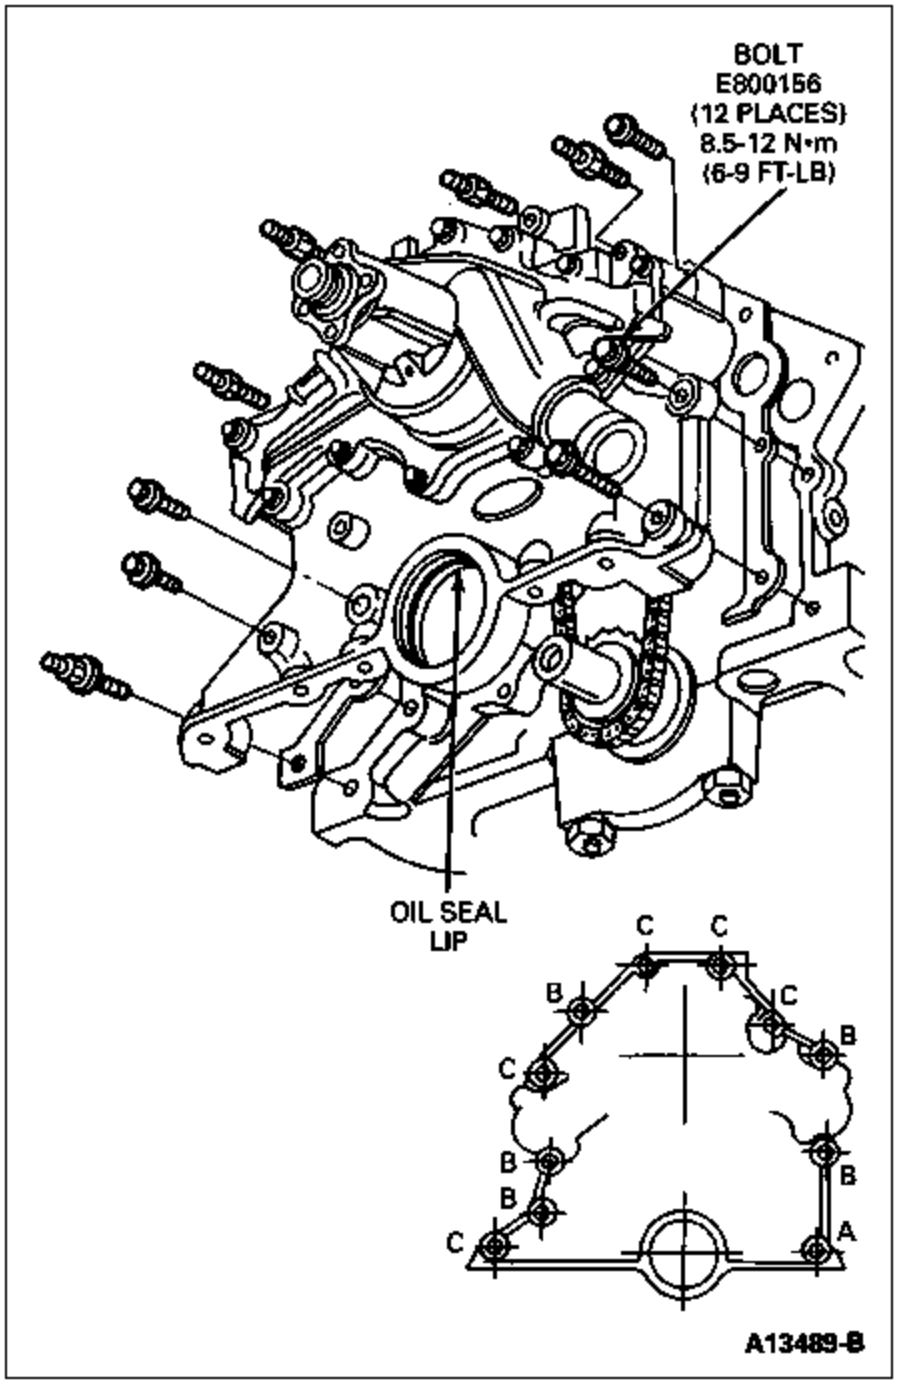
17. Install drive belt over pulleys. Make sure that all V-grooves make proper contact with the pulleys.

18. Lift tensioner and slide drive belt under tensioner pulley. Release drive belt tensioner to rest pulley on belt.

19. Install air cleaner outlet tube.

20. Refill cooling system. Start engine and check for leaks.

tomsn048@gmail.com



FRONT COVER BOLTS

Fastener	Location	Size	Quan.	Torque Nm (Lb-Ft)
Bolt	A	M8x47	(1)	17-21 (13-15)
Bolt	B	M8x25	(5)	17-21 (13-15)
Stud	C	M8-47-19	(5)	17-21 (13-15)

tomsn048@gmail.com

Timing Chain, Sprockets, Tensioners and Guides

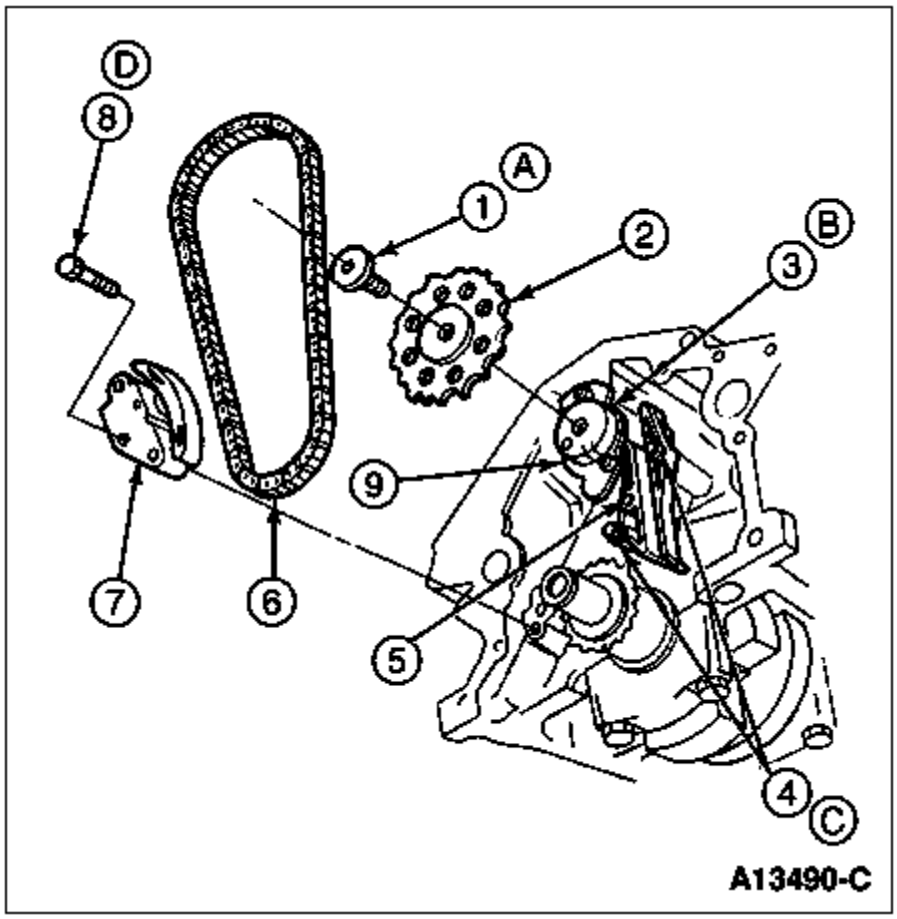
Removal

NOTE: It is necessary to replace oil pan gasket (6710) when removing and installing engine front cover (6019). On Ranger, it is necessary to remove engine (6007) to remove oil pan (6675). On Aerostar, it is necessary to remove transmission to properly seal oil pan

1. On Aerostar vehicles remove radiator (8005) as outlined in Section 03-03 .
2. Remove engine front cover as outlined in this section.
3. **NOTE: A packaging clip from a new automatic tensioner can be used to hold tensioner in a retracted position. If a packaging clip is not available, fabricate a clip to hold the tensioner in a retracted position using shop materials.**

   Push timing chain/belt tensioner (6K254) into the retracted position and install retaining clip.
4. Remove the camshaft sprocket retaining bolt and the crankshaft sprocket key.
5. Remove the crankshaft sprocket (6306) and camshaft sprocket (6256) with the timing chain/belt (6268).
6. Remove the timing chain/belt and timing chain guide (6K297) as required.

tomsn048@gmail.com



Item	Part Number	Description
1	E804389-S200	Torx® Screw
2	6256	Camshaft Sprocket
3	6250	Camshaft
4	E804358-S75	Torx® Bolt
5	6K297	Timing Chain Guide
6	6268	Timing Chain/Belt
7	6K254	Timing Chain/Belt Tensioner
8	E600112-S	Bolt
9	6269	Camshaft Thrust Plate
A	—	Tighten to 60-68 Nm (40-50 Lb-Ft)
B	—	Camshaft End Play to Be Within 0.065-0.165mm (0.025-0.064 Inch)
C	—	Tighten to 10-12 Nm (7-9 Lb-Ft)
D	—	Tighten to 9-11 Nm

tomsn048@gmail.com

		(7-8 Lb-Ft)

Installation

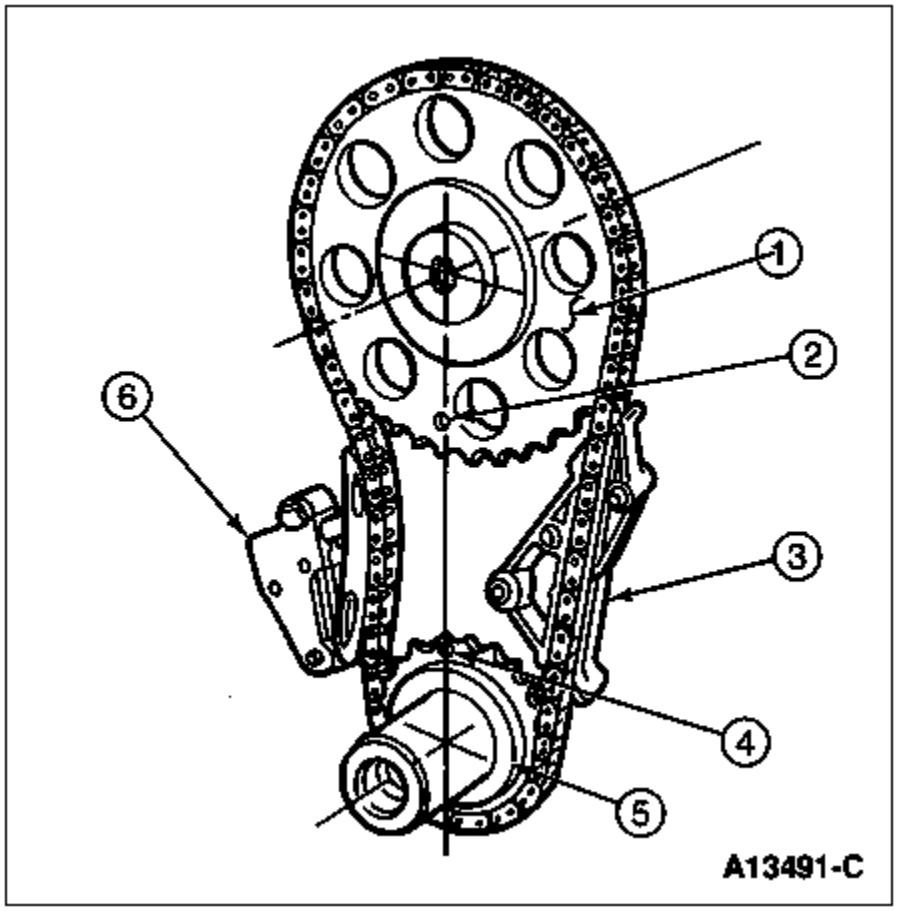
1. Install the timing chain guide to the cylinder blocks (6010) with the pin of the guide inserted into the oil hole in the block. Install the two retaining bolts, and tighten to 10-12 Nm (7-9 lb-ft).

2. Position the camshaft (6250) so the timing mark will align with the crankshaft (6303). Position the crankshaft so the timing mark will align with the camshaft.

3. Install the crankshaft sprocket, camshaft and timing chain/belt together.

4. **NOTE: Make sure that the tensioner side of the timing chain is held inward, and that the guide side of the chain is straight and tight.**

   Install the crankshaft key and check the timing marks on the crankshaft sprocket and camshaft sprocket for correct alignment (as shown).



Item	Part Number	Description

tomsn048@gmail.com

1	6256	Camshaft Sprocket
2	—	Camshaft Timing Mark (Part of 6256)
3	6K297	Timing Chain Guide
4	—	Crankshaft Timing Mark (Part of 6306)
5	6306	Crankshaft Sprocket
6	6K254	Timing Chain/Belt Tensioner

5. Install the camshaft sprocket retaining bolt, and tighten to 60-68 Nm (44-50 lb-ft).
6. Remove the clip from the timing chain/belt tensioner.
7. Check the camshaft end play as outlined in Section 03-00 .
8. Install the engine front cover as outlined in this section. On Aerostar, install the radiator.
9. Fill and bleed the cooling system. Refer to Section 03-03 .
10. Fill the crankcase with clean engine oil of the recommended grade and viscosity.
11. Start the engine and operate at fast idle. Check for coolant and oil leaks.

tomsn048@gmail.com

Camshaft

SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
Sensor Adjusting Wrench	T94T-12270-A

NOTE: 4.0L OHV engines are equipped with a camshaft position sensor (CMP sensor) (12A112) mounted on the camshaft synchronizer (12A362). The camshaft synchronizer replaces the oil pump drive assembly. To perform the removal and installation procedure for the camshaft (6250), the camshaft synchronizer must be removed after oil pan (6675) removal. Refer to Section 03-14 for camshaft synchronizer removal and installation.

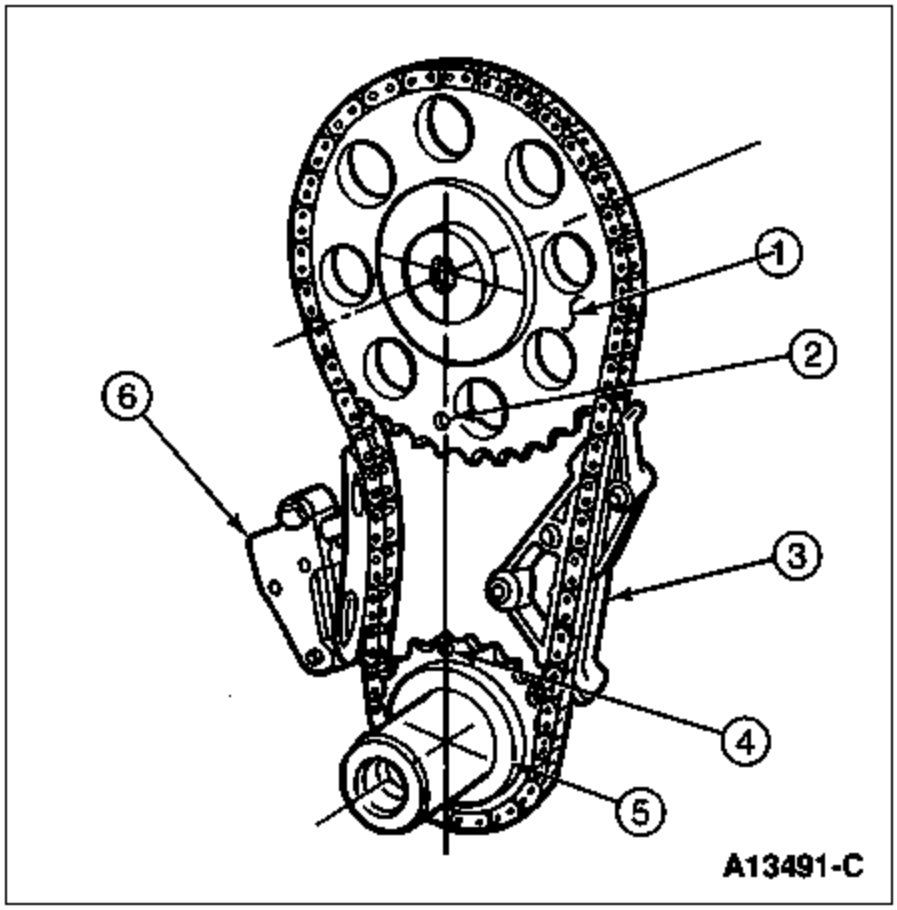
Removal

NOTE: It is necessary to replace oil pan gasket (6710) when removing and installing engine front cover (6019). On the Ranger, it is necessary to remove the engine (6007) to remove the oil pan. On Aerostar, it is necessary to remove the transmission to properly reseal oil pan.

1. On the Ranger, remove engine as outlined in this section.
2. On Aerostar vehicles, remove radiator (8005) as outlined in Section 03-03 and remove transmission as outlined in Group 07.
3. Remove the upper and lower intake manifolds as outlined in this section.
4. Remove the engine front cover as outlined in this section.
5. Remove the oil pan as outlined in this section.
6. Remove the hold-down clamp (12270), screw and oil pump drive shaft from the rear of the cylinder blocks (6010).
7. **NOTE: Ranger has a CID sensor mounted on top of the oil pump drive assembly. Sensor Adjusting Wrench T94T-12270-A is designed for easy access to the hold-down clamp screw.**

   On the Ranger, disconnect the engine wiring harness connector at the CID sensor.
8. Remove the valve covers (6582) and rocker arm shaft (6563) assemblies as outlined in this section. Lift out the push rods (6565) and place in a marked rack so they can be installed in the same location.
9. Remove the valve tappets (6500). Refer to Tappet removal and installation procedure in this section.
10. Push the timing chain/belt tensioner (6K254) into the retracted position, and install the retaining clip.

tomsn048@gmail.com



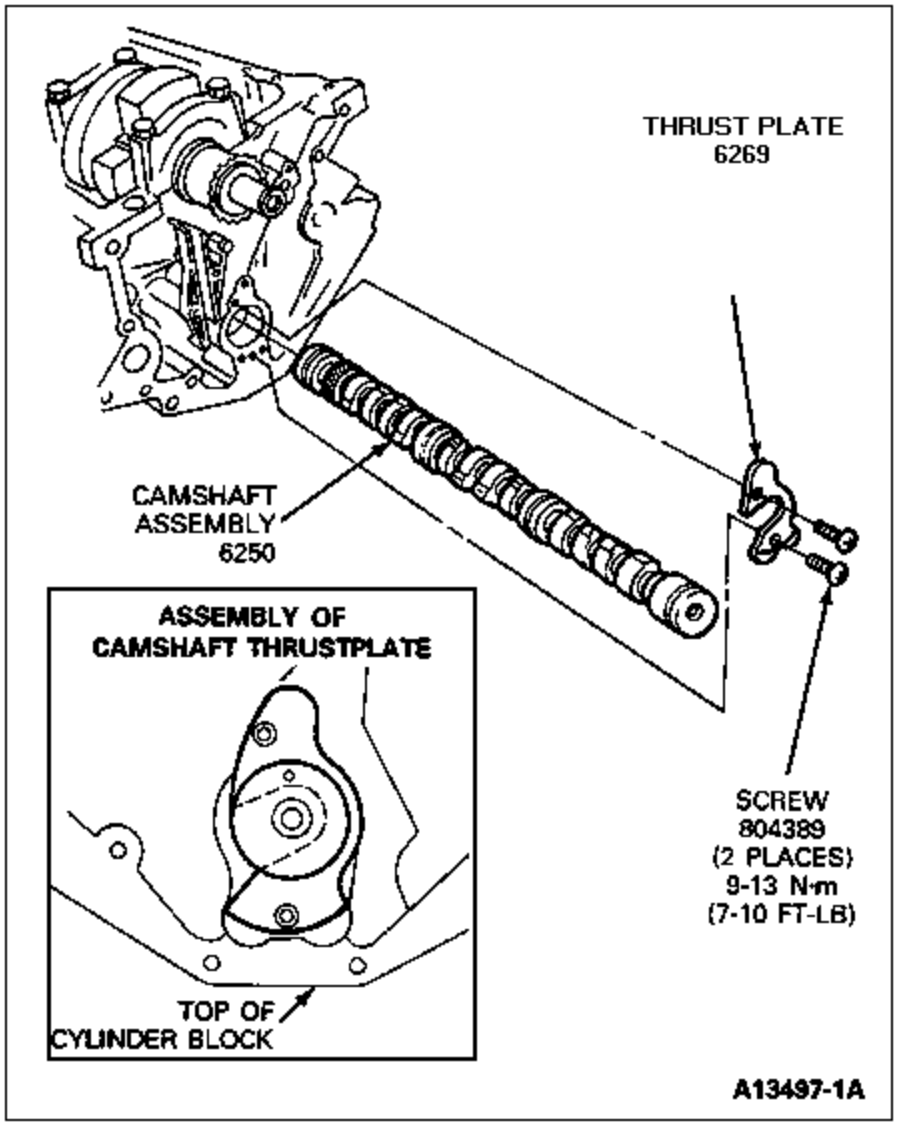
Item	Part Number	Description
1	6256	Camshaft Sprocket
2	—	Camshaft Timing Mark (Part of 6256)
3	6K297	Timing Chain Guide
4	—	Crankshaft Timing Mark (Part of 6306)
5	6306	Crankshaft Sprocket
6	6K254	Timing Chain/Belt Tensioner

11. Remove the camshaft sprocket attaching bolt and remove the camshaft sprocket (6256) from the camshaft.

12. Remove the camshaft thrust plate (6269).

13. Remove the camshaft carefully from the cylinder blocks, avoiding any damage to the camshaft bearings.

tomsn048@gmail.com



Installation

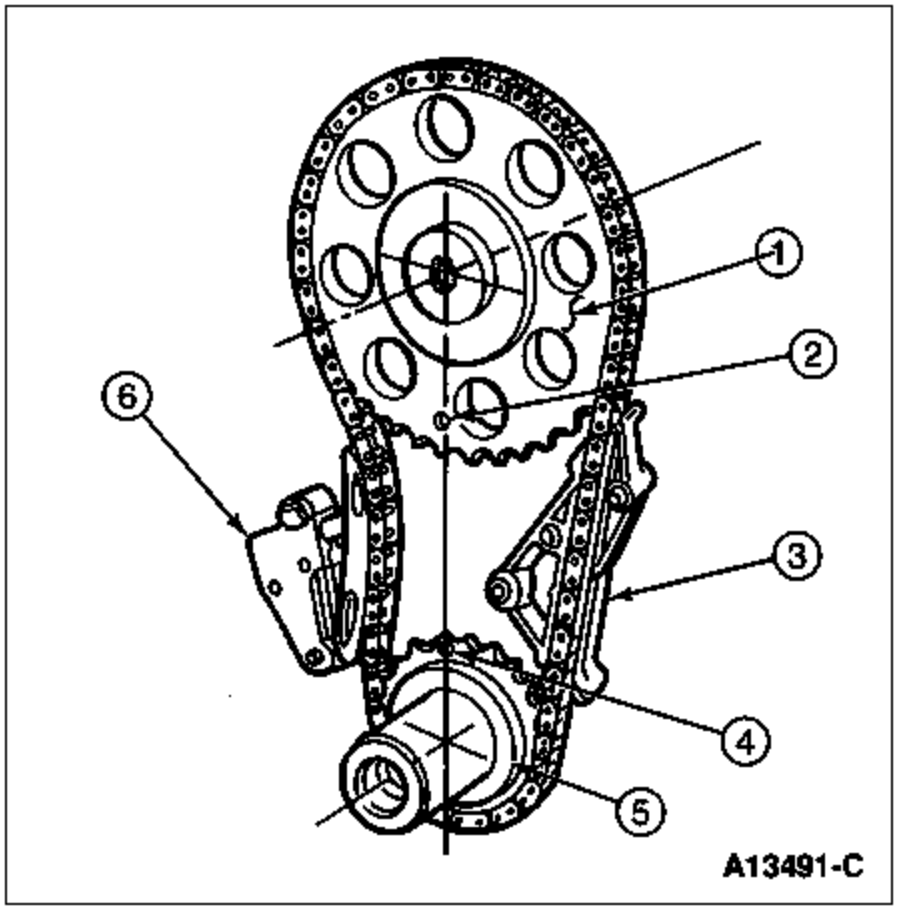
1. Oil the camshaft journals and cam lobes with SAE 50 Service SG engine oil or equivalent meeting Ford specification ESE-M2C39-F. Insert the camshaft key.

2. Install the camshaft in the cylinder blocks, being careful to avoid damaging the bearing surfaces.

3. Install the thrust plate as shown so that it covers the main oil gallery. Tighten the attaching screws to 9-13 Nm (7-10 lb-ft).

4. Turn the camshaft and crankshaft (6303) as necessary to align the timing marks. Install the camshaft sprocket, install the attaching bolt and tighten to 60-68 Nm (44-50 lb-ft).

tomsn048@gmail.com



Item	Part Number	Description
1	6256	Camshaft Sprocket
2	—	Camshaft Timing Mark (Part of 6256)
3	6K297	Timing Chain Guide
4	—	Crankshaft Timing Mark (Part of 6306)
5	6306	Crankshaft Sprocket
6	6K254	Timing Chain/Belt Tensioner

5. Check the camshaft for correct end play. Refer to Section 03-00 . End play should be 0.065-0.165mm (0.0025-0.0064 inch). Remove the clip from the timing chain tensioner.

6. Position the valve tappets in their original locations as outlined. Apply SAE 50 Service SG or equivalent oil meeting Ford specification ESE-M2C39-F to both ends of the push rods. Install the push rods in the same locations as removed.

7. Install the intake manifolds as outlined in this section.

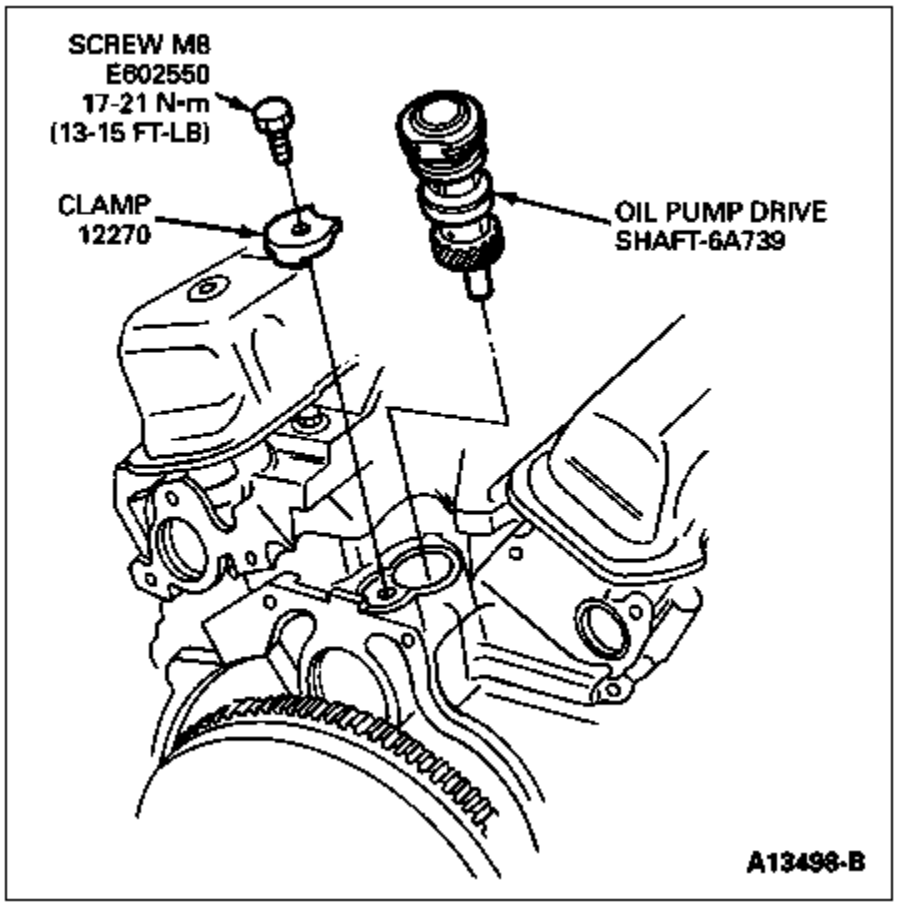
8. Install the rocker arm shaft assemblies. Tighten the rocker arm stand bolts evenly and in sequence to 6-8 Nm (53-71 lb-in). Refer to Rocker Arm , Installation in this section.

tomsn048@gmail.com

9. Install the valve covers as outlined.

10. Install the engine front cover as an assembly. Refer to Engine Front Cover , Installation, in this section.

11. Install the oil pump drive, hold-down clamp and screw.



12. Install oil pan as outlined in this section.

13. Install engine front cover as outlined in this section.

14. On the Ranger, install engine as outlined in this section.

15. On Aerostar vehicles, install transmission as outlined in this section.

16. On Aerostar, install the radiator.

17. Fill the cooling system to the proper level with the specified coolant and bleed the cooling system as outlined in Section 03-03 .

18. Fill the crankcase with the specified quantity and grade of oil.

19. **NOTE: When the battery has been disconnected and reconnected, some abnormal drive**

tomsn048@gmail.com

symptoms may occur while the powertrain control module (PCM) (12A650) relearns its adaptive strategy. The vehicle may need to be driven 16 km (10 miles) or more to relearn the strategy.

Connect the battery ground cable (14301) to the battery.

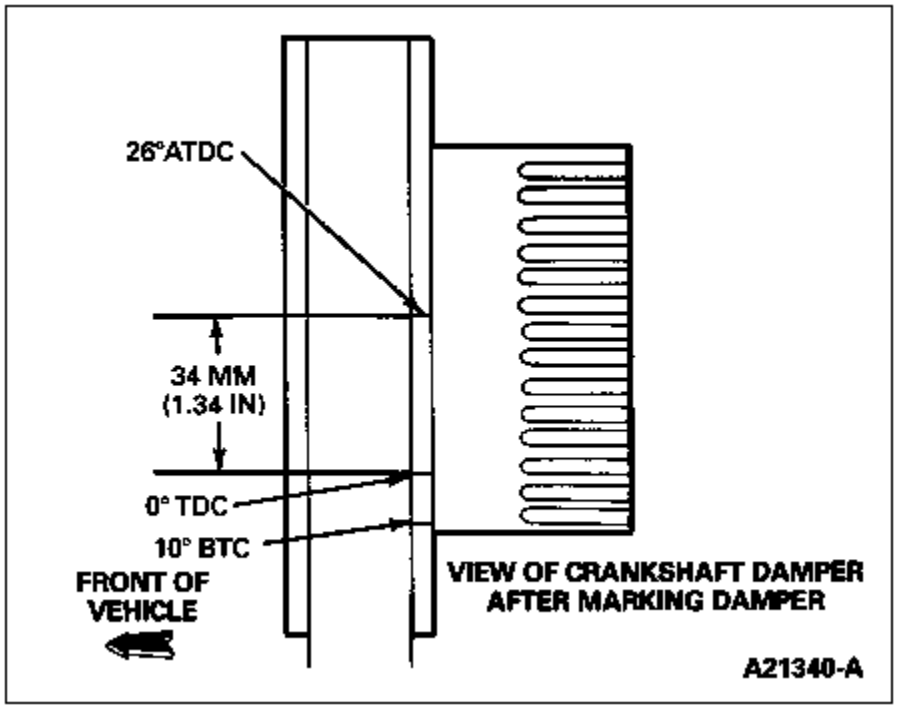
20. Run the engine at fast idle speed and check for coolant, fuel, vacuum and oil leaks.

Installation, Ranger

SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
CID Testing Wiring Harness	T94T-50-B

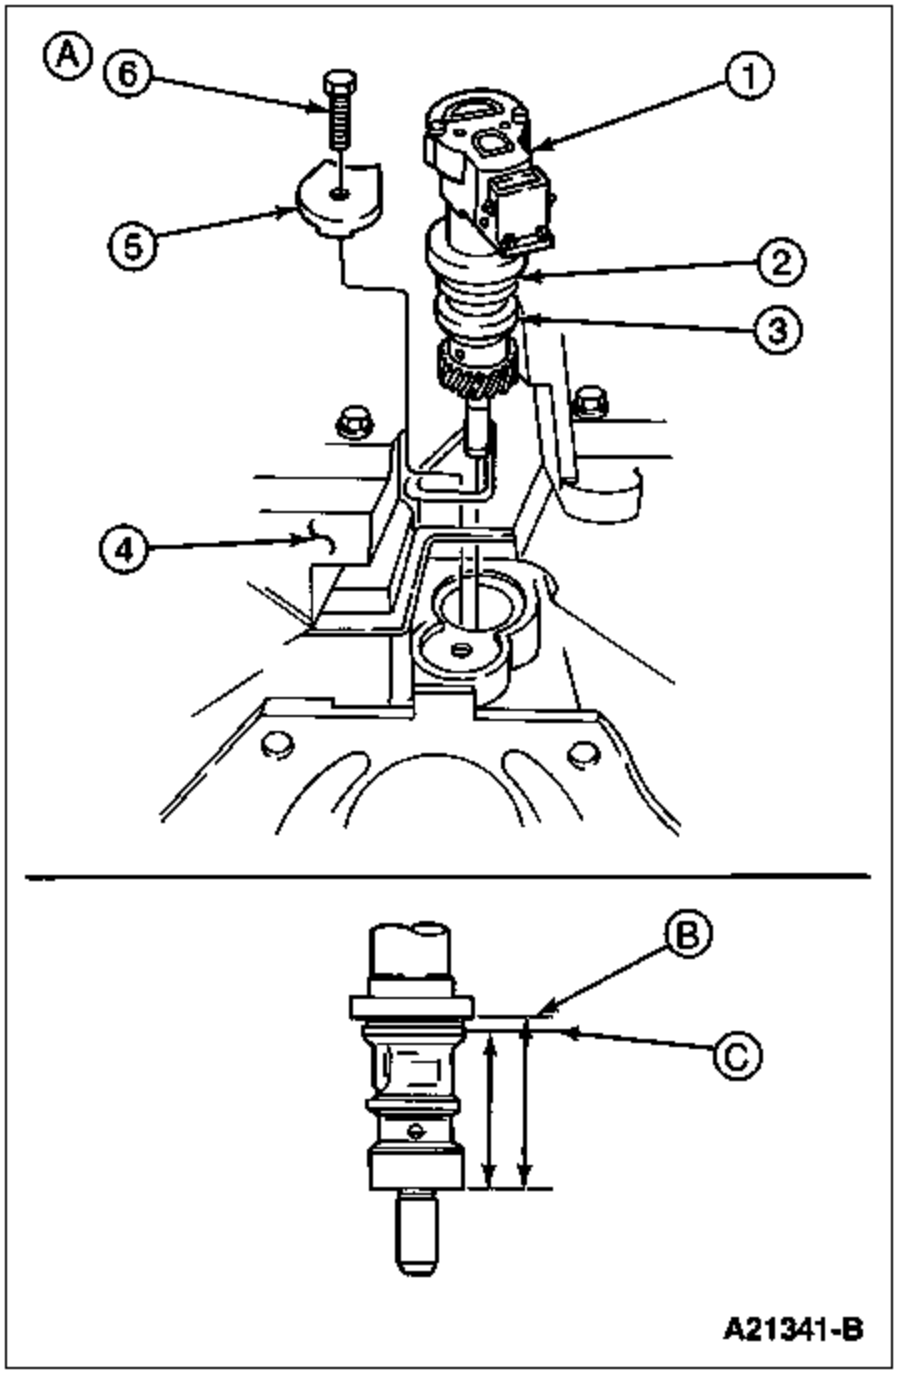
1. After performing Steps 1-11 above, rotate crankshaft until TDC mark on the damper is accessible. If not present, place an additional mark on the damper at 26 degrees After Top Dead Center (ATDC). This position is 34mm (1.34 inches) counterclockwise from the Top Dead Center (TDC) mark.



2. Position No. 1 cylinder to TDC between compression and ignition stroke. (Both intake and exhaust valves must be closed with TDC mark on vibration damper at pointer.)

3. Lubricate oil pump drive pinion and O-ring on assembled oil pump drive gear and CID sensor with SM-2C 1013-A oil. Do not get oil above mounting flange.

tomsn048@gmail.com



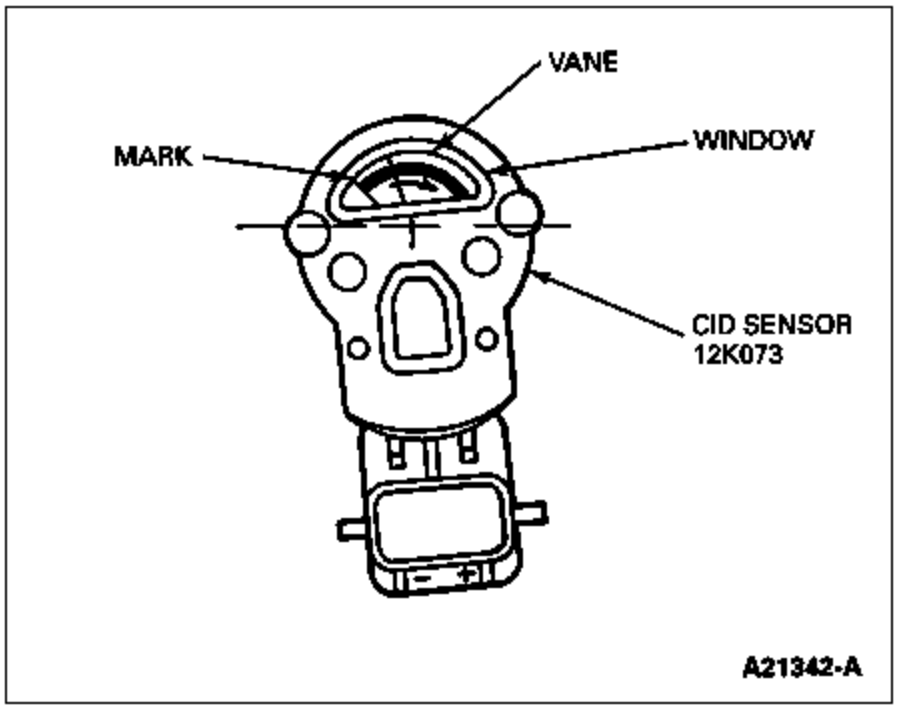
Item	Part Number	Description
1	12K073	CID Sensor
2	E853103-S	O-Ring
3	6846	Oil Pump Drive Assembly
4	6007	Engine
5	12270	Hold-Down Clamp
6	E602550	Screw

tomsn048@gmail.com

A	—	Tighten to 17-21 Nm (13-15 Lb-Ft)
B	—	Maximum Level for Pre-Oiling Drive Gear
C	—	Minimum Level for Pre-Oiling Drive Gear

4. **NOTE: Normal CID sensor rotation is clockwise viewed from top of CID sensor.**

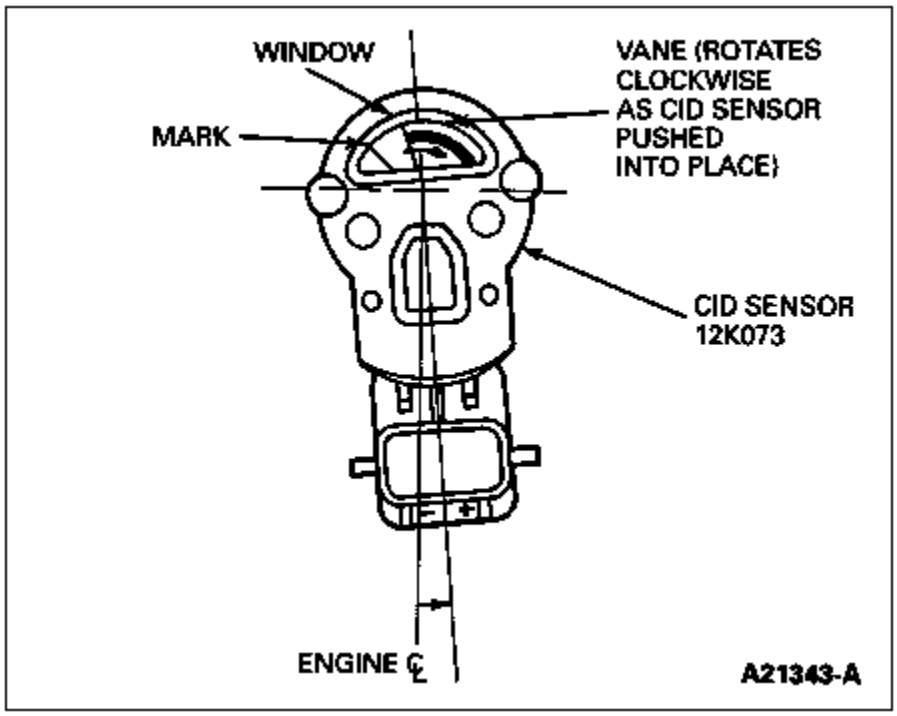
   Align the CID sensor rotor as shown with the trailing edge of the vane lined up with the short mark at the left-hand side of the plastic window.



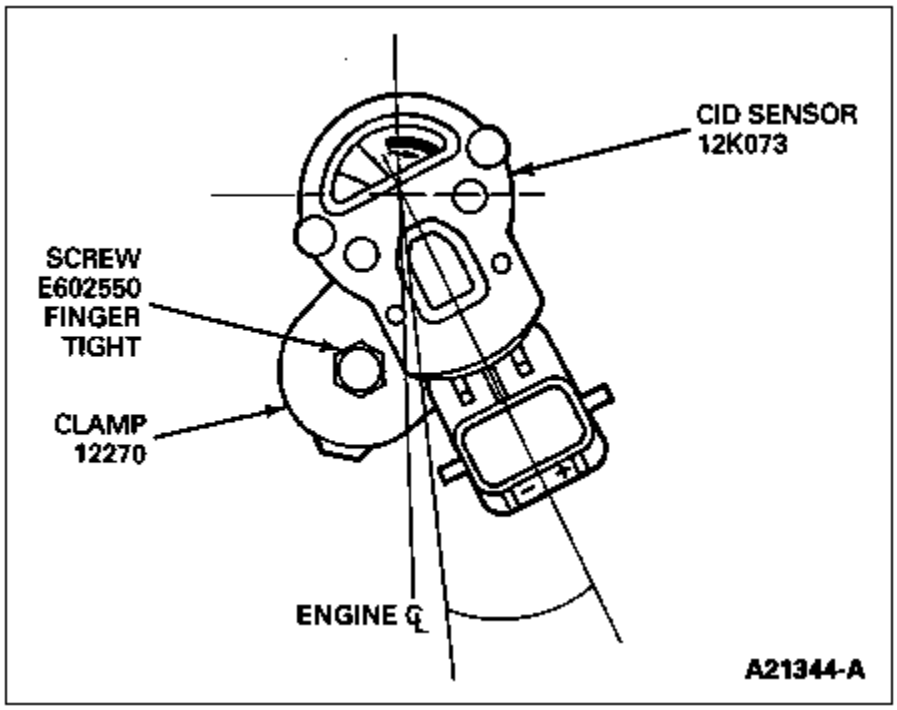
5. Position the sensor above its hole at right angles to the block rear face.

6. Install the assembled CID sensor and oil pump drive gear into the engine. As the assembly is pushed into place, the camshaft gear will rotate the sensor vane clockwise toward the center of the window.

tomsn048@gmail.com



7. Rotate the CID sensor counterclockwise. Install clamp and screw finger-tight. Rotate the sensor back to its position at right angles to the back of the block.

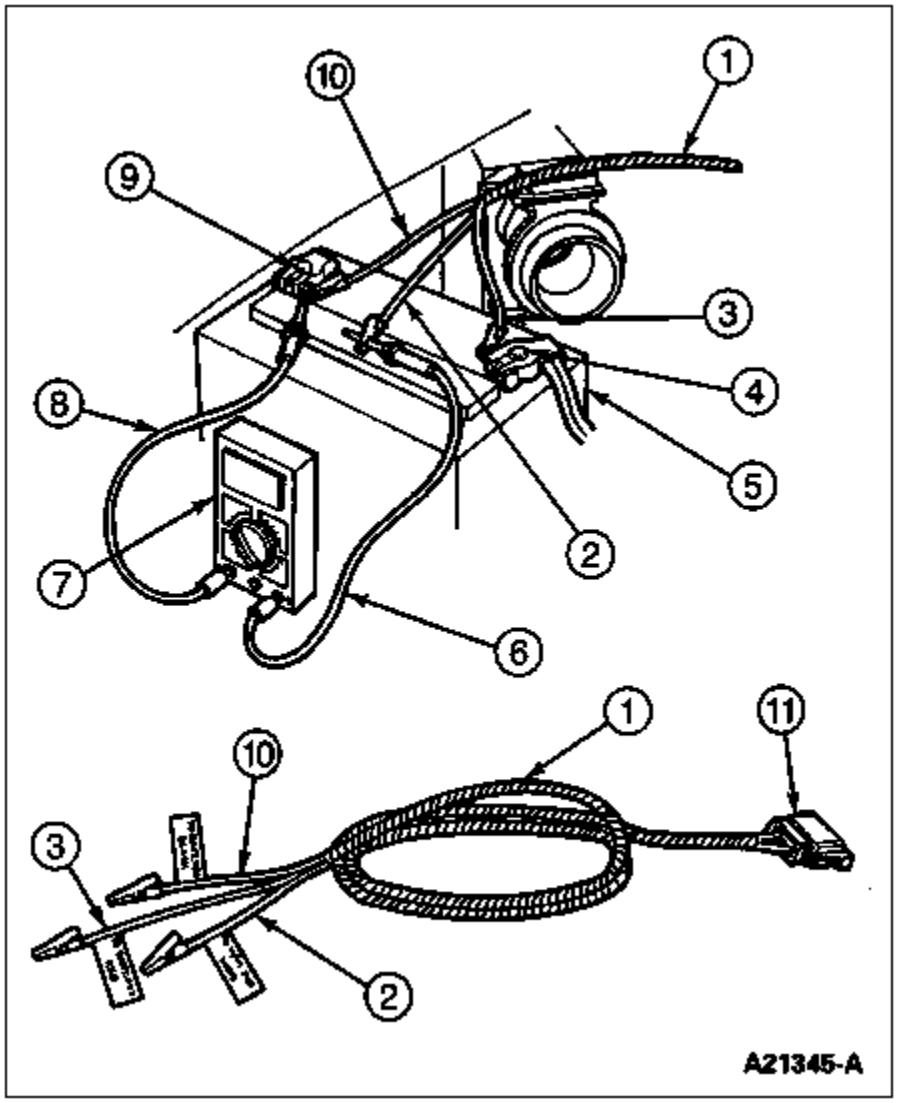


8. Connect the CID Testing Wiring Harness T94T-50-B to the CID Sensor.

9. Connect the CID Testing Wiring Harness leads:

tomsn048@gmail.com

a. Red harness wire to battery positive terminal.
b. Black harness wire to battery negative terminal.
c. Voltmeter positive lead to harnesses white lead.
d. Voltmeter negative lead to battery negative terminal.



Item	Part Number	Description

8	—	Black Lead (Part of 007-00407)
9	—	Negative Terminal (Part of 10655)
10	—	Black Lead (Part of T94T-50-B)
11	—	Connector (Part of T94T-50-B) (Attaches to CID Sensor)

10. Rotate engine two revolutions to take up slack in timing chain and return No. 1 cylinder to its compression stroke.

11. **NOTE: No. 1 cylinder must be at 26 degrees After Top Dead Center (ATDC) to set CID sensor.**

    Verify that No. 1 cylinder is on its compression stroke (both valves closed).

12. Continue to rotate the crankshaft until the new 26 degrees ATDC mark lines up with the timing pointer.

13. **NOTE: The voltmeter will register battery voltage whenever the CID sensor closes and makes a complete circuit.**

    While rotating the CID sensor, note the exact point where the sensor switches from 0 to 12 volts on the voltmeter.

14. **NOTE: The final movement to set the CID sensor must be in a COUNTERCLOCKWISE direction.**

    Rotate the CID sensor clockwise past the CID switching point (from 12 to 0 volts).

15. Rotate the CID sensor counterclockwise and stop at the exact point the voltmeter switches from 0 to 12 volts.

16. Tighten the CID sensor hold-down bolt to 17-21 Nm (13-15 lb-ft) using Sensor Adjusting Wrench T94T-12270-A.

17. Disconnect the testing wiring harness and the voltmeter and proceed with Step 12 of Installation above.

---

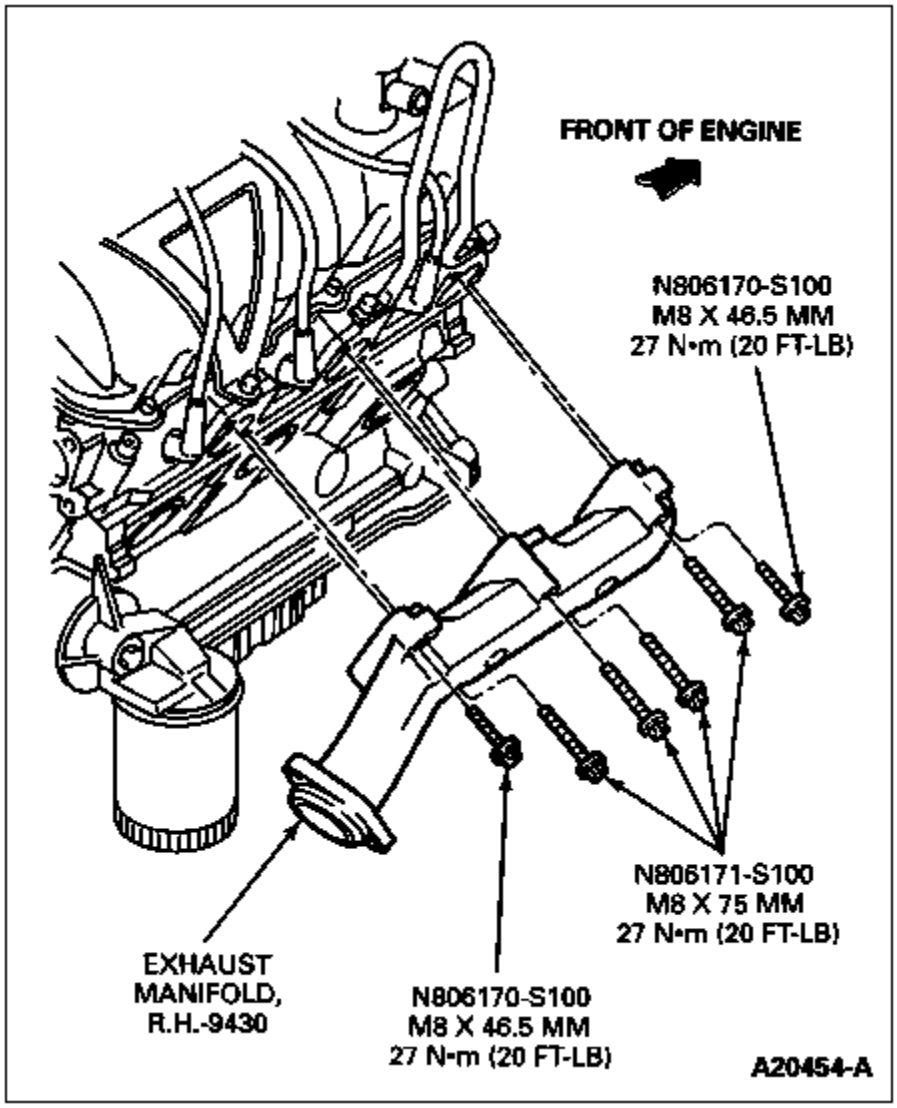
tomsn048@gmail.com

tomsn048@gmail.com

Exhaust Manifold, RH

Removal

1. Remove heater hose support bracket.
2. Disconnect heater water hoses (18472).
3. Remove manifold-to-exhaust inlet pipe attaching nuts.
4. Remove exhaust manifold attaching bolts. Remove exhaust manifold (9430).



Installation

tomsn048@gmail.com

1. **NOTE: Lightly oil all bolt and stud threads before installation.**

   Clean mating surfaces on the exhaust manifold, cylinder head (6049) and exhaust inlet pipe (5246).

2. Position exhaust manifold on the cylinder head and install manifold attaching bolts. Tighten to 25 Nm (18 lb-ft).

3. Connect exhaust inlet pipe to the exhaust manifold. Tighten the attaching nuts to 27 Nm (20 lb-ft).

4. Install heater hose support bracket.

5. Connect heater water hose.

6. Fill and bleed cooling system. Refer to Section 03-03 .

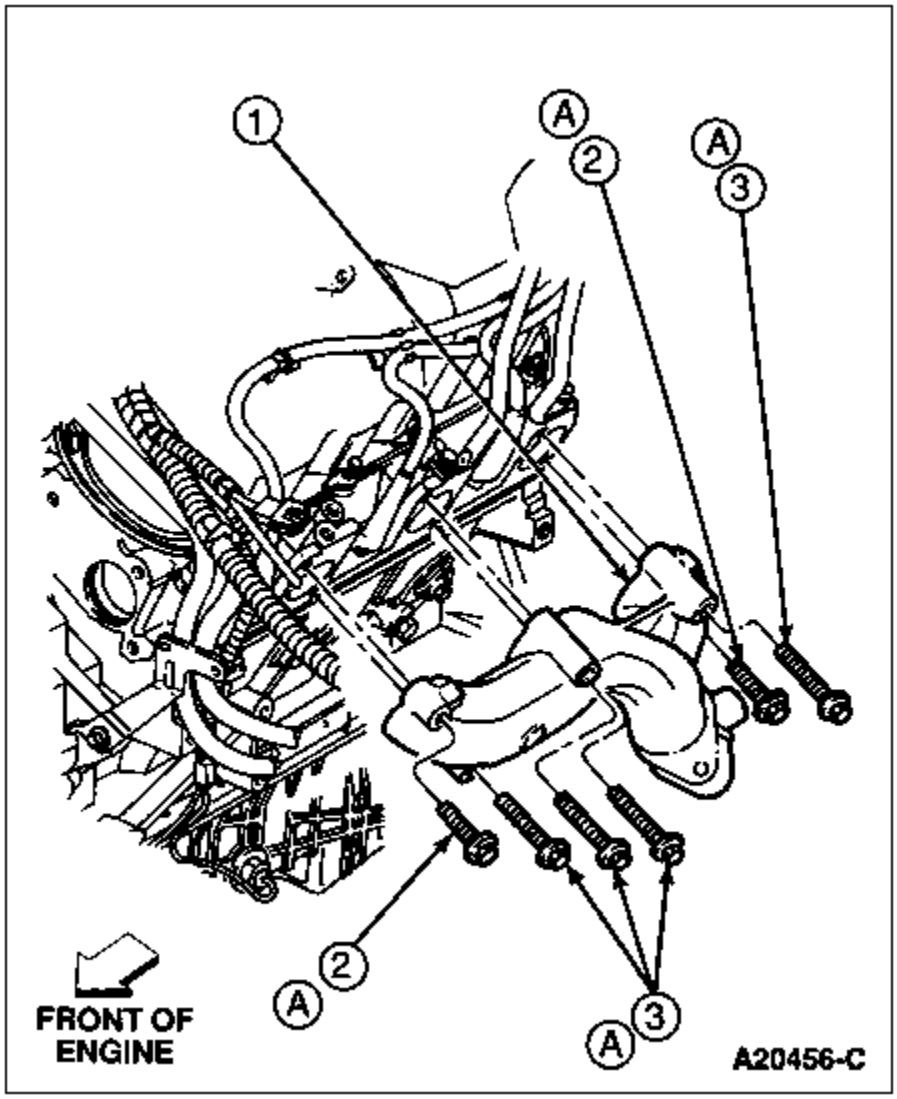
7. Start engine (6007) and check for exhaust and coolant leaks.

---

tomsn048@gmail.com

Exhaust Manifold, LH

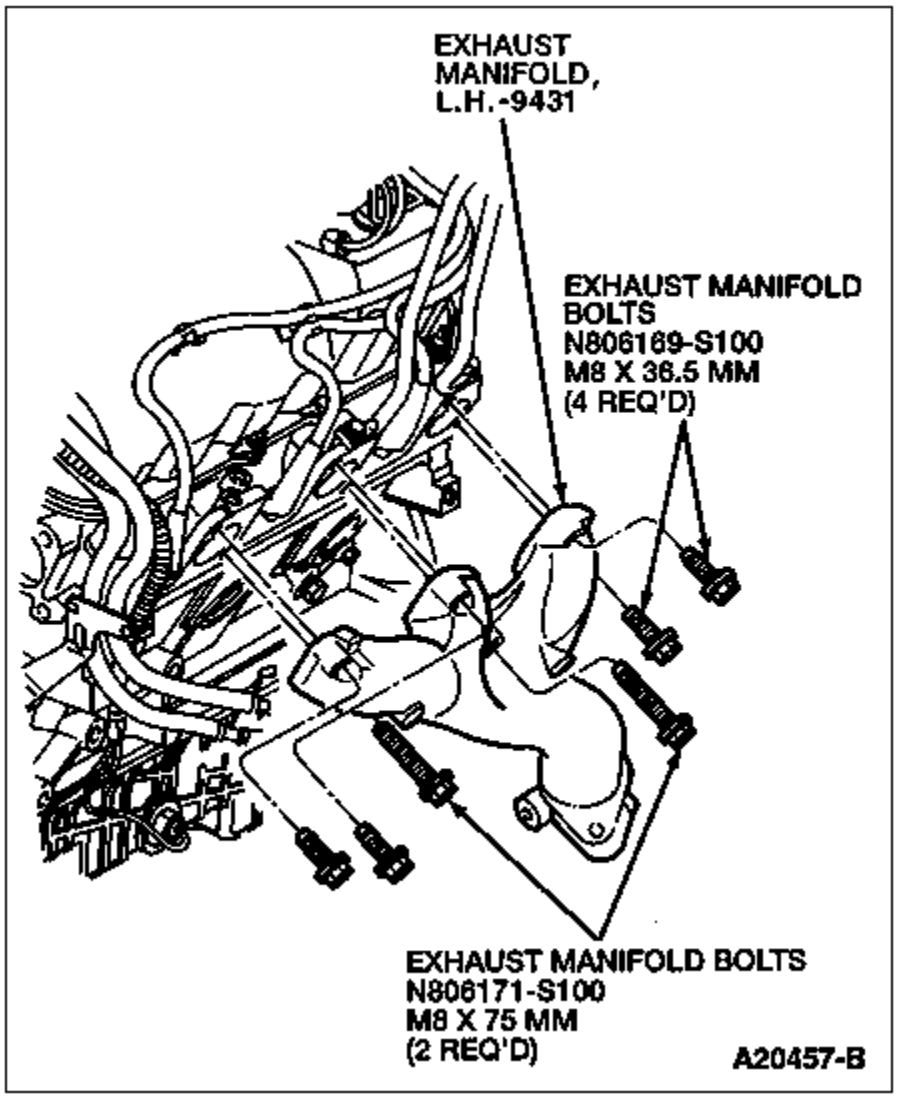
LH Exhaust Manifold — Ranger



Item	Part Number	Description
1	9430	Exhaust Manifold (LH)
2	N806170-S100	Exhaust Manifold Bolts (2 Req'd)
3	N806171-S100	Exhaust Manifold Bolts (4 Req'd)
A	—	Tighten to 27 Nm (20 Lb-Ft)

tomsn048@gmail.com

LH Exhaust Manifold — Aerostar



Removal

1. Remove oil level indicator tube support bracket.
2. Disconnect the EGR transducer vacuum hoses.
3. Loosen and remove the EGR valve to exhaust manifold tube.
4. Remove EGR valve bolts and EGR valve.
5. Remove the intake manifold to EGR valve tube stud and the intake manifold to EGR valve tube.

tomsn048@gmail.com

6. Remove power steering pressure hose (3A719) and power steering return hose (3A713) if necessary.
7. Remove exhaust pipe to manifold nuts.
8. Remove exhaust manifold bolts and exhaust manifold (9430).

Installation

1. **NOTE: Lightly oil all bolt and stud threads before installation.**

   Clean mating surfaces on the exhaust manifold, cylinder head (6049) and exhaust pipe.
2. Position exhaust manifold on the cylinder head and install exhaust manifold bolts. Tighten to 27 Nm (20 lb-ft).
3. Connect exhaust pipe to the exhaust manifold. Tighten the exhaust pipe to manifold nuts to 27 Nm (20 lb-ft).
4. Connect power steering pressure hose and power steering return hose, if removed.
5. Position the intake manifold to EGR valve tube to the intake manifold and install the intake manifold to EGR valve tube stud. Tighten to 40-55 Nm (30-40 lb-ft).
6. Position the EGR valve to the intake manifold to EGR valve tube and install the EGR valve bolts. Tighten to 20-30 Nm (15-22 lb-ft).
7. Install the EGR valve to exhaust manifold tube. Tighten the EGR valve to exhaust manifold tube nuts to 34-48 Nm (26-35 lb-ft).
8. Connect the EGR transducer vacuum hoses.
9. Install oil level indicator tube support bracket. Apply sealant to end of oil indicator tube to prevent oil leak at block.

tomsn048@gmail.com

tomsn048@gmail.com

Oil Pan, Aerostar and Aerostar E-4WD

Removal

1. Position the vehicle on a suitable hoist.
2. Disconnect the battery ground cable (14301).
3. Remove engine cover.
4. Remove rear engine support and transmission (7003). Refer to Section 07-01A .
5. Remove starter motor.
6. Remove flywheel (6375). Refer to Section 03-01C .
7. On E-4WD vehicles:
    a. Support front suspension lower arm (3078) with transmission jack.
    b. Note bolt arm position and remove both left lower control arm pivot bolts.
    c. Remove transmission jack and allow control arm to hang. It is retained by shock absorber and ball joint.
    d. Support front suspension lower arm (3079) with transmission jack.
    e. Note bolt arm position and remove both right lower control arm pivot bolts.
    f. Remove transmission jack and allow control arm to hang. It is retained by shock absorber and ball joint.
    g. Support front carrier assembly with transmission jack.
    h. Remove bolts and rear pivot crossmember.
    i. Remove bolts and nuts servicing front carrier assembly to front drive axle crossmember.
    j. Lower front carrier assembly enough to access oil pan (6675).
8. Drain the engine oil and remove the oil bypass filter (6714).
9. Remove the engine oil pan bolts and nuts.
10. Remove the oil pan.
11. Remove the crankshaft oil windage baffle (6L680) and oil pump (6600) assembly.
12. **NOTE: Leave the wedge seal tabs sealed in position in the cavities between the rear main cap and cylinder blocks (6010) to help ensure a good seal in these areas.**

    Carefully lift the rear outside corners of the oil pan gasket and use a suitable sharp instrument to cut off the soft rubber wedge seal tabs.
13. Thoroughly clean all sealing surfaces with Ford Metal Surface Cleaner F4AZ-19A536-RA or equivalent meeting Ford specification WSE-M5B392-A.

tomsn048@gmail.com

Installation

1. **CAUTION: Prevent engine contamination. Always use necessary precautions to prevent old sealer or gasket material from falling into engine.**

   Thoroughly clean all the oil and the old sealer from the oil pan taking special care to remove all the old sealer from the oil pan gasket in the oil pan. Thoroughly wash the oil pan.

2. Thoroughly clean all exposed areas with Metal Surface Cleaner F4AZ-19A536-RA or equivalent meeting Ford specification WSE-M5B392-A.

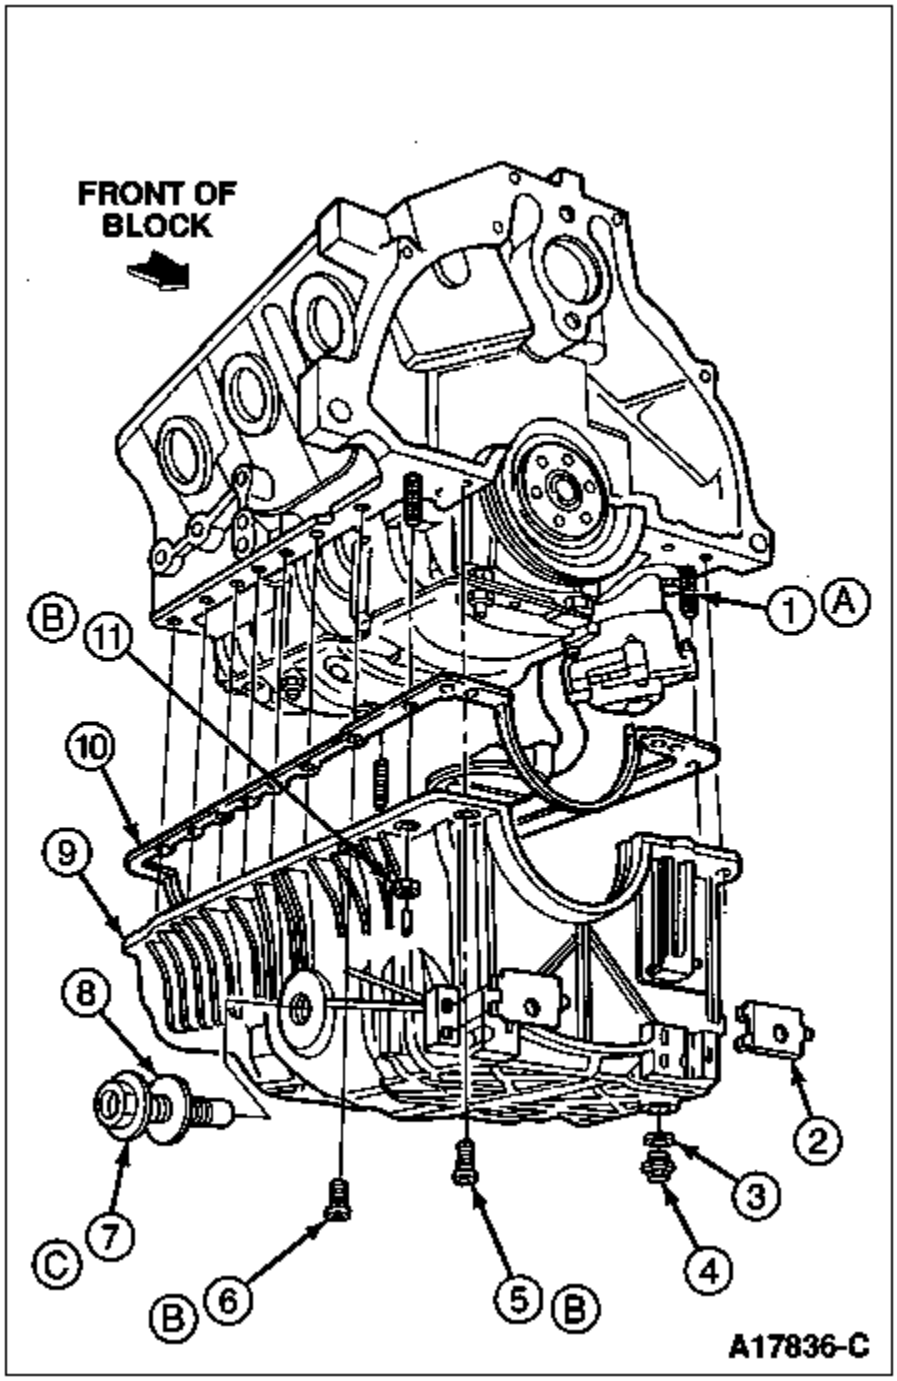
3. Thoroughly clean all oil and old sealer from the cylinder block oil pan sealing area and the rear main bearing cap.

4. After all parts have been thoroughly cleaned and washed, it is necessary and extremely important that they be wiped down with Extra Strength Spot and Stain Remover B7A-19521-AA meeting Ford specification ESR-M5B197-A or denatured alcohol.

5. Thoroughly clean the transmission bell-housing area and the rear of the cylinder blocks. Oil removal should be verified with an ultraviolet lamp ("black light").

Oil Pan Installation

tomsn048@gmail.com



Item	Part Number	Description
1	E804579-S72	Stud
2	6C629	Oil Pan Spacer
3	6734	Oil Pan Drain Plug Gasket
4	6730	Oil Pan Drain Plug
5	E804587-S72	Torx® Bolt
6	E802185-S72	Bolt

tomsn048@gmail.com

7	6C624	Low Oil Level Sensor
8	6C626	Low Oil Level Sensor Washer
9	6675	Oil Pan
10	6710	Oil Pan Gasket
11	E60012-S72	Nut
A	—	Tighten to 4 Nm (35 Lb-In)
B	—	Tighten to 7-10 Nm (5-7 Lb-Ft)
C	—	Tighten to 17-27 Nm (13-20 Lb-Ft)

6. Clean and inspect the oil inlet tube. Prime the oil pump by filling the inlet opening with oil while rotating the shaft until oil emerges from the outlet opening. Install the pump and screen and tighten the oil pump bolts to 17-21 Nm (13-15 lb-ft).

7. Install the crankshaft oil windage baffle and tighten the crankshaft oil baffle nuts to 17-21 Nm (13-15 lb-ft).

8. Use a suitable sharp instrument to cleanly cut the rubber wedge seal tabs off of new oil pan gasket (6710).

9. Apply a bead of Silicone Gasket and Sealant F6AZ-19562-AA or equivalent meeting Ford specification WSE-M4G323-A6 on each of the gasket tabs remaining between the rear main cap and cylinder blocks, on the sealing rail at the front cover to block joint, and on the corners of the radius of the front cover.

   Refer to the Ford Powertrain Service Engineering Video 1995 Powertrain Update POV503 — 4.0L Engine Oil Leaks.

10. Position the oil pan gasket on the flange of the cylinder blocks.

11. Apply a bead of Silicone Gasket and Sealant F6AZ-19562-AA or equivalent meeting Ford specification WSE-M4G323-A6 on the oil pan flange at the radius areas at the front and rear.

12. Position theoil pan to the cylinder blocks. Install and snug four oil pan nuts tight enough to align the bolt holes, but loose enough for the oil pan to move backward.

13. **CAUTION: Failure to align the rear face of the oil pan mounting pads to the rear face of the cylinder block can result in oil pan damage and oil leaks.**

    NOTE: The transmission is mounted to the engine (6007) and oil pan when installed.

    Use a straightedge to align the rear face of the oil pan mounting pads to the rear face of the cylinder blocks.

14. Install the remaining oil pan bolts and finger-tighten.

15. Tighten the oil pan nuts and bolts evenly to 7-10 Nm (5-7 lb-ft).

16. Install the oil pan drain plug (6730) and the oil filter (6731).

tomsn048@gmail.com

17. On E-4WD vehicles, perform the following steps:

    a. Raise front carrier assembly into place.
    b. Install front carrier assembly to front drive axle crossmember bolts and tighten to 95-108 Nm (70-80 lb-ft).
    c. Install rear pivot cross member and tighten bolts.
    d. Remove transmission jack and use it to raise front suspension lower arm into place.
    e. Install right lower control arm pivot bolts with bolt arm in original position. Install nuts and tighten to 136-190 Nm (100-140 lb-ft).
    f. Remove transmission jack and use to raise front suspension lower arm into place.
    g. Install left lower control arm pivot bolts with bolt arm in original position. Install nuts and tighten to 136-190 Nm (100-140 lb-ft).
    h. Remove transmission jack.

18. Install the flywheel. Refer to Section 03-01C .

19. Install the transmission and rear engine support. Refer to Section 07-01A .

20. Install the starter motor (11001).

21. Lower the vehicle.

22. Install the engine cover.

23. After letting vehicle sit overnight, fill the crankcase with the quantity and quality of engine oil. Refer to Section 00-03 .

24. **NOTE: When battery voltage is removed from the powertrain control module (PCM) (12A650), all learned values will be cleared and reset to predetermined values. When battery voltage is restored to the PCM, the vehicle may exhibit certain driveability concerns. It will be necessary to drive the vehicle to allow the PCM to relearn values for optimum driveability and performance.**

    Connect the battery ground cable.

25. Start the engine and check for leaks.

---

tomsn048@gmail.com

tomsn048@gmail.com

Oil Pump

NOTE: The oil pump (6600) is only serviced as an assembly. Refer to Section 03-00 for disassembly and cleaning instructions.

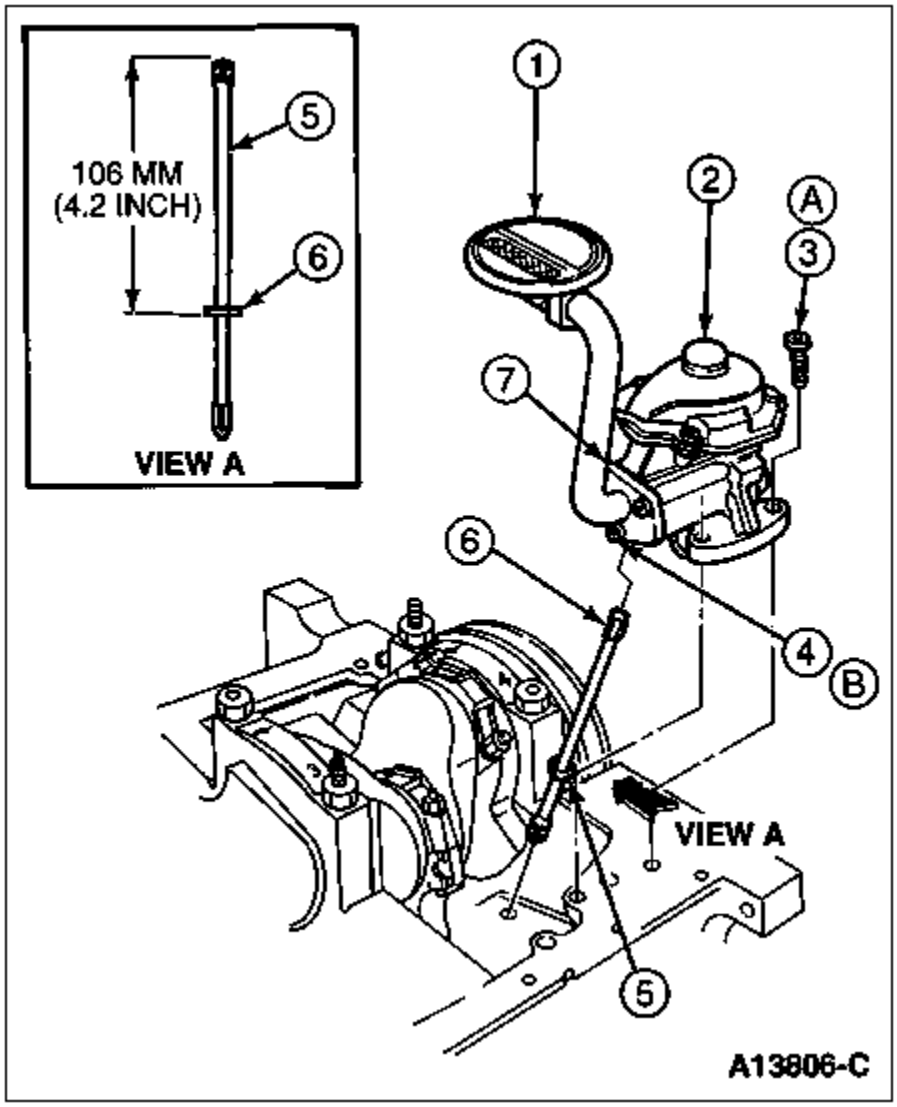
Removal

1. **NOTE: On Ranger vehicles it is necessary to remove the engine to remove the oil pan. On Aerostar vehicles, it is necessary to remove the transmission as outlined in Group 07 to properly reseal the oil pan.**

   Remove oil pan (6675) as detailed in this section.

2. Remove oil pump attaching bolts. Lift off oil pump and withdraw oil pump intermediate shaft (6A618).

tomsn048@gmail.com



Item	Part Number	Description
1	6622	Oil Pump Screen Cover and Tube
2	6600	Oil Pump
3	E804387	Screw
4	E804553	Screw
5	6A618	Oil Pump Intermediate Shaft
6	6629	Oil Pump Intermediate Shaft Retaining Ring
7	6626	Oil Pump Inlet Tube Gasket
A	—	Tighten to 17-21 Nm (13-15 Lb-Ft)
B	—	Tighten to 9-13 Nm (7-10 Lb-Ft)

tomsn048@gmail.com

Installation

1. Prime the oil pump by filling either the inlet or outlet port with engine oil XO-5W30-QSP or equivalent meeting Ford specification WSE-M2903-A1 or SAE 5W-30 Service SG engine oil. Rotate the pump shaft to distribute the oil within the pump body.

2. Insert oil pump intermediate shaft into block with the pointed end facing inward. The pointed end is closest to the pressed-on flange. Place oil pump in position to install attaching screws. Tighten screws 17-21 Nm (13-15 lb-ft). Clean and install the oil pump screen cover and tube (6622) with an oil pump inlet tube gasket (6626). Tighten the bolts to 9-13 Nm (7-10 lb-ft).

3. Install oil pan as outlined under Oil Pan, Installation, Aerostar or Ranger .

4. Operate the engine (6007) at fast idle speed and check for oil leaks.

---

tomsn048@gmail.com

Crankshaft Main Bearings

The main and connecting rod bearing inserts are selective fit. **Do not file or lap bearing caps or use shims to obtain the proper bearing clearance. Selective fit main bearings are available for service in standard and undersizes. Refer to the parts catalog for the available sizes. Undersize bearings which are not selective fit are available for use on journals that have been refinished. Refer to Specifications at the end of this section.**

Removal

1. **NOTE: Oil pan removal on Ranger requires engine removal. Rear main bearing replacement on Aerostar vehicles requires engine removal.**

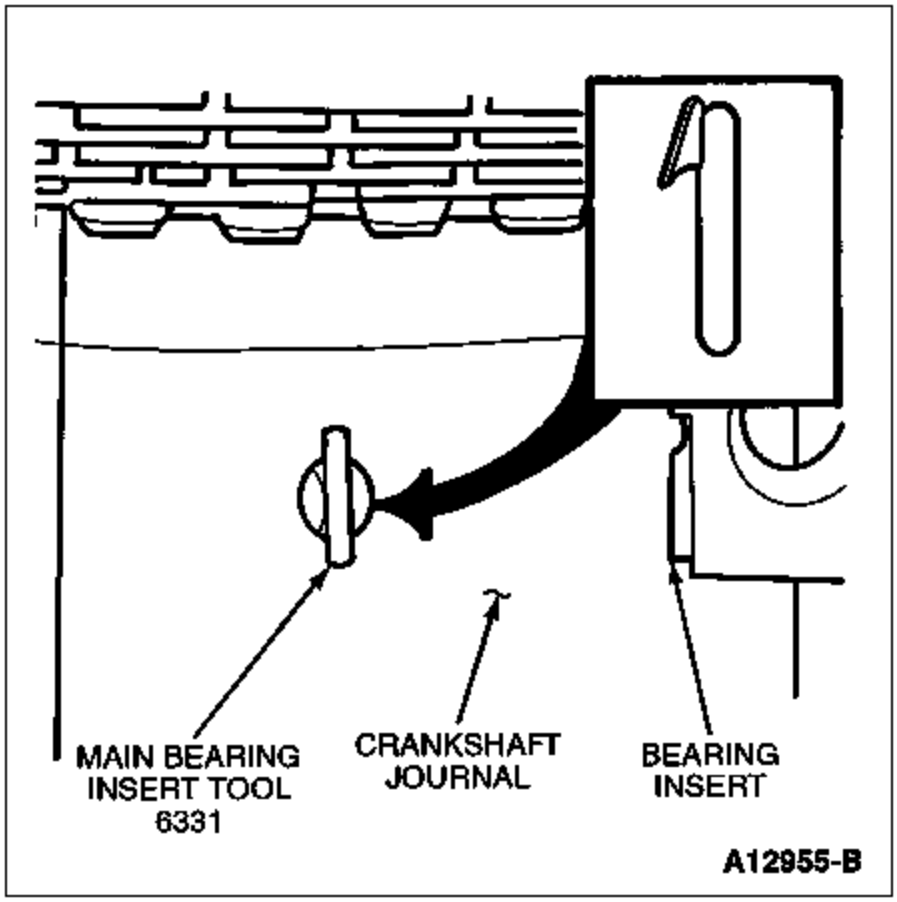
   Drain the crankcase. Remove the oil pan (6675) and oil pump (6600) as outlined in this section.

2. **Replace one crankshaft main bearing (6333) at a time, leaving the other crankshaft main bearings securely fastened.** Remove the main bearing cap to which new crankshaft main bearings are to be installed.

3. Insert Main Bearing Insert TOOL-6331-E or equivalent in the crankshaft journal oil hole.

4. Rotate the crankshaft (6303) slowly in the direction of engine rotation to force the bearing insert out of the block.

tomsn048@gmail.com



Installation

1. Clean each crankshaft journal before installing the main bearing insert. Inspect the journals for nicks, burrs, or bearing pickup that would cause premature bearing wear.

2. Select fit the bearing for proper clearance following procedures under Fitting Main and Connecting Rod Bearings in Section 03-00 .

3. **NOTE: New bolts must be used for assembling main bearing caps.**

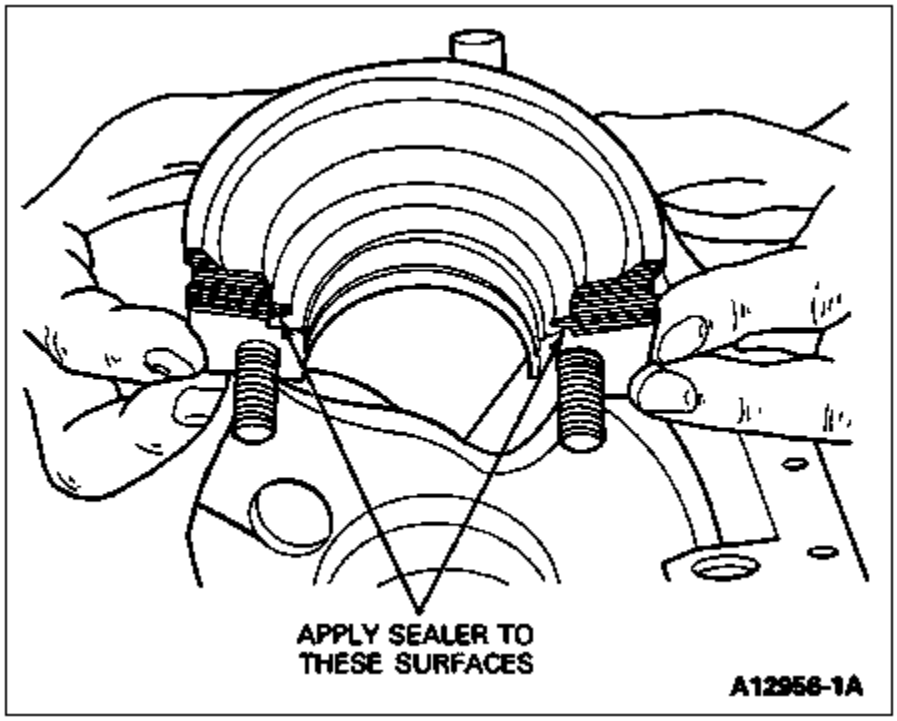
   NOTE: Make sure that the main bearing caps are installed in their original positions and orientation.

   To install the upper main bearing, lubricate the bearing with heavy engine oil SF. Then place the end of the bearing over the shaft on the locking tang side of the cylinder blocks (6010) and partially install the bearing so that Main Bearing Insert TOOL-6331-E or equivalent can be inserted in the journal oil hole. With tool installed, rotate the crankshaft slowly in the opposite direction of engine rotation until the bearing tang is seated. Remove the bearing tool.

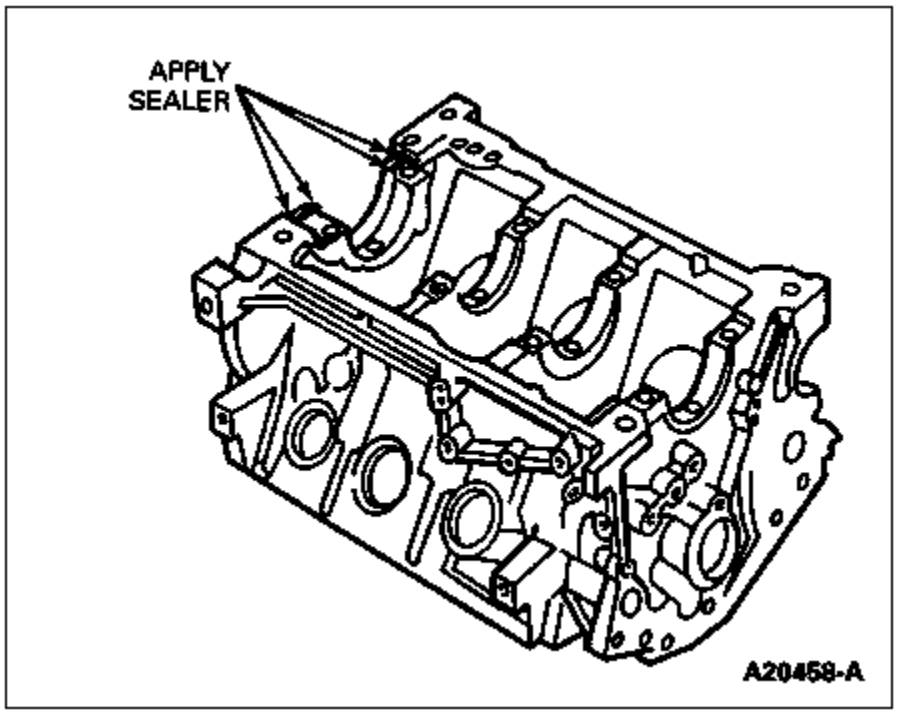
4. For bearings number one, two, and three, coat the bearing insert and journal with SAE 50 Service SG meeting Ford specification ESE-M2C39-F and install the bearing cap. Tighten the cap to 90-104 Nm (66-77 lb-ft).

5. Install the remaining bearings in the same manner. If servicing the rear main bearing, apply sealer to the cap as shown.

tomsn048@gmail.com



Cylinder Block Sealer Application



6. For rear main bearing:

tomsn048@gmail.com

a. Clean all oil off rear main bearing cap and block mating surface using Ford Extra Strength Spot and Stain Remover B7A-19521-AA meeting Ford specification ESR-M5B197-A.
b. Place a bead of Ford Gasket Eliminator E1FZ-19562-A meeting Ford specification WSK-M2G348-A4 or Loctite 515® sealer to the block along the corners of the rear main bearing cap joint area and on the joint face, approximately 1/2 inch from the rear of the cylinder blocks as illustrated.
c. **NOTE: New bolts must be used during assembly.**

   Verify that the lower rear main bearing insert is in place. Install the rear main bearing cap and snug the bolts.
d. Align the rear main bearing cap to block by moving the bearing cap fore or aft (approximately 13mm [1/2 inch] inward in the rear oil seal bore) so that the rear seal stop of the block and cap line up. This will ensure that the rear main oil seal will seat squarely when installed in the bore.
e. Tighten the rear main cap bolts to 90-104 Nm (66-77 lb-ft).
f. Fill the cavities on both sides of the rear main cap with Ford Gasket Eliminator E1FZ-19562-A meeting Ford specification WSK-M2G348-A4 or Loctite 515® . Refer to Figure 2.
g. Reinstall the oil pump and crankshaft oil windage baffle (6L680) tray. Torque to 17-21 Nm (13-15 lb-ft).

7. Install crankshaft rear oil seal as outlined in this section.

8. On Ranger vehicles, reinstall engine (6007) in vehicle.

---

tomsn048@gmail.com

Pistons and Connecting Rods

Removal

1. **NOTE: On the Ranger, it is necessary to remove the engine to remove the oil pan and perform this procedure.**

   Drain engine cooling system.

2. Remove intake manifold as outlined in this section.

3. Remove cylinder head (6049) as outlined in this section.

4. Remove oil pan (6675) and crankshaft oil windage baffle (6L680).

5. Remove oil pump (6600) and oil pump intermediate shaft (6A618).

6. Inspect the top of each cylinder bore before removing the piston (6108). If a ridge has formed at the top of the cylinder it must be removed before piston removal. Remove ridge as follows:

   a. Turn crankshaft (6303) until the piston to be removed is at the bottom of the cylinder bore.
   b. Place a clean shop cloth over the piston head to collect cuttings.
   c. Remove ridge using a suitable ridge reamer following the instructions of manufacturer. Never cut into the ring travel area more than 0.794mm (1/32 inch) when removing the ridge.

7. **NOTE: The cylinder number is stamped on the top of the piston. Matched letters are stamped on the sides of corresponding rod and cap.**

   Turn crankshaft until the piston to be removed is at the high point of its travel. If more than one piston is being removed, identify the pistons and connecting rod ca ps. Each component should be installed in its original position during assembly.

8. Remove connecting rod cap attaching nuts and cap.

9. Install spark plug boots over connecting rod cap studs and push piston out through top of the cylinder bore. Use care to prevent damage to bearing surfaces.

10. Install connecting rod cap and hold in position with cap attaching nuts.

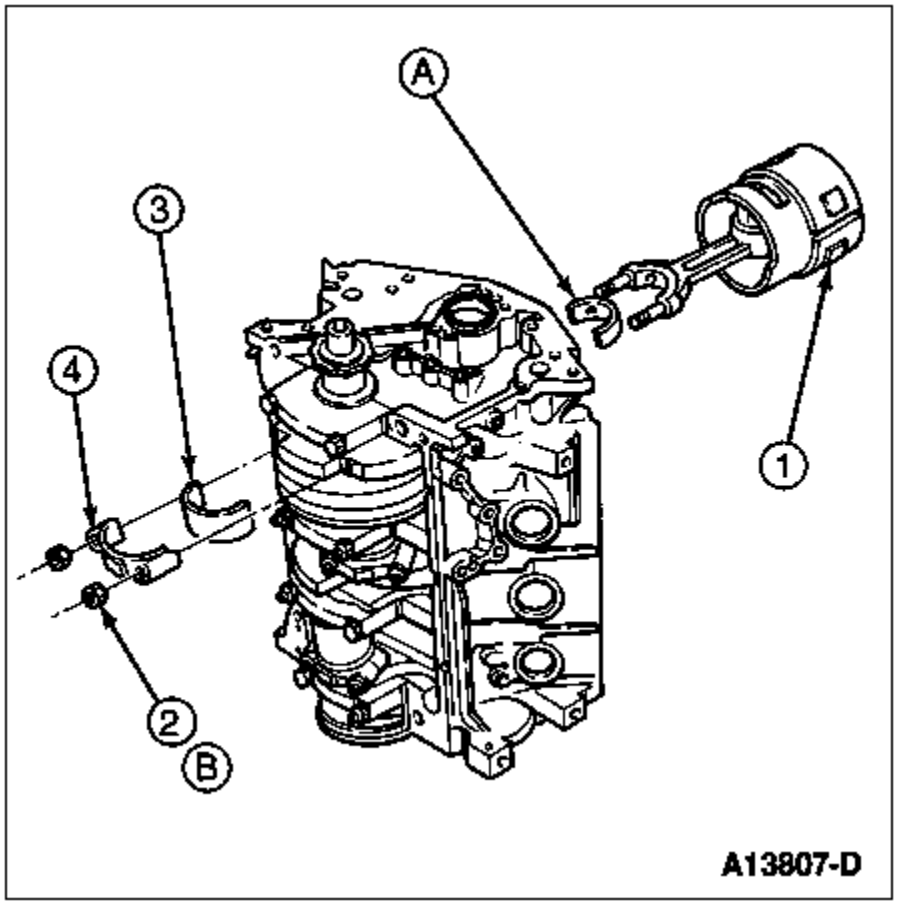
11. If piston is to be disassembled, refer to Piston Disassembly in this section.

12. Inspect cylinder bore. If new piston rings are to be installed on the piston, a visible cross-hatch pattern should be obvious on cylinder bore wall.

    - If honing is required, remove glaze from cylinder wall using spring-loaded hone. Follow manufacturer's instructions when using this type of equipment.

tomsn048@gmail.com

13. After honing, thoroughly clean cylinder bore using a detergent and water solution.



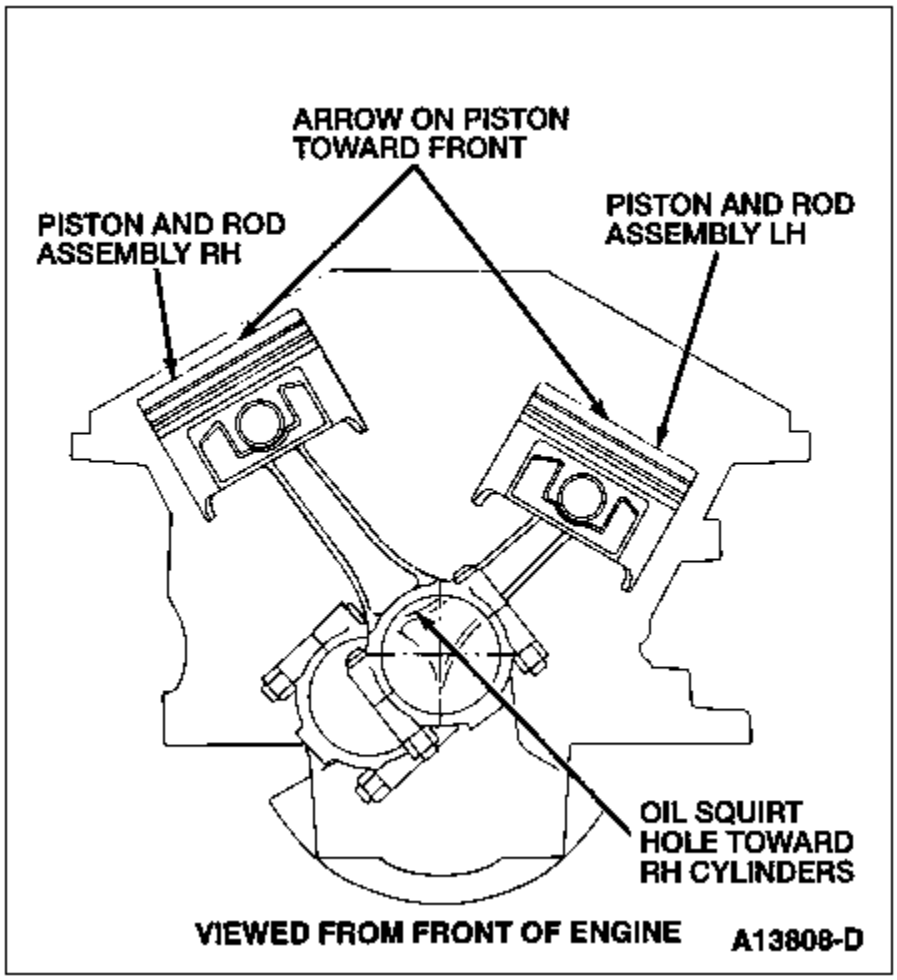
Item	Part Number	Description
1	D81L-6002-C	Piston Ring Compressor
2	6212	Connecting Rod Nut
3	6211	Connecting Rod Bearing
4	—	Connecting Rod Bearing Cap (Part of 6200_
A	—	Oil Hole to Be Assembled As Shown Toward Right Bank Cylinders
B	—	Tighten to 25-32 Nm (18-24 Lb-Ft)

Installation

CAUTION: When installing pistons, make sure arrows in the piston domes face the front of

tomsn048@gmail.com

engine (6007) and the oil squirt holes are oriented toward the RH side of the engine (toward the RH cylinders).

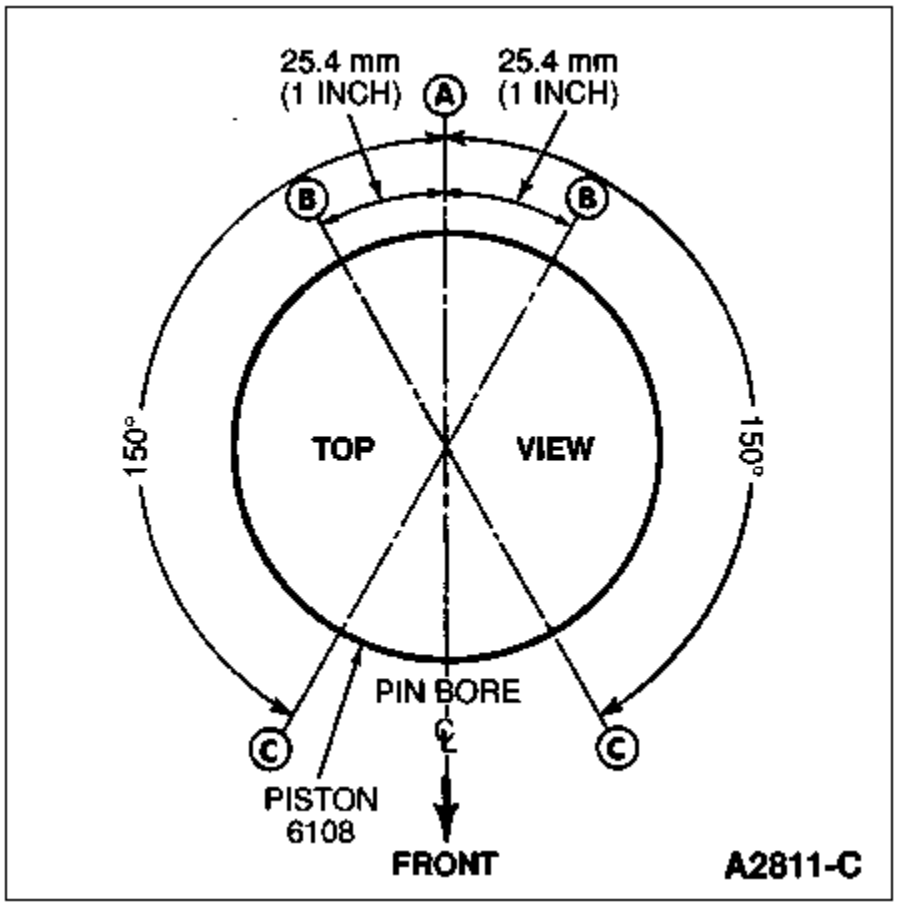


NOTE: Connecting rod and cap are not identified from the factory as to cylinder position.

Lightly oil all attaching bolt and stud threads before installation except those specifying special sealant.

Make sure piston ring gaps are spaced as shown.

tomsn048@gmail.com



1. Lubricate cylinder wall and piston with Engine Assembly Lubricant D9AZ-19579-D or equivalent meeting Ford specification ESR-M99C80-A or SAE 50 Service SG or equivalent oil meeting Ford specification ESE-M2C39-F.

2. Remove connecting rod cap and install spark plug boots on the connecting rod studs.

3. **NOTE: Be sure to install the pistons in the same cylinders from which they were removed or to which they were fitted. The connecting rod and bearing caps are identified with matching correlation letters. Letters on the connecting rod and bearing cap must be on the same side when installed in the cylinder bore. If a connecting rod (6200) is transposed from one block or cylinder to another, new bearings should be fitted.**

   Install piston using Piston Ring Compressor D81L-6002-C or equivalent.

4. As piston is tapped into bore with a hammer handle, guide connecting rod onto crankshaft journal to avoid damage to bearing surfaces.

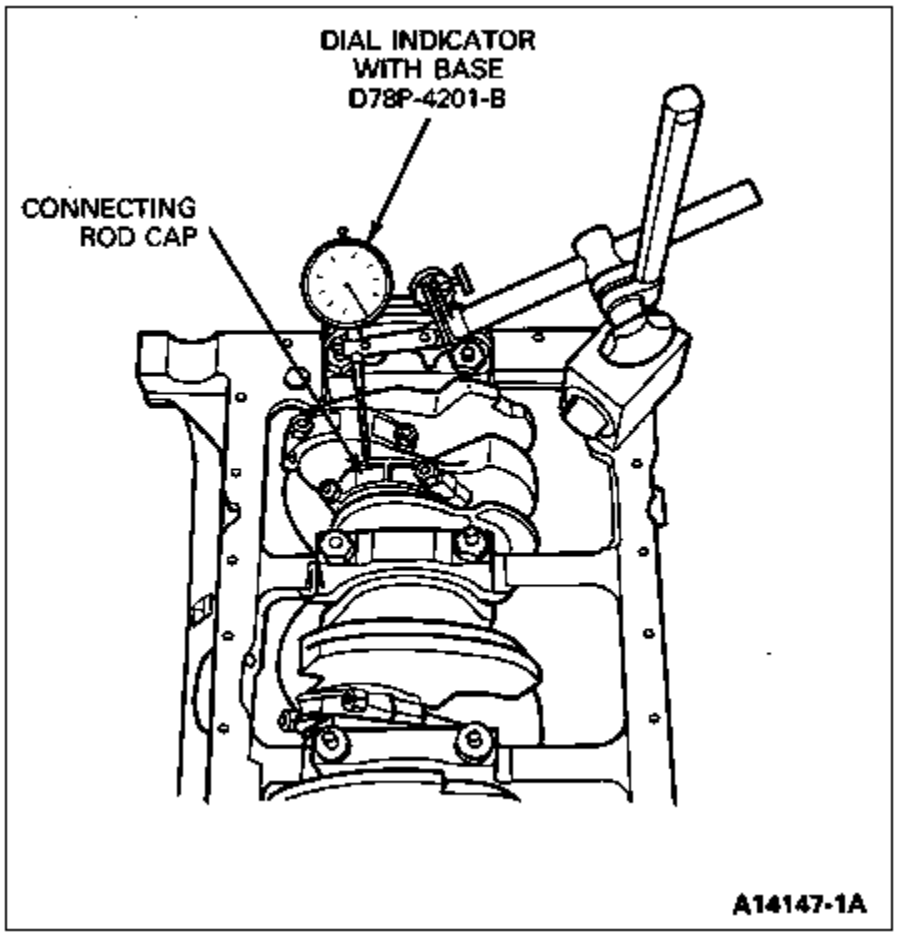
5. Check connecting rod bearing clearance. Refer to Section 03-00 .

6. Lubricate bearing surfaces with Engine Assembly Lubricant D9Z-19579-D or equivalent meeting Ford specification ESR-M99C80-A or SAE 50 Service SG or equivalent oil meeting Ford specification ESE-M2C39-F oil.

7. Make sure connecting rod is seated on crankshaft journal and install connecting rod cap. Tighten the attaching nuts to 25-32 Nm (18-24 lb-ft).

tomsn048@gmail.com

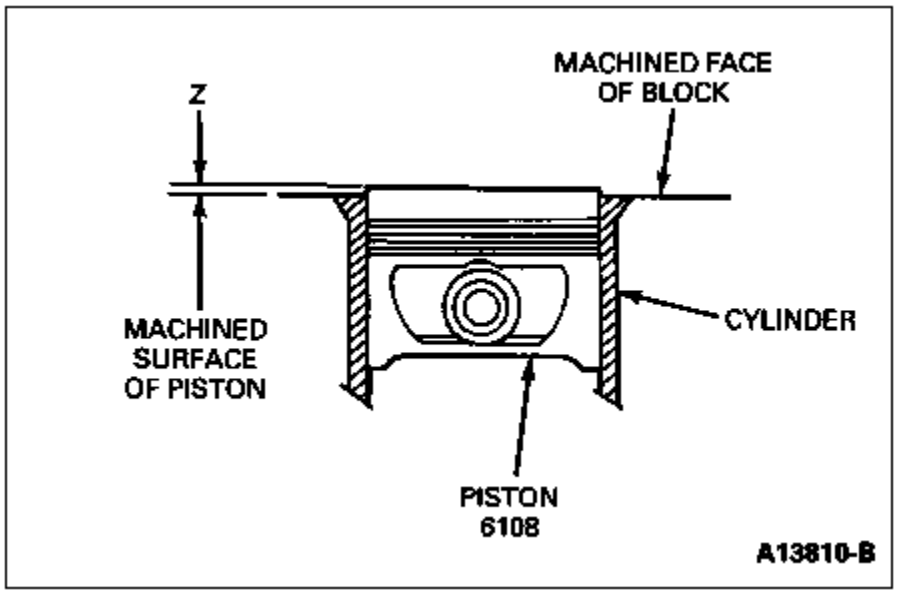
8. If necessary, check connecting rod side clearance as outlined. Refer to Section 03-00 .



9. Check the piston installed height if any of the following repair procedures have been performed:

- New pistons were installed.
- New connecting rods were installed.
- New cylinder blocks (6010) was installed.
- Cylinder block machine work (that could affect cylinder block deck height).
- Cylinder block crankshaft align boring.

tomsn048@gmail.com



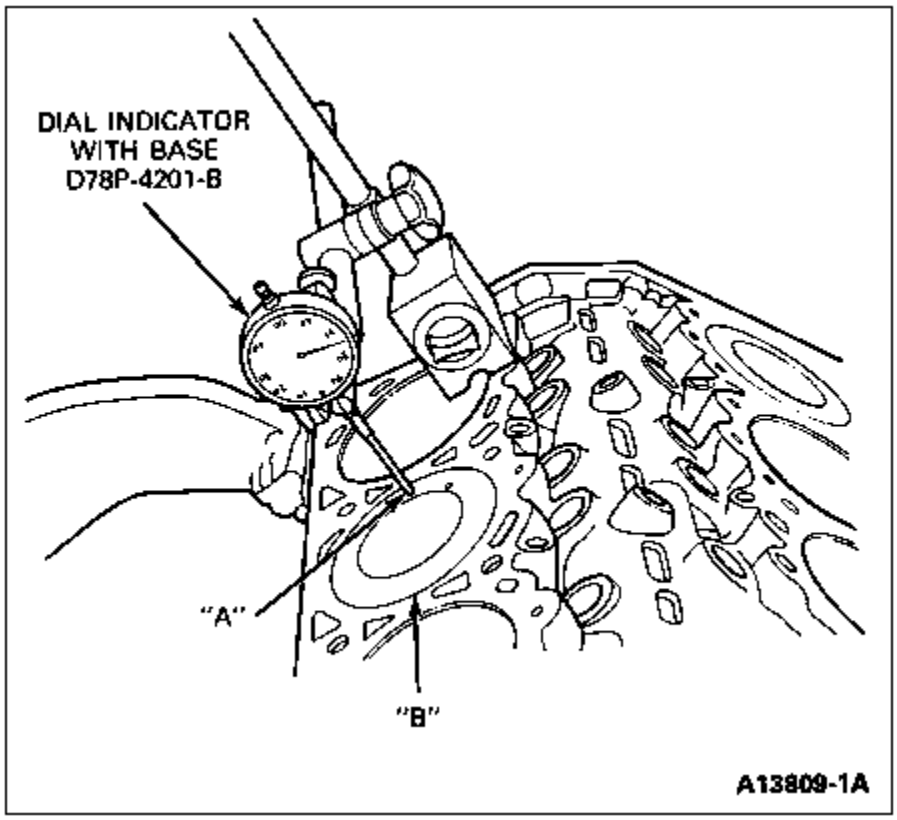
10. **NOTE: Each piston to be positioned at TDC. Dimension "Z" is the average of two readings measured from top of cylinder block to piston dome face.**

    NOTE: Both measurements must be taken parallel to crankshaft and a straight line through the measuring points must pass through the true center of the cylinder.

    Check the piston installed height as follows:

    a. Install Dial Indicator with Base D78P-4201-B or equivalent on the cylinder deck, next to the piston to be checked.
    b. Zero the indicator with the tip on the engine block deck.
    c. Carefully move the indicator over to the piston and take a reading on the piston's machined crown.

tomsn048@gmail.com



d. Take a reading at the front "A" and rear "B" of the piston, in line with the piston pin (6135).
e. Compare readings with specifications.
f. If the difference between the two readings ("A" and "B") is excessive, the piston or connecting rod is damaged or out of specification.

	Minimum	Maximum
Piston Height	mm (Inch)	mm (Inch)
"Z"	0.04 (0.0016)	0.52 (0.020)

11. Install oil pump and oil pump intermediate shaft. Tighten attaching bolts to 17-21 Nm (13-15 lb-ft).
12. Install crankshaft oil windage baffle. Tighten nuts to 17-21 Nm (13-15 lb-ft).
13. Install oil pan as outlined in this section.
14. Install cylinder heads as outlined in this section.
15. Install intake manifolds as outlined in this section.
16. Install valve covers (6582) as outlined in this section.
17. If removed from vehicle, install engine as outlined in this section.
18. Fill crankcase with specified oil.
19. Fill cooling system with specified coolant.

tomsn048@gmail.com

20. Start engine and check for oil, exhaust and coolant leaks.

21. Check and, if necessary, adjust transmission throttle linkage and speed control.

---

tomsn048@gmail.com

Connecting Rod Bearings

NOTE: The connecting rod bearings are selective fit. Refer to procedures under Fitting Main and Connecting Rod Bearings, Section 03-00 .

Removal

1. **NOTE: On Ranger, it is necessary to remove the engine (6007) to remove the oil pan (6675). On Aerostar it is necessary to remove the transmission to properly reseal the oil pan.**

   Drain the crankcase. Remove the oil pan and related parts as outlined in this section.

2. Remove the crankshaft oil windage baffle (6L680) and oil pump (6600).

3. Rotate the crankshaft (6303) until the connecting rod (6200) in which the bearings are to be fitted is at the bottom.

4. Remove the bearing cap from the connecting rod, then remove the connecting rod bearing (6211).

5. Cover connecting rod bolts with protective covers (old spark plug boots) to avoid damage to crankshaft journals.

Installation

1. Make sure connecting rod bearing and bearing bore in connecting rod and cap are clean. Foreign material under inserts or between rod and cap will distort the bearing and cause premature failure.

2. Clean the crankshaft journal.

3. Check connecting rod oil squirt holes for restrictions.

4. Install the bearing inserts in the connecting rod and cap with the tangs fitted in the slots provided.

5. Pull the connecting rod assembly down firmly on the crankshaft journal.

6. Select fit the bearing following procedures in Section 03-00 .

7. Clean and apply a light coat of engine oil XO-5W30-QSP meeting Ford specification ESE-M2C153-E or equivalent SAE 5W-30 Service SG to the journal and bearings. Install the connecting rod cap. Tighten the nuts to 25-32 Nm (18-24 lb-ft).

8. Clean the oil pump inlet tube screen. Prime the pump by filling the inlet opening with XO-5W30-QSP or equivalent meeting Ford specification ESE-M2C153-E or SAE 5W-30 Service SG engine oil while rotating the shaft until oil emerges from the outlet opening. Install the oil pump with a new gasket and tighten the attaching bolts to 17-21 Nm (13-15 lb-ft).

9. Install the oil pan as outlined in this section.

10. If removed from vehicle, install engine as outlined in this section.

tomsn048@gmail.com

11. Fill the crankcase to the correct level with the specified oil. Start the engine and check for leaks.

---

tomsn048@gmail.com

Flywheel

Removal

1. Remove transmission as outlined in Group 07.
2. If equipped with manual transmission, remove clutch assembly as outlined in Section 08-01 .
3. Remove flywheel-to-crankshaft bolts (6379) and remove flexplate and flywheel crankshaft spacer (6434) or flywheel.

Installation

All major rotating components including flexplate/flywheel are individually balanced to zero. Engine assembly balancing is not required. Balance weights should **NOT** be installed in new flywheels.

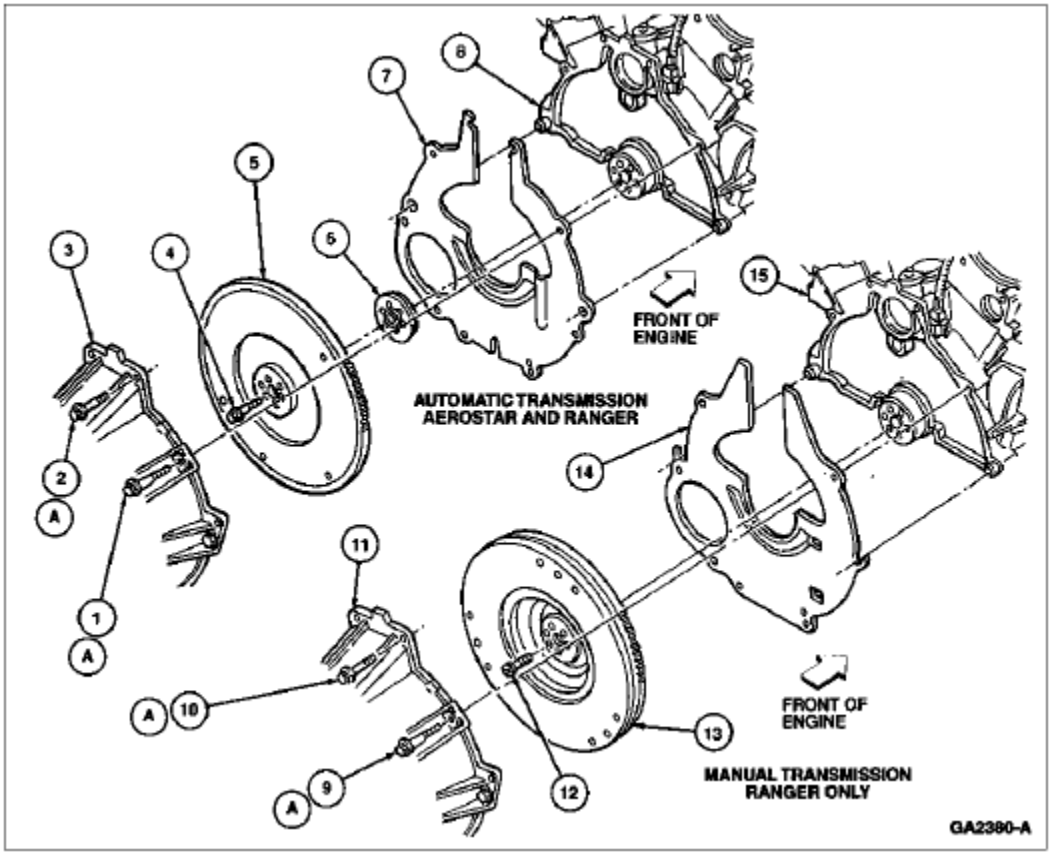
1. **NOTE: Special bolts are used for flywheel/flexplate installation. Do not use standard bolts.**

   If vehicle has manual transmission, inspect Pilot Bearing. If necessary, replace as outlined in Section 08-01 .
2. Position flywheel or flywheel crankshaft spacer and flexplate on crankshaft (6303) and hand-start flywheel-to-crankshaft bolts.
3. Using standard cross-tightening sequence, tighten flywheel-to-crankshaft bolts as follows:

   a. First stage — 12-15 Nm (9-11 lb-ft).
   b. Second stage — 68-74 Nm (50-55 lb-ft).
4. If vehicle has manual transmission, install clutch as outlined in Section 08-01 .
5. Install transmission as outlined in Group 07.

Flywheel/Flexplate Installation, Ranger, and Aerostar

tomsn048@gmail.com



Item	Part Number	Description

Crankshaft Rear Oil Seal

SPECIAL SERVICE TOOL(S) REQUIRED

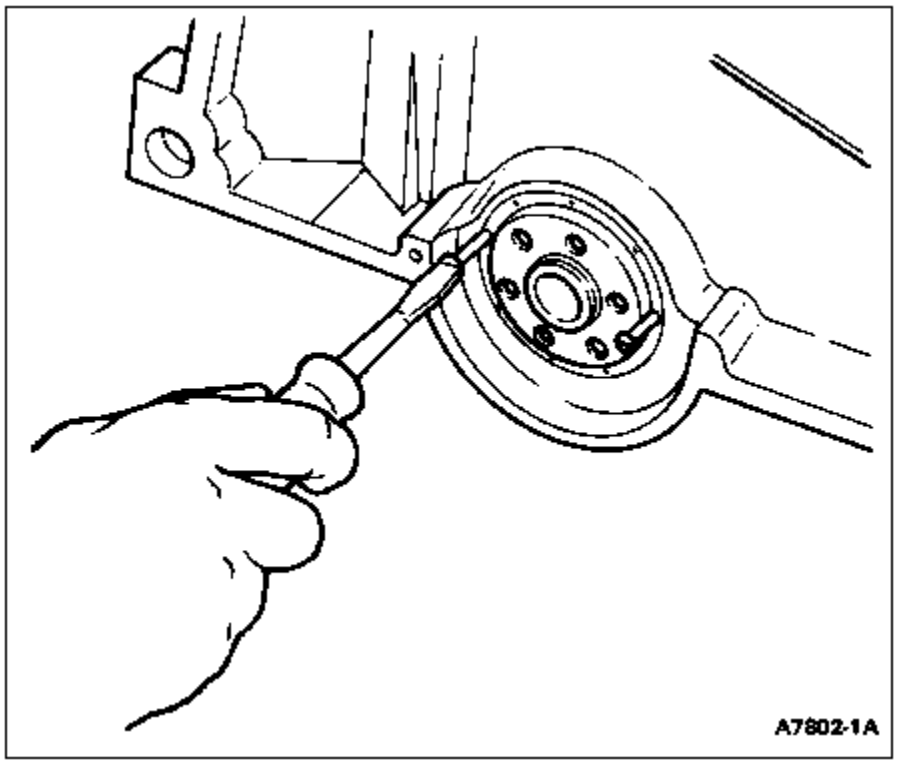
Description	Tool Number
Rear Crankshaft Seal Replacer	T95T-6701-A
Rear Crankshaft Seal Replacer	T97T-6701-A

NOTE: Use dye and black light as outlined in Section 03-00 to determine if oil leak is from oil pan gasket (6710) or crankshaft rear oil seal.

Removal

1. Remove the transmission as outlined in Group 07.
2. If equipped with manual transmission, remove clutch as outlined in Section 08-01 .
3. Remove flywheel-to-crankshaft bolts (6379) and remove flex plate and flywheel crankshaft spacer (6434) or flywheel.
4. Use an awl to punch two holes in the crankshaft rear oil seal (6701). Punch the holes on opposite sides of the crankshaft (6303) and just above the bearing cap-to-cylinder block split line. Install a sheet metal screw in each hole. Use two large screwdrivers or small pry bars and pry against both screws at the same time to remove the crankshaft rear oil seal. It may be necessary to place small blocks of wood against the cylinder blocks (6010) to provide a fulcrum point for the pry bars. **Use caution throughout this procedure to avoid scratching or otherwise damaging the crankshaft oil seal surface.**
5. Clean the oil seal recess in the cylinder blocks and main bearing cap. **Inspect and clean the oil seal contact surface on the crankshaft. Refer to Section 03-00 .**

tomsn048@gmail.com



Installation

Crankshaft rear oil seals used for service applications can come either with or without a metallic crankshaft sleeve. Special Service Tool T95T-6701-A and T97T-6701-A Rear Crankshaft Seal Replacer, is used for both applications.

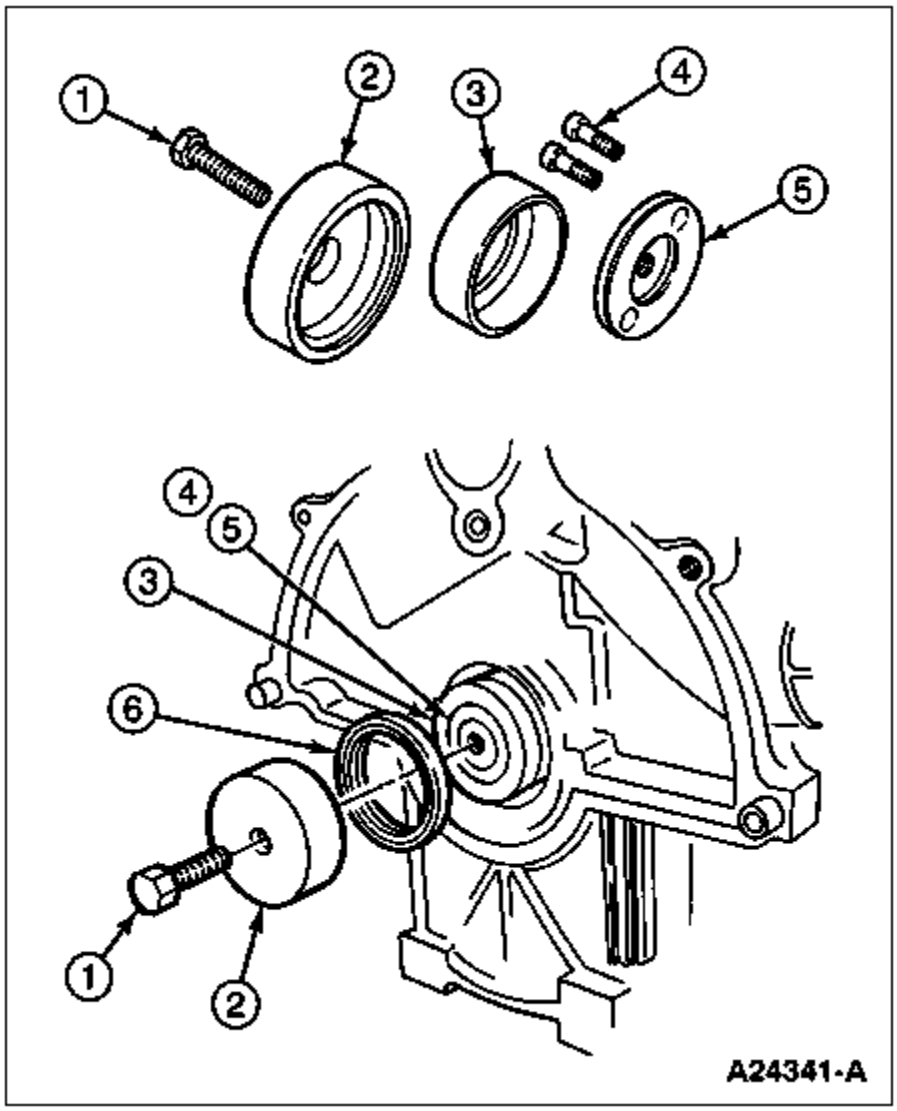
The rear crankshaft seal adapter and two mounting screws attach to the crankshaft. The threaded hole in the center of the crankshaft seal adapter is used by the rear crankshaft seal replacer to draw down and locate the crankshaft rear oil seal.

The rear crankshaft seal protector is used for installing seals without a metallic sleeve. It is not used when installing a rear main oil seal with a sleeve.

CAUTION: Do not remove the metal sleeve from the seal.

CAUTION: This installation procedure requires the use of hand tools only. The use of power tools or hammering on the installer can damage the sleeve and seal.

tomsn048@gmail.com



Item	Part Number	Description
1	—	Bolt (Part of T95T-6701-A)
2	T95T-6701-A2	Rear Crankshaft Seal Replacer
3	T95T-6701-A1	Rear Crankshaft Seal Protector
4	T95T-6701-A4	Bolts
5	T95T-6701-A3	Rear Crankshaft Adapter
6	6701	Crankshaft Rear Oil Seal

Seal Installation With Metal Sleeve

1. Attach the rear crankshaft adapter to the rear of the crankshaft using the supplied mounting screws.
2. Apply a few drops of clean engine oil to the inboard side of the seal/sleeve at the area where the seal contacts the sleeve.

tomsn048@gmail.com

3. Apply a very light film of clean engine oil on the inner diameter of the sleeve and outer diameter of seal.

4. Slide the seal/sleeve over the rear crankshaft seal adapter with flange to the rear of the engine.

5. **NOTE: It is normal for the seal to sit approximately 0.76mm (0.030 inch) deeper than the sleeve flange. DO NOT ADJUST.**

   Use the rear crankshaft seal replacer and supplied bolt to push the rear seal into the cylinder blocks.

   Remove rear crankshaft seal adapter.

Seal Installation Without Metal Sleeve

1. Attach the rear crankshaft adapter to the rear of the crankshaft using supplied mounting screws.

2. Slide rear crankshaft seal protector over the rear crankshaft seal adapter and over the end of the crankshaft.

3. Start the crankshaft rear oil seal over the rear crankshaft seal protector.

4. Use the rear crankshaft seal replacer and supplied bolt to push the seal into the cylinder blocks.

5. Remove rear crankshaft seal protector and rear crankshaft seal adapter.

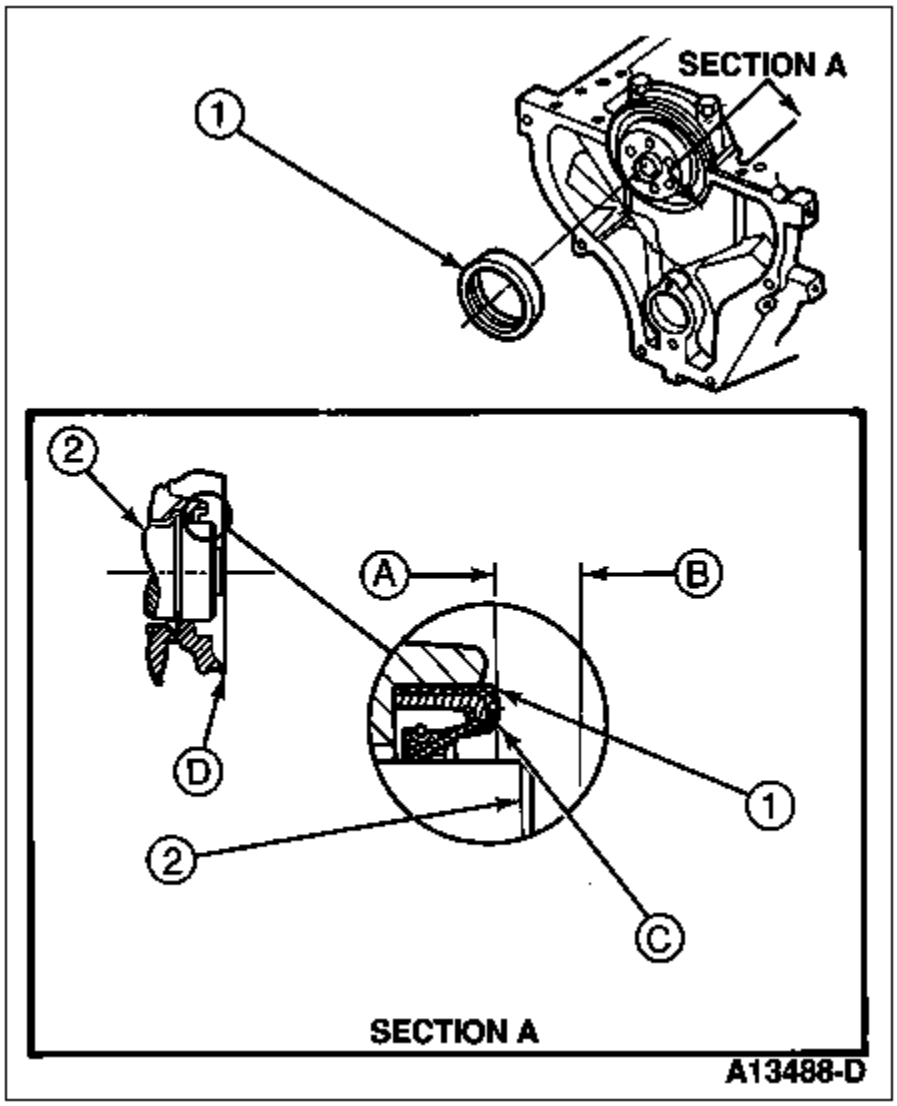
6. Install flywheel (6375). Tighten flywheel-to-crankshaft bolts as follows:

   a. First stage — 12-15 Nm (9-11 lb-ft).
   b. Second stage — 68-74 Nm (50-55 lb-ft).

7. If equipped, install clutch as outlined in Section 08-01 .

8. Install transmission as outlined in Group 07.

tomsn048@gmail.com



Item	Part Number	Description
1	6701	Crankshaft Rear Oil Seal
2	6303	Crankshaft
A	—	10.5 + 0.2-0.3mm (0.413 + 0.008-0.012 Inch)
B	—	Installation Dimension from Rear Face of Cylinder Block to Oil Seal

tomsn048@gmail.com

Camshaft Rear Bearing Cover

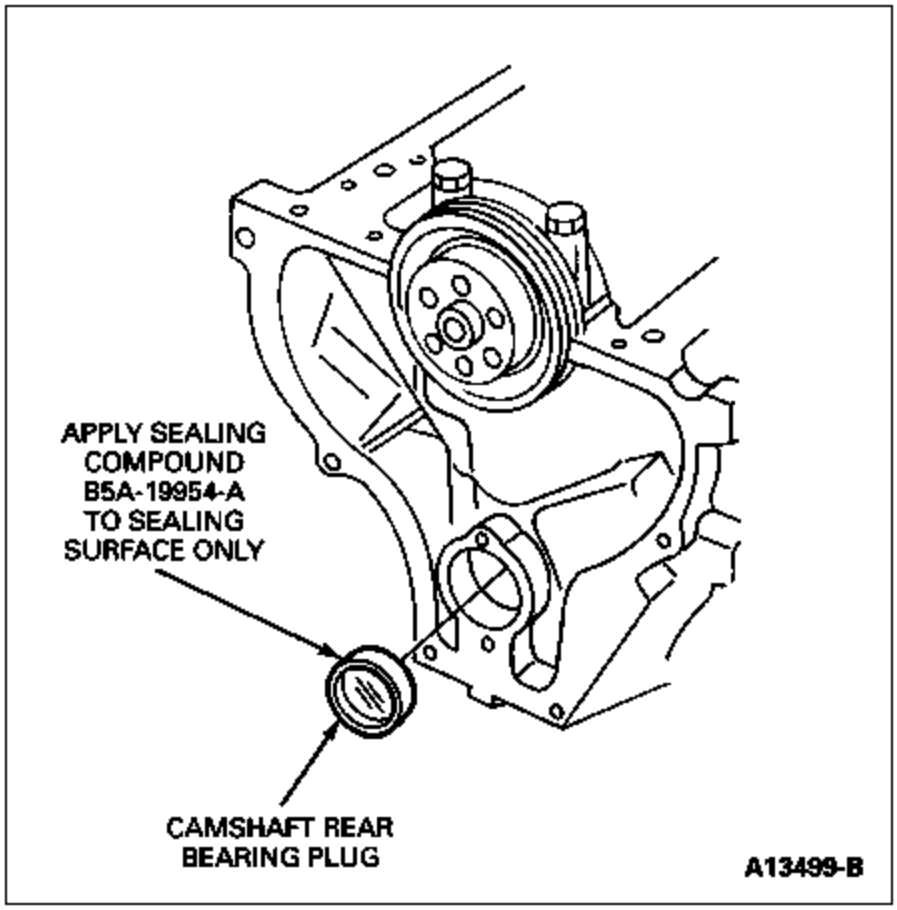
SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
Slide Impact Hammer	T59L-100-B
Slide Impact Hammer	T50T-100-A

Removal

1. Remove transmission. Refer to the applicable section in Group 07.
2. If equipped with manual transmission, remove clutch as outlined in Section 08-01 .
3. Remove flywheel-to-crankshaft bolts (6379) and remove flexplate and flywheel reinforcing plate (6A366) or flywheel.
4. Using a sharp chisel or punch and hammer, cut a hole in the center of the camshaft rear bearing cover (6266).
5. Remove the camshaft rear bearing cover using Impact Slide Hammer T59L-100-B or T50T-100-A. The camshaft rear bearing cover can also be pried from the bore using a large punch. Use care to prevent damage to the plug bore.

tomsn048@gmail.com



Installation

Prior to installing camshaft rear bearing cover, the plug bore should be inspected for any damage that would interfere with the proper sealing of the plug. If the bore is damaged it will be necessary to true the surface by boring for the next specified oversize plug. Oversize (OS) plugs are identified by the OS stamped in the flat located on the cup side of the plug.

1. Apply a light coating of Perfect-Seal Sealing Compound B5A-19554-A meeting Ford specifications ESR-M18P2-A and ESE-M4G115-A or equivalent to the sealing edge of the camshaft rear bearing cover before installation. Install bore camshaft rear bearing cover using a suitable driver.

2. Install flywheel or flexplate and flywheel reinforcing plate. Tighten flywheel-to-crankshaft bolts as follows:

    a. First stage — 12-15 Nm (9-11 lb-ft).
    b. Second stage — 68-74 Nm (50-55 lb-ft).

3. If equipped, install clutch as outlined in Section 08-01 .

4. Install transmission. Refer to the applicable section in Group 07.

tomsn048@gmail.com

tomsn048@gmail.com

Oil Filter

Removal

1. **NOTE: It may be necessary to pull the battery cables forward and out of the way in order to access the oil filter.**

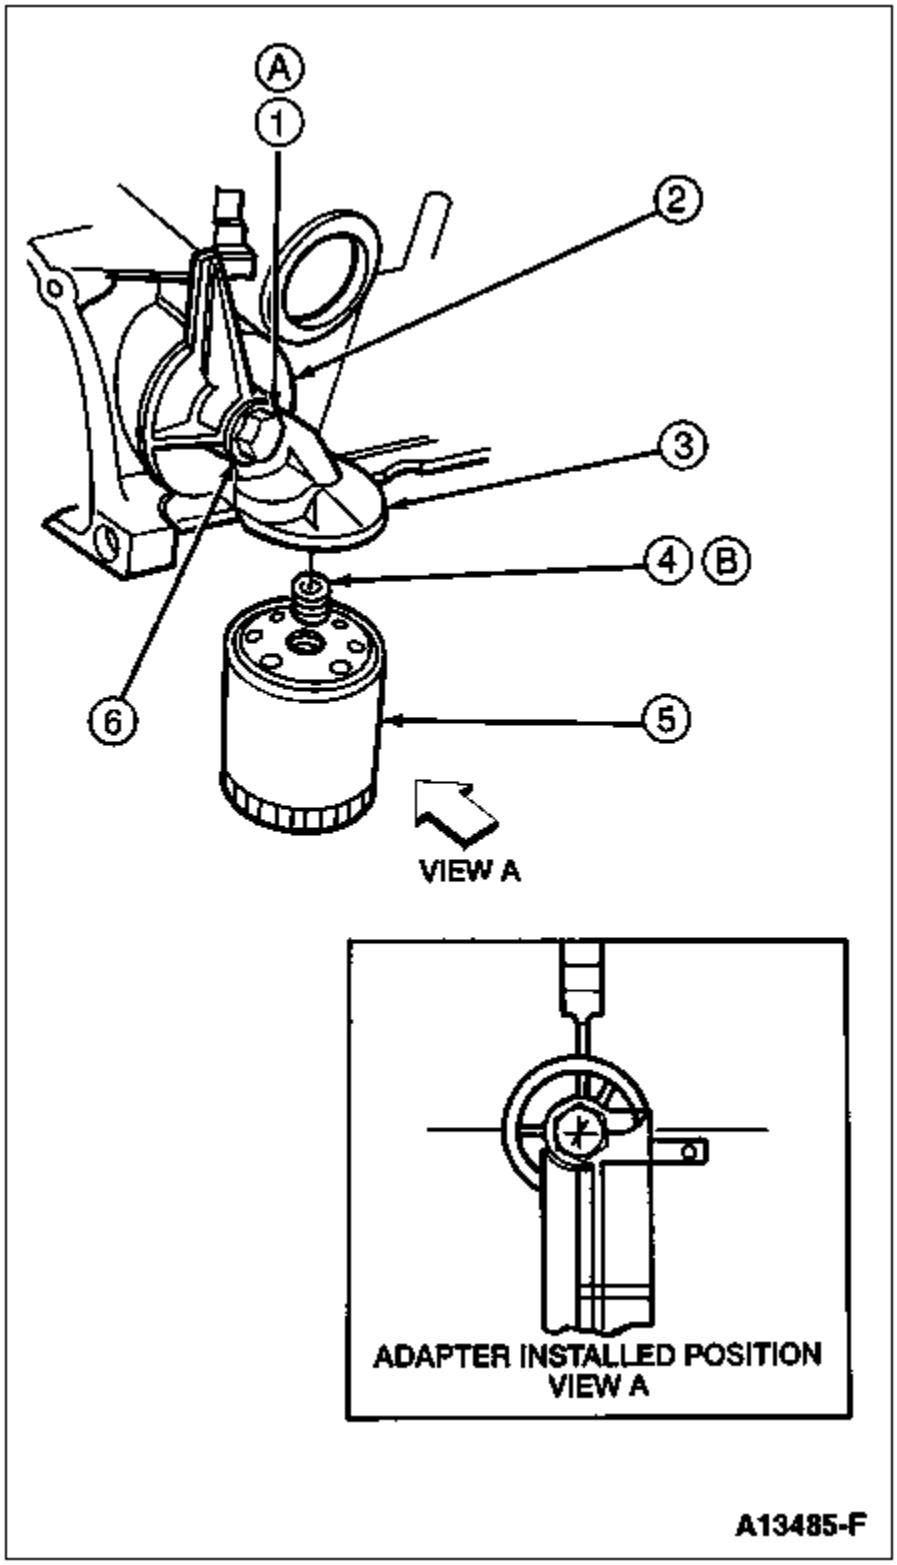
   Place a drip pan under the filter.

2. Use suitable oil filter wrench to loosen filter.

3. Unscrew and remove the oil bypass filter (6714) from the oil filter mounting insert (6890). Empty oil remaining in filter into appropriate container so it may be properly recycled or discarded. Clean the filter adapter recess.

Oil Filter and Adapter — Ranger

tomsn048@gmail.com



Item	Part Number	Description
1	6894	Oil Filter Adapter Mounting Bolt
2	6L621	O-Ring

tomsn048@gmail.com

3	6881	Oil Filter Adapter
4	6890	Oil Filter Mounting Insert
5	6714	Oil Bypass Filter
6	E843188-S	O-Ring
A	—	Tighten to 35-40 Nm (26-30 Lb-Ft)
B	—	Tighten to 35-48 Nm (26-35 Lb-Ft)

Installation

1. Coat the gasket on the replacement oil bypass filter with clean oil. Position the oil bypass filter on the oil filter mounting insert. Hand-tighten the oil bypass filter until the gasket contacts the adapter face, then advance it one-half turn.

2. Fill the crankcase to the correct level with the specified viscosity and grade of oil.

tomsn048@gmail.com

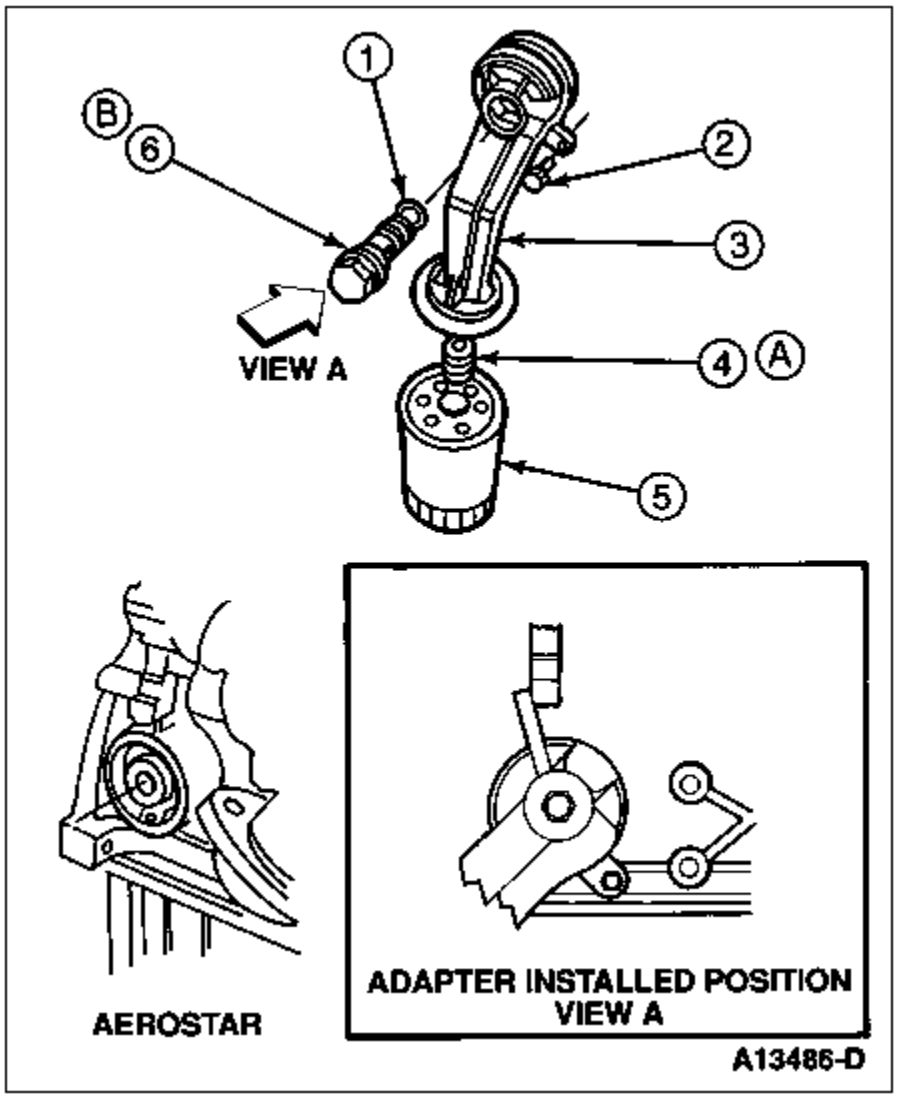
Oil Filter Adapter

Removal

1. Place a drip pan under the oil bypass filter (6714) and remove oil bypass filter.
2. On Aerostar, remove the small locating bolt securing the oil filter adapter (6881) to the cylinder blocks (6010).
3. Remove the oil filter adapter mounting bolt (6894) from the adapter, and remove the oil filter adapter from the engine (6007).

Oil Filter and Adapter — Aerostar

tomsn048@gmail.com



Item	Part Number	Description
1	E853188-S	O-Ring
2	E602189	Bolt
3	6881	Oil Filter Adapter
4	6890	Oil Filter Mounting Insert
5	6714	Oil Bypass Filter
6	6894	Oil Filter Adapter Mounting Bolt
A	—	Tighten to 14-21 Nm (10-15 Lb-Ft)
B	—	Tighten to 35-40 Nm (26-30 Lb-Ft)

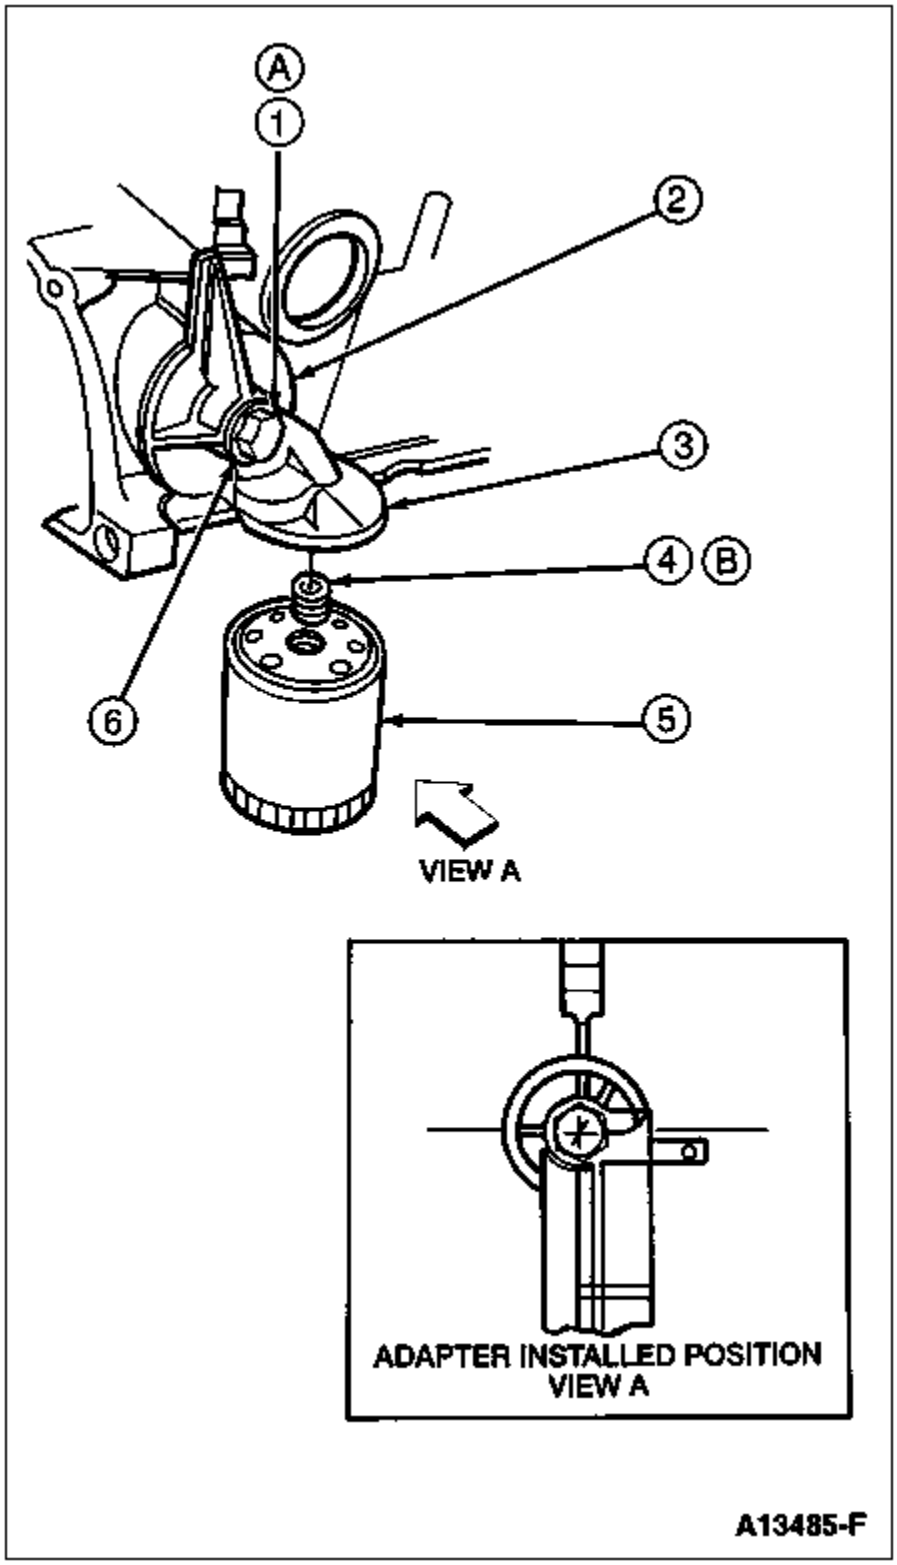
Installation

tomsn048@gmail.com

1. Position the oil filter adapter to the cylinder blocks with a new gasket between the oil filter adapter and the cylinder blocks.

Oil Filter and Adapter — Ranger

tomsn048@gmail.com



Item	Part Number	Description
1	6894	Oil Filter Adapter Mounting Bolt
2	6L621	O-Ring

tomsn048@gmail.com

3	6881	Oil Filter Adapter
4	6890	Oil Filter Mounting Insert
5	6714	Oil Bypass Filter
6	E843188-S	O-Ring
A	—	Tighten to 35-40 Nm (26-30 Lb-Ft)
B	—	Tighten to 35-48 Nm (26-35 Lb-Ft)

2. Install a new oil filter mounting bolt seal (6749) on the oil filter adapter mounting bolt and install the bolt into the engine block, hand-tight.
3. Position the oil filter adapter as shown, aligning the locating bolt (Aerostar).
4. Tighten the oil filter adapter mounting bolt to 35-40 Nm (26-30 lb-ft). On Aerostar vehicles, install the locating bolt.

---

tomsn048@gmail.com

Sensors

Low Oil Level Sensor

Removal

1. With engine off, drain at least 1.9 liters (2 quarts) of oil from engine (6007).
2. Disconnect electrical connection.
3. Remove low oil level sensor (6C624) with a 26mm (1-inch) socket or end wrench. Discard old gasket.

Installation

1. **NOTE: Always replace gasket when removing low oil level sensor.**

   Install new gasket onto low oil level sensor, noting flange faces sensor and the words "pan side" are facing the oil pan (6675).

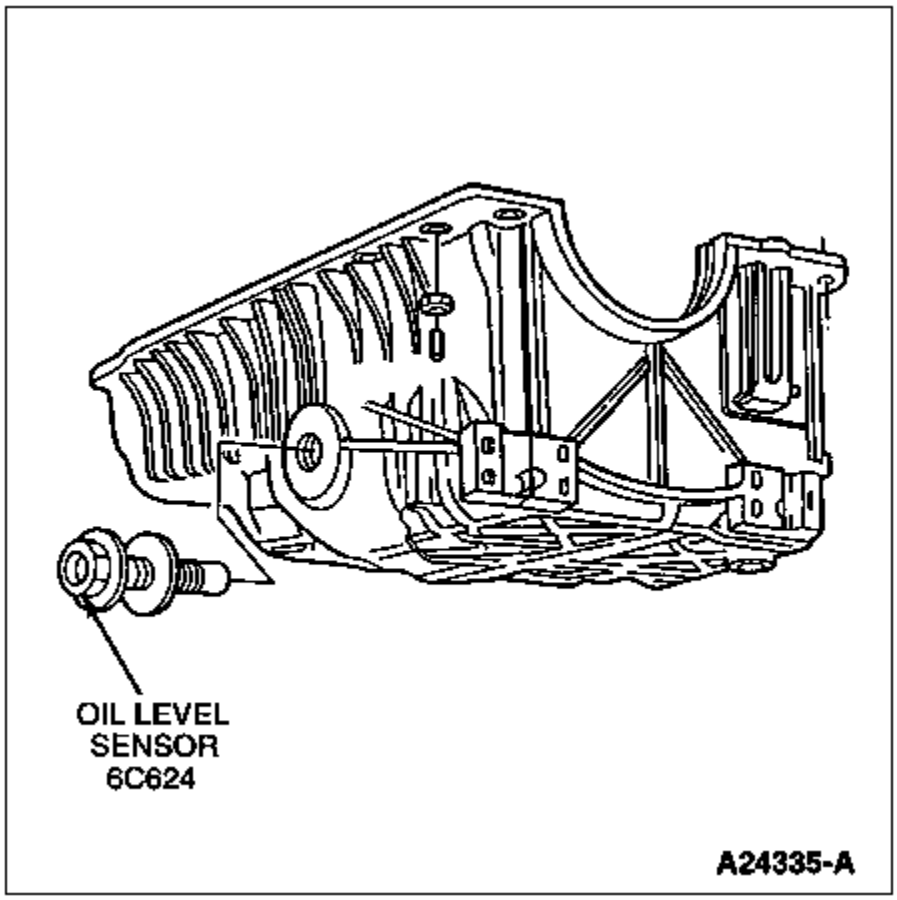
2. **NOTE: When replacing low oil level sensor using a metal gasket with a rubber O-ring, tighten sensor to 17-27 Nm (13-20 lb-ft).**

   Install low oil level sensor and gasket assembly. Tighten to 20-34 Nm (15-25 lb-ft).

3. Connect electrical connection.
4. Refill crankcase to correct level.
5. Start engine and check for oil leaks.

Typical Oil Level Sensor Installation

tomsn048@gmail.com



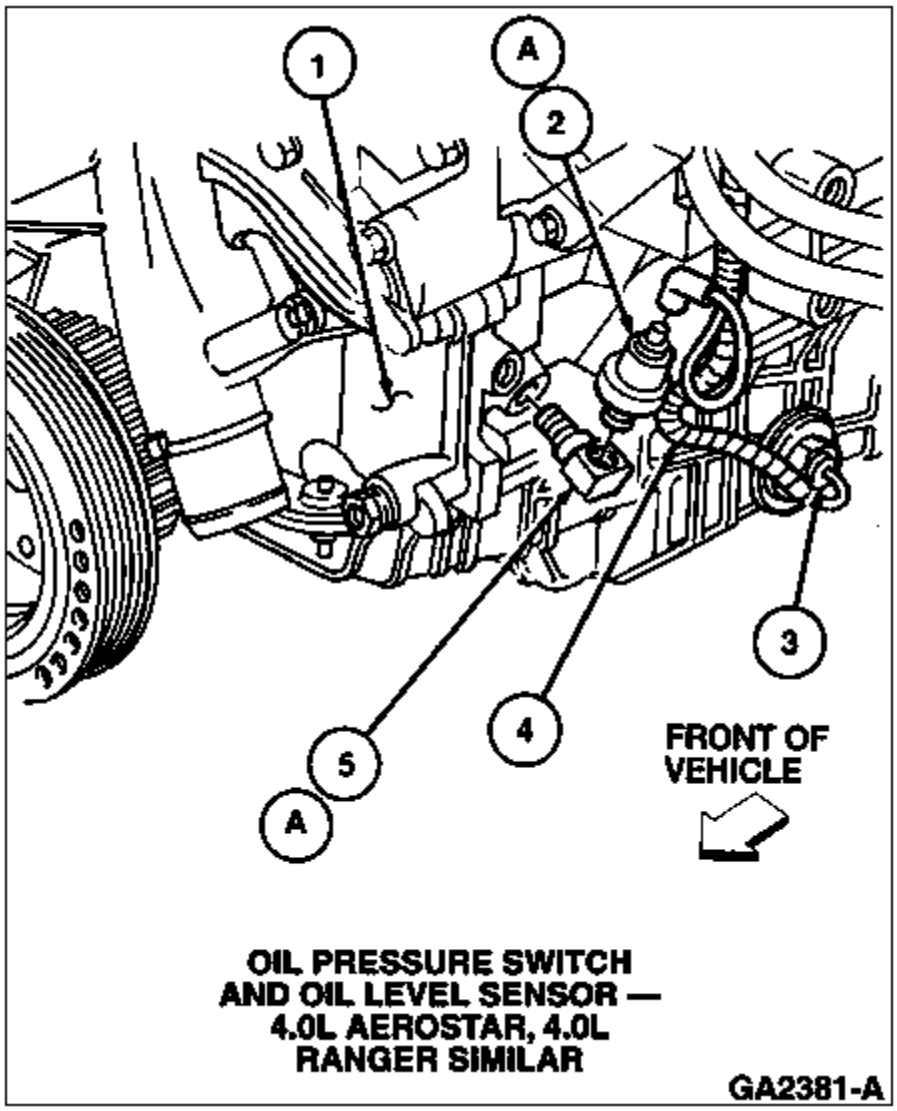
Oil Pressure Sender/Switch

Removal and Installation (4.0L Engine)

1. Make sure engine is turned off.
2. Remove electrical connection to oil pressure sensor (9278) at the front left of the engine block.
3. Remove switch from cylinder blocks (6010).
4. Apply Pipe Sealant with Teflon®, D8AZ-19554-A meeting Ford specifications ESG-M4G-194-A and ESR-M18P7-A or equivalent to new switch unit threads.

   For installation follow removal procedures in reverse order. Tighten oil pressure sensor to 11-16 Nm (8-12 lb-ft). If the oil pressure switch fitting was removed, tighten to 11-16 Nm (8-12 lb-ft) and then one additional turn for correct orientation (fitting should be vertical to 30 degrees toward front of vehicle). Start engine and check switch for oil leaks.

tomsn048@gmail.com



Item	Part Number	Description
1	6010	Cylinder Blocks (LH)
2	9278	Oil Pressure Sensor
3	6C624	Low Oil Level Sensor
4	9D930	Fuel Charging Wiring
5	9B339	Oil Pressure Sender Fitting

tomsn048@gmail.com

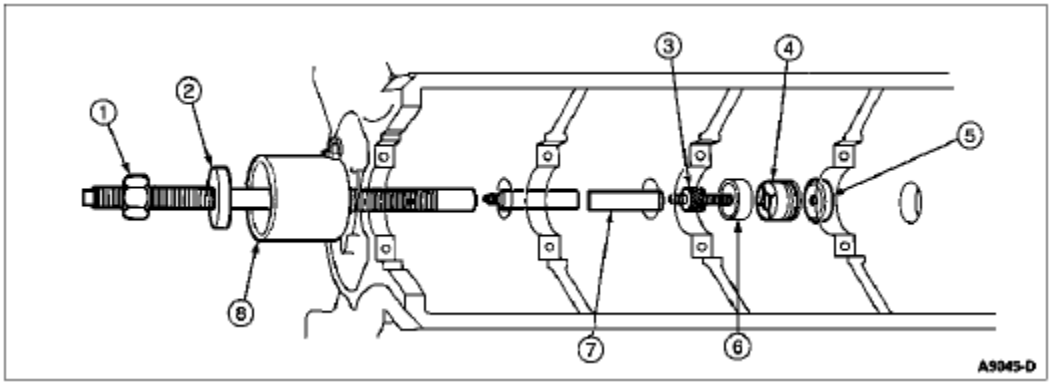
tomsn048@gmail.com

Camshaft Bearings

Removal

1. Remove engine (6007). Place engine on work stand and remove camshaft (6250), crankshaft (6303) and camshaft rear bearing cover (6266).
2. Remove camshaft bearing (6261) with Camshaft Bearing Set T65L-6250-A.
3. Select proper size expanding collet and backup nut, and assemble on the expanding mandrel. With the expanding collet collapsed, install collet assembly in the camshaft bearing, and tighten backup nut on the expanding mandrel until the collet fits the camshaft bearing.
4. Assemble pulling screw and extension, if necessary, and install on the expanding mandrel. Wrap a cloth around the threads of the pulling screw to protect the bearing or journal. Tighten the pulling nut against the thrust bearing and pulling plate to remove camshaft bearing. Be sure to hold the end of the pulling screw to prevent it from turning.
5. Repeat the above step for each bearing. To remove the front bearing, install the puller from the rear of the block.

Camshaft Bearings, Removal and Installation



Item	Part Number	Description
1	—	Pulling Screw (Part of T65L-6250-A)
2	—	Pulling Plate (Part of T65L-6250-A)
3	—	Expanding Mandrel (Part of T65L-6250-A)

tomsn048@gmail.com

4	—	Expanding Collet (Part of T65L-6250-A)
5	—	Backup Nut (Part of T65L-6250-A)
6	6262	Bearing, Camshaft (Part Number Given Is for Reference Only)
7	—	Puller Screw Extension (Part of T65L-6250-A)
8	—	Front Spacer (Part of T65L-6250-A) NOTE: All items except No. 6 (Bearing) are included in Camshaft Bearing Set T65L-6250-A.

Installation

The camshaft bearings are available pre-finished to size and require no reaming for standard and 0.081mm (0.015 inch) undersize journal diameters.

1. **NOTE: Align the oil holes in the camshaft bearings with the oil holes in the cylinder blocks (6010) before pressing bearings into place.**

   Make sure the front bearing is installed 0.51-0.89mm (0.020-0.035 inches) below the front face of the cylinder block.

   Position camshaft bearings at the bearing bores and press them in place with Camshaft Bearing Set T65L-6250-A. Be sure to center the pulling plate and puller screw to avoid damage to the bearing.

   Failure to use the correct expanding collet can cause severe bearing damage.

2. Install camshaft rear bearing cover as outlined.

tomsn048@gmail.com

tomsn048@gmail.com

Oil Pan, Ranger

Removal

1. Remove the engine (6007) as detailed in this section.

2. **CAUTION: Mounting the engine upside down on the engine stand before removing the oil pan (6675) may cause sludge to drop into the cylinders and onto the camshaft (6250) and valve tappets (6500) causing rapid wear when the engine is restarted.**

   Mount the engine on an engine stand **with the engine upright** . Remove the oil pan and crankshaft oil windage baffle (6L680).

3. Rotate the engine upside down and remove the oil pump (6600) and rear main bearing cap.

4. Remove and discard the crankshaft rear main seal.

Installation

1. **CAUTION: Prevent engine assembly contamination. Always use necessary precautions to prevent old sealer or gasket material from falling into the engine.**

   Thoroughly clean **ALL** the oil and the old sealer from the oil pan taking special care to remove **ALL** the old sealer from the oil pan gasket groove in the oil pan. Thoroughly clean the oil pan.

2. **NOTE: Thoroughly clean all exposed areas with metal surface cleaner F4AZ-19A536-RA or denatured alcohol. Place special attention on removing the remains of the integral rubber wedge seal. The tabs on the wedge seal tear away from the oil pan gasket when the oil pan is removed and remain lodged between the block and the rear main bearing cap.**

   Thoroughly clean **ALL** the old sealer from the rear main bearing cap using a scraper and wire wheel. The original sealer used during production assembly becomes extremely hard after it has cured. It is extremely important that **ALL** old sealer is removed from all joining faces and grooves.

3. Thoroughly clean **ALL** oil and old sealer from the cylinder block oil pan sealing area and the rear main bearing cap joint area.

4. Thoroughly clean **ALL** oil and old sealer from the area at the rear main bearing cap.

5. After all parts have been thoroughly cleaned and washed, it is necessary and extremely important that they be wiped down with Extra Strength Spot and Stain Remover B7A-19521-AA meeting Ford specification ESR-M5B197-A or denatured alcohol.

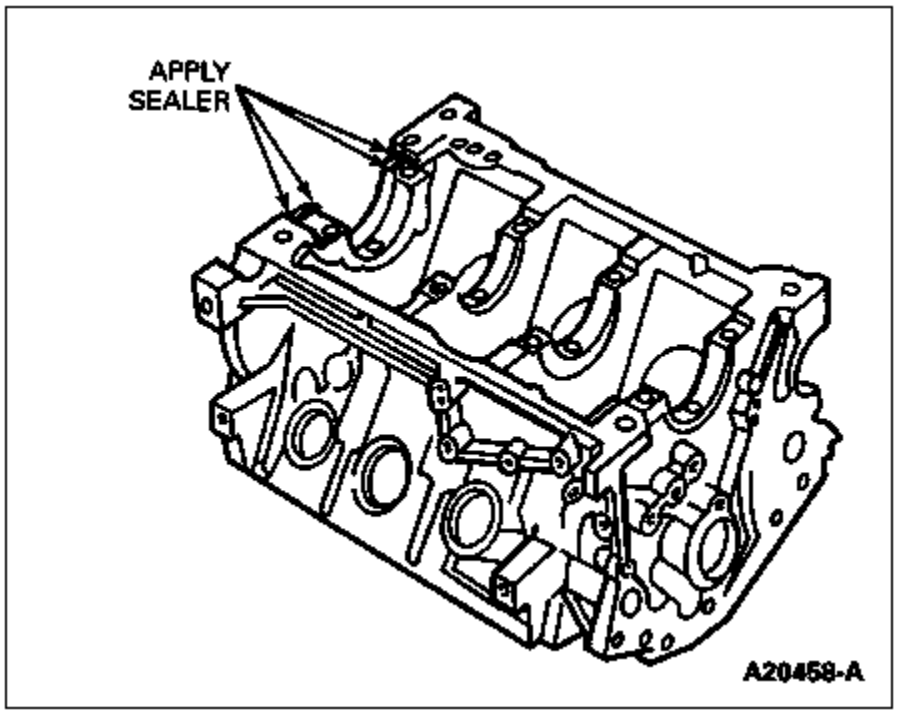
6. Thoroughly clean the transmission bell-housing area and the rear of the cylinder blocks (6010). Oil removal should be verified with an ultraviolet lamp ("black light").

7. Apply a bead of Ford Gasket Eliminator E1FZ-19562-A or Loctite® 515, or equivalent sealer meeting

tomsn048@gmail.com

Ford specification ESE-M4G234-A1, to the cylinder blocks along the corners of the rear main bearing cap joint area, and on the joint face approximately 13mm (1/2 inch) from the rear of the cylinder blocks.

Cylinder Block Sealer Application



8. **NOTE: New main bearing cap bolts must be used during assembly.**

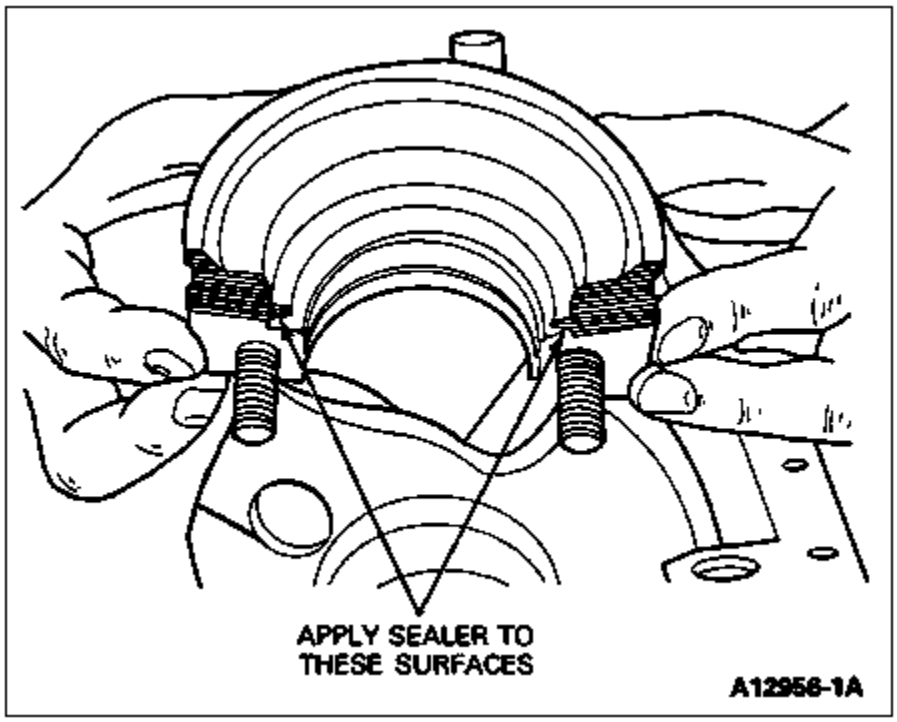
   Verify that the lower rear main bearing insert is in place and install the rear main bearing cap and snug the bolts.

9. **NOTE: The rear main bearing cap MUST be aligned and installed properly to seal. Misalignment will cause an oil leak.**

   Align the rear main bearing cap to block by moving the bearing cap fore or aft so the rear seal stop (located approximately 1/2 inch inward in the rear oil seal bore) of the block and cap line up. This will ensure the crankshaft rear oil seal (6701) will seat properly when installed in the bore.

10. Tighten the bolts evenly to 90-104 Nm (66-77 lb-ft).

tomsn048@gmail.com

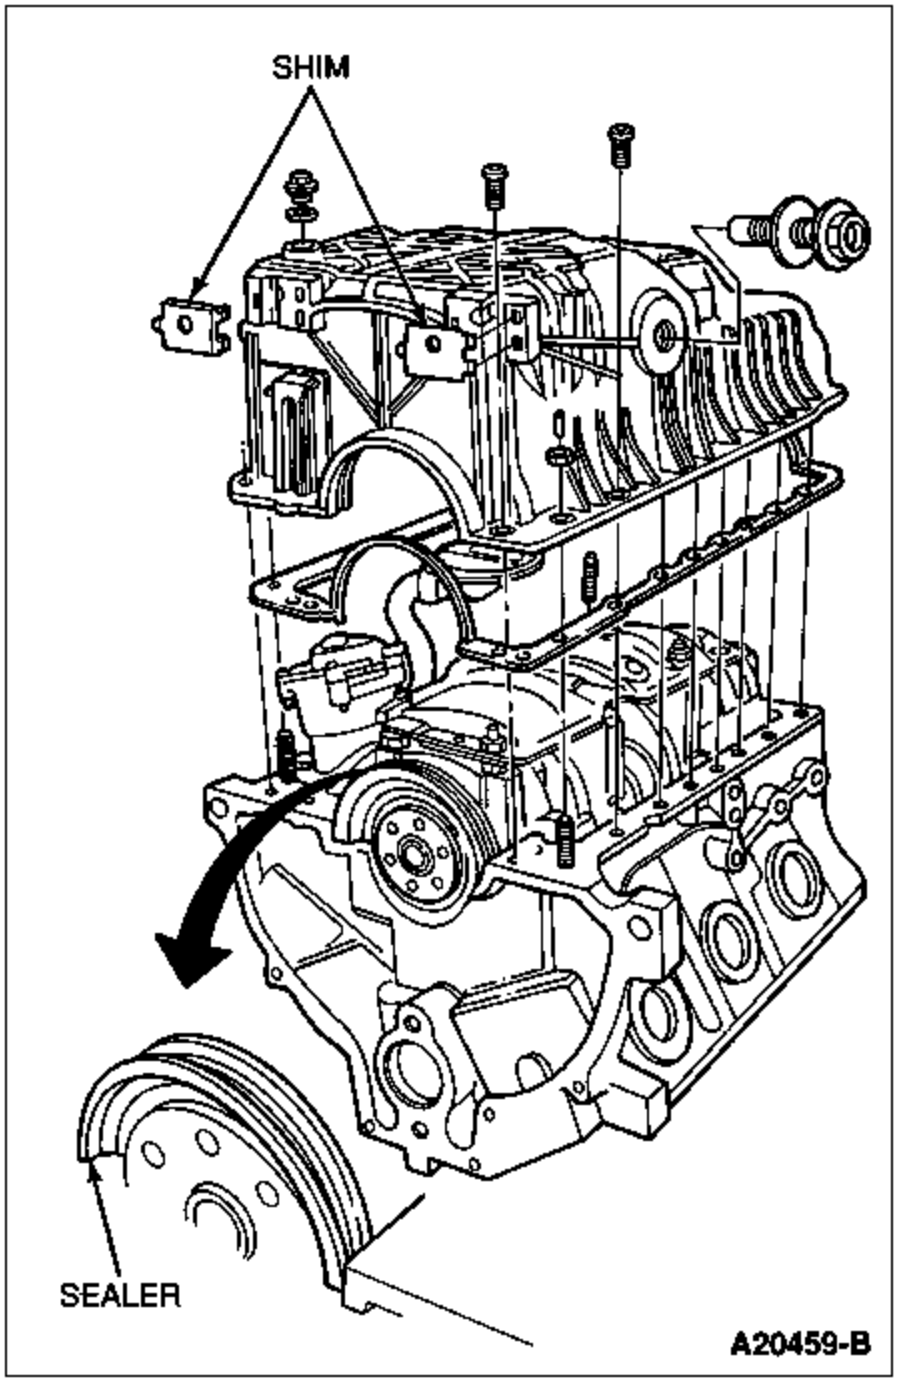


11. **CAUTION: Use a NEW oil seal. Failure to install a new seal, or incorrect installation will result in an oil leak after the vehicle is returned to service.**

    Fill the cavities on both sides of the rear main cap with Gasket Eliminator E1FZ-19562-A or Loctite 515® or equivalent sealer meeting Ford specification ESE-M4G234-A1. See illustration.

Oil Pan Installation

tomsn048@gmail.com



12. Clean and inspect the oil inlet tube. Prime the oil pump by filling the inlet opening with oil while rotating the shaft until oil emerges from the outlet opening. Install the pump and screen and tighten the bolts to 17-21 Nm (13-15 lb-ft).

13. Install the windage tray and tighten to 17-21 Nm (13-15 lb-ft).

14. Place a bead of Ford Silicone Sealer F1AZ-19562-A, Loctite® 598 or equivalent sealer in the oil pan gasket flange at the radius areas at the front and rear of the oil pan.

15. Place the oil pan gasket (6710) in place on the flange of cylinder block while setting integral wedge seal in place.

tomsn048@gmail.com

16. Place a bead of Ford Silicone Sealer F1AZ-19562-A, or Loctite® 598 or equivalent sealer meeting Ford specification WSE-M4G279, on top of the oil pan gasket at the radius areas at the front and rear of the oil pan.

17. Place a bead of Ford Silicone Sealer F1AZ-19562-A or Loctite® 598 sealer or equivalent meeting Ford specification WSE-M4G277, on the cylinder blocks at the cylinder block-to-front cover joint area.

18. Set the oil pan in place as the wedge seal is placed in position. Install and snug four oil pan nuts tight enough to align the bolt holes, but loose enough that the oil pan may be pushed backwards.

19. **NOTE: If the rear face of the oil pan cannot be aligned within .010 inch of the rear face of the cylinder blocks, the oil pan spacer (6C629) should be used.**

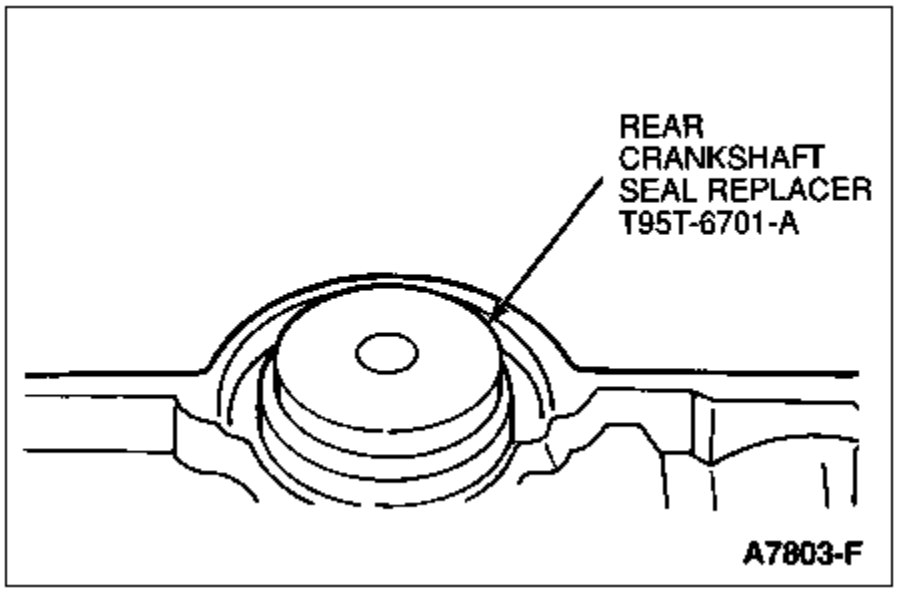
    Align the rear face of the oil pan with the rear face of the cylinder blocks.

20. Install the remaining oil pan bolts and finger-tighten.

21. Tighten the oil pan nuts and bolts evenly to 7-10 Nm (62-89 lb-in).

22. **NOTE: Do not put oil in the engine or run the engine until the next day to allow the sealers to set up properly. If time is not allowed for sealers to cure, engine will leak.**

    Always use a new crankshaft rear oil seal. Coat the rear main seal-to-cylinder block surface of the oil seal with oil XO-5W30-QSP or equivalent meeting Ford specification WSE-M2903-A1 or equivalent SAE 5W-30 Service SG engine oil. Refer to Crankshaft Rear Oil Seal Installation in this section.



23. **CAUTION: Failure to measure the required spacer thickness will result in insufficient or excessive clearance between the oil pan and the transmission (7003) when installed in the vehicle. This can result in oil pan damage and an oil leak.**

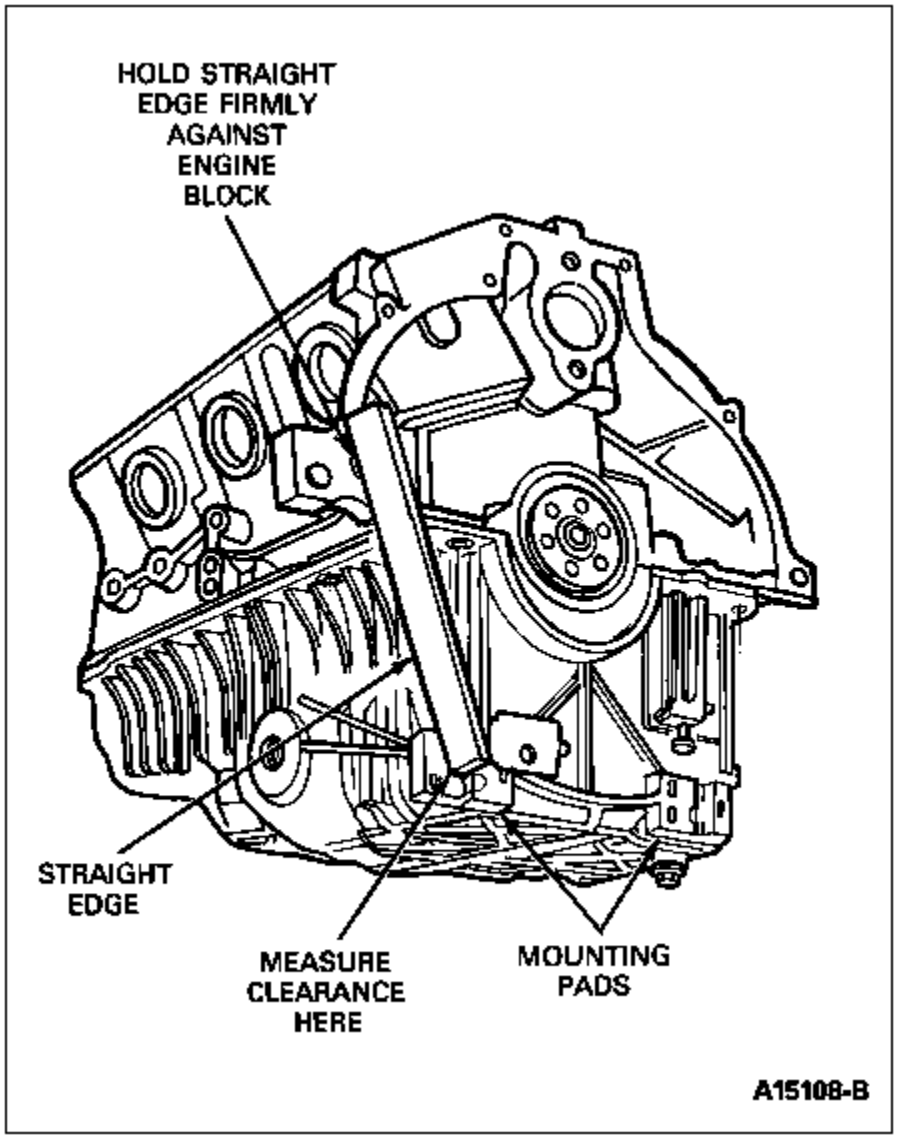
    NOTE: The transmission bolts to the engine and oil pan when installed, so it is important to measure the gap between the surface of the rear face of the oil pan (at the spacer locations) and the rear face of the cylinder blocks. Refer to the following procedure for checking this

tomsn048@gmail.com

dimension.

Determine if oil pan spacers will be required at installation.

a. With the oil pan installed on the engine, position straightedge D83L-4201-A or equivalent flat on the rear of the cylinder blocks (as shown) so that it extends over one of the oil pan/transmission bolt mounting pads.



b. Using Feeler Gauge D81L-4201-A or equivalent, measure the gap between the mounting pad and the straightedge. Repeat the procedure for the other mounting pad. Select oil pan spacer of the required thickness from the chart.
c. Install the selected oil pan spacer to the mounting pads on the rear of the oil pan before bolting the engine and transmission together.

24. Remove engine from stand and install as outlined in this section.

SPACER SELECTION CHART

tomsn048@gmail.com

Measured Gap		Spacer Required		
mm	Inch	mm	Inch	Shim Color Code
0.0-0.254	0.0-0.010	None	None	—

Engine Assembly, Ranger

SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
Fan Clutch Nut Wrench	T84T-6312-D
Fan Clutch Holding Tool	T84T-6312-C

WARNING: RESIDUAL PRESSURE REMAINS IN FUEL SYSTEM AFTER ENGINE IS SHUT OFF. THIS COULD RESULT IN INJURY WHEN FUEL LINES ARE DISCONNECTED. DISCONNECT INERTIA FUEL SHUTOFF SWITCH AND CRANK ENGINE UNTIL FUEL IN LINES IS USED UP. REFER TO SECTION 03-04C.

NOTE: It is not necessary to remove upper intake manifold for engine removal.

Removal

1. Disconnect the battery ground cable (14301) and drain the cooling system.
2. Using Rotunda 023-0100 Refrigerant Reclaim System or equivalent, drain air conditioning system, if equipped.
3. Remove the hood (16612).
4. Remove the accelerator control splash shield (9E766) and air cleaner outlet tube (9B659).
5. Remove the upper radiator hose (8260) and lower radiator hose (8286).
6. Remove the fan shroud attaching bolts and position the shroud over the fan blade (8600). Disconnect radiator overflow hose (8075). Remove radiator bolts and remove radiator (8005). Lift fan shroud (8146) off of fan blade.
7. Using Fan Clutch Nut Wrench T84T-6312-D and Fan Clutch Holding Tool T84T-6312-C, remove fan blade. Using wrench, lift drive belt tensioner pulley (6B217) and remove drive belt (8620).
8. Recover refrigerant from air conditioning system. Refer to Section 12-00 .
9. Disconnect air conditioning manifold tube assembly from A/C compressor (19703). Disconnect compressor electrical connector.
10. Remove A/C compressor mounting bracket (2882) and brace and set aside. It is not necessary to disconnect power steering return hose (3A713) and power steering pressure hose (3A719).
11. Using door trim tool, remove connector from generator mounting bracket (10153). Remove clip from engine control sensor wiring (12A581) and generator mounting bracket.

tomsn048@gmail.com

12. Disconnect generator (GEN) (10300). Remove bolts and generator mounting bracket with attached generator and set aside.

13. Disconnect the manifold tube assembly at the intake manifold (9424) and water pump (8501).

14. Remove the ground wires from the cylinder block and wire from air conditioning pressure switch.

15. Disconnect accelerator cable (9A758) and kickdown control shaft rod (7A187) and remove throttle cable bracket.

16. Tag and disconnect vacuum lines from rear of engine, throttle body (9E926), and intake manifold.

17. Remove air conditioning manifold tube assembly bolt from upper intake manifold, disconnect lines from suction accumulator/drier (19C836) and A/C condenser core (19712), and remove.

18. Disconnect the fuel tank-to-fuel rail fuel lines at the fuel rail. Refer to Section 03-04C .

19. For California Ranger, disconnect the engine wiring harness connector at the CID sensor.

20. Tag and disconnect remaining vacuum line and electrical connectors.

21. Disconnect heated oxygen sensor (HO2S) (9F472).

22. Remove two top transmission-to-engine bolts and oil filler tube (7A228).

23. Raise the vehicle and secure with safety stands.

24. Disconnect the exhaust inlet pipes (5246) at the exhaust manifolds.

25. Disconnect the battery to starter relay cable (14300) and remove the starter motor (11001).

26. If vehicle has an automatic transmission (7003), remove flex plate-to-torque converter nuts through starter opening.

27. **NOTE: It is not necessary to disconnect the clutch hydraulic line for engine removal on manual transmission vehicles.**

    Remove the converter housing-to-cylinder block bolts and the adapter plate-to-converter housing bolt.

28. Partially lower the vehicle.

29. Remove battery cable bracket bolt and wire harness-to-engine clip.

30. On automatic transmission vehicles, remove transmission line bracket-to-engine bolts.

31. Install lifting brackets on the exhaust manifolds. Attach Rotunda Engine Lifting Sling 014-00036 or equivalent.

32. Position a jack under the transmission.

33. Raise the engine (6007) slightly and carefully pull it from the transmission. Carefully lift the engine out of the engine compartment so that the rear cover plate is not bent, or components damaged. Install the engine on a work stand.

tomsn048@gmail.com

Installation

1. **NOTE: To facilitate engine-to-transmission installation and prevent clutch hub damage on manual transmission vehicles, make two guide studs by cutting the heads off two M10 x 70mm bolts and grinding a screwdriver slot in each bolt on the unthreaded end.**

   Install two studs into opposite engine-to-transmission bolt holes in engine to simplify installation.

2. Attach Rotunda Engine Lifting Sling 014-00036 or equivalent and hoist to lifting brackets at exhaust manifolds. Remove engine from work stand.

3. Lower the engine carefully into the engine compartment. Make sure exhaust manifolds are properly aligned with the exhaust inlet pipes.

4. Remove transmission jack and lifting equipment from engine.

5. Install transmission-to-engine bolts finger-tight and remove guide studs and install those two bolts finger-tight.

6. Position transmission-to-engine bracket and finish installing transmission-to-engine bolts and tighten to 38-51 Nm (28-38 lb-ft).

7. Install flexplate-to-torque converter nuts and tighten to 45-61 Nm (33-45 lb-ft).

8. Install starter motor and tighten bolts to 20-27 Nm (15-20 lb-ft). Install starter bracket and tighten to specifications.

9. Route and connect battery cable.

10. Connect the muffler inlet pipes at the exhaust manifolds. Tighten bolts to 37-50 Nm (27-37 lb-ft).

11. Install transmission line bracket bolts and tighten to 16-24 Nm (12-18 lb-ft).

12. Install battery cable bracket bolt and tighten.

13. Install the engine front support nuts and washer to the crossmember or through-bolts.

14. Lower the vehicle.

15. Install ground wires to cylinder block.

16. Route wiring harness through intake manifold.

17. For Ranger, connect the engine wiring harness connector to the CID sensor.

18. Connect air conditioner manifold tube assembly to condenser A/C condenser core and suction accumulator/drier and install bolt attaching it to upper intake manifold.

19. Install vacuum hoses, PCV hose, and tie strap.

20. Uncap and connect fuel lines as outlined in Section 03-04C .

tomsn048@gmail.com

21. Install accelerator cable bracket (9723) and tighten bolts to 21-27 Nm (15-20 lb-ft).

22. Install A/C compressor mounting bracket and brace with assembled power steering pump (3A674) and A/C compressor. Tighten screws to 40-55 Nm (30-40 lb-ft).

23. Plug in compressor electrical connections.

24. Install warm air duct.

25. Connect heater water hose (18472) to water pump and other electrical and vacuum connections.

26. Install generator mounting bracket with assembled generator. Tighten bolts to 40-55 Nm (30-40 lb-ft).

27. Connect heater water hose to engine. Clip engine control sensor wiring to side of generator mounting bracket.

28. Install drive belt over pulleys. Make sure that all V-grooves make proper contact with pulleys.

29. Lift tensioner and slide belt under tensioner pulley. Release drive belt tensioner (6B209) to rest on belt.

30. Install air cleaner outlet tube, accelerator control splash shield, and radiator overflow hose.

31. Fill and bleed the cooling system. Refer to Section 03-03 . Fill the crankcase with the proper grade and quantity of oil.

32. **NOTE: When the battery has been disconnected and reconnected, some abnormal drive symptoms may occur while the powertrain control module (PCM) (12A650) relearns its adaptive strategy. The vehicle may need to be driven 16 km (10 miles) or more to relearn the strategy.**

    Connect battery ground cable.

33. Charge air conditioning system, if so equipped as outlined in Section 12-00 .

34. Operate the engine at fast idle until it reaches normal operating temperature and check all gaskets and hose connections for leaks.

35. Install and adjust the hood.

---

tomsn048@gmail.com

tomsn048@gmail.com

Engine Assembly, Aerostar

Removal

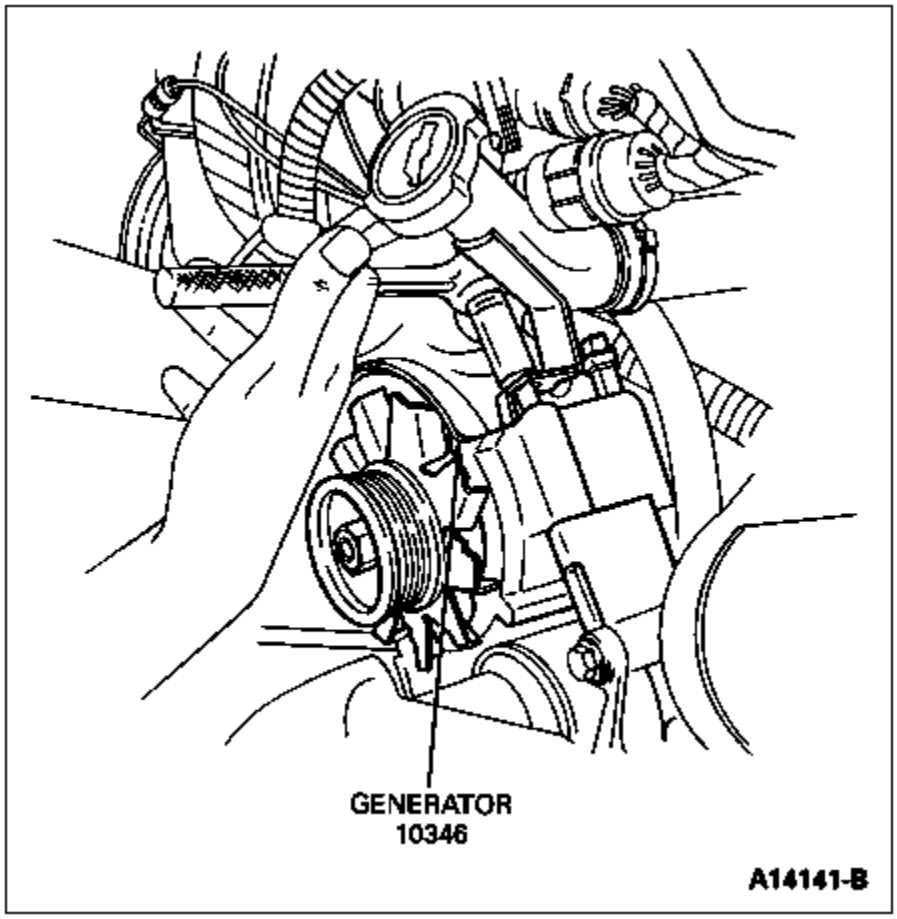
1. **NOTE: The engine assembly on Aerostar E4WD vehicles can be removed through the front of the engine compartment without the transmission (7003) attached.**

   WARNING: RESIDUAL PRESSURE REMAINS IN FUEL SYSTEM AFTER ENGINE IS SHUT OFF. THIS COULD RESULT IN INJURY OR FIRE WHEN FUEL LINES ARE DISCONNECTED. DISCONNECT INERTIA FUEL SHUTOFF SWITCH AND CRANK ENGINE UNTIL FUEL IN LINES IS USED UP. REFER TO SECTION 03-04C.

   Open the hood (16612) and disconnect the battery negative cable.

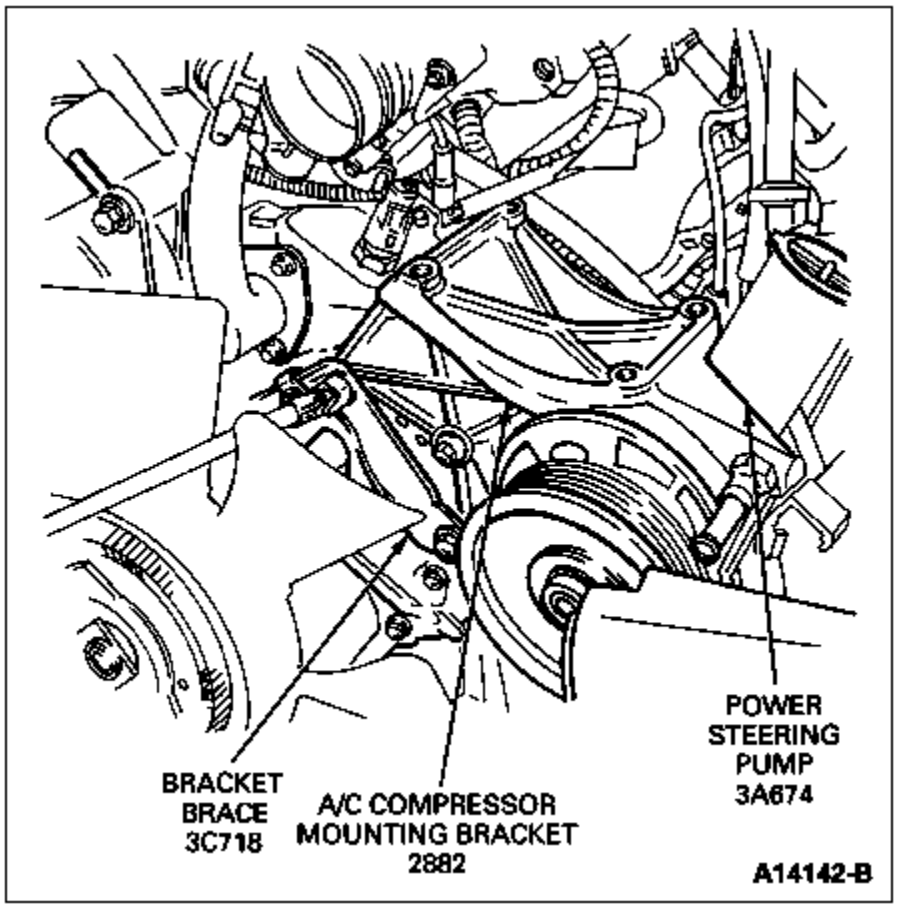
2. Recover refrigerant from air conditioning system. Refer to Section 12-00 .
3. Remove the radiator grille (8200) and inside engine cover.
4. Remove the air cleaner outlet tube (9B659) and the engine air cleaner (ACL) (9600).
5. Disconnect and remove the A/C condenser core (19712) (if so equipped) as detailed in Section 12-03A .
6. Position a drain pan under the oil pan (6675) and drain the engine oil.
7. Position a drain pan, disconnect and remove the power steering return hose (3A713).
8. Remove the front bumper (17757).
9. Position a drain pan, disconnect and remove the transmission fluid cooler (7A095).
10. Drain the radiator (8005) and remove the upper radiator hose (8260) and lower radiator hose (8286).
11. Disconnect the fluid cooler inlet tube (7A030) and fluid cooler tube (7A031) from the radiator.
12. Disconnect the fan shroud (8146) and position it over the fan blade (8600).
13. Remove the radiator.
14. Using a wrench, lift drive belt tensioner pulley (6B217) and remove the drive belt (8620).
15. Remove the radiator air deflector (8327).
16. Remove the hood and the center hood latch support.
17. Disconnect and remove the generator (GEN) (10346).

tomsn048@gmail.com



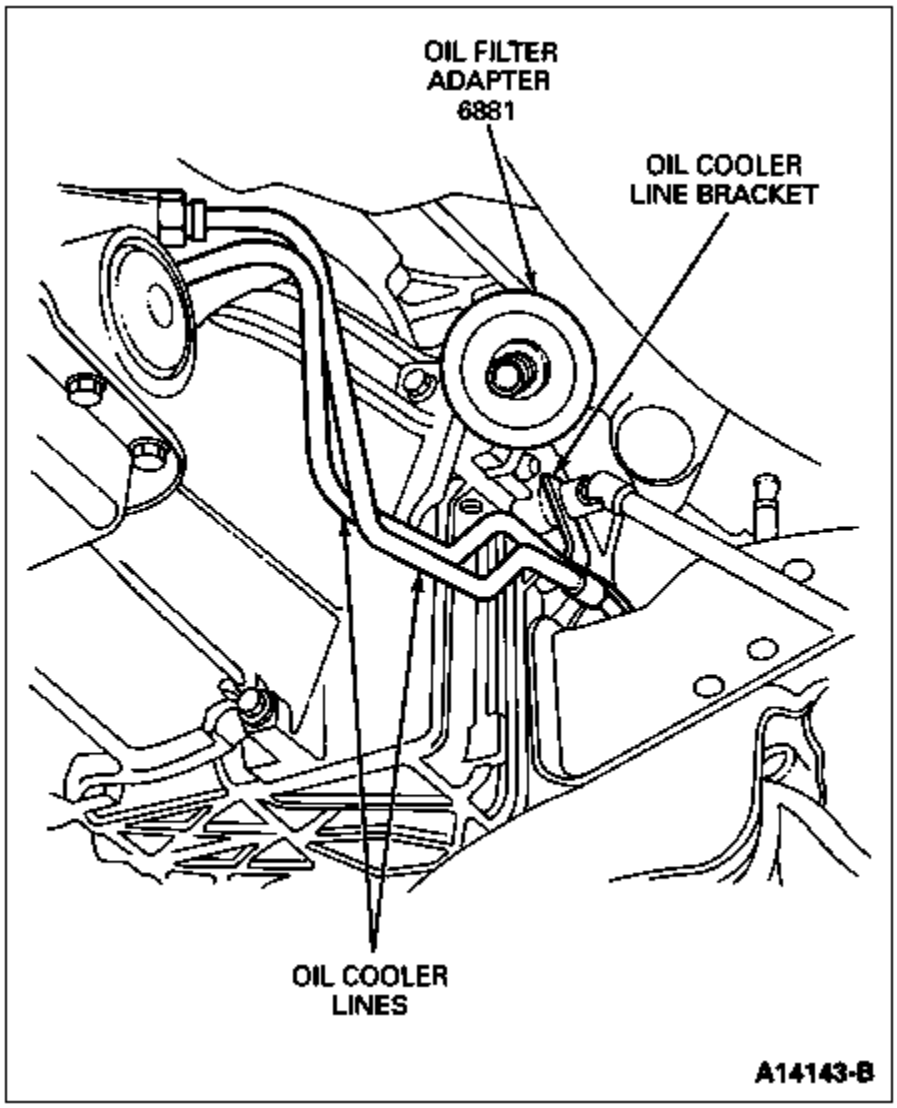
18. Disconnect and remove the A/C compressor (if so equipped) as detailed in Section 12-03A .
19. Remove the oil fill pipe (6A868).
20. From inside the vehicle, remove the engine cover.
21. Remove the accelerator control splash shield (9E766).
22. At the power steering pump (3A674), remove the power steering pressure hose (3A719) and power steering return hoses.
23. Remove the power steering pump and A/C compressor mounting bracket (2882).

tomsn048@gmail.com



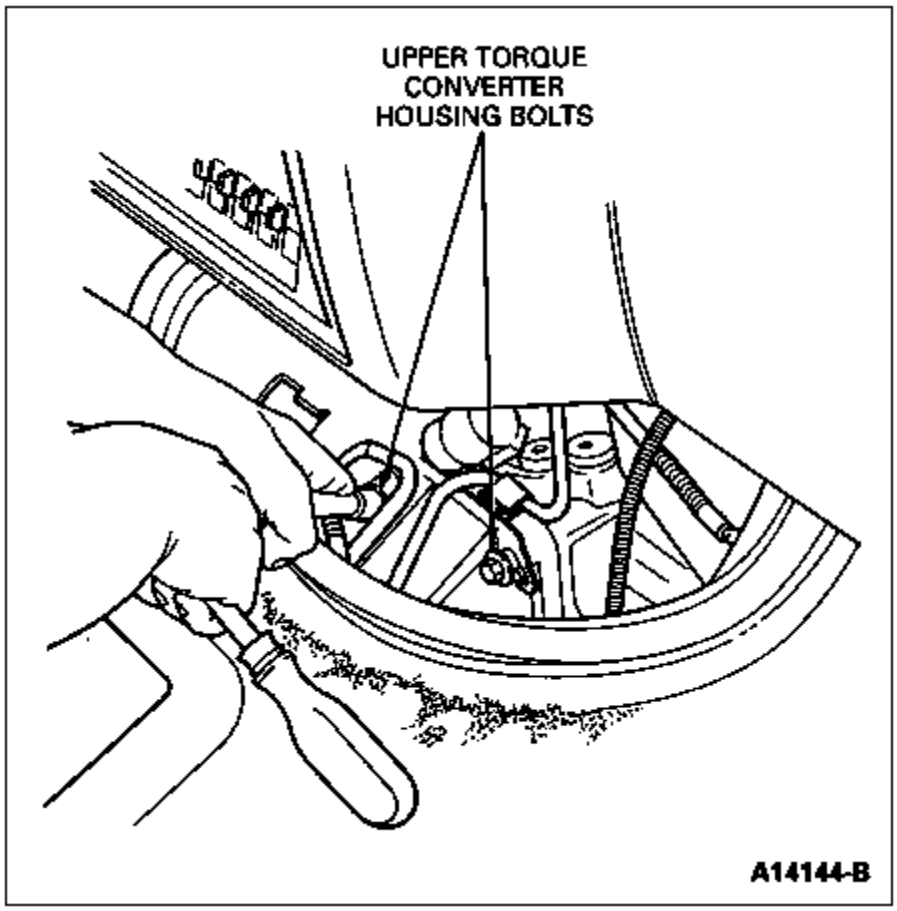
24. Remove the transmission oil filler tube (7A228) and fluid level indicator (7A020).
25. Remove the engine oil level dipstick (6750) and oil level indicator tube (6754).
26. Disconnect the dual converter Y pipe (5F250) from the exhaust manifolds (9430).
27. Disconnect and remove the starter motor (11001).
28. Remove the converter-to-flywheel bolts through the starter motor opening in the converter housing.
29. Remove the transmission oil cooler line bracket retaining bolt.

tomsn048@gmail.com



30. Remove the engine mount to frame bolts (left and right sides).
31. Remove the torque converter housing to engine bolts, except the upper bolts.
32. Remove the left front engine support insulator (6038) from the engine.
33. Remove the upper torque converter housing bolts.

tomsn048@gmail.com



34. Disconnect the transmission and transfer case electrical connectors.

35. Using Disconnect Tools D87L-9280-A and D87L-9280-B, disconnect the fuel supply and return lines where the engine supply and return tubes connect to the chassis fuel lines to the left of the engine near the frame. Refer to Section 03-04C .

36. Disconnect the accelerator cable (9A758) and accelerator cable bracket (9723) and position aside.

37. Disconnect the upper and lower heater water hoses (18472).

38. Disconnect the engine vacuum lines from the evaporative emissions canister (EVAP canister) (9D653), lower intake manifold and the upper intake manifold vacuum outlet fitting and cap.

39. Remove the spark plug wires from the ignition coil (12029) assembly and disconnect and remove the ignition coil assembly, with ignition coil mounting strap (12043).

40. Disconnect the electrical connector from the throttle body throttle position sensor (TP sensor) (9B989).

41. Remove the throttle body (9E926) and upper intake manifold as an assembly.

42. Disconnect the fuel charging wiring connectors at both left front and right rear of engine.

43. Install engine lifting brackets on the right front and left rear of the engine (6007) and remove from the vehicle.

tomsn048@gmail.com

Installation

NOTE: To facilitate engine-to-transmission installation and prevent clutch hub damage on manual transmission vehicles, make two guide studs by cutting the heads off two M10 x 70mm bolts and grinding a screwdriver slot in the end of each bolt on the unthreaded end.

1. **WARNING: DO NOT OPERATE ENGINE WITH HOOD OPEN UNTIL FAN HAS BEEN FIRST CHECKED FOR POSSIBLE CRACKS AND SEPARATION.**

   Position the engine in the vehicle and remove the engine lifting brackets.

2. Connect the fuel charging wiring main connectors.

3. Install the throttle body and upper intake manifold.

4. Install the ignition coil and ignition coil mounting strap, and connect the spark plug wires and the coil assembly wiring connector.

5. Connect the electrical connector for the throttle position sensor.

6. Connect the upper and lower heater water hoses.

7. Connect the engine vacuum lines to the evaporative emissions canister, lower intake manifold and the upper intake manifold vacuum outlet fitting and cap.

8. Connect the accelerator cable and accelerator cable bracket.

9. Connect the fuel supply and return lines where engine supply and return tubes connect to the chassis fuel lines to the left of the engine near the frame.

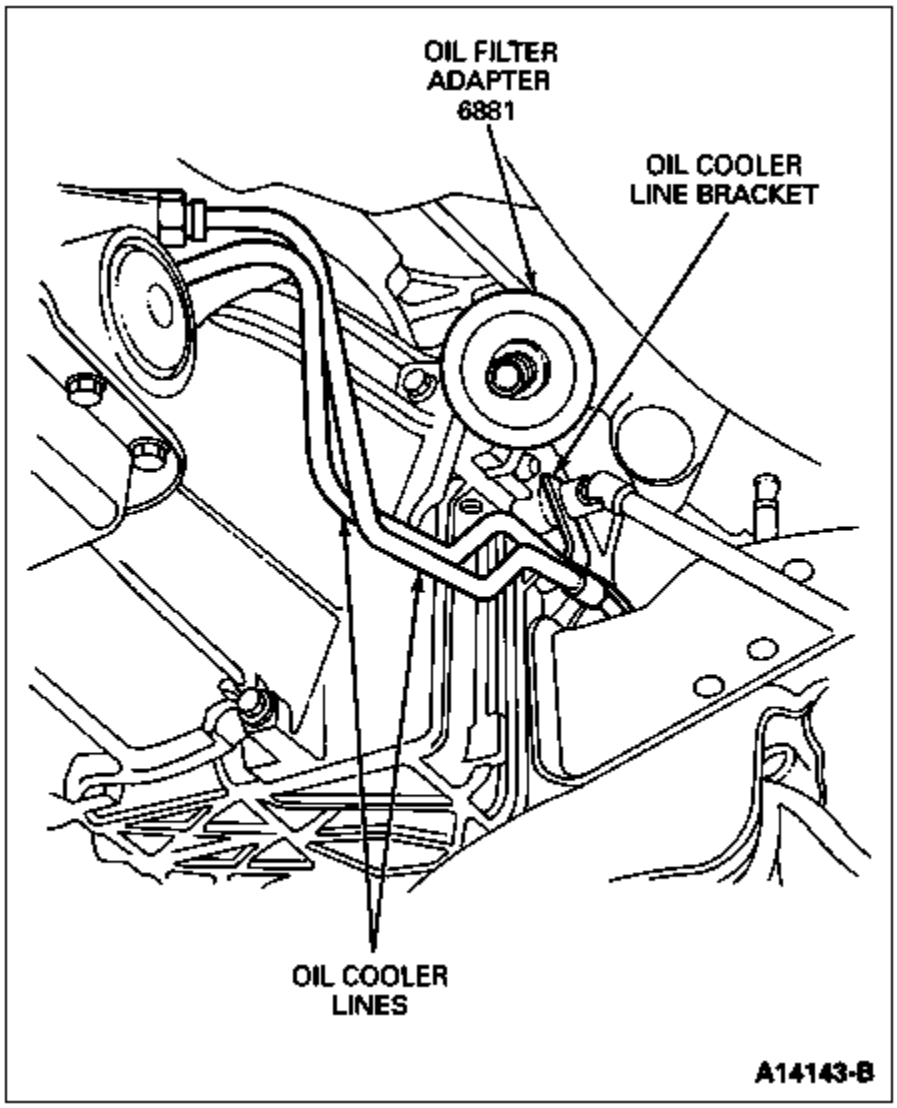
10. Install the left front engine support insulator.

11. Install the converter housing to engine bolts. Connect the transmission electrical connectors.

12. Install the engine mount to frame bolts (left and right sides).

13. Install the transmission oil cooler line bracket retaining bolt.

tomsn048@gmail.com



14. Through the starter motor opening in the converter housing, install the converter-to-flywheel bolts.

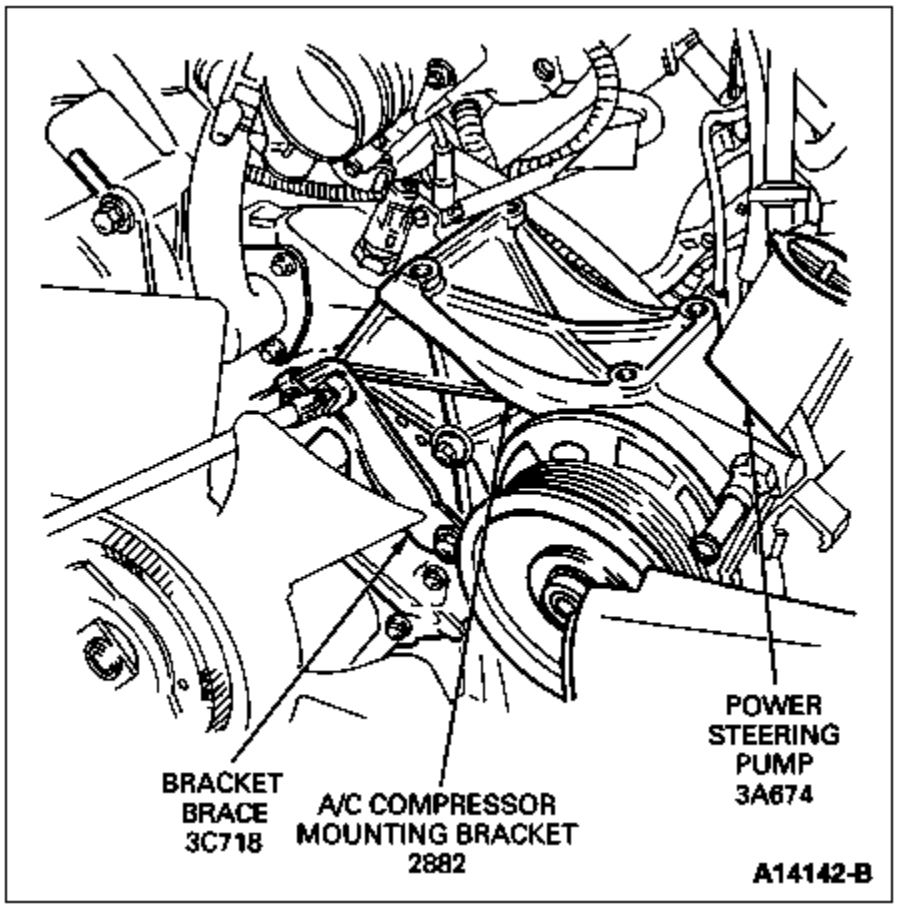
15. Install the starter motor and connect the starter motor wires. Connect the exhaust system to the manifolds.

16. Install the transmission oil filler tube and fluid level indicator.

17. Install the engine oil level dipstick and oil level indicator tube.

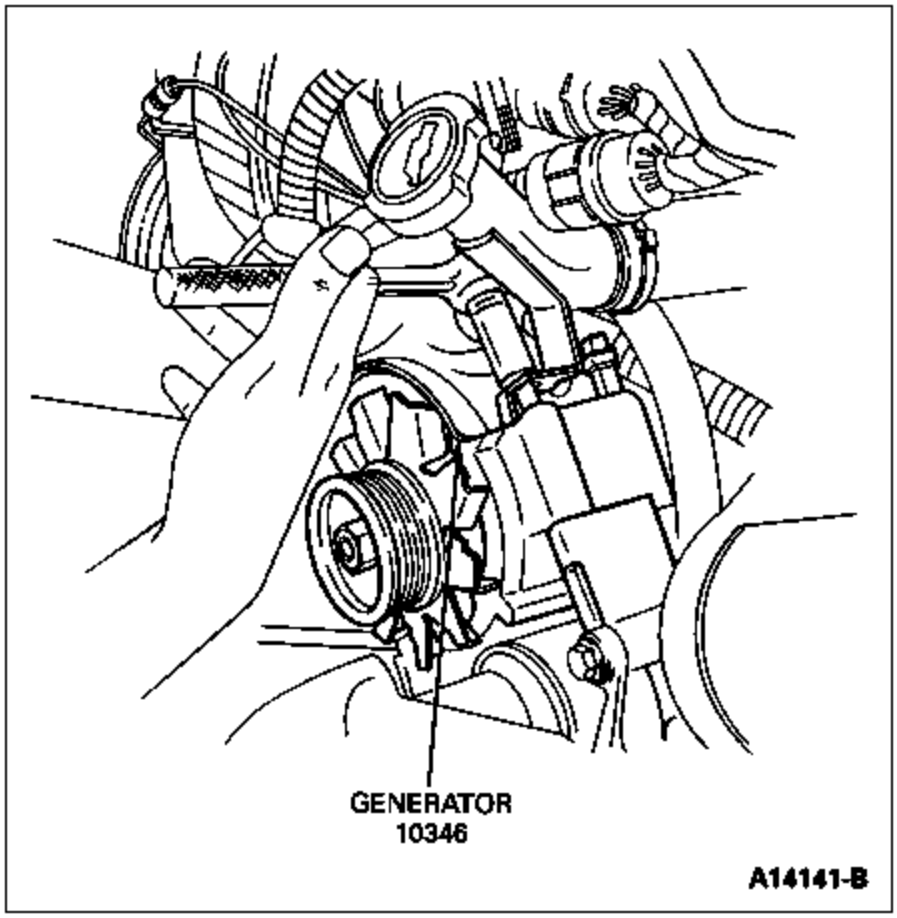
18. Install the power steering pump and A/C compressor mounting bracket.

tomsn048@gmail.com



19. Install the power steering pressure hose and power steering return hose at the power steering pump.
20. Install the accelerator control splash shield.
21. Install the engine oil fill pipe (6763).
22. From inside the vehicle, install the engine cover.
23. Install and connect the A/C compressor (19703) (if so equipped) as detailed in Section 12-03A .
24. Install and connect the generator.

tomsn048@gmail.com



25. Install the hood and center hood latch support.
26. Install the right front radiator air deflector.
27. Install drive belt.
28. Install the radiator.
29. Install the radiator fan shroud.
30. Connect the fluid cooler inlet tube and oil cooler outlet tube at the radiator.
31. Install the upper radiator hose and lower radiator hose, fill and bleed the cooling system.
32. Install the transmission fluid cooler.
33. Install the front bumper.
34. Install and connect the power steering return hose.
35. Refill the engine with the recommended quantity and quality of engine oil.
36. Install and connect the A/C condenser core (if so equipped) as detailed in Section 12-03A .

tomsn048@gmail.com

37. Install the engine air cleaner and air tube.

38. Install the radiator grille and inside engine cover.

39. **NOTE: When the battery has been disconnected and reconnected, some abnormal drive symptoms may occur while the powertrain control module (PCM) (12A650) relearns its adaptive strategy. The vehicle may need to be driven 16 km (10 miles) or more to relearn the strategy.**

    Connect the battery ground cable (14301).

40. Recharge air conditioning as outlined in Section 12-00 .

41. Start engine and check for leaks.

---

tomsn048@gmail.com

Crankshaft

Removal

1. Remove engine (6007) from vehicle and place on a work stand.
2. Remove oil pan (6675) and oil pan gasket (6710) as outlined in this section.
3. Remove engine front cover (6019) assembly as outlined in this section.
4. Remove timing chain/belt (6268), camshaft sprocket (6256) and crankshaft sprocket (6306).
5. Invert engine on the work stand. Remove flywheel (6375). Remove oil pump screen cover and tube (6622) and oil pump (6600).
6. Make sure all bearing caps (main and connecting rod) are marked so they can be installed in their original positions. Turn crankshaft (6303) until connecting rod (6200) from which the cap is being removed is up. Remove connecting rod cap. Push connecting rod and piston assembly up in the cylinder. Repeat procedure for the remaining connecting rod assemblies.
7. Remove main bearing caps.
8. **CAUTION: Handle the crankshaft with care to avoid possible fracture or damage to the finished surfaces.**

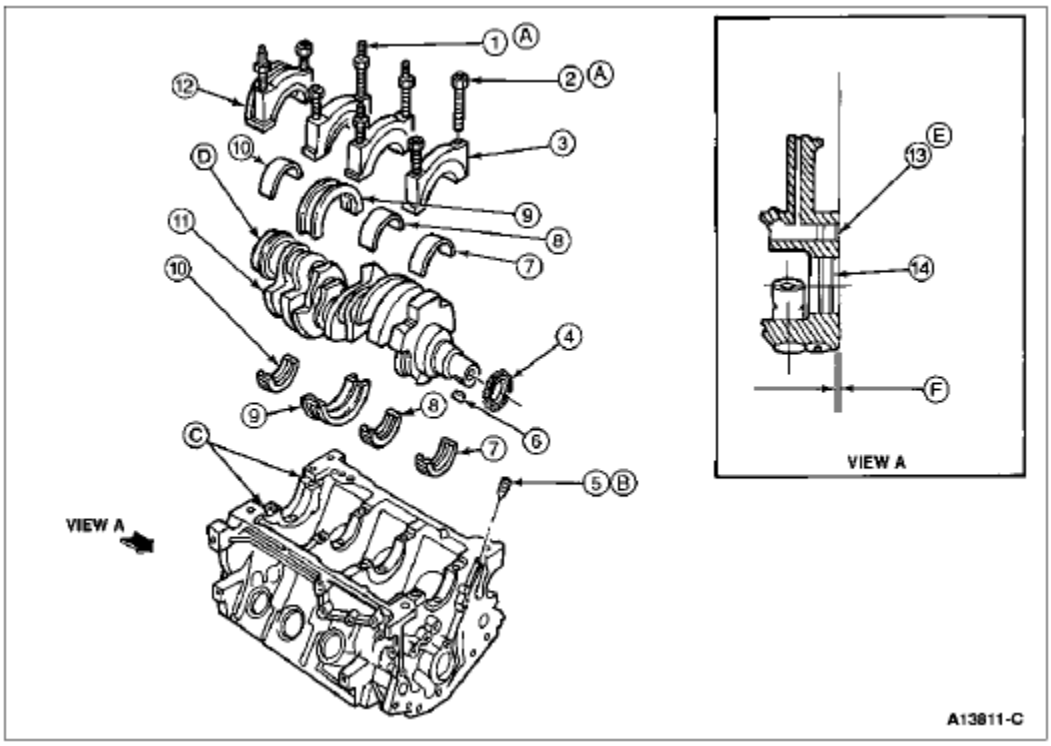
   Lift the crankshaft carefully out of the block so that the upper thrust bearing surfaces are not damaged.

Installation

NOTE: If bearings are to be reused, they should be identified to make sure that they are installed in their original positions.

Crankshaft Assembly, Installation

tomsn048@gmail.com



Item	Part Number	Description
1	6345	Stud, Main Bearing Cap (4 Places)
2	6345	Bolt, Main Bearing Cap (4 Places)
3	—	Main Bearing Cap (Part of 6010)
4	6306	Crankshaft Sprocket
5	6026	Oil Gallery Plug
6	375055-GS	Key
7	6333	Crankshaft Main Bearing (No. 1)
8	6333	Crankshaft Main Bearing (No. 2)
9	6337	Crankshaft Thrust Main Bearing (No. 3 Main Bearing)
10	6333	Crankshaft Main Bearing (No. 4)
11	6303	Crankshaft
12	—	Rear Main Bearing Cap (Part of 6010)
13	87837-5	Oil Gallery Plug
14	6266	Camshaft Rear Bearing Cover
A	—	Tighten to 90-104 Nm (66-77 Lb-Ft)

tomsn048@gmail.com

B	—	Tighten to 6-12 Nm (4-9 Lb-Ft)
C	—	Seal Here with Silicone Rubber D6AZ-19562-BA or Equivalent Meeting Ford Specifications ESB-M4G92-A and ESE-M4G195-A
D	—	Apply Engine Fill Oil
E	—	Tighten to 27-37 Nm (20-27 Lb-Ft)
F	—	Flush or Maximum to Chamfer

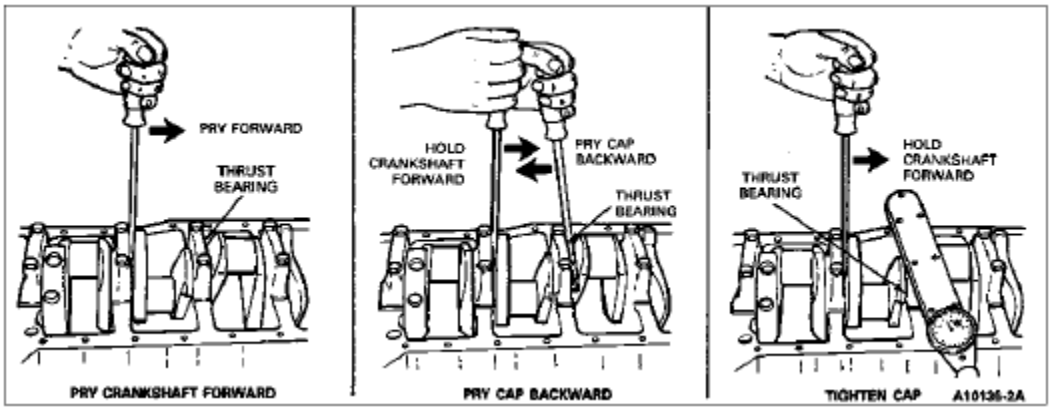
1. Remove crankshaft main bearings (6333) from cylinder blocks (6010) and bearing caps.
2. Remove connecting rod bearing (6211) from the connecting rod and caps.
3. Inspect all machined surfaces on the crankshaft for nicks, scratches, scores, etc., which could cause premature bearing wear. Lightly stone all such surfaces.
4. **CAUTION: Make sure crankshaft main bearings and bearing bores are clean. Foreign material under the inserts will distort the crankshaft main bearing and cause a failure.**

   If the crankshaft main bearing journals have been refinished to a definite undersize, install the correct undersize crankshaft main bearings.
5. Place upper main bearing inserts in position in the bores with the tang fitted in the slot provided.
6. Install lower main bearing inserts in bearing caps.
7. Carefully lower crankshaft into place.
8. Check the clearance of each crankshaft main bearing. Select fit the crankshaft main bearings for proper clearance. Refer to Section 03-00 .
9. **NOTE: Make sure that the main bearing caps are installed in their original positions and orientation.**

   Apply a light coat of SAE 50 Service SG meeting Ford specification ESE-M2C39-F oil, to the journals and bearings, and rear seal surface. Install all bearing caps.
10. Lubricate the journal with engine oil and install the thrust bearing cap with the bolts finger-tight. Pry the crankshaft forward against the thrust surface of the upper half of the bearing. Hold the crankshaft cap to the rear. This will align the thrust surfaces of both halves of the bearing. Retain the forward pressure on the crankshaft. Tighten the cap bolts to 90-104 Nm (66-77 lb-ft).

Thrust Bearing Cap, Installation

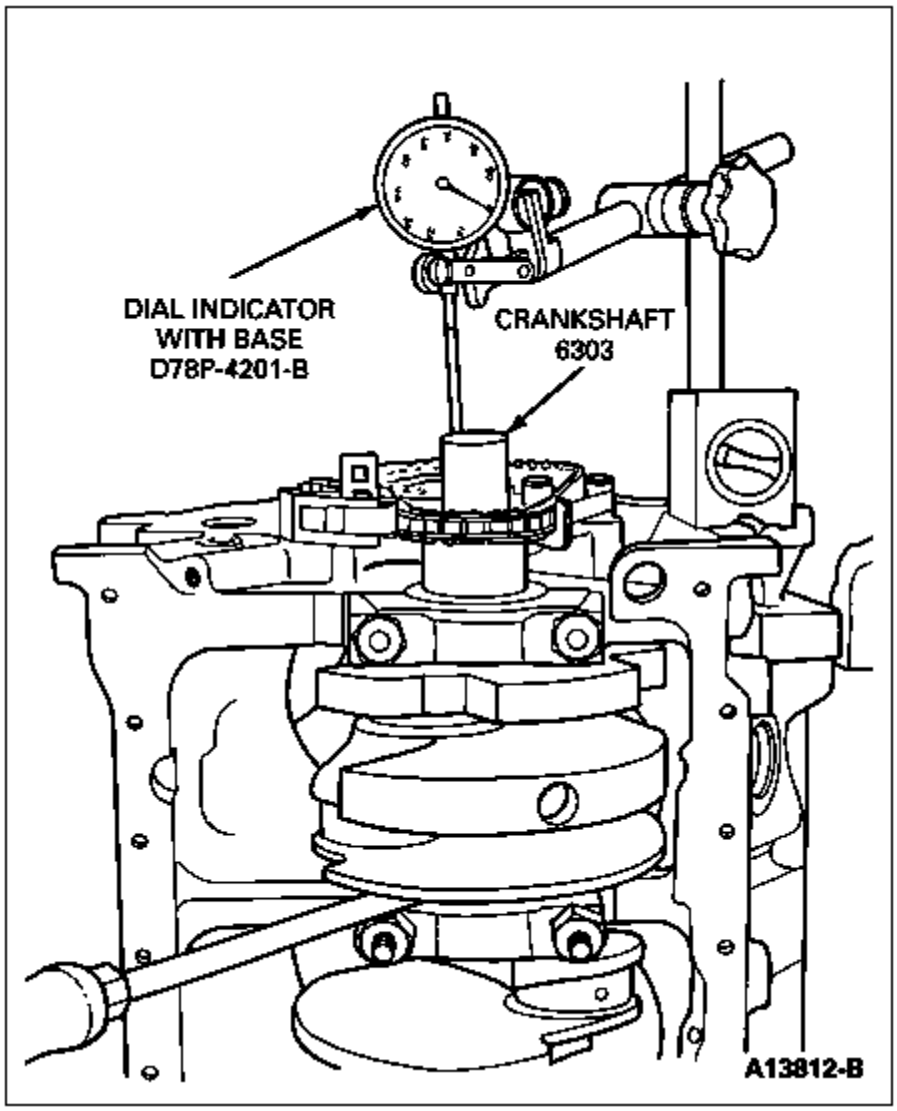
tomsn048@gmail.com



11. Check crankshaft end play as outlined in Section 03-00 . End play should be 0.05-0.32mm (0.002-0.0125 inch).

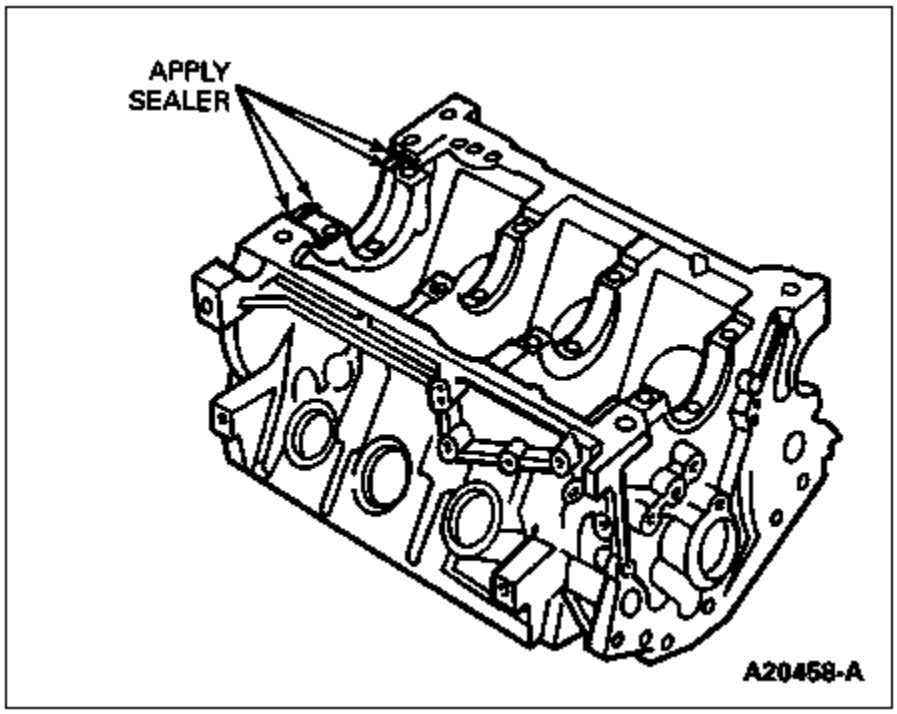
12. If end play exceeds specification, replace upper and lower thrust bearings. If the end play is less than specification, inspect thrust bearing faces for damage, dirt or improper alignment. Install thrust bearing and align the faces. Recheck end play.

tomsn048@gmail.com



Cylinder Block Sealer Application

tomsn048@gmail.com



13. Seal and assemble the rear main cap to the cylinder block.

    a. Clean all oil off of rear main bearing cap and block mating surface using Extra Strength Spot and Stain Remover, B7A-19521-AA or equivalent meeting Ford specification ESR-M5B197-A.
    b. Place a bead of Gasket Eliminator E1FZ-19562-A or Loctite® 515 sealer or equivalent meeting Ford specification WSK-M2G348-A4 to the block along the corners of the rear main bearing cap joint area and on the joint face, approximately 13mm (1/2 inch) from the rear of the cylinder blocks as illustrated.
    c. **NOTE: New bolts must be used during assembly.**

       Verify that the lower rear main bearing insert is in place. Install the rear main bearing cap and snug the bolts.
    d. Align the rear main bearing cap to block by moving the bearing fore or aft (approximately 13mm [1/2 inch] inward in the rear oil seal bore) so that the rear seal stop of the block and cap line up. This will ensure that the rear main oil seal will seat squarely when installed in the bore.
    e. Torque the rear main cap bolts to 90-104 Nm (66-77 lb-ft).
    f. Fill the cavities on both sides of the rear main cap with Gasket Eliminator E1FZ-19562-A or Loctite® 515 sealer or equivalent meeting Ford specification WSK-M2G348-A4.

14. Install crankshaft rear oil seal as outlined in this section.

15. Install new connecting rod bearings in the connecting rods and caps. Check the clearance of each bearing. Refer to Section 03-00 .

16. Check clearances for each connecting rod bearing as outlined in Section 03-00 .

17. If bearing clearances are to specification, apply a light coat of SAE 50 Service SG oil to the connecting rod journals and bearings.

18. Turn the crankshaft throw to the bottom of the stroke. Push the piston (6108) all the way down until the connecting rod bearings seat on the crankshaft journal.

tomsn048@gmail.com

19. Install connecting rod cap.

20. After piston and connecting rod assemblies have been installed, check connecting rod side clearance.

21. Turn engine on the work stand so that the front end is up. Install timing chain/belt, camshaft sprockets, crankshaft sprocket, engine front cover, crankshaft front seal (6700) and crankshaft vibration damper and pulley (6B321) as outlined in this section.

    Turn engine on the work stand so that the rear end is up. Install rear oil seal as outlined in this section.

22. Clean oil pan, oil pump and oil pump screen cover and tube assembly.

23. Prime oil pump by filling the inlet opening with XO-5W30-QSP meeting Ford specification ESE-M2C153-E or SAE 5W-30 Service SG oil and rotating the pump shaft until oil emerges from the outlet opening. Install oil pump, crankshaft oil windage baffle (6L680) and oil pan.

24. Position flywheel on the crankshaft. Tighten according to procedure in this section.

25. Turn engine on the work stand so that the engine is in the normal upright position.

26. Install engine in vehicle.

---

tomsn048@gmail.com

Engine

Removal and Installation

NOTE: 4.0L OHV engines are equipped with a camshaft position sensor (CMP sensor) (12A112) mounted on the camshaft synchronizer (12A362). The camshaft synchronizer replaces the oil pump drive assembly.

tomsn048@gmail.com

Engine

NOTE: The cylinder head (6049)(s) and intake manifold installation procedure has changed. The cylinder head bolts and intake manifold bolts are tightened alternately and in sequence to ensure correct fit and gasket crush. Failure to follow complete sequence will cause follow up repair. Refer to Cylinder Head installation procedure in this section.

NOTE: 4.0L OHV engines are equipped with a camshaft position sensor (CMP sensor) (12A112) mounted on the camshaft synchronizer (12A362). The camshaft synchronizer replaces the oil pump drive assembly. Refer to Section 03-14 for camshaft synchronizer removal and installation.

NOTE: When installing the oil pump (6600) during engine assembly refer to the following illustration.

Disassembly

1. **NOTE: Before starting disassembly, remove all wiring harnesses, emission control system, ignition system, flywheel or flexplate and front end accessory drive components. For more detailed information on any particular system, refer to the specific section in the appropriate repair group.**

   NOTE: All valve train components should be identified to make sure they are installed in their original positions during assembly.

   With the engine (6007) mounted on a work stand: Remove the left and right hand valve covers (6582) as outlined in this section and discard the gaskets.

2. Remove the right exhaust manifold (9430) and left exhaust manifold.

3. Remove the upper intake manifold, the fuel injection supply manifold (9D280), fuel injectors and lower intake manifold as outlined in Section 03-04C and in this section.

4. Remove the bolt and clamp retaining the oil pump drive shaft and remove the oil pump drive shaft.

5. Remove the oil level dipstick (6750) and oil level indicator tube (6754) and remove the oil filter, adapter and oil cooler (if equipped).

6. Remove the rocker arm (6564), rocker arm shaft (6563), rocker arm shaft support (6531), and push rod (6565) as outlined in this section.

7. Remove the cylinder heads as outlined in this section.

8. Remove the crankshaft position sensor (CKP sensor) (6C315), crankshaft vibration damper and pulley (6B321) from the front of the engine as outlined in this section.

9. Remove the oil pan (6675) as outlined in this section and discard the oil pan gasket (6710).

10. Remove the water pump housing gasket (8507) and front cover as an assembly. Discard the gasket and seal.

tomsn048@gmail.com

11. Remove the oil pump, oil pump screen cover and tube (6622), oil pump intermediate shaft (6A618) and crankshaft oil windage baffle (6L680).

12. Remove the crankshaft rear oil seal.

13. Remove the timing chain vibration damper (6284)

14. Remove the camshaft sprocket capscrew and slide the timing chain vibration damper, crankshaft sprocket (6306) and camshaft sprocket (6256) off as an assembly. Remove the timing chain guide (6K297).

15. Remove the camshaft thrust plate (6269) and remove the camshaft (6250).

16. **NOTE: Pistons (6108), connecting rods (6200) and connecting rod bearings (6211) should be numbered to make sure they are assembled in their original positions.**

    NOTE: Before removing pistons, inspect the top of the cylinder bores. If necessary, remove the ridge and/or carbon deposits from each cylinder using Cylinder Ridge Reamer T64L-6011-EA.

    Remove the connecting rod caps and remove the pistons.

17. **CAUTION: When removing the crankshaft (6303), take care not to damage any of the bearing surfaces on the crankshaft.**

    NOTE: The location of the main bearing caps and the crankshaft main bearings (6333) should be identified. When the engine is assembled, crankshaft main bearings which are to be reused should be installed in their original positions.

    Remove the crankshaft main bearing caps, crankshaft main bearings and crankshaft.

18. For cleaning purposes, the oil gallery and coolant drain plugs can be removed.

Assembly

SPECIAL SERVICE TOOL(S) REQUIRED

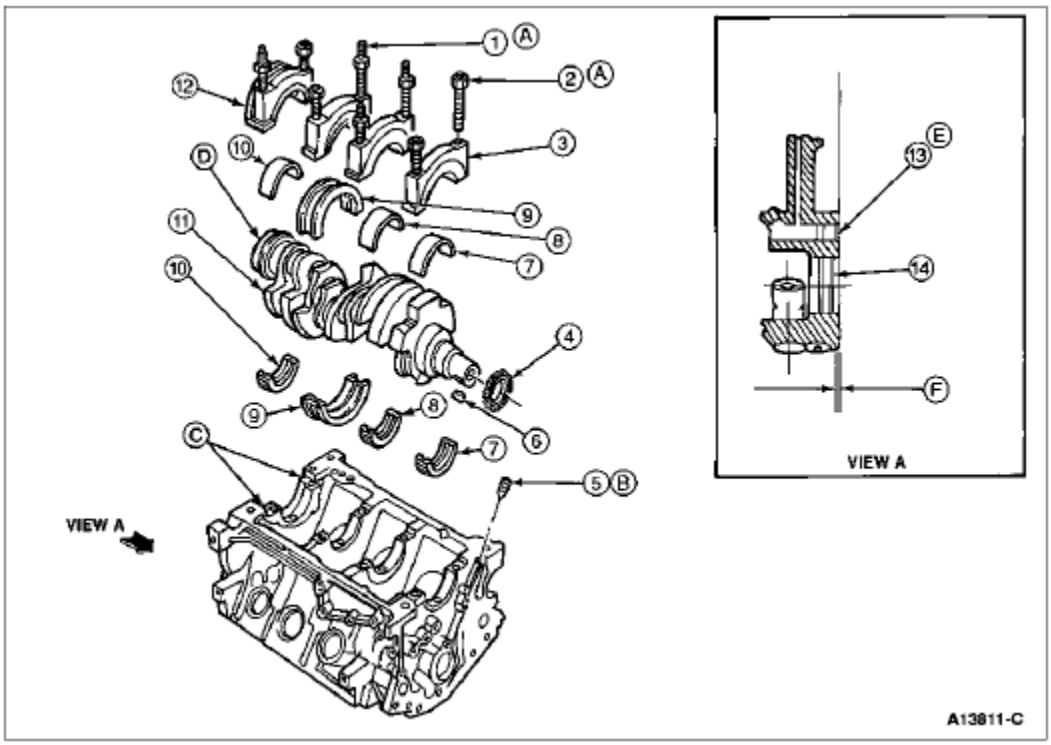
Description	Tool Number
Rear Crankshaft Seal Replacer	T97T-6701-A
Valve Stem Seal Replacer	T90T-6571-A

Before assembling cylinder blocks (6010), all sealing surfaces must be clean and free of chips, dirt, paint, and foreign material. Also, make sure coolant and oil passages are clear.

If new piston rings are to be installed and no visible cross hatch marks remain on the cylinder wall, remove cylinder wall glaze using a spring type tool. Follow instructions of tool manufacturer.

Crankshaft Assembly, Installation

tomsn048@gmail.com



Item	Part Number	Description
1	6345	Stud, Main Bearing Cap (4 Places)
2	6345	Bolt, Main Bearing Cap (4 Places)
3	—	Main Bearing Cap (Part of 6010)
4	6337	Crankshaft Thrust Main Bearing (No. 3 Main Bearing)
5	6333	Crankshaft Main Bearing (No. 2)
6	6306	Crankshaft Sprocket
7	375055-G5	Key
8	6333	Crankshaft Main Bearing (No. 1)
9	6026	Oil Gallery Plug
10	6333	Crankshaft Main Bearing (No. 4)
11	6303	Crankshaft
12	—	Rear Main Bearing Cap (Part of 6010)
13	87837-5	Oil Gallery Plug
14	6266	Camshaft Rear Bearing Cover
A	—	Tighten to 90-104 Nm (66-77 Lb-Ft)
B	—	Tighten to 6-12 Nm

tomsn048@gmail.com

		(4-9 Lb-Ft)
C	—	Seal Here with Silicone Rubber D6AZ-19562-BA or Equivalent Meeting Ford Specifications ESB-M4G92-A and ESE-M4G195-A
D	—	Apply Engine Fill Oil
E	—	Tighten to 27-37 Nm (20-27 Lb-Ft)

1. **CAUTION: Prevent engine contamination. Always use necessary precautions to prevent old sealer or gasket material from falling into the engine.**

   NOTE: Lightly oil all attaching bolt and stud threads before installation, except those specifying special sealant.

   Before beginning to assemble engine:

   a. Clean ALL the oil and the old sealer from the oil pan, taking special care to remove ALL the old sealer from the oil pan gasket groove in the oil pan. Thoroughly wash the oil pan.
   b. Clean ALL the old sealer from the rear main bearing cap USING A SCRAPER AND WIRE WHEEL. The original sealer used during production assembly becomes extremely hard after it has cured. It is extremely important that ALL the old sealer be removed from joint faces and grooves.
   c. Clean ALL the oil and old sealer from the cylinder block oil pan sealing area and the rear main bearing cap joint area.
   d. After all the parts have been cleaned they must be wiped down with a cleaner that leaves no residue or film such as Ford Extra Strength Spot Remover B7A-19521-AA meeting Ford specification ESR-M5B197-A or denatured alcohol.
   e. Clean the transmission bell-housing area and the rear of the cylinder block of ALL oil residue. Verify with a black light that all oil residues have been cleaned from this area.

2. Place crankshaft upper main bearings in position in the bores with the tang fitting in the slot provided. Lubricate bearings with SAE 50 Service SG oil.

3. Install the lower main bearings in the bearing caps.

4. Lower crankshaft into place. Use care to prevent damage to bearing surfaces.

5. Check clearance of each main bearing, following the procedure under Fitting Main and Connecting Rod Bearings in Section 03-00 .

6. After crankshaft main bearings have been fitted, apply SAE 50 Service SG oil to the journals and bearings.

7. **NOTE: Apply Silicone Rubber D6AZ-19562-BA meeting Ford specifications ESB-M4G92 and ESE-M4G195-A or equivalent in a 1.59mm (1/16-inch) bead in each corner of rear main bearing cap saddle, the full length of the saddle.**

   Install all bearings and caps except thrust bearing cap (No. 3 bearing). **MAKE SURE MAIN BEARING CAPS ARE INSTALLED IN THEIR ORIGINAL POSITION.** Tighten bearing caps to 90-104 Nm (66-77 lb-ft).

8. Install thrust bearing cap (No. 3) with bolts finger-tight.

tomsn048@gmail.com

9. Pry crankshaft forward against thrust surface of upper half of bearing.

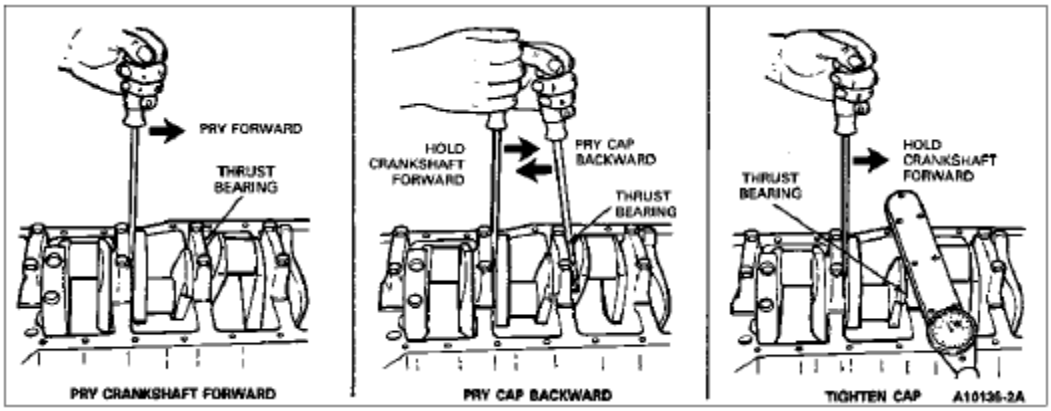
10. Hold crankshaft forward and pry thrust bearing cap to the rear. This will align thrust surfaces of both halves of the bearing.

11. Retain forward pressure on crankshaft. Tighten No. 3 cap bolts to specification.

12. Force crankshaft toward the rear of the engine.

13. Check crankshaft end play. End play should be 0.05-0.32mm (0.002-0.0125 inch). Refer to Section 03-00 .

Thrust Bearing Cap, Installation

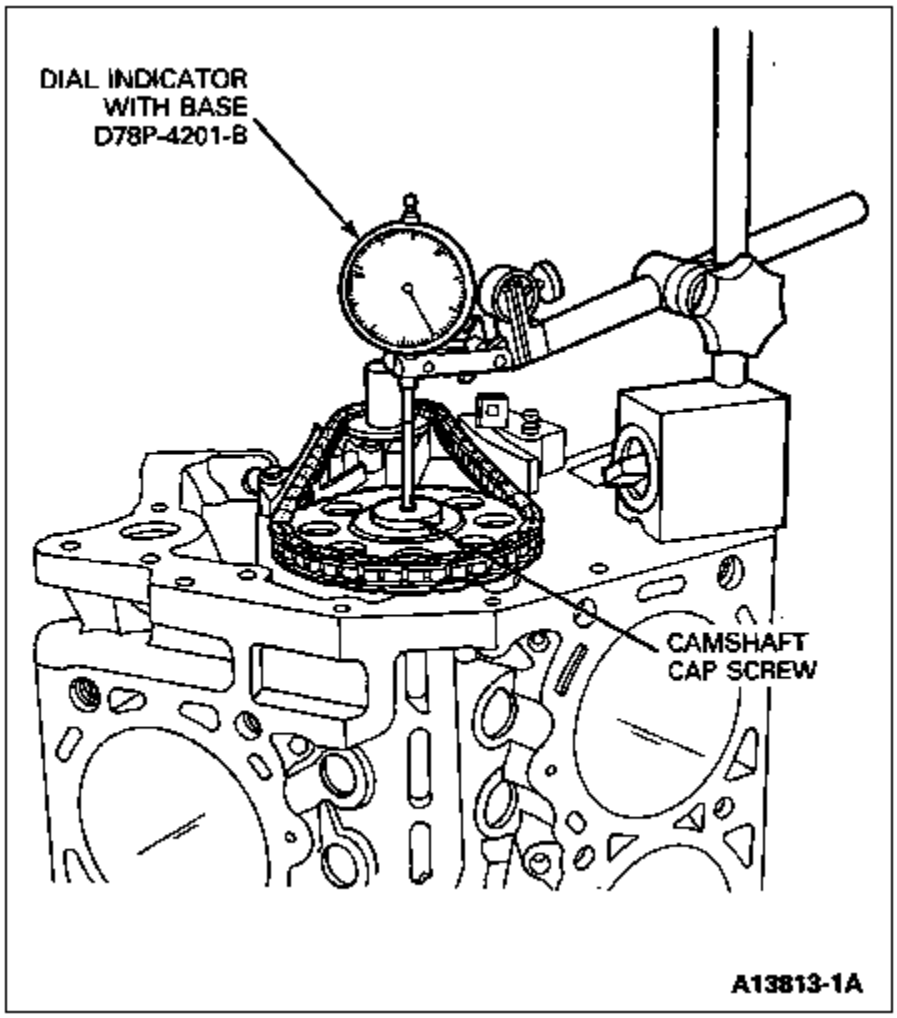


14. Coat all camshaft bearings, camshaft lobes and oil pump drive shaft with SAE 50 Service SG oil.

15. Slide camshaft carefully through camshaft bearings. Install camshaft thrust plate with groove toward cylinder blocks. Tighten thrust plate retaining bolts.

16. Check camshaft end play. Refer to Section 03-00 . If not within specification, replace camshaft thrust plate.

tomsn048@gmail.com



17. Install the timing chain guide with the guide pin in to the oil supply hole. Tighten guide bolts to 10-12 Nm (7-9 lb-ft).

18. Install camshaft sprocket, timing chain/belt (6268) and crankshaft sprocket. Position sprockets and timing chain/belt on camshaft and crankshaft simultaneously.

19. **NOTE: A packaging clip from a new automatic tensioner can be used to hold tensioner in a retracted position. If a packaging clip is not available, fabricate a clip using shop materials.**

    With the timing chain vibration damper held in the retracted position with clip, install the tensioner and tighten the bolts to 9-11 Nm (7-8 lb-ft).

20. Install the camshaft capscrew. Tighten camshaft capscrew to 60-68 Nm (44-50 lb-ft).

tomsn048@gmail.com

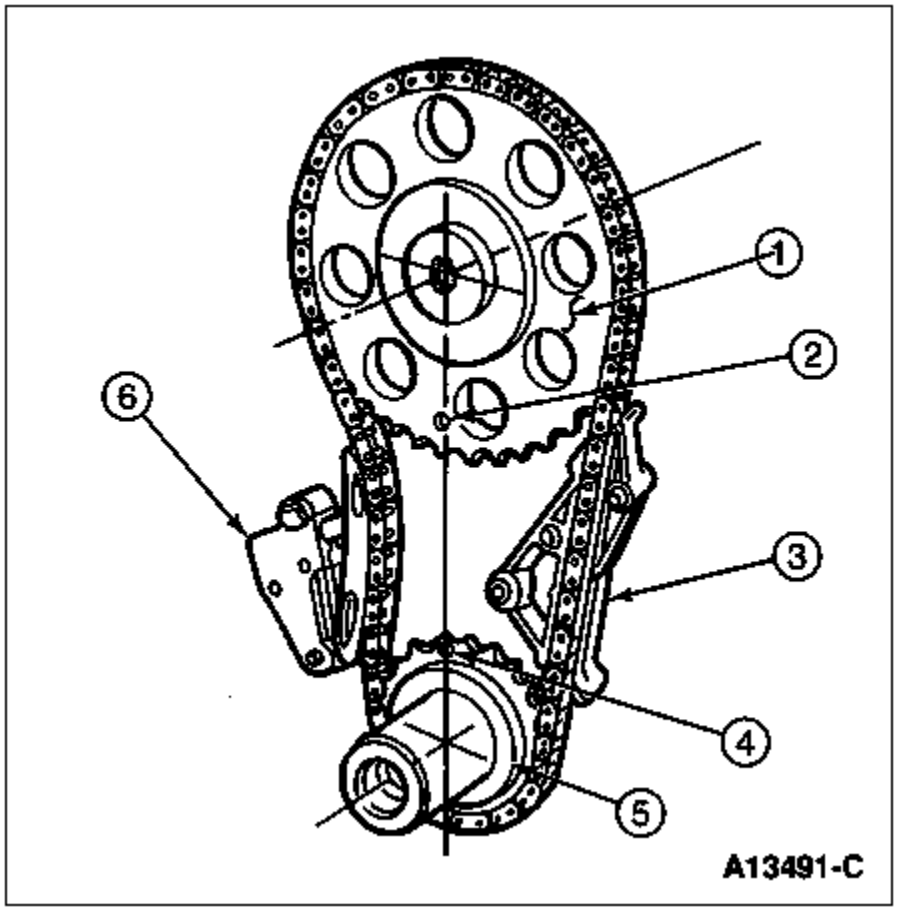
9	6269	Camshaft Thrust Plate
A	—	Tighten to 60-68 Nm (44-50 Lb-Ft)
B	—	Camshaft End Play to Be Within 0.065-0.165mm (0.025-0.064 Inch)
C	—	Tighten to 10-12 Nm (7-9 Lb-Ft)
D	—	Tighten to 9-11 Nm

tomsn048@gmail.com

		(7-8 Lb-Ft)

21. After the sprockets have been installed, insert the crankshaft sprocket key. Make sure timing marks on the sprockets are aligned as shown.



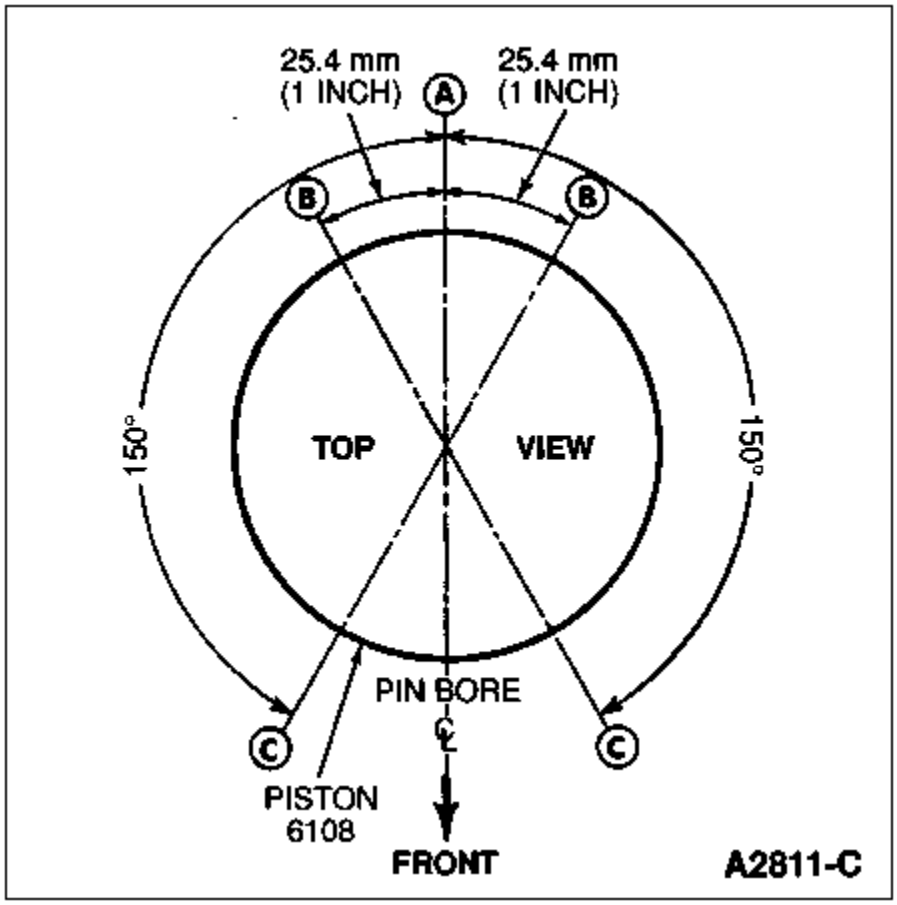
Item	Part Number	Description
1	6256	Camshaft Sprocket
2	—	Camshaft Timing Mark (Part of 6256)
3	6K297	Timing Chain Guide
4	—	Crankshaft Timing Mark (Part of 6306)
5	6306	Crankshaft Sprocket
6	6K254	Timing Chain/Belt Tensioner

22. Remove the clip that holds the timing chain vibration damper in a released position.

23. Oil the piston rings, pistons and cylinder walls. Be sure to install the pistons in the same cylinders from which they were removed.

tomsn048@gmail.com

24. Make sure the ring gaps are properly spaced around the circumference of the piston. Refer to Piston and Connecting Rod Installation in this section.



25. **NOTE: Install piston with indentation notch in the piston head toward front of engine.**

    Install a piston ring compressor on the piston and push piston in with a hammer handle until it is slightly below the top of the cylinder. Be sure to guide connecting rods to avoid damaging crankshaft journals (cover studs).

26. Check clearance of each connecting rod bearing. Refer to procedure in Section 03-00 .

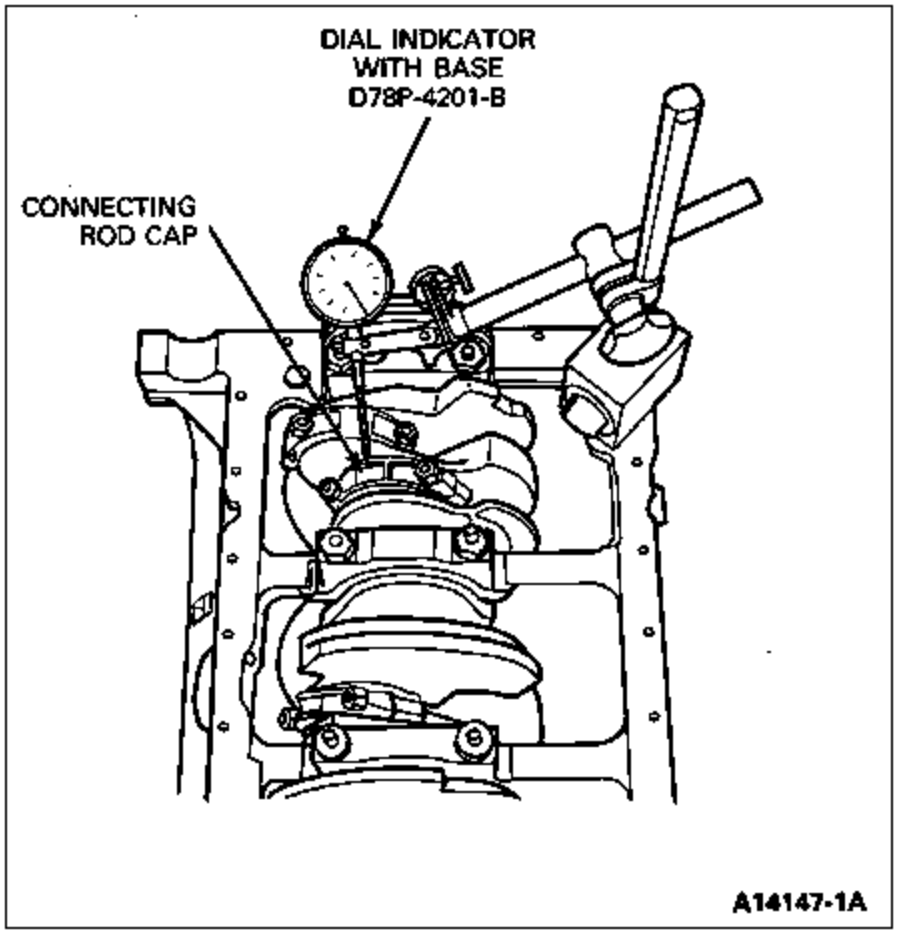
27. After bearings have been fitted, apply a light coat of SAE 50 Service SG oil to the journals and bearings.

28. Turn the crankshaft throw to the bottom of its stroke. Push piston all the way down until connecting rod bearing seats on the crankshaft journal.

29. Install connecting rod cap. Tighten nuts to 25-32 Nm (18-24 lb-ft).

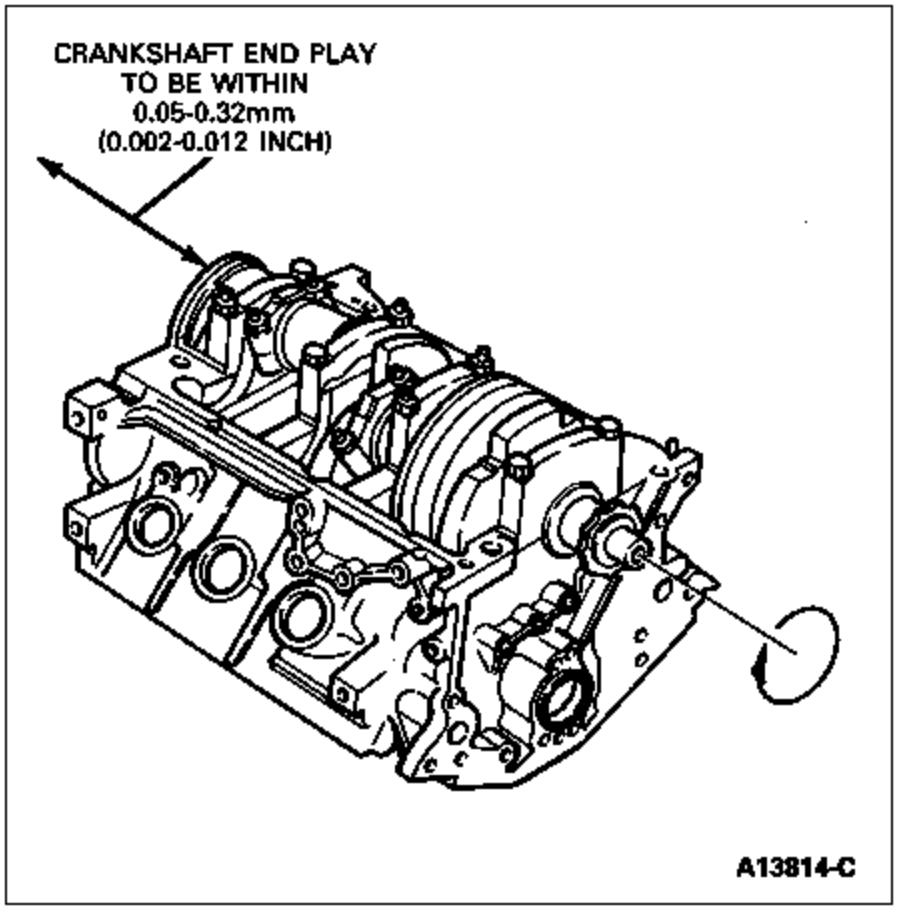
30. Check side clearance between connecting rods on each crankshaft journal.

tomsn048@gmail.com



31. Check the crankshaft and connecting rod bearings for assembled rotational torque. Torque required to rotate the crankshaft assembly with pistons installed is not to exceed 45 Nm (33 lb-ft).

tomsn048@gmail.com



32. Check the piston installed height if any of the following repair procedures have been performed:

    - New pistons were installed.
    - New connecting rods were installed.
    - New cylinder blocks was installed.
    - Cylinder block machine work (that could affect cylinder block deck height).
    - Cylinder block crankshaft align boring.

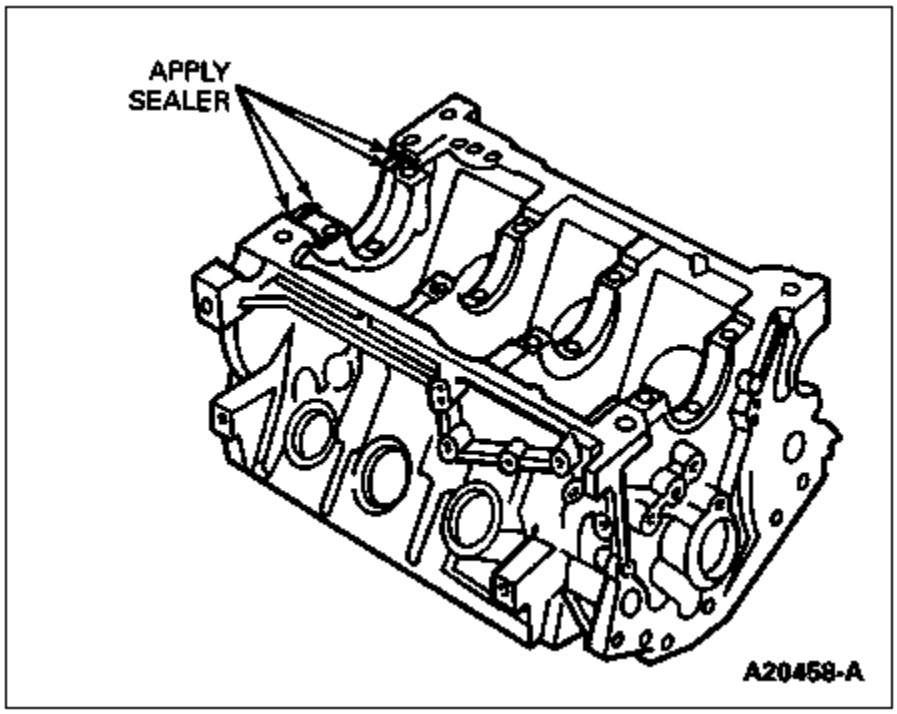
    Refer to Piston and Connecting Rod Removal and Installation procedures in this section for piston height checking procedure.

33. **NOTE: New rear main bearing bolts must be used during assembly.**

    Seal and assemble the rear main cap to the cylinder blocks.

    a. Place a bead of Ford Gasket Eliminator E1FZ-19562-A meeting Ford specification WSK-M2G348-AA or Loctite® 515 sealer to the block along the corners of the rear main bearing cap joint area and on the joint face, approximately 13mm (1/2 inch) from the rear of the block as shown in illustration.

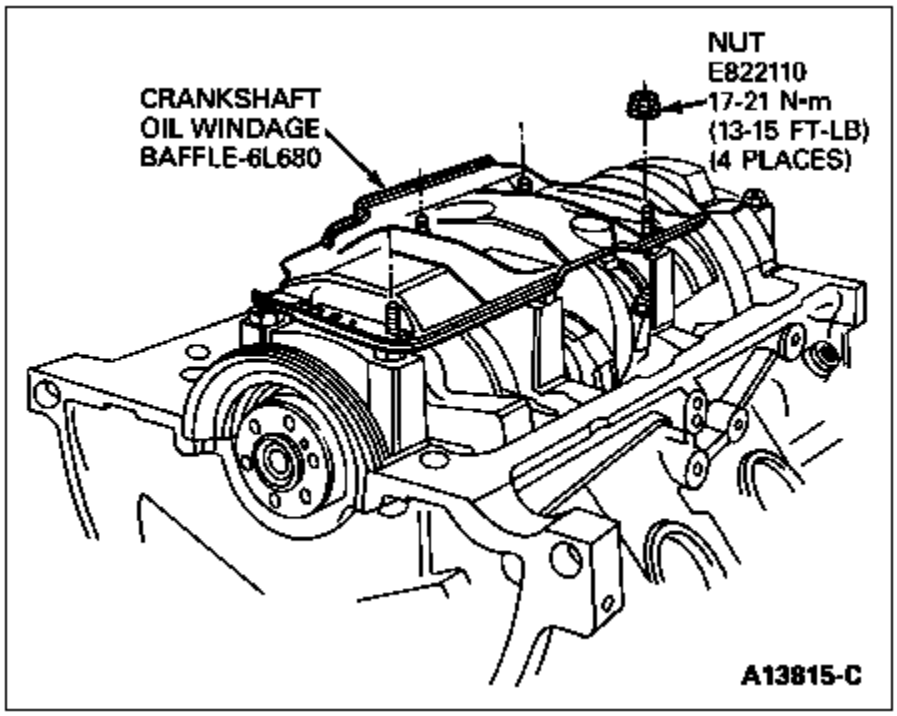
tomsn048@gmail.com



b. Verify that the lower rear main bearing insert is in place. Install the rear main bearing cap and snug the bolts.
c. Align the rear main bearing cap to cylinder blocks by moving the bearing fore or aft approximately 13mm (1/2 inch) inward in the rear oil seal bore so that the rear seal stop of the block and cap line up. This will ensure that the crankshaft rear oil seal (6701) will seat squarely when installed in the bore.
d. Torque the rear main cap bolts to 90-104 Nm (66-77 lb-ft).
e. Fill the cavities on both sides of the rear main cap with Ford Gasket Eliminator E1FZ-19562-A meeting Ford specification WSK-M2G348-A4 or Loctite® 515.
f. Wipe the excessive sealer from the cylinder block/rear main cap area.

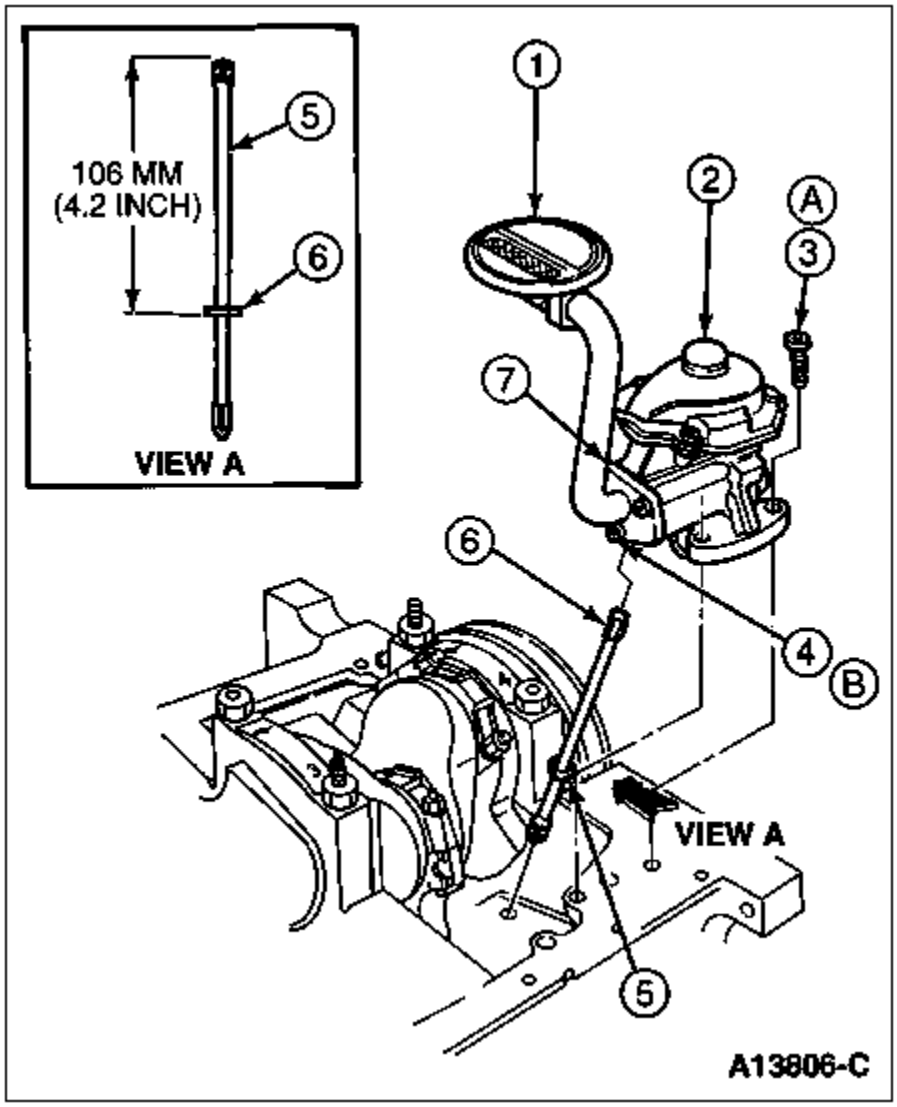
34. Install the crankshaft oil windage baffle. Tighten nuts to 17-21 Nm (13-15 lb-ft).

tomsn048@gmail.com



35. Prime the oil pump with XO-5W30-QSP meeting Ford specification ESE-M2C153-E or equivalent SAE 5W-30 Service SG oil and install oil pump, oil pump intermediate shaft, and oil pump screen cover and tube. Tighten oil pump bolts to 17-21 Nm (13-15 lb-ft).

tomsn048@gmail.com



Item	Part Number	Description
1	6A618	Oil Pump Intermediate Shaft
2	6629	Oil Pump Intermediate Shaft Retaining Ring
3	6622	Oil Pump Screen Cover and Tube
4	6600	Oil Pump
5	E804387	Screw
6	E804553	Screw
7	6626	Oil Pump Inlet Tube Gasket
A	—	Tighten to 17-21 Nm (13-15 Lb-Ft)
B	—	Tighten to 9-13 Nm (7-10 Lb-Ft)

36. Install crankshaft rear oil seal. (Refer to the procedure in this section.)

tomsn048@gmail.com

37. Install crankshaft front seal (6700), gasket, and front cover. Tighten cover bolts to 17-21 Nm (13-15 lb-ft).

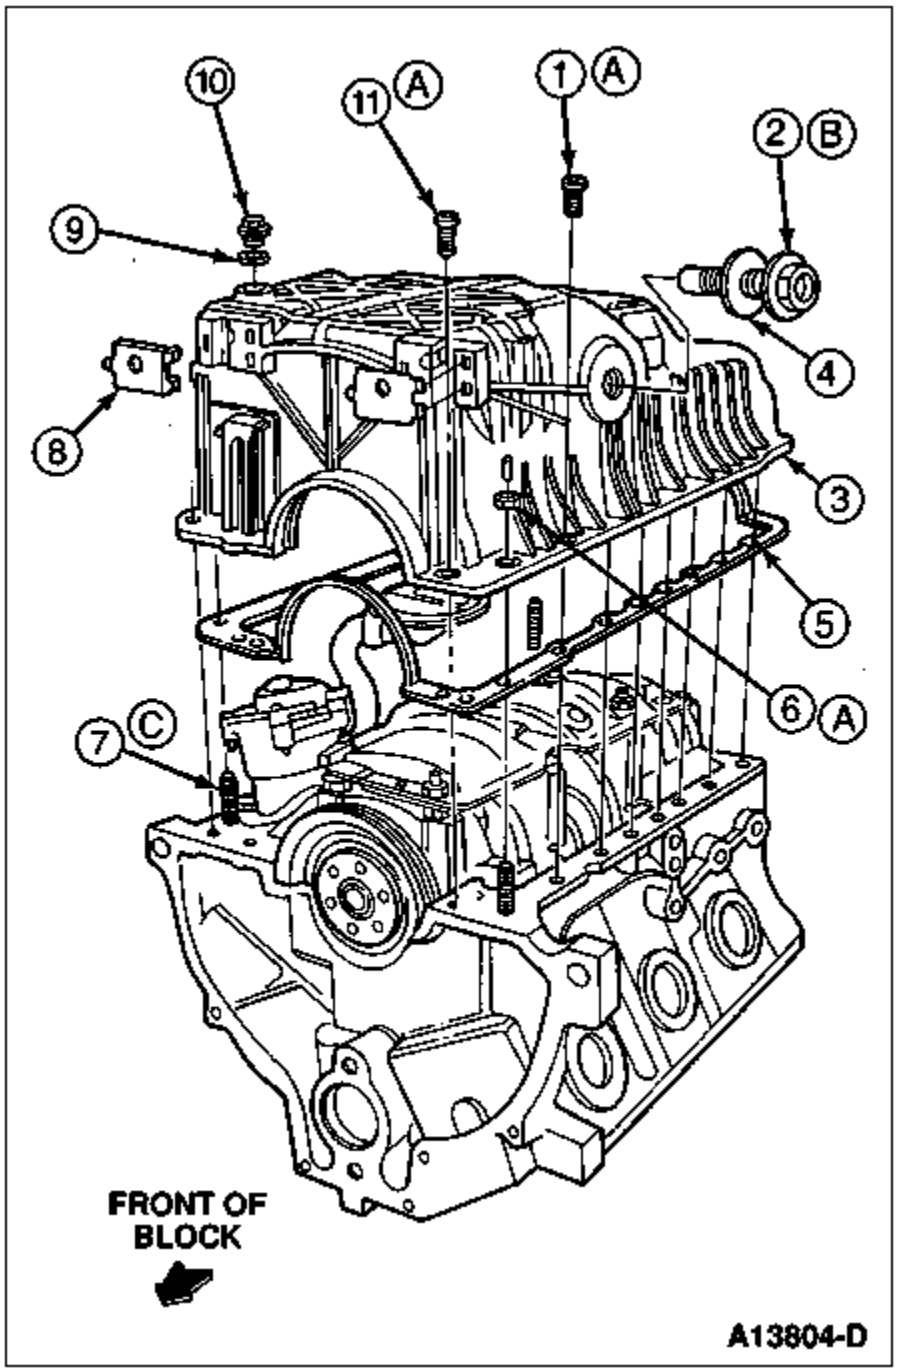
38. Install crankshaft vibration damper and pulley as detailed in this section. Tighten bolt to 40-50 Nm (30-37 lb-ft). Then tighten bolt another 85 degrees.

39. Install crankshaft position sensor and tighten bolts to 9-12 Nm (80-106 lb-in).

40. Install the oil filter adapter (6881), oil cooler (if equipped) and a new oil bypass filter (6714).

Oil Pan, Installation

tomsn048@gmail.com



Item	Part Number	Description
1	E804588-S72	Bolt, M6
2	6C624	Low Oil Level Sensor
3	6C626	Low Oil Level Sensor Washer
4	6675	Oil Pan
5	6710	Oil Pan Gasket
6	E60012-S72	Nut

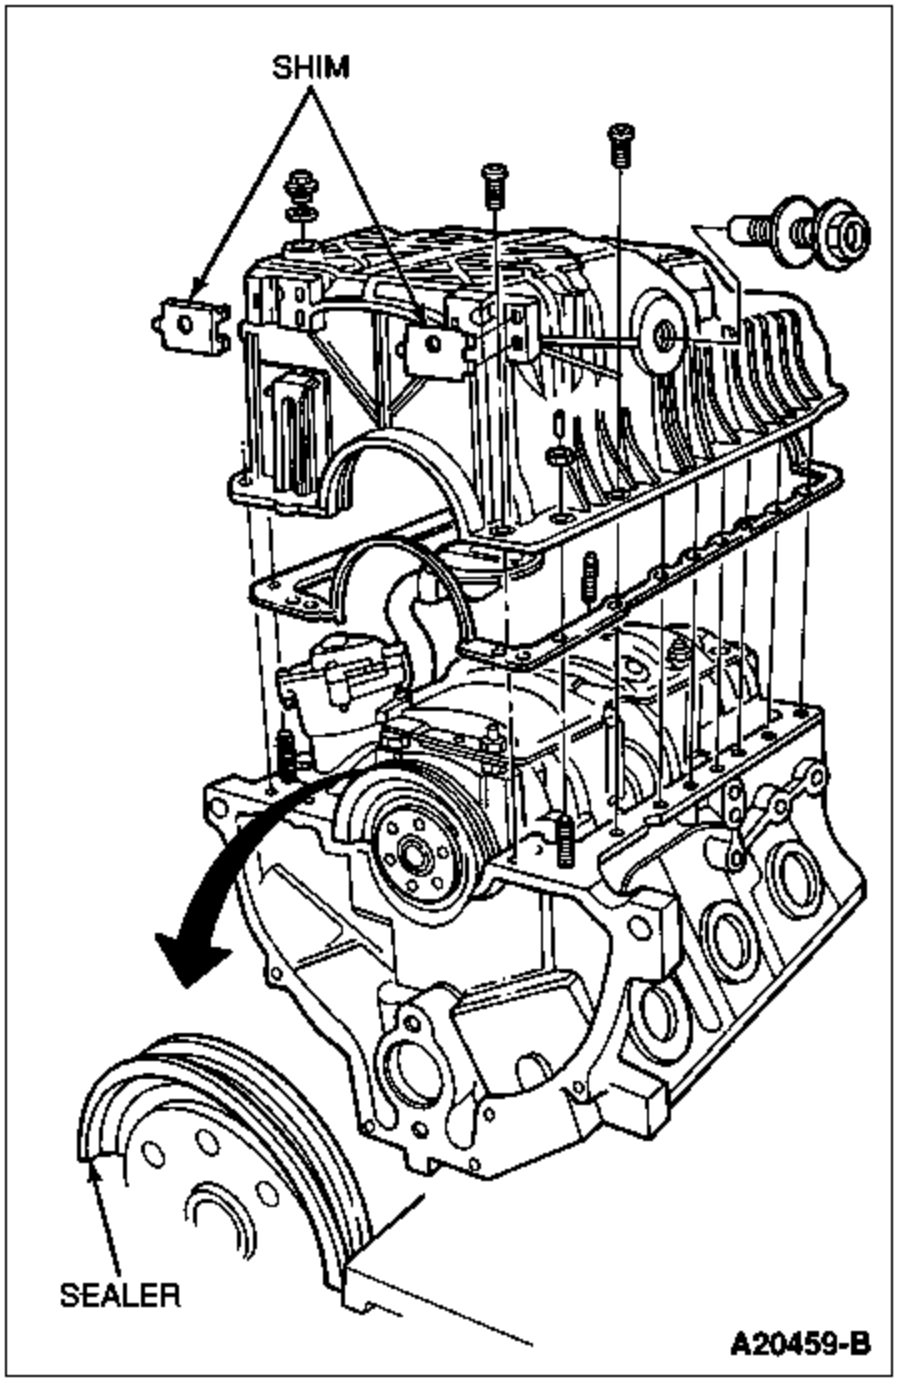
tomsn048@gmail.com

7	—	Stud (Part of 6010)
8	6A674	Clip
9	6734	Oil Pan Drain Plug Gasket
10	6730	Oil Pan Drain Plug
11	6C629	Torx® Bolt
A	—	Tighten to 7-10 Nm (5-7 Lb-Ft)
B	—	Tighten to 17-21 Nm (13-20 Lb-Ft)
C	—	Tighten to 4 Nm (35 Lb-In)

41. Install and seal the oil pan:

    a. Place a bead of Ford Silicone Sealer F1AZ-19562-A meeting Ford specification WSE-M4G320-A2 or Loctite® 598 sealer in the oil pan gasket groove at the radius areas at the front and rear of the oil pan.
    b. Place a bead of Ford Silicone Sealer F1AZ-19562-A meeting Ford specification WSE-M4G320-A2 or Loctite® 598 on top of the oil pan gasket at the radius areas at the front and rear of the oil pan.
    c. Place a bead of Ford Silicone Sealer F1AZ-19562-A meeting Ford specification WSE-M4G320-A2 or Loctite® 598 on the cylinder blocks at the cylinder block to front cover joint area.
    d. Set the oil pan in place and snug the 4 pan nuts. Ensure integral wedge seal is properly located.
    e. Align the rear face of the oil pan with the rear face of the cylinder blocks.

tomsn048@gmail.com



f. Install the remaining oil pan bolts and torque to 7-10 Nm (62-89 lb-ft).

42. **NOTE: Always use a new rear main seal.**

Refer to Crankshaft Rear Oil Seal Installation in this section.

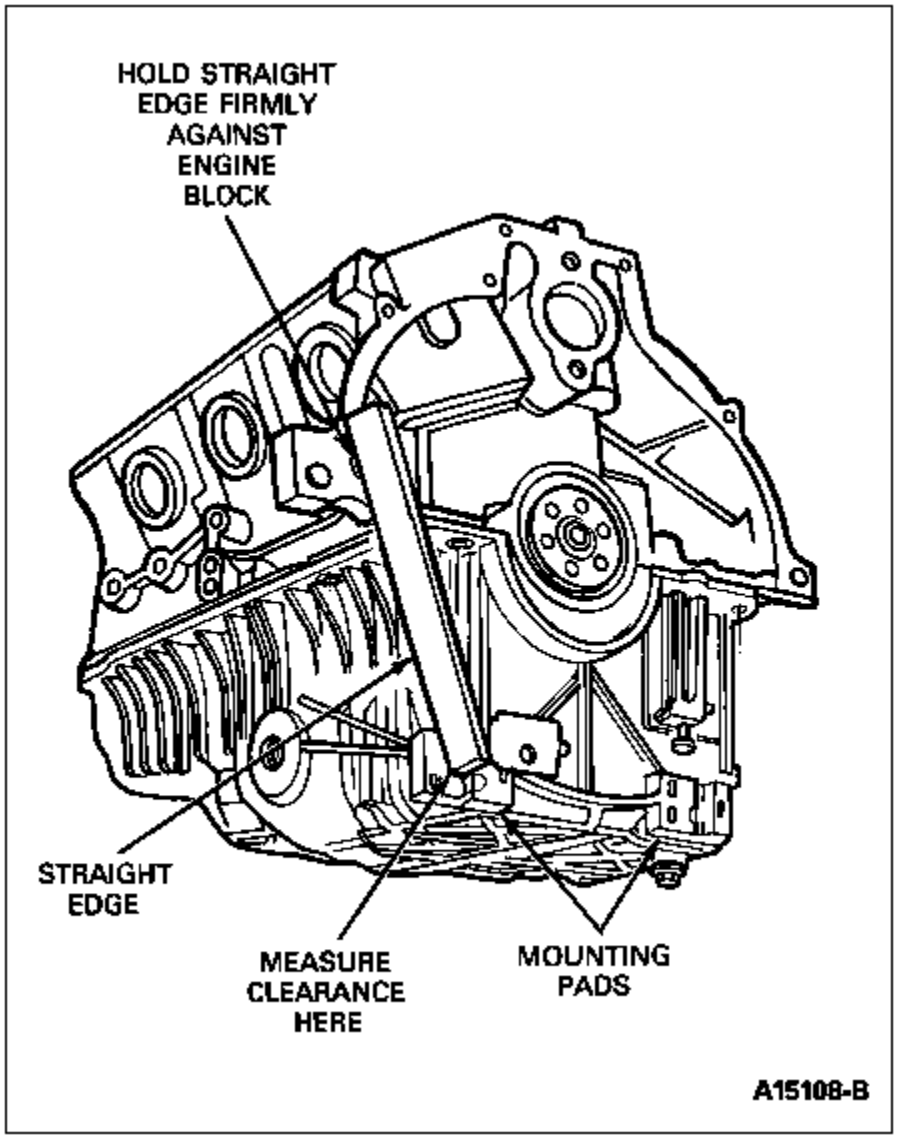
43. **NOTE: The transmission bolts to the engine and oil pan when installed, so it is important to measure the difference between the surface of the rear face of the oil pan (at the spacer locations) and the rear face of the cylinder blocks. If the rear face of the oil pan cannot be aligned within .0100 in. of the rear face of the cylinder block, the appropriate shims must be used. Refer to the following procedure for checking this dimension.**

tomsn048@gmail.com

CAUTION: Failure to measure the required spacer thickness can result in insufficient, or excessive clearance between the oil pan and transmission when installed in the vehicle. This can lead to oil pan damage, and/or oil leakage.

Determine if spacers are needed and if so, what thickness:

a. With the oil pan installed on the engine, position a straightedge on the rear of the cylinder blocks so that it is in contact with the transmission mounting machined face of the cylinder blocks and extends over one of the oil pan/transmission bolt mounting pads.



b. Using a feeler gauge, measure the gap between the mounting pad and the straightedge. Repeat the procedure on the other mounting pad. Select spacers of the required thickness from the chart.
c. Install the selected spacers to the mounting pads on the rear of the oil pan before bolting the engine and transmission together.

SPACER SELECTION CHART

Measured Gap	Spacer Required

tomsn048@gmail.com

mm	Inch	mm	Inch	Shim Color Code
0.0-0.254	0.0-0.010	None	None	—
0.27-0.51	0.011-0.020	0.254	0.010	Yellow
0.52-0.76	0.021-0.029	0.508	0.020	Blue
0.77-1.00	0.030-0.039	0.762	0.030	Pink

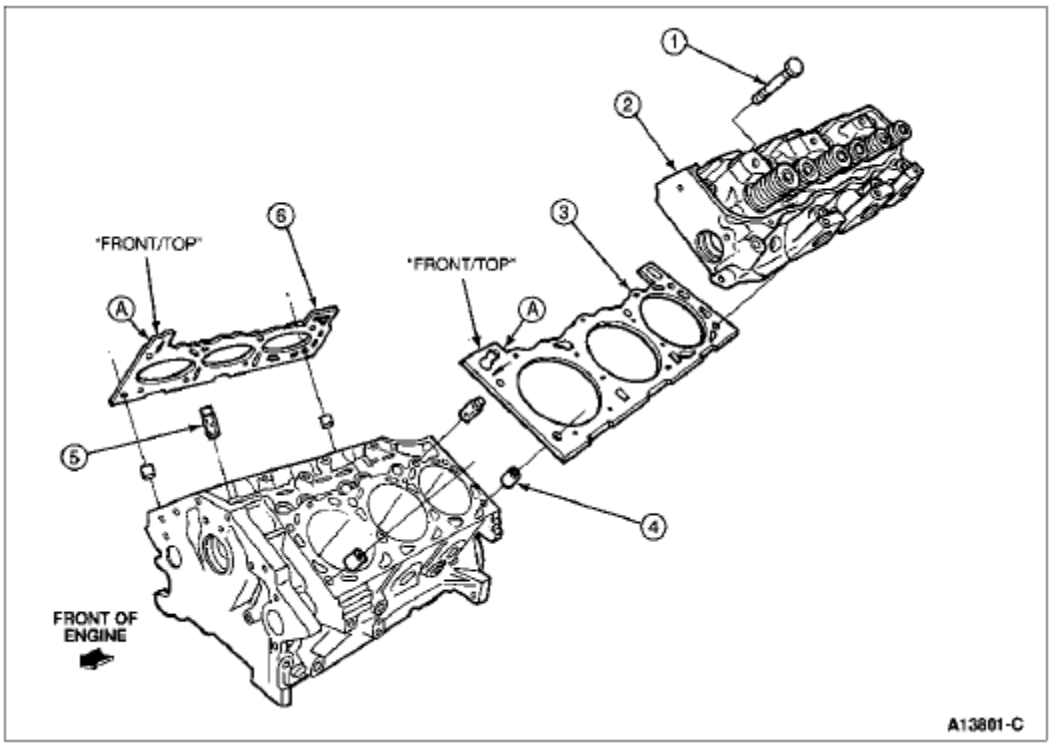
44. Install valve tappets (6500) in their original bores.

45. **NOTE: If cylinder head was completely disassembled, refer to Cylinder Head Disassembly and Assembly in this section.**

    NOTE: Head gaskets are not interchangeable.

    Install cylinder head locating dowels. Position cylinder head gaskets (6051) on cylinder blocks ensuring the installation arrows on the head gaskets are pointing to the front of the engine.

Cylinder Head, Installation



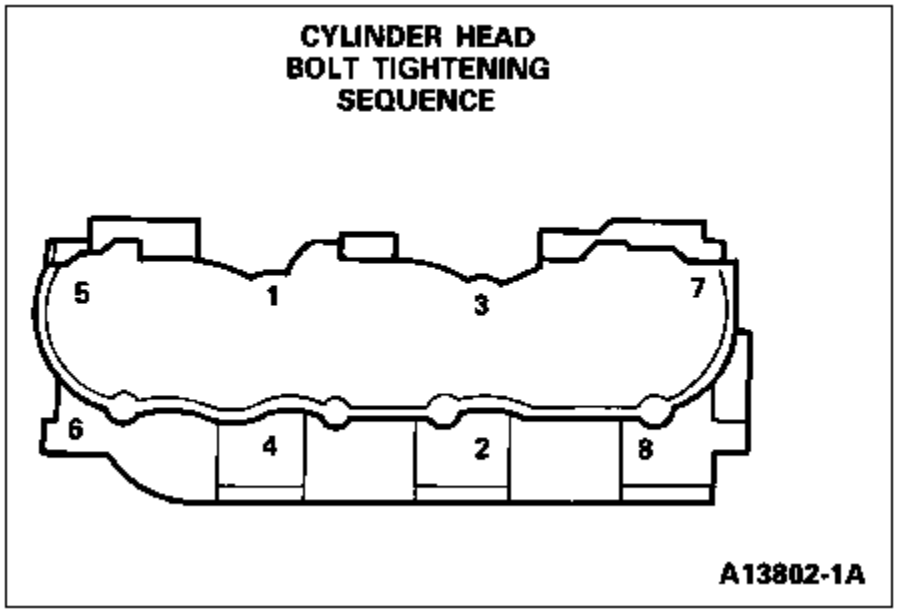
Item	Part Number	Description
1	6065	Cylinder Head Bolt

tomsn048@gmail.com

2	6049	Cylinder Head
3	6051	Head Gasket (LH)
4	6A008	Cylinder Head to Block Dowel
5	6500	Valve Tappet
6	6051	Head Gasket (RH)
A	—	Installation Arrows (on Top) Must Point to Front of Engine

46. Install and tighten the cylinder head bolts, in the sequence shown, in the following steps.

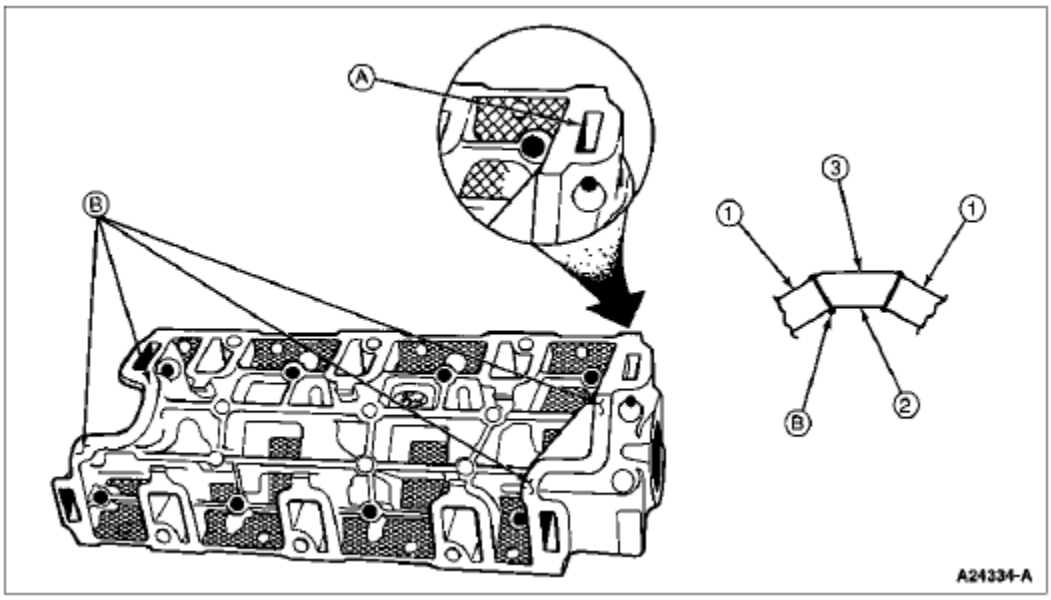
- Step 1 — 30-35 Nm (22-26 lb-ft)
- Step 2 — 70-75 Nm (52-56 lb-ft)
- Step 3 — rotate bolts 90 degrees



47. **NOTE: Once applied, the silicone sealer will set up in approximately 15 minutes. The intake manifold must be installed immediately after the sealer is applied.**

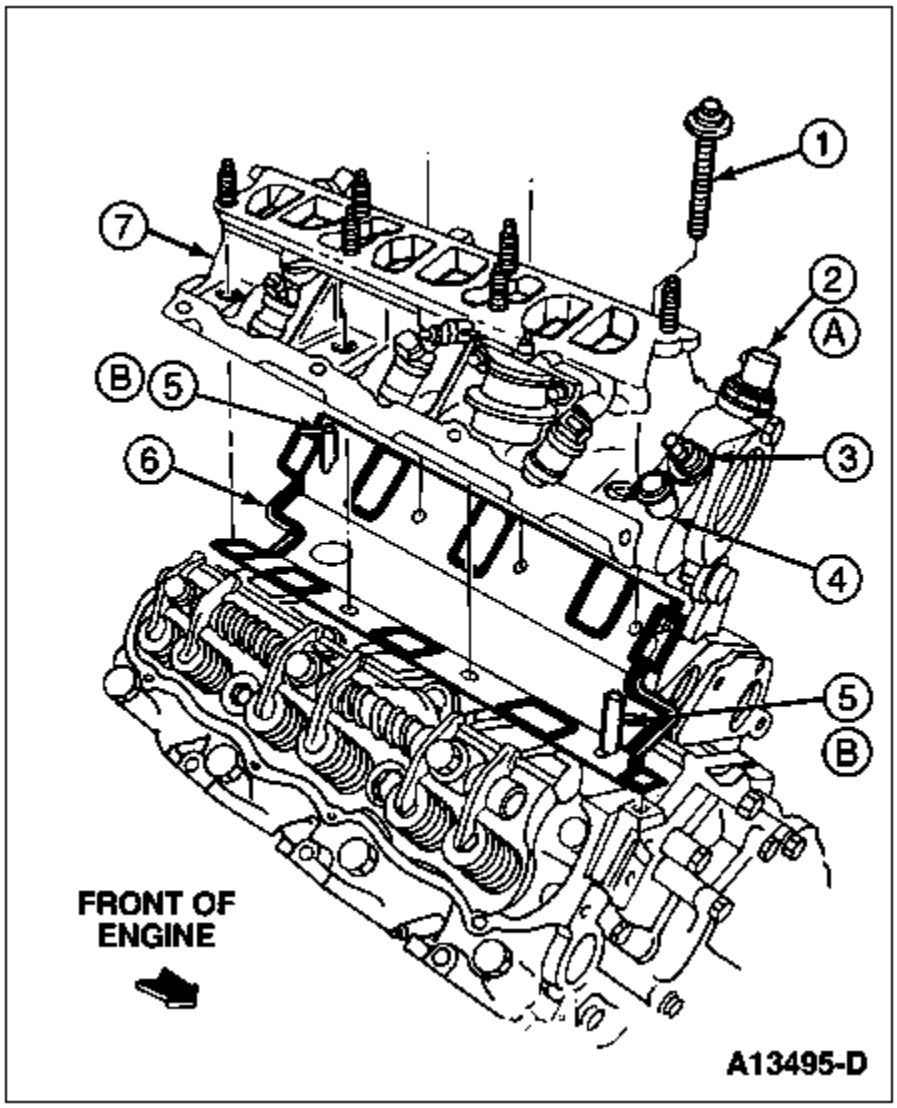
Apply Silicone Rubber D6AZ-19562-BA or equivalent meeting Ford specifications ESB-M4G92-A and ESE-M4G195-A to the block and cylinder head mating surfaces at the four corners. Install the intake manifold gasket (9439) and again apply sealer to the four corner locations.

tomsn048@gmail.com



Item	Part Number	Description
1	6049	Cylinder Head
2	9439	Intake Manifold Gasket
3	9424	Intake Manifold
A	—	Examine Closely for Erosion, Corrosion, or Pitting on This Surface
B	—	Silicone Sealer — 4 Places

tomsn048@gmail.com

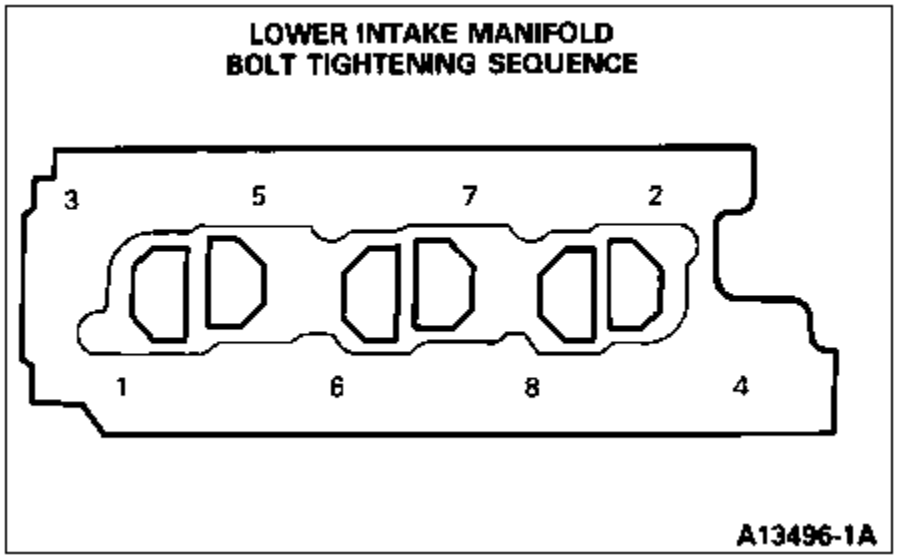


Item	Part Number	Description
1	W702301S309M	Bolt with Captive Washer (8)
2	12A648	Engine Coolant Temperature Sensor
3	10884	Water Temperature Indicator Sender Unit
4	8501	Water Pump
5	—	Stud (Part of 9424)
6	9439	Intake Manifold Gasket
7	9424	Intake Manifold
A	—	Tighten to 16 Nm (12 Lb-Ft)
B	—	Used to Locate Lower Intake Manifold Only

48. Position the intake manifold (9424) with the aid of two guide studs in position 3 and 4 below, and then install the intake manifold bolts. Remove the two guide studs and replace with bolts. Tighten the intake manifold bolts in three stages following the sequence shown.

tomsn048@gmail.com

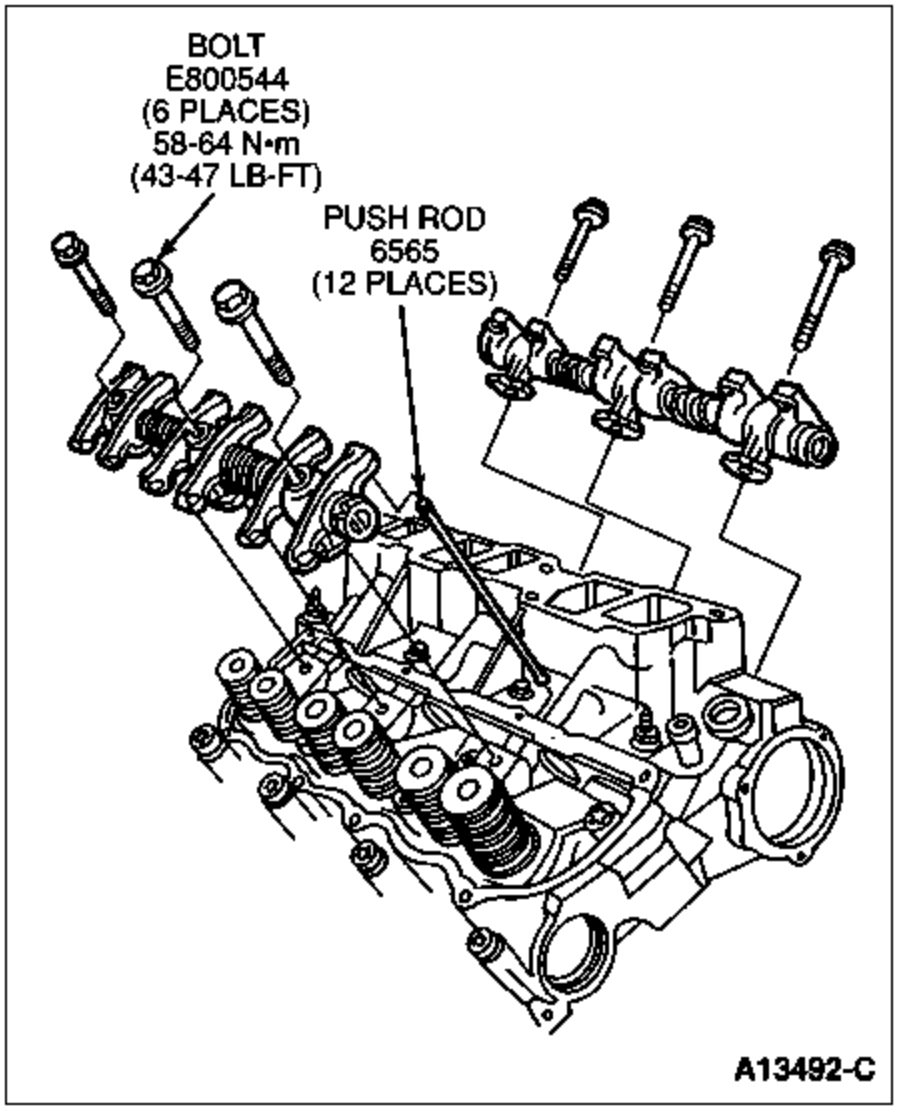
a. 8 Nm (6 lb-ft)
b. 15 Nm (11 lb-ft)
c. 22 Nm (16 lb-ft)



49. **NOTE: Lightly oil bolts with engine oil prior to installation. Do not place any oil in the threads on the cylinder head.**

Install valve tappets, rocker arm and shaft assemblies as outlined in this section.

tomsn048@gmail.com



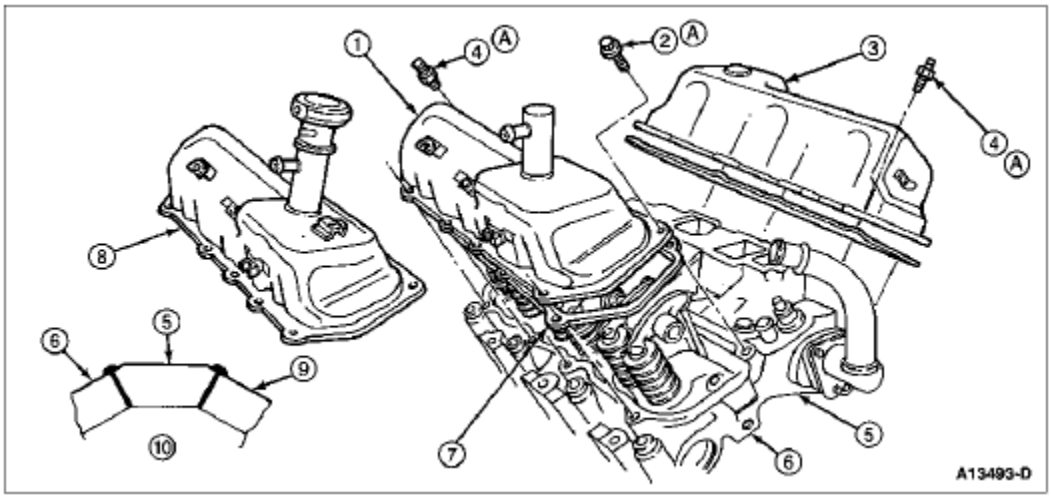
50. Install oil level indicator tube, oil level dipstick assembly.

51. **NOTE: Since silicone rubber will set up within 15 minutes, if you are installing both covers, apply only to one side at a time.**

    Apply Silicone Rubber D6AZ-19562-BA or equivalent meeting Ford specifications ESB-M4G92-A and ESE-M4G195-A to intake manifold-to-cylinder head parting seam.

Rocker Arm Cover and Gasket, Installation

tomsn048@gmail.com



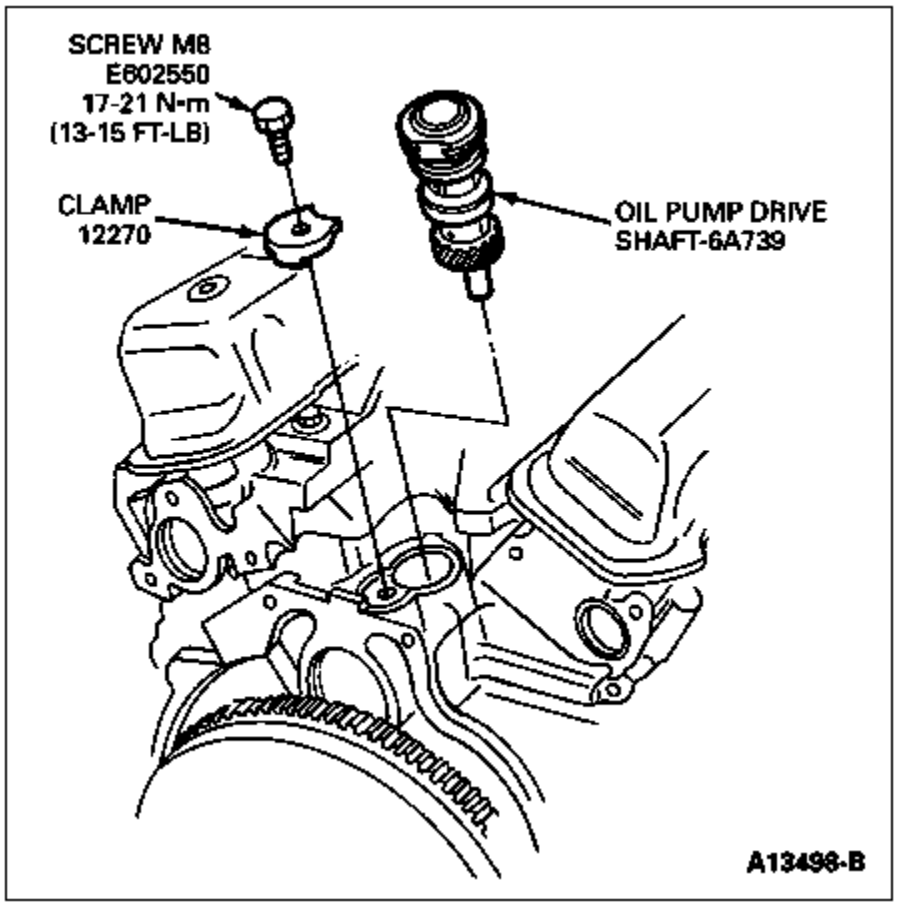
Item	Part Number	Description
1	6582	Valve Cover — Aerostar (RH)
2	E800390-S72	Screw, M6x22 Flange Head
3	6582	Valve Cover (LH)
4	W701041	Stud
5	9424	Intake Manifold
6	6049	Cylinder Head (RH)
7	6584	Valve Cover Gasket
8	6582	Valve Cover — Ranger (RH)
9	6049	Cylinder Head (LH)
10	6010	Cylinder Blocks
A	—	Tighten to 8-10 Nm (71-89 Lb-In)

52. Install left valve cover, rocker arm cover flange plates (6A523), and bolts and snug bolts starting from center bolts and working in crisscross pattern to end bolts. Tighten in same pattern to 6-8 Nm (53-70 lb-in).

53. Install the upper intake manifold and tighten the nuts to 20-25 Nm (15-18 lb-ft).

54. Install the oil pump drive and secure with the clamp and bolt. Tighten the bolt to 17-21 Nm (13-15 lb-ft).

tomsn048@gmail.com

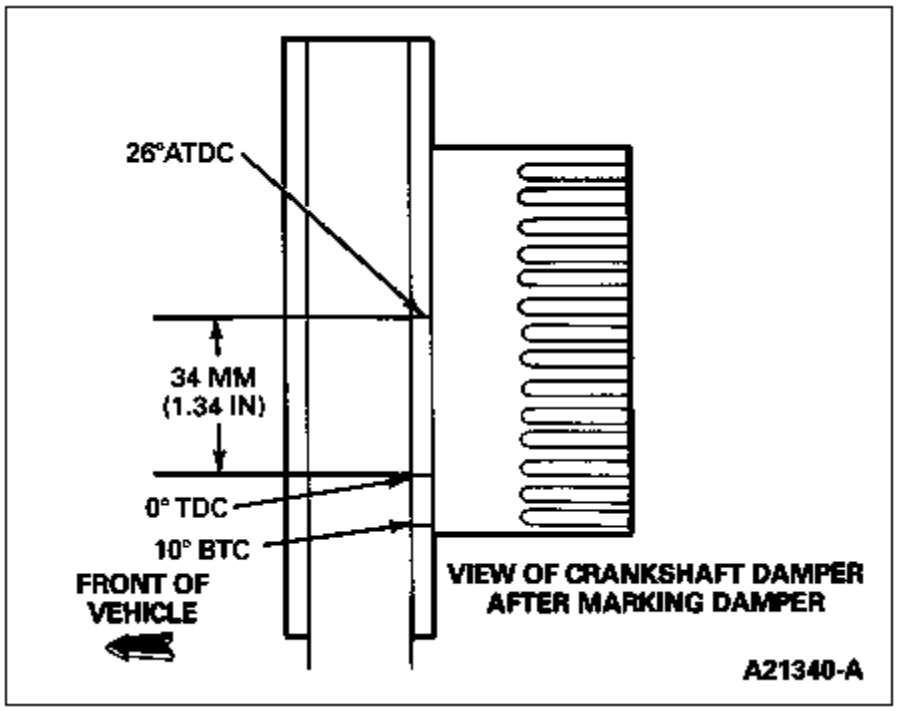


55. Install wiring harnesses, emission control system, fuel system, ignition system and front end accessory drive components, by referring to procedures in the specific sections.

Assembly, Ranger

1. After performing Steps 1-55 above, rotate crankshaft until TDC mark on the damper is accessible. If not present, place an additional mark on the damper at 26 degrees After Top Dead Center (ATDC). This position is 34mm (1.34 inches) counterclockwise from the Top Dead Center (TDC) mark.

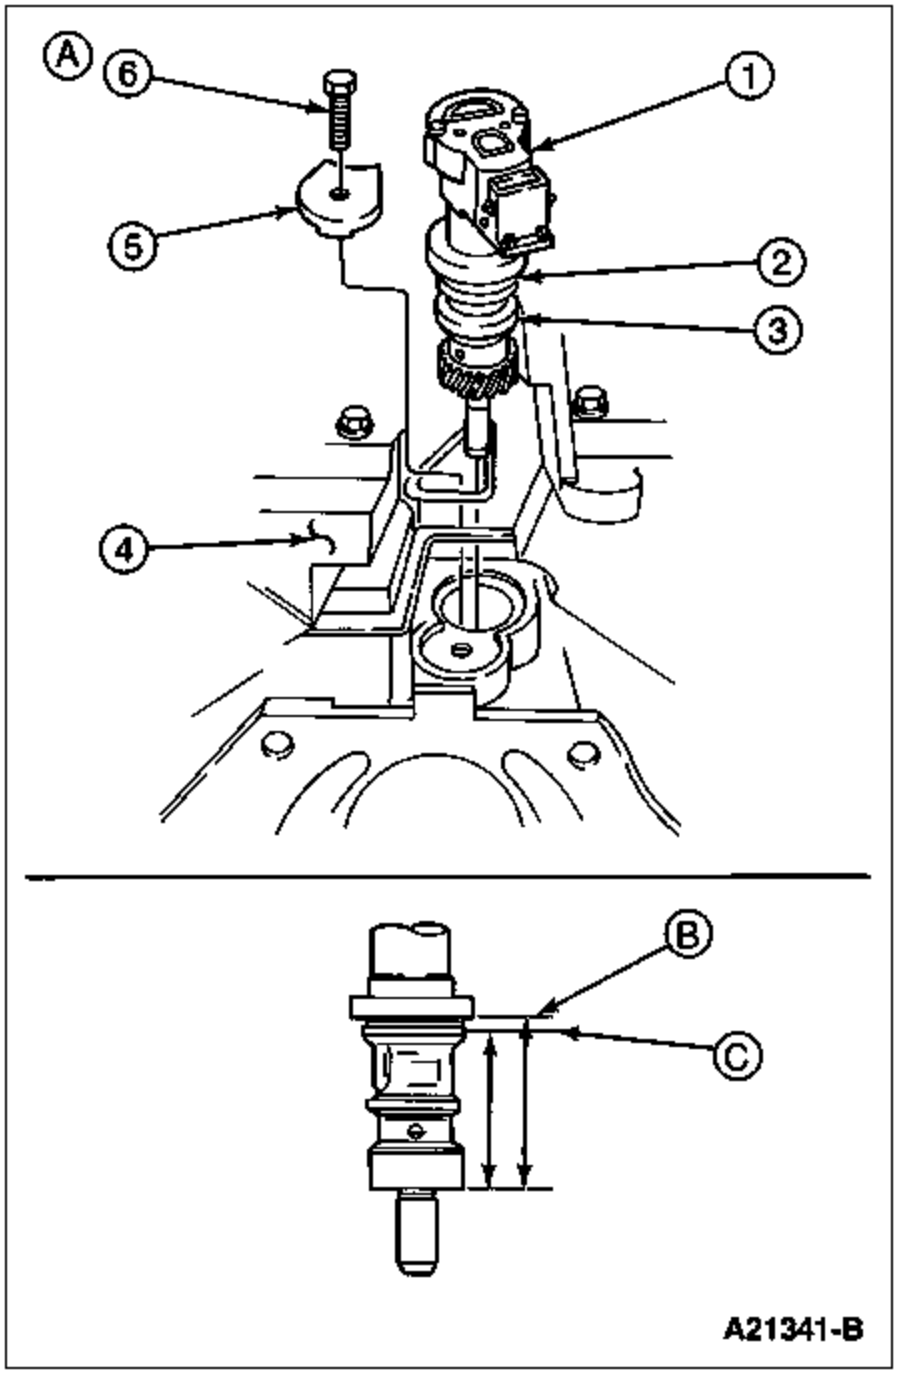
tomsn048@gmail.com



2. Position No. 1 cylinder to TDC between compression and ignition stroke. (Both intake and exhaust valves must be closed with TDC mark on vibration damper at pointer.)

3. Lubricate oil pump drive pinion and O-ring on assembled oil pump drive gear and CID sensor with SM-2C 1013-A oil. Do not get oil above mounting flange.

tomsn048@gmail.com



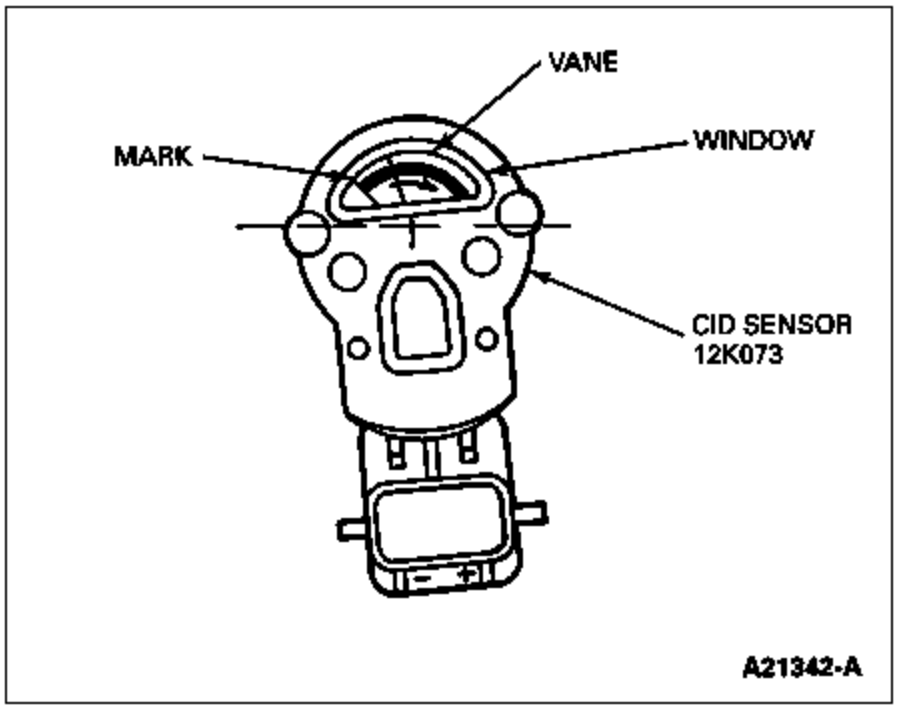
Item	Part Number	Description
1	12K073	CID Sensor (California Only)
2	E853103-S	O-Ring
3	6846	Oil Pump Drive Assembly
4	6007	Engine
5	12270	Distributor Hold-Down Clamp
6	E602550	Screw

tomsn048@gmail.com

A	—	Tighten to 17-21 Nm (13-15 Lb-Ft)
B	—	Maximum Level for Pre-Oiling Drive Gear
C	—	Minimum Level for Pre-Oiling Drive Gear

4. **NOTE: Normal CID sensor rotation is clockwise viewed from top of CID sensor.**

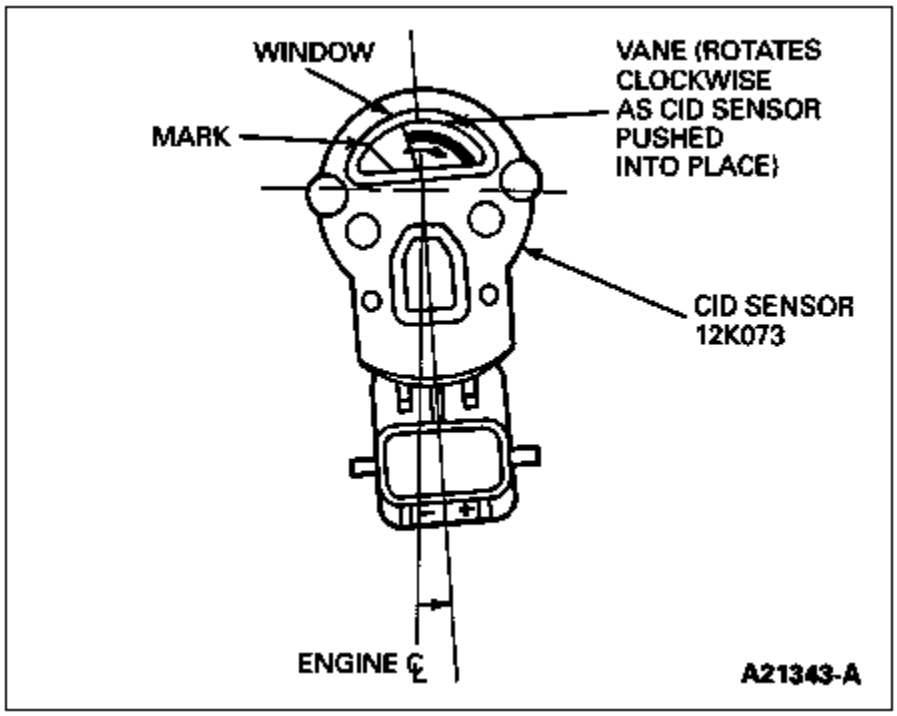
   Align the CID sensor rotor as shown with the trailing edge of the vane lined up with the short mark at the left hand side of the plastic window.



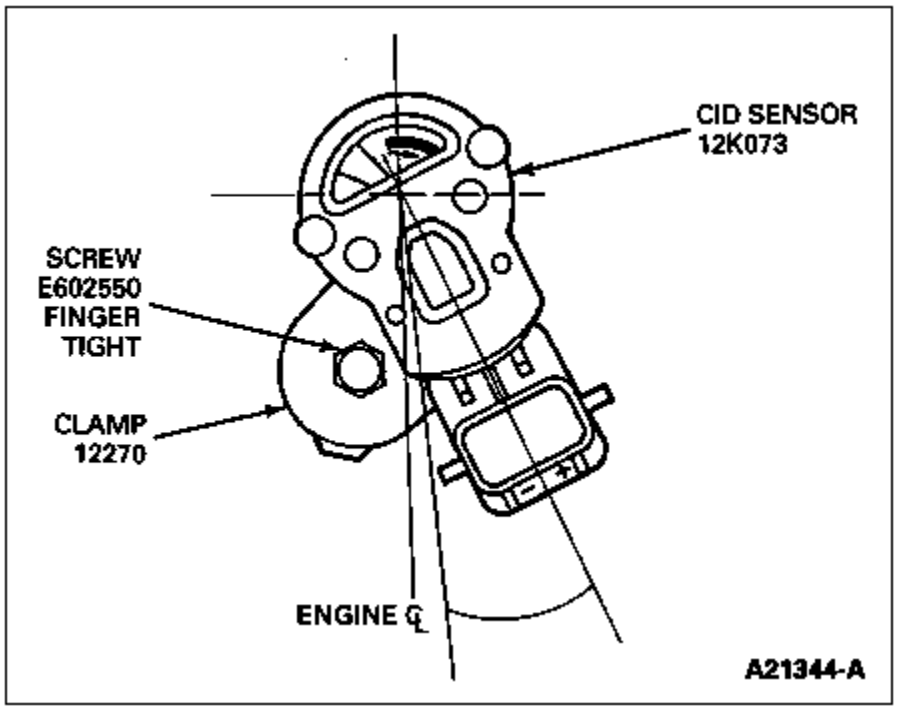
5. Position the sensor above its hole at right angles to the block rear face.

6. Install the assembled CID sensor and oil pump drive gear into the engine. As the assembly is pushed into place, the camshaft gear will rotate the sensor vane clockwise toward the center of the window.

tomsn048@gmail.com



7. Rotate the CID sensor counterclockwise. Install clamp and screw finger-tight. Rotate the sensor back to its position at right angles to the back of the block.



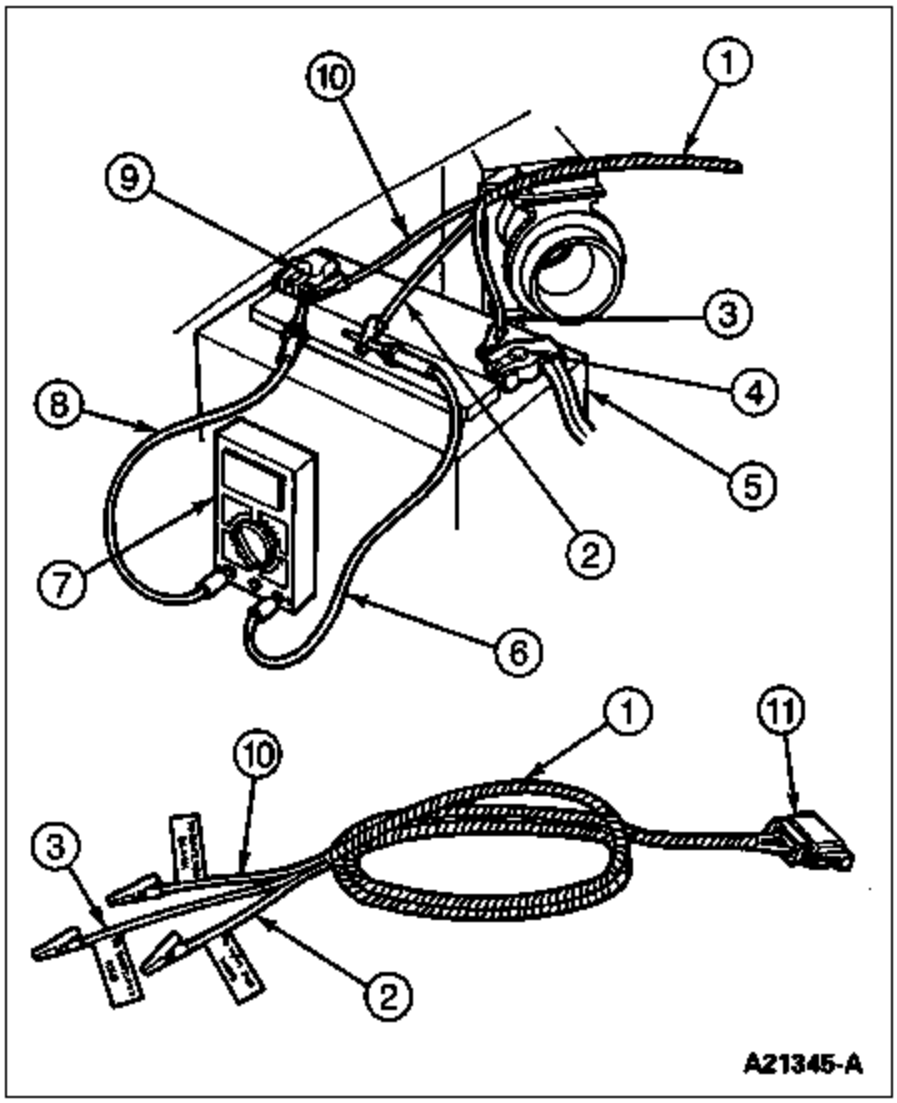
8. **NOTE: For out of vehicle assembly, use loose 12 volt battery or battery in a conveniently located vehicle.**

   Connect the CID Testing Wiring Harness T94T-50-B to the CID Sensor.

tomsn048@gmail.com

9. Connect the CID Testing Wiring Harness leads:

    a. Red harness wire to battery positive terminal.
    b. Black harness wire to battery negative terminal.
    c. Voltmeter positive lead to harnesses white lead.
    d. Voltmeter negative lead to battery negative terminal.



Item	Part Number	Description
1	T94T-50-B	CID Testing Wiring Harness
2	—	White Lead (Part of T94T-50-B)
3	—	Red Lead (Part of T94T-50-B)
4	—	Positive Terminal (Part of 10655)
5	10655	Battery

tomsn048@gmail.com

6	—	Red Lead (Part of 007-00407)
7	007-00407	Rotunda Digital Volt-Ohmmeter or Equivalent
8	—	Black Lead (Part of 007-00407)
9	—	Negative Terminal (Part of 10655)
10	—	Black Lead (Part of T94T-50-B)
11	—	Connector (Part of T94T-50-B) (Attaches to CID Sensor)

10. Rotate engine two revolutions to take up slack in timing chain and return No. 1 cylinder to its compression stroke.

11. **NOTE: No. 1 cylinder must be at 26 degrees After Top Dead Center (ATDC) to set CID sensor.**

    Verify that No. 1 cylinder is on its compression stroke (both valves closed).

12. Continue to rotate the crankshaft until the new 26 degrees ATDC mark lines up with the timing pointer.

13. **NOTE: The voltmeter will register battery voltage whenever the CID sensor closes and makes a complete circuit.**

    While rotating the CID sensor, note the exact point where the sensor switches from 0 to 12 volts on the voltmeter.

14. **NOTE: The final movement to set the CID sensor must be in a COUNTERCLOCKWISE direction.**

    Rotate the CID sensor clockwise past the CID switching point (from 12 to 0 volts).

15. Rotate the CID sensor counterclockwise and stop at the exact point the voltmeter switches from 0 to 12 volts.

16. Tighten the CID sensor hold-down bolt to 17-21 Nm (13-15 lb-ft) using Sensor Adjusting Wrench T94T-12270-A.

17. Disconnect the testing wiring harness and the voltmeter and install wiring harnesses, emission control system, fuel system, ignition system and front end accessory drive components, by referring to procedures in the specific sections.

tomsn048@gmail.com

tomsn048@gmail.com

Cylinder Head

SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
Valve Stem Seal Replacer	T90T-6571-A

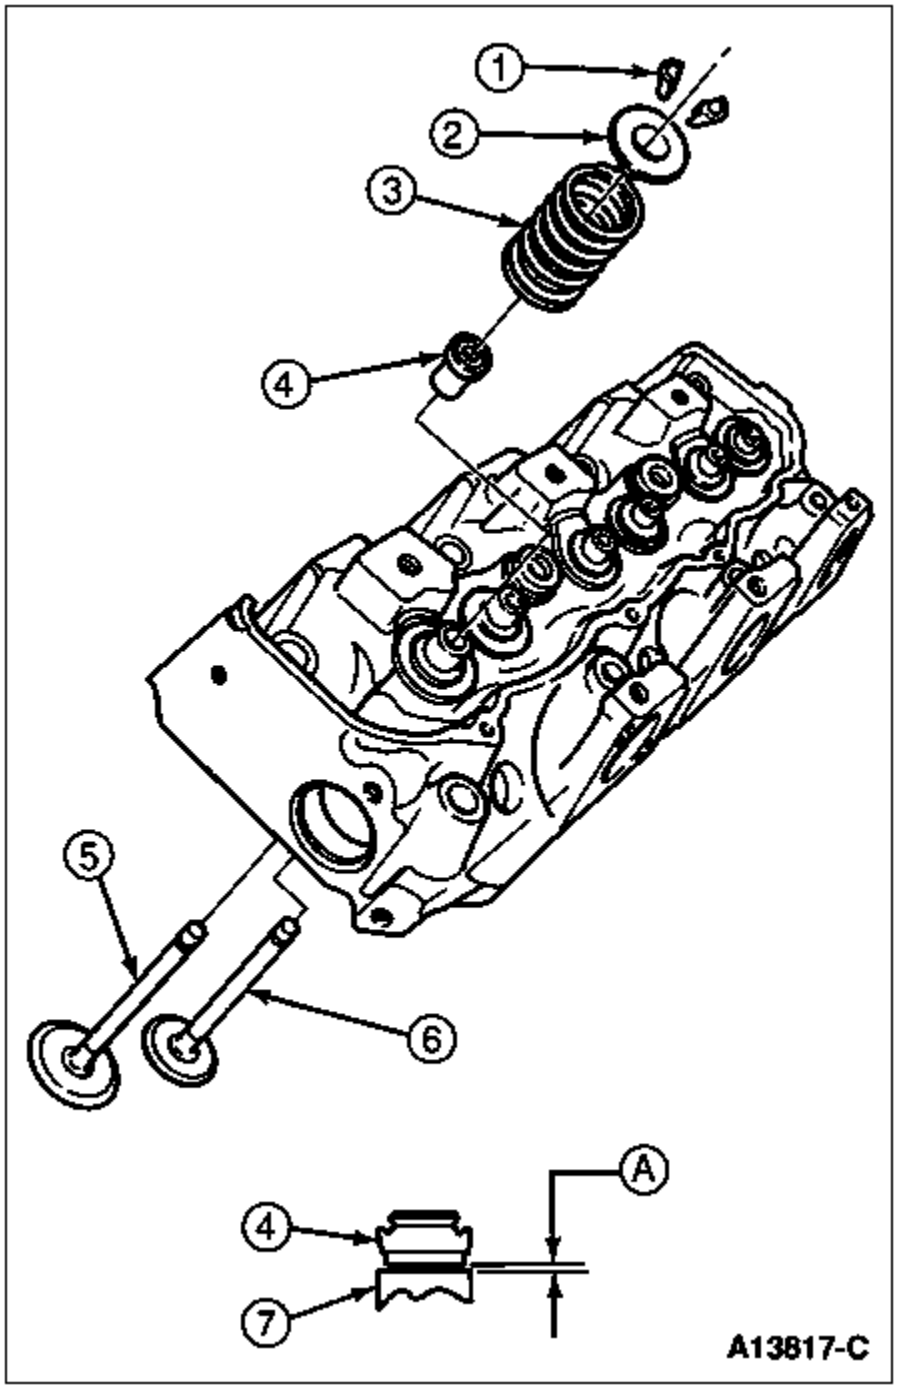
Disassembly

1. Remove deposits from the combustion chambers and valve heads with a scraper and a wire brush. **Be careful not to scratch the cylinder head gasket surfaces.**

2. Compress the valve springs (6513). Remove the valve spring retainer keys (6518) and release the valve springs.

3. Remove the valve spring retainer (6514), valve stem seal (6571), and intake valve (6507) or exhaust valve (6505). Discard the valve stem seals. Identify all valve parts for assembly. Remove the left exhaust manifold (9430) or right exhaust manifold assembly and spark plugs (12405).

tomsn048@gmail.com



Item	Part Number	Description
1	6518	Valve Spring Retainer Key
2	6514	Valve Spring Retainer
3	6513	Valve Spring
4	6571	Valve Stem Seal
5	6507	Intake Valve
6	6505	Exhaust Valve

tomsn048@gmail.com

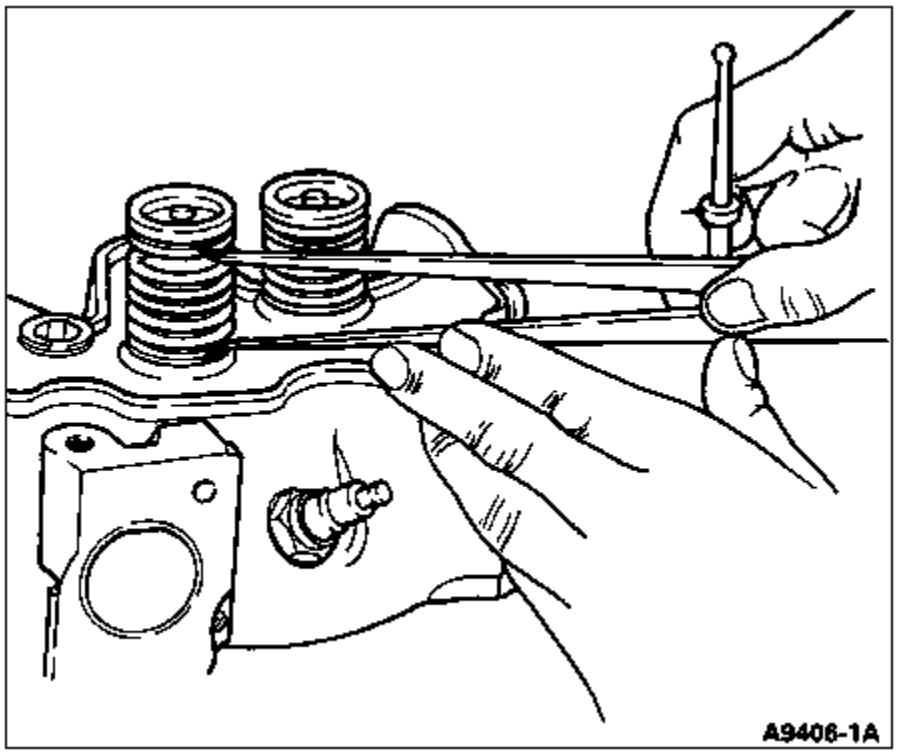
7	—	Valve Guide Boss (Part of 6507)
A	—	0.5mm (0.019 Inch) Maximum Gap

Assembly

1. Clean, inspect and repair all parts before assembly.
2. Install the left exhaust manifold or right exhaust manifold and spark plugs. Tighten the spark plugs and manifold attaching parts to specifications.
3. Lubricate the valve guides and valve stems with engine oil. Apply SAE 50 Service SG or equivalent oil to the tips of the valve stems.
4. Install each valve in the valve guide from which it was removed or to which it was fitted. Install a new oil-coated valve stem seal on the valve using Valve Stem Seal Replacer T90T-6571-A.
5. Install the valve spring over the valve, with close coils toward the cylinder head. Install the spring valve spring retainer.
6. Compress the valve spring and install the valve spring retainer keys.
7. Measure the assembled height of the valve spring from the surface of the cylinder head spring pad to the underside of the valve spring retainer with dividers.
8. **CAUTION: Do not install spacers unless necessary. Use of excess spacers will result in overstressing the valve springs and overloading the camshaft lobes, which would lead to spring breakage and worn camshaft lobes.**

   Check the dividers against a scale. If the assembled height is greater than specifications, install the necessary spacer(s) between the cylinder head spring pad and the valve spring to bring the assembled height to the recommended dimension.

tomsn048@gmail.com

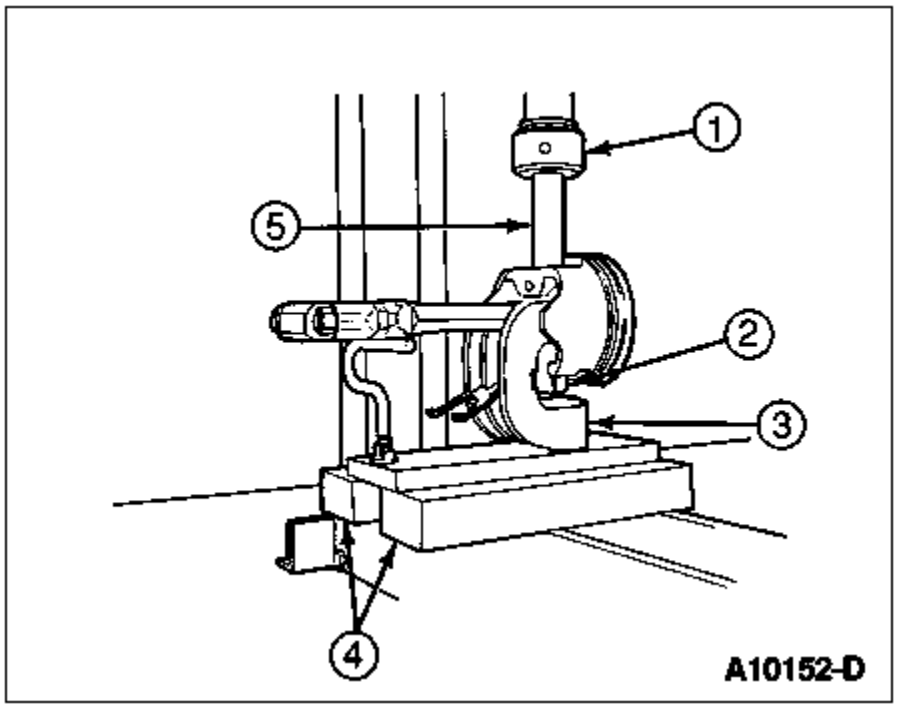


tomsn048@gmail.com

Pistons, Piston Pins and Rings

Disassembly

1. Remove connecting rod bearings (6211) from connecting rod and cap.
2. Remove piston rings using a suitable piston ring expander.
3. Mark connecting rod cap to make sure of assembly with the same piston (6108) and installation in the same cylinders from which they were removed.
4. Using an arbor press and Piston Pin Removal and Replacer D81L-6135-A or equivalent, press the piston pin (6135) from the piston and connecting rod (6200).



Item	Part Number	Description
1	—	Press Ram (Part of D81L-6135-A)
2	6135	Piston Pin
3	—	Receiving Tube (Part of D81L-6135-A)

tomsn048@gmail.com

4	—	Press Plates (Part of D81L-6135-A)
5	—	Pin Pusher (Part of D81L-6135-A)

Assembly

Check the fit of a new piston in the cylinder bore as outlined in Section 03-00 before assembling the piston and piston pin to the connecting rod.

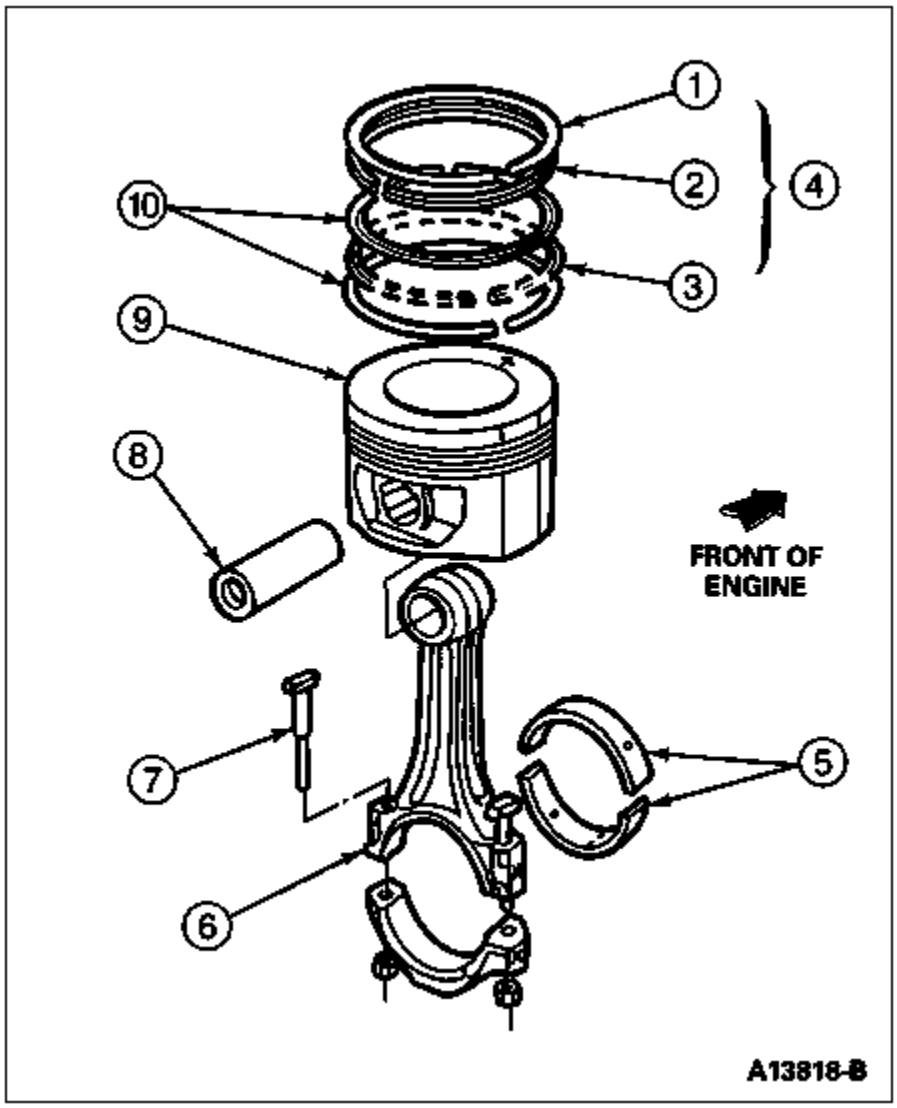
The piston pin bore of a connecting rod and the diameter of the piston pin must be within specification.

1. Apply a light coat of engine oil XO-5W30-QSP or equivalent meeting Ford specification ESE-M2C153-E or SAE 5W-30 Service SG or SAE 50 Service SG to all parts.

2. **NOTE: Squirt hole faces right bank cylinders.**

   Assemble the piston to the connecting rod, putting the notch in the piston dome and the connecting rod on the same side.

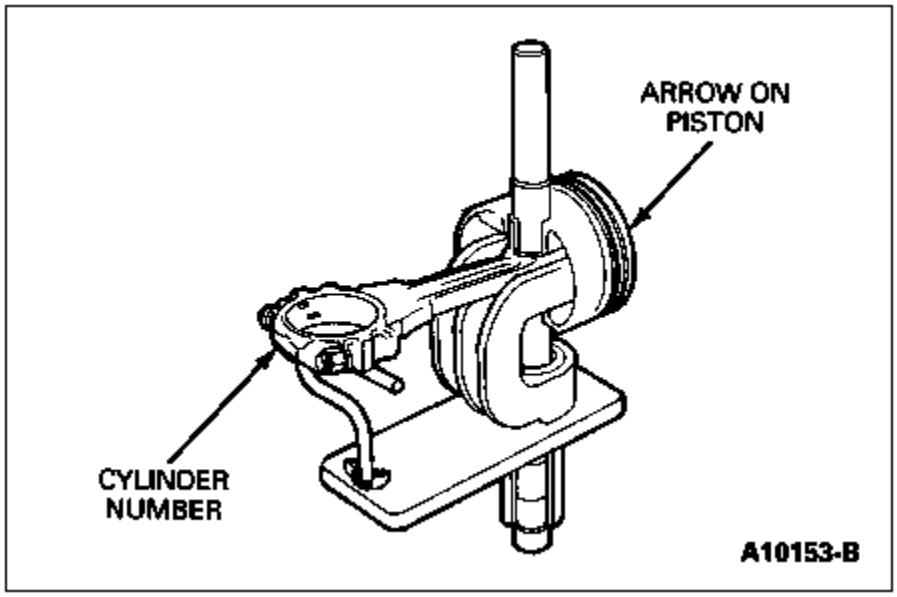
tomsn048@gmail.com



Item	Part Number	Description
1	—	Piston Ring Compression, Upper (Part of 6148)
2	—	Piston Ring Compression, Second (Part of 6148)
3	—	Piston Ring, Oil Control (Part of 6148)
4	6148	Partial Piston Ring Set
5	6211	Connecting Rod Bearing
6	6200	Connecting Rod
7	6214	Connecting Rod Bolt
8	6135	Piston Pin
9	6108	Piston
10	—	Piston Ring Expander, Oil Control Ring (Part of 6148)

tomsn048@gmail.com

3. Start the piston pin in the piston and connecting rod (this may require a very light tap with a mallet). Using an arbor press and Piston Pin Tool D81L-6135-A or equivalent, press the piston pin through the piston until the piston pin is centered in the piston.



4. Check the end gap of all piston rings. It must be within specification:

   - Compression (Top) 0.38-0.58mm (0.015-0.023 in.)
   - Compression (Bottom) 0.38-0.58mm (0.015-0.023 in.)
   - Oil Ring (Steel Rail) 0.38-1.39mm (0.015-0.055 in.)

5. Follow the instructions contained on the piston ring package and install the piston rings.

6. Check the ring side clearance of the compression rings with Feeler Gauge D81L-4201-A or equivalent by inserting it between the ring and its lower land. The gauge should slide freely around the entire ring circumference without binding. Any wear that occurs will form a step at the inner portion of the lower land. If the lower lands have high steps, the piston should be replaced.

7. Make sure bearing inserts and the bearing bore in the connecting rod and cap are clean. Foreign material under the inserts will distort the bearing and cause a failure. Install the connecting rod bearings in the connecting rod and cap with the tangs fitting in the slots provided.

tomsn048@gmail.com

tomsn048@gmail.com

Cylinder Block Assembly

Disassembly

1. Mount the engine (6007) on a work stand and remove all parts not furnished with the new cylinder assembly.
2. Remove the old cylinder assembly from the work stand.

Assembly

1. Clean the gasket and seal surfaces of all serviceable parts and assemblies.
2. Position the new cylinder assembly in a work stand and transfer all serviceable parts removed from the old cylinder assembly.
3. Check all assembly clearances and correct as necessary.

tomsn048@gmail.com

Cylinder Block, Bare

Before replacing a cylinder blocks (6010), determine if it is repairable. If so, make the necessary repairs following the procedures given in Section 03-00 .

Disassembly

1. Completely disassemble the old engine.
2. Remove core plugs as outlined in Section 03-00 .
3. Remove oil gallery pipe plugs.
4. **NOTE: A rifle-cleaning brush is helpful for cleaning engine oil galleries.**

   Clean cylinder blocks and inspect as outlined in Section 03-00 .

Assembly

1. If using new or reconditioned cylinder block uncrate and clean preservative materials according to supplier's instructions.
2. Position the new cylinder blocks in a work stand and install all serviceable parts removed from the old cylinder blocks.
3. Check all assembly clearances and correct as necessary.

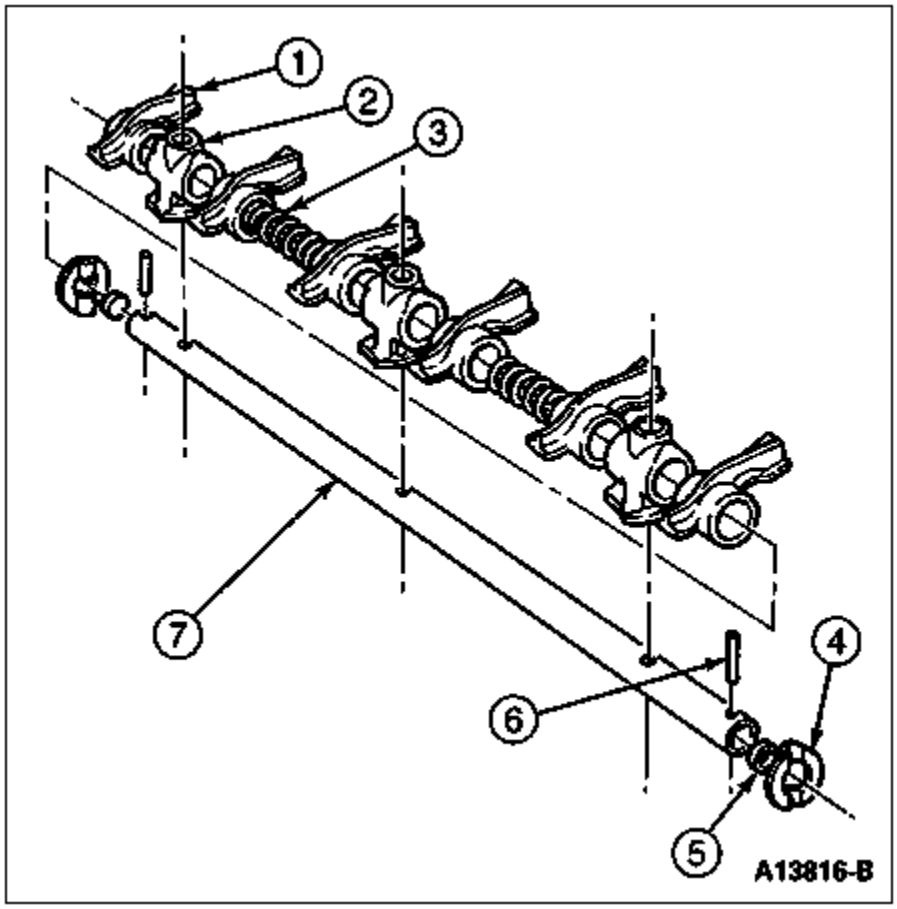
tomsn048@gmail.com

tomsn048@gmail.com

Rocker Arm Shaft Assembly

Disassembly

1. Remove the spring washer and pin from each end of the rocker arm shaft (6563).
2. Slide the rocker arms (6564), springs and rocker arm shaft supports (6531) off the rocker arm shaft. Be sure to mark the parts for assembly in the same locations.
3. If it is necessary to remove the plugs from each end of the rocker arm shaft, drill or pierce the plug on one end large enough for steel rod to pass through. Use a steel rod to knock out the plug on the opposite end. Working from the open end, knock out the remnants of the first plug.



Item	Part Number	Description
1	6564	Rocker Arm
2	6531	Rocker Arm Shaft Support
3	6587	Rocker Arm Shaft Spring

tomsn048@gmail.com

4	6598	Rocker Arm Shaft Washer
5	6572	Rocker Arm Shaft Plug
6	6A533	Rocker Arm Shaft Retaining Pin
7	6563	Rocker Arm Shaft

Assembly

1. Use a blunt tool and install a plug, cup side out, in each end of the rocker arm shaft if the plugs were removed from the shaft. Make sure plugs are in deep enough that they do not block pin holes.

2. Install a spring washer and pin on one end of the rocker arm shaft, coat the rocker arm shaft with heavy SF engine oil and install the parts in the same sequence in which they were removed.

3. Install the remaining spring washer and pin.

4. Coat the rocker arm pads with SAE 50 Service SG (ESE-M2C39-F) oil before installation on the engine.

5. Install the rocker arm shaft with the oil holes pointing down. This position of the shaft can be recognized by a notch on the front face of the shaft.

---

tomsn048@gmail.com

Valve Clearance

The 4.0L engine uses hydraulic roller tappets and non-adjustable rocker arms (6564). The valve tappets (6500) are not adjustable, and if found to be excessively worn or noisy, should be tested and repaired or replaced as described in Section 03-00 .

tomsn048@gmail.com

SPECIFICATIONS

Engine Specifications

Item	Specification
Displacement	4.0L (4000 cc)
Number of Cylinders	6
Bore and Stroke	100 x 84mm (3.94 x 3.31 inch)

tomsn048@gmail.com

tomsn048@gmail.com

Inspection and Verification

1. Verify the vehicle owner's original concern by operating the system.
2. Inspect to determine if one of the following mechanical concerns apply:

Mechanical
• Damaged hoses • Loose/damaged hose clamps • Damaged water thermostat • Damaged head gaskets • Damaged intake manifold gasket • Damaged water pump • Damaged radiator • Damaged radiator coolant recovery reservoir • Damaged heater core

3. If the concern(s) remains after the inspection, determine the symptom(s) and proceed to the following symptom chart.

tomsn048@gmail.com

Symptom Chart — Engine Cooling

NOTE: Use Rotunda 73 Digital Multimeter 105-R0051 or equivalent to perform electrical pinpoint tests.

ENGINE COOLING

Condition	Possible Source	Action
• Loss of Coolant	• Damaged radiator. • Damaged water pump. • Loose/damaged radiator hoses/clamps/heater water control valve. • Loose/damaged heater water hoses. • Damaged heater core. • Cracked cylinder block or head. • Damaged engine gaskets. • Damaged radiator coolant recovery reservoir. • Damaged engine block plug.	• GO to Pinpoint Test A.
• Engine Overheats	• Damaged water thermostat. • Damaged water pump. • Internal engine coolant leak. • Inoperative cooling fan clutch. • Plugged radiator. • Plugged heater core. • Loose/damaged drive belt. • Defective radiator cap. • Low coolant level.	• GO to Pinpoint Test B.
• Engine Does Not Reach Normal Operating Temperature	• Damaged water thermostat.	• GO to Pinpoint Test C.
• Block Heater Does Not Operate Properly	• Block heater wiring. • Block heater.	• GO to Pinpoint Test D.

tomsn048@gmail.com

tomsn048@gmail.com

Pinpoint Tests

PINPOINT TEST A: LOSS OF COOLANT

A1 CHECK COOLANT LEVEL

NOTE: If engine is hot, allow engine to cool before proceeding.

- Check coolant level at radiator coolant recovery reservoir.

Is coolant level OK?

Yes	No
GO to **A2** .	REFILL as outlined. GO to **A7** .

A2 CHECK FOR VISIBLE LEAKAGE

- Engine coolant has an added dye that makes the coolant an excellent leak detector.
- Check entire cooling system for visible leakage, clamps, hoses, water valve.

Is there visible leakage?

Yes	No
SERVICE leaking component. RETEST system.	GO **A3** .

A3 CHECK RADIATOR CAP

- Test pressure relief radiator cap. Refer to Radiator Cap/Pressure Relief Cap Pressure Test component test in this section.
- Allow engine to cool. Remove radiator cap, inspect radiator cap for foreign material between sealing gasket and diaphragm.

Did pressure relief radiator cap test OK?

Yes	No
GO to **A4** . Go to **A8** .	REPLACE damaged radiator cap. RETEST system. REFER to Cleaning and Inspection . Service as

tomsn048@gmail.com

	required.

A4 CHECK COOLANT FOR INTERNAL LEAKAGE

- Visually inspect coolant in radiator coolant recovery reservoir for signs of transmission fluid or engine oil.

Are contaminants evident in coolant?

Yes	No
If engine oil is evident, REMOVE cylinder head. Refer to Section 03-01A , Section 03-01B , or Section 03-01C , depending on engine. INSPECT for leaking head gasket and head or block cracks. If transmission fluid is evident, REPLACE the radiator as outlined in this section and CHECK condition of transmission fluid as outlined in this section.	GO to **A5** .

A5 CHECK ENGINE AND TRANSMISSION FOR COOLANT

- Remove fluid level indicator for engine and transmission.
- Carefully inspect fluid level indicator for evidence of coolant.

Is coolant evident?

Yes	No
If coolant is evident in engine oil, REMOVE cylinder head. Refer to Section 03-01A , Section 03-01B , or Section 03-01C , depending on engine. INSPECT for leaking head gasket and head or block cracks. If coolant is evident in transmission fluid, REFER to Fluid Condition. Check in Section 07-01A or Section 07-01B . REPLACE radiator.	GO to **A6** .

A6 PRESSURE TEST COOLING SYSTEM

- Pressurize cooling system. Refer to the procedure in this section.

  NOTE: Check inside vehicle for possible heater core leakage.

Is there leakage?

tomsn048@gmail.com

Yes	No
SERVICE leaking component. RETEST system.	GO to **A7** .

A7 CHECK RADIATOR OVERFLOW HOSE

- Remove radiator overflow hose.
- Inspect radiator overflow hose for obstruction, cracks or cuts.

Is radiator overflow hose condition OK?

Yes	No
GO to A9.	SERVICE hose as required.

A8 CHECK RESERVOIR

- Replenish coolant to "Cold" level.
- Inspect radiator coolant recovery reservoir for leaks.

Is there leakage at radiator coolant recovery reservoir?

Yes	No
REPLACE radiator coolant recovery reservoir. RESTORE vehicle.	REFER to Pressure Test in this section. SERVICE as required.

PINPOINT TEST B: ENGINE OVERHEATS

B1 CHECK COOLANT LEVEL

NOTE: If engine is hot, allow engine to cool before proceeding.

- Remove radiator cap and check coolant level at radiator coolant recovery reservoir.

Is coolant level OK?

Yes	No
GO to **B2** .	REFILL as outlined. GO to Pinpoint Test A .

B2 CHECK DRIVE BELT

- Inspect drive belt for proper adjustment and signs of damage.

tomsn048@gmail.com

Is drive belt properly adjusted and showing no sign of damage?

Yes	No
GO to **B3** .	ADJUST or REPLACE drive belt. REFER to Section 03-05 . RETEST system.

B3 CHECK FOR AIRFLOW OBSTRUCTION

- Visually inspect A/C condenser core and radiator for obstructions, such as leaves or bugs.

Is there any obstruction?

Yes	No
REMOVE obstruction and CLEAN A/C condenser core and radiator. RETEST system.	GO to **B4** .

B4 CHECK WATER THERMOSTAT OPERATION

- Run engine for 10 minutes.
- Feel the inlet and outlet heater water hose and the underside of the upper radiator hose.

Are the upper radiator hose and heater water hoses cold?

Yes	No
REPLACE water thermostat. REFER to the procedure in this section. RETEST system.	GO to **B5** .

B5 CHECK COOLING FAN

- Engine running.
- Check for proper cooling fan clutch operation as outlined in Component Tests.

Did cooling fan clutch operate OK?

Yes	No
GO to **B6** .	REPLACE fan clutch. REFER to the procedure in this section. RETEST system.

B6 CHECK FOR RUST OR CORROSION ON RADIATOR TUBES

- Remove radiator cap and inspect header ends of radiator tubes for signs of blockage by rust that migrated from engine or from corroding tubes.

Is there evidence of rust or corrosion blocking tubes?

tomsn048@gmail.com

Yes	No
REPLACE radiator.	GO to **B7** .

B7 CHECK WATER PUMP CONDITION AND OPERATION

- Inspect water pump for leaking or signs of bearing or seal concerns such as grease on the water pump shaft.
- Remove drive belt and check for water pump shaft looseness.
- Rotate water pump manually; feel for bearing problems and the possibility the impeller came loose from the shaft.

Does water pump appear OK?

Yes	No
GO to **B8** .	REMOVE and INSPECT water pump. REPLACE water pump as required. REFER to the procedure in this section.

B8 CHECK ENGINE COOLANT PASSAGES FOR OBSTRUCTION

- Remove cylinder heads. Refer to Section 03-01A , Section 03-01B , or Section 03-01C , depending on engine.
- Probe coolant passageways with a long thin screwdriver to see if there is obstruction from rust, scale, or core sand.

Are rust, scale, or sand obstructing coolant passageways?

Yes	No
SCRAPE coolant passageways clean with long, thin screwdriver, then FLUSH.	RESTORE vehicle. PERFORM road test.

PINPOINT TEST C: ENGINE DOES NOT REACH NORMAL OPERATING TEMPERATURE

C1 CHECK THERMOSTAT OPERATION

- Perform either the Electrical Thermostat Test component tests or Mechanical Thermostat Test component test as described in this section.

Does water thermostat pass either of these tests?

Yes	No
REINSTALL water thermostat and CHECK temperature gauge for proper operation.	REPLACE thermostat.

tomsn048@gmail.com

REFER to the procedure in this section.	

PINPOINT TEST D: ENGINE BLOCK HEATER DOES NOT OPERATE PROPERLY

D1 CHECK PLUG AND WIRE

- Check for corroded or broken spades on plug.
- Check for broken, cracked or cut wires.

Are plug and wires OK?

Yes	No
GO to **D2** .	REPAIR or REPLACE as necessary. GO to **D2** .

D2 CHECK CONTINUITY OF PLUG AND WIRES

- Disconnect plug and block heater. Check continuity of wires from plug to element connectors.

Are plug and wires OK?

Yes	No
GO to **D3** .	REPAIR or REPLACE plugs and wires as necessary. GO to **D4** .

D3 CHECK RESISTANCE OF BLOCK HEATER

- Plug disconnected.
- Check for continuity across block heater pins.

Is there continuity?

Yes	No
GO to **D4** .	REPLACE engine block heater. GO to **D4** .

D4 CHECK OPERATION

- Reconnect block heater.
- Key ON. Make sure engine is cold (ambient temperature). Key OFF.
- Plug in block heater to known good 120V A/C source and wait 10 minutes.
- Key ON. Coolant should be up to 5 to 10℃ (40-50°F) (bottom of NORMAL range on gauge).

tomsn048@gmail.com

Has system performed as specified?

Yes	No
ADVISE customer of proper operation.	REPLACE engine block heater.

tomsn048@gmail.com

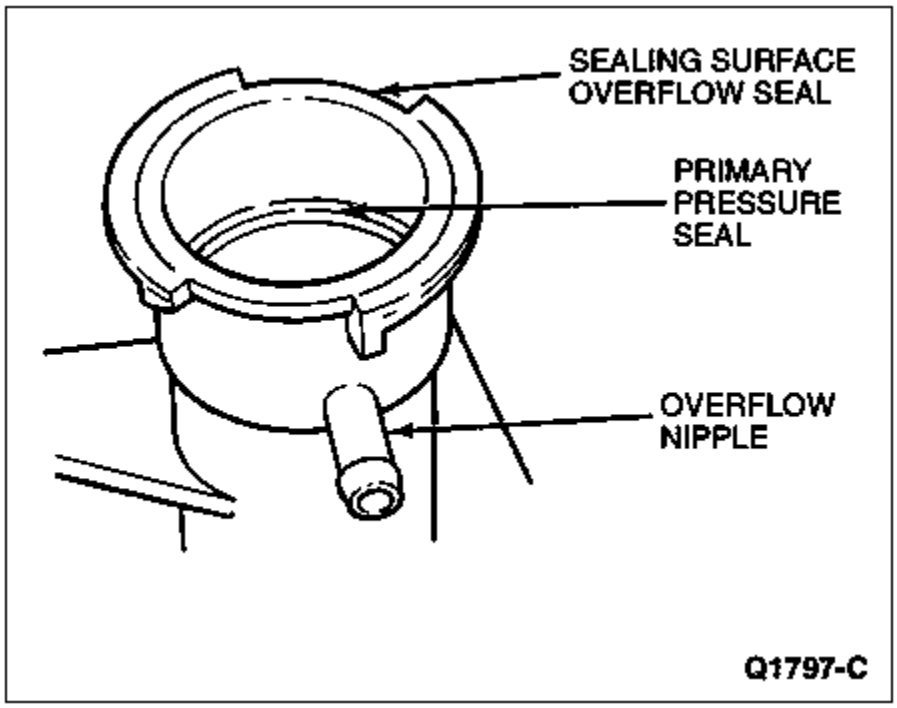
Component Test

Pressure Test

WARNING: NEVER REMOVE THE RADIATOR CAP UNDER ANY CONDITIONS WHILE THE ENGINE IS OPERATING OR WHEN THE COOLING SYSTEM IS HOT. FAILURE TO FOLLOW THESE INSTRUCTIONS COULD RESULT IN DAMAGE TO THE COOLING SYSTEM OR ENGINE OR PERSONAL INJURY. TO AVOID HAVING SCALDING HOT COOLANT OR STEAM BLOW OUT OF THE RADIATOR, USE EXTREME CARE WHEN REMOVING THE RADIATOR CAP. WAIT UNTIL THE ENGINE HAS COOLED, THEN WRAP A THICK CLOTH AROUND THE RADIATOR CAP AND TURN IT SLOWLY TO THE FIRST STOP, STEP BACK WHILE THE PRESSURE IS RELEASED FROM THE COOLING SYSTEM. WHEN THE PRESSURE HAS BEEN RELEASED, PRESS DOWN ON THE RADIATOR CAP (STILL WITH A CLOTH), TURN AND REMOVE IT.

1. Shut off the engine (6007).
2. Open hood and install protective fender covers.
3. When engine is cool, carefully remove radiator cap (8100).
4. Disconnect battery ground cable (14301).
5. Adjust radiator coolant level to 25mm (1 inch) below filler neck before testing.
6. Disconnect the electrical connector from the water temperature indicator sender unit (10884) and remove the water temperature indicator sender unit from the engine.
7. Install the adapter fitting from the Rotunda Radiator/Heater Core Pressure Tester or equivalent (the adapter has a male thread on one end, and a hose connector on the other end to accommodate the tester hose).
8. Remove the radiator overflow hose (8075) from the overflow nipple. Install a separate hose firmly on the overflow nipple. Insert free end of hose into a container of water. Wipe sealing surfaces of filler neck and inspect for scratches, cracks, gouges, etc., that may prevent proper sealing. If seal surfaces are damaged in any way the radiator (8005) must be replaced.

tomsn048@gmail.com



9. Attach the pressure pump and gauge to the adapter fitting and pressurize the cooling system to 97 kPa (14 psi) (minimum test pressure).

   No bubbles should appear in the water container when the system is pressurized to the minimum test pressure. Gradually increase the system pressure until a slight stream of bubbles appear in the water container. Do not exceed the maximum operating pressure specification of 124 kPa (18 psi).

   Replace any radiator cap that exceeds the specified maximum operating pressure without discharging bubbles.

10. Remove and wash the radiator cap in clean water to dislodge all foreign particles from the gaskets if the radiator cap does not hold pressure. Check the sealing surface in the radiator filler neck.

    Inspect the cam lock flanges on both sides of the filler neck for maximum cap engagement.

11. Pressurize the cooling system as described in Steps 7-9 (using a radiator cap that operates within the specified minimum and maximum pressure limits) and observe the gauge reading for approximately two minutes. Pressure should be held between 97 and 124 kPa (14 and 18 psi) and should not drop during this time.

    Results: If the system holds pressure, proceed to Step 12.

    If the pressure drops, check for leaks at the engine-to-heater core hoses, engine-to-radiator hoses, bypass hose, water valve hose (if applicable), thermostat housing gasket, radiator and heater core (18476), etc. Also refer to engine system checks if a leak cannot be located in the cooling system. Correct any leaks found and recheck the system.

12. Release the system pressure by loosening the radiator cap, then remove the adapter. Install the water temperature indicator sender unit and check coolant level. Replenish as necessary with the correct coolant solution.

13. Check the radiator overflow hose for any obstructions which may block the flow of coolant either to or

tomsn048@gmail.com

from the radiator coolant recovery reservoir.

14. **NOTE: When the battery voltage is removed from the powertrain control module (PCM) (12A650), all learned values will be cleared and reset to predetermined values. When battery voltage is restored to the PCM, the vehicle may exhibit certain driveability concerns. It will be necessary to drive the vehicle to allow the PCM to relearn values for optimum driveability and performance.**

    Connect battery ground cable.

Radiator Cap/Pressure Relief Cap Pressure Test

WARNING: NEVER REMOVE THE RADIATOR CAP UNDER ANY CONDITIONS WHILE THE ENGINE IS OPERATING. FAILURE TO FOLLOW THESE INSTRUCTIONS COULD RESULT IN DAMAGE TO THE COOLING SYSTEM OR ENGINE AND/OR PERSONAL INJURY. TO AVOID HAVING SCALDING HOT COOLANT OR STEAM BLOW OUT OF THE RADIATOR, USE EXTREME CARE WHEN REMOVING THE RADIATOR CAP FROM A HOT RADIATOR. WAIT UNTIL THE ENGINE HAS COOLED, THEN WRAP A THICK CLOTH AROUND THE RADIATOR CAP AND TURN IT SLOWLY TO THE FIRST STOP. STEP BACK WHILE THE PRESSURE IS RELEASED FROM THE COOLING SYSTEM. WHEN IT IS CERTAIN ALL THE PRESSURE HAS BEEN RELEASED, PRESS DOWN ON THE RADIATOR CAP (STILL WITH A CLOTH), TURN AND REMOVE.

1. Remove radiator cap from radiator filler neck.
2. Use water to clean in area of rubber seal and vacuum relief valve. Immerse radiator cap in water and install radiator cap pressure test adapter from Rotunda Radiator/Heater Core Pressure Tester or equivalent on the radiator cap.

    The filler neck seal is reversible so it may be used on either end of radiator cap pressure test adapter.
3. Immerse filler neck seal in water and install in filler neck adapter. Then, install filler neck adapter with seal on open end of radiator cap pressure test adapter.
4. Connect female quick disconnect fitting of pressure test pump to male quick disconnect fitting of filler neck adapter.
5. **NOTE: If plunger of pump is depressed too quickly, an erroneous pressure reading will result.**

    Slowly depress plunger of pressure test pump until pressure gauge reading stops increasing, and note highest pressure reading obtained.
6. Release pressure by turning pressure relief screw counterclockwise. Then tighten pressure relief screw and repeat Step 5 at least twice to ensure pressure test reading is repeatable within acceptable gauge reading limits of radiator cap and is not erratic.
7. If pressure test gauge readings are not within acceptable gauge reading limits, replace radiator cap.

Thermostat, Water

tomsn048@gmail.com

The water thermostat (8575) should be replaced only after the following tests have been performed.

Thermostat Test, Electrical

CAUTION: Always vent the exhaust to the outside when performing this test.

NOTE: When the battery voltage is removed from the powertrain control module, all learned values will be cleared and reset to predetermined values. When battery voltage is restored to the PCM, the vehicle may exhibit certain driveability concerns. It will be necessary to drive the vehicle to allow the PCM to relearn values for optimum driveability and performance.

NOTE: Procedure is most accurate if performed indoors at less than 37.8°C (100°F) ambient air. This test may be performed with or without the hood open and with the engine warm or cold.

1. Check coolant level in radiator and engine coolant recovery reservoir. Fill as needed.

2. With the key OFF, remove the engine coolant temperature (ECT) sensor harness connector and attach the Rotunda Service Coolant Temperature Monitor Harness 007-00064 or equivalent as a jumper between the powertrain control module and the ECT. Attach a Rotunda 73 Digital Multimeter 105-R0051 or equivalent to the thermostat monitor harness. Voltage values (0 to 5 V) may now be monitored while the sensor retains its connection to the wiring harness.

   Rotunda New Generation STAR (NGS) Tester 007-00500 or the Service Bay Diagnostic System (SBDS) may be used to monitor the ECT on vehicles equipped with Data Link Connector (DLC). The SBDS sequence to use for the screen is: Toolbox-Electronic Engine Control and DCL-Item.

3. **NOTE: Running this test with the vehicle in gear or with the A/C compressor clutch engaged (running) will cause improper diagnosis.**

   Place transmission in PARK (P) or NEUTRAL (N).

4. Start the engine and allow to idle throughout this test. Allow engine to run for 2 minutes, then record the ECT voltage. Record ECT voltage every 60 seconds. When ECT voltage trend changes direction or only changes slightly (0.03 voltage or less) from the previous reading, record this as the thermostat opening voltage. Use the voltage and corresponding coolant temperature chart listed below.

Coolant Temperature °C (°F)	ECT (Volts)
22 (71)	3.00
43 (109)	2.01
71 (159)	1.01
82 (180)	0.75
91 (195)	.59
97 (206)	.50
105 (221)	.40

5. If the thermostat opening voltage is greater than 0.75 volts and less than 82°C (180°F), replace the water thermostat.

tomsn048@gmail.com

6. If the thermostat opening voltage is less than 0.75 volts and greater than 82°C (180°F), water thermostat is good and should not be replaced. Refer to the cooling Symptom Chart for further instructions.

7. If the voltage is less than 0.45 volts before the thermostat opens, the thermostat should be replaced.

Thermostat Test, Mechanical

Remove the water thermostat and immerse in a boiling solution of antifreeze and water mixture. An 92°C (197°F) water thermostat open to 0.08mm (0.003 inch), when heated in the boiling solution to 100°C (21 2° F), should open 3.2mm (0.125 inch).

If heat is not available, check the water thermostat for leakage. Hold the water thermostat up to a lighted background. Leakage of light around the thermostat valve at room temperature indicates that the water thermostat should be replaced. Some water thermostats have a small leakage notch at one location on the perimeter of the thermostat valve, which is considered normal.

Radiator Leak Test, Removed from Vehicle

CAUTION: Do not leak test an aluminum radiator in the same water that is used to leak test copper/brass radiators. Flux and caustic cleaners may be present in the test water which will corrode aluminum.

Clean the radiator before leak testing to prevent contaminating the test tank. Then leak test the radiator in clean water with 144 kPa (21 psi) air pressure.

A separate clean test tank is recommended for aluminum radiators. If a separate tank is not available for aluminum radiator testing, rinse the test tank each time before testing an aluminum radiator.

Fan Clutch Test

Spin the fan. A light resistance should be felt. If there is no resistance or very high resistance, replace the fan clutch.

tomsn048@gmail.com

tomsn048@gmail.com

Thermostat, Water, All Except 3.0L

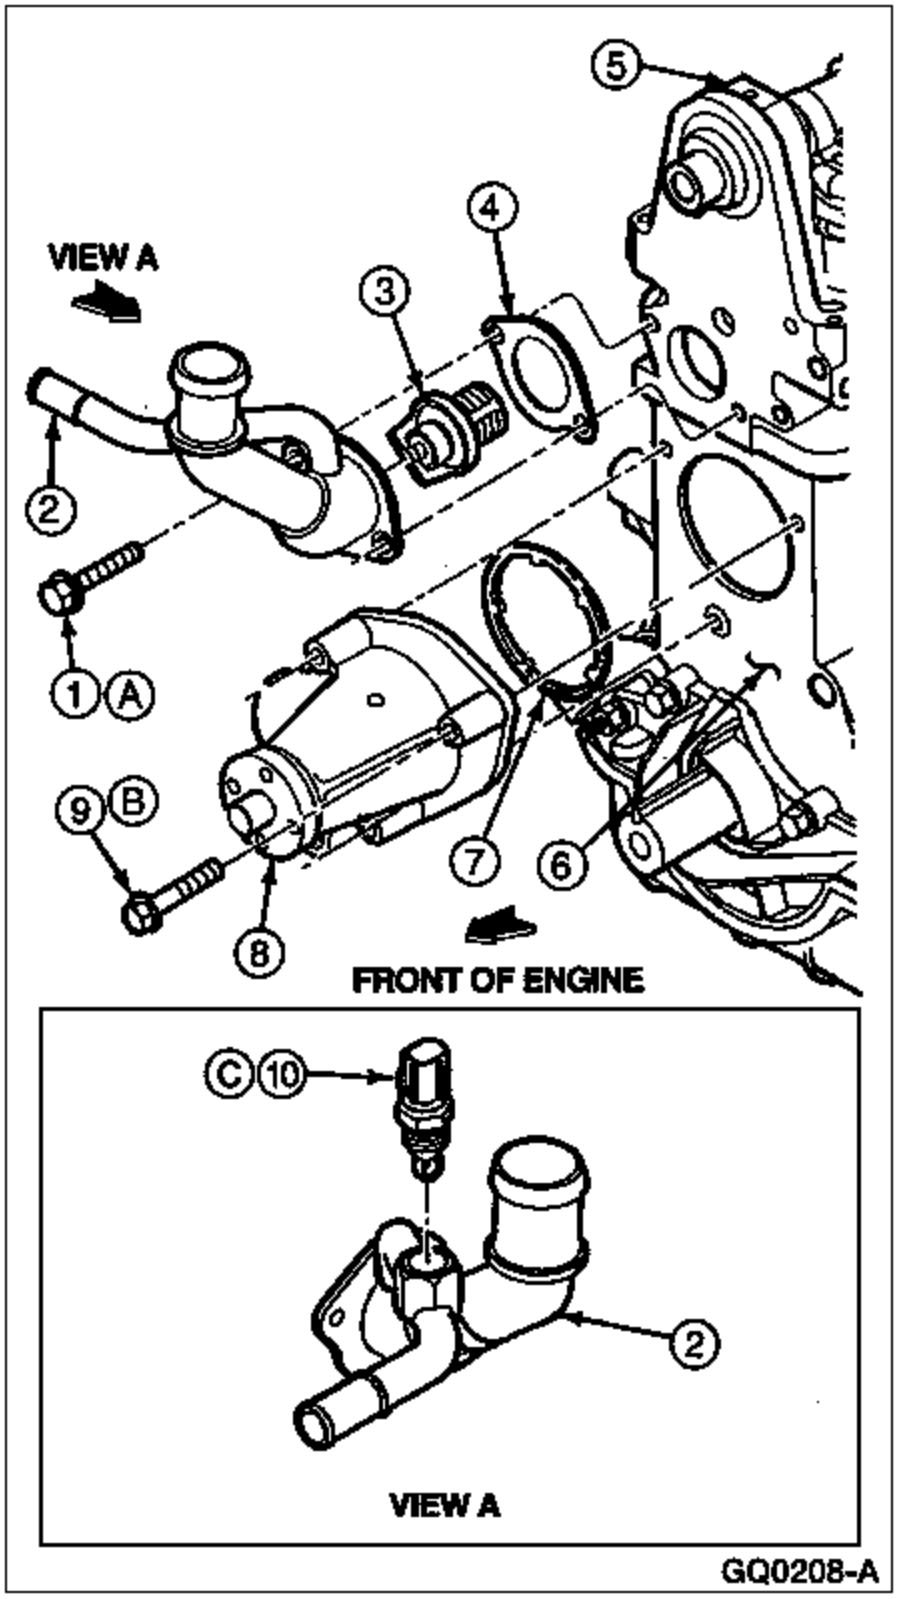
Removal

CAUTION: Do not pry on water thermostat (8575) to remove.

1. Drain the cooling system so that the coolant level is below the water thermostat as described in Cleaning and Inspection, Cooling System Draining and Filling in this section.
2. Disconnect the heater return hose at thermostat housing located on the left front lower side of the engine (6007) (2.3L only). Disconnect engine coolant temperature sensor (ECT sensor) (12A648) connector (2.3L only).
3. Remove upper radiator hose (8260).
4. Remove the coolant outlet housing retaining bolts. Pull the elbow away from the cylinder head (6049) or manifold sufficiently to provide access to the water thermostat. Remove the water thermostat and gasket.

2.3L Engine

tomsn048@gmail.com



Item	Part Number	Description

7	8575	Water Thermostat
A	—	Tighten to 9-12 Nm (77-110 Lb-In)
B	—	Sealing Ring Must Be Preassembled onto Thermostat Prior to Thermostat Installation. Air Release Valve Must Be Positioned Once Thermostat Is Installed.

tomsn048@gmail.com

Installation

WARNING: DO NOT STAND IN LINE WITH OR NEAR RADIATOR FAN BLADE (8600) WHEN ENGINE IS RUNNING.

CAUTION: The thermostat seal (8590) must be positioned on the water outlet connection before the water thermostat is installed.

To prevent incorrect installation of the water thermostat, the water outlet connection casting contains a locking recess into which the water thermostat is turned and locked. Install the water thermostat with the bridge section in the outlet casting. Turn the water thermostat clockwise to lock it in position on the flats cast into the water outlet connection.

1. Clean the upper radiator hose connection, cylinder head and water outlet connection surfaces. Coat a new thermostat housing gasket with Perfect Seal Sealing Compound B5A-19554-A or equivalent meeting Ford specification ESE-M4G115-A. Position the thermostat housing gasket on the cylinder head opening.

   It is critical that the correct water thermostat installation alignment be made to provide coolant flow to heater. Insert and rotate water thermostat to the left or right until it stops in the water outlet connection housing, then visually check for full width of heater outlet tube opening to be visible within the thermostat port in assembly.

   This port alignment at assembly is required to provide maximum coolant flow to the heater.

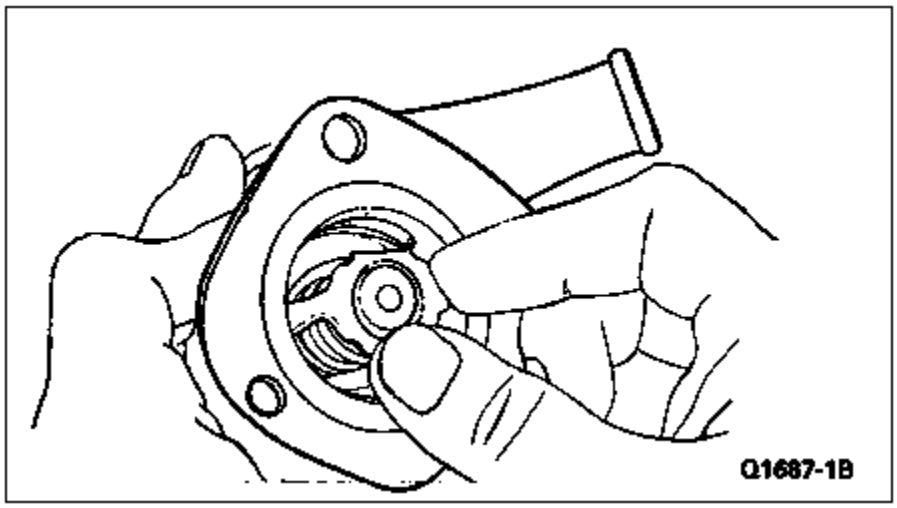
2. Position the coolant water outlet connection against the cylinder head, intake manifold (9424) or water pump (8501). Install and tighten the retaining bolts to 20-30 Nm (14-21 lb-ft).

3. Connect the upper radiator hose to water outlet connection.

4. Fill the cooling system with the recommended Premium Cooling System Fluid E2FZ-19549-AA or equivalent meeting Ford specification ESE-M97B44-A and water mixture as described in this section. Check for leaks and proper coolant level after the engine has reached operating temperature.

   A coolant mixture of 50 percent ethylene glycol and 50 percent water is recommended to maintain best overall performance. To avoid damaging the radiator (8005), the ethylene glycol should not exceed 60 percent.

tomsn048@gmail.com



tomsn048@gmail.com

Thermostat, Water, 3.0L Aerostar and Ranger

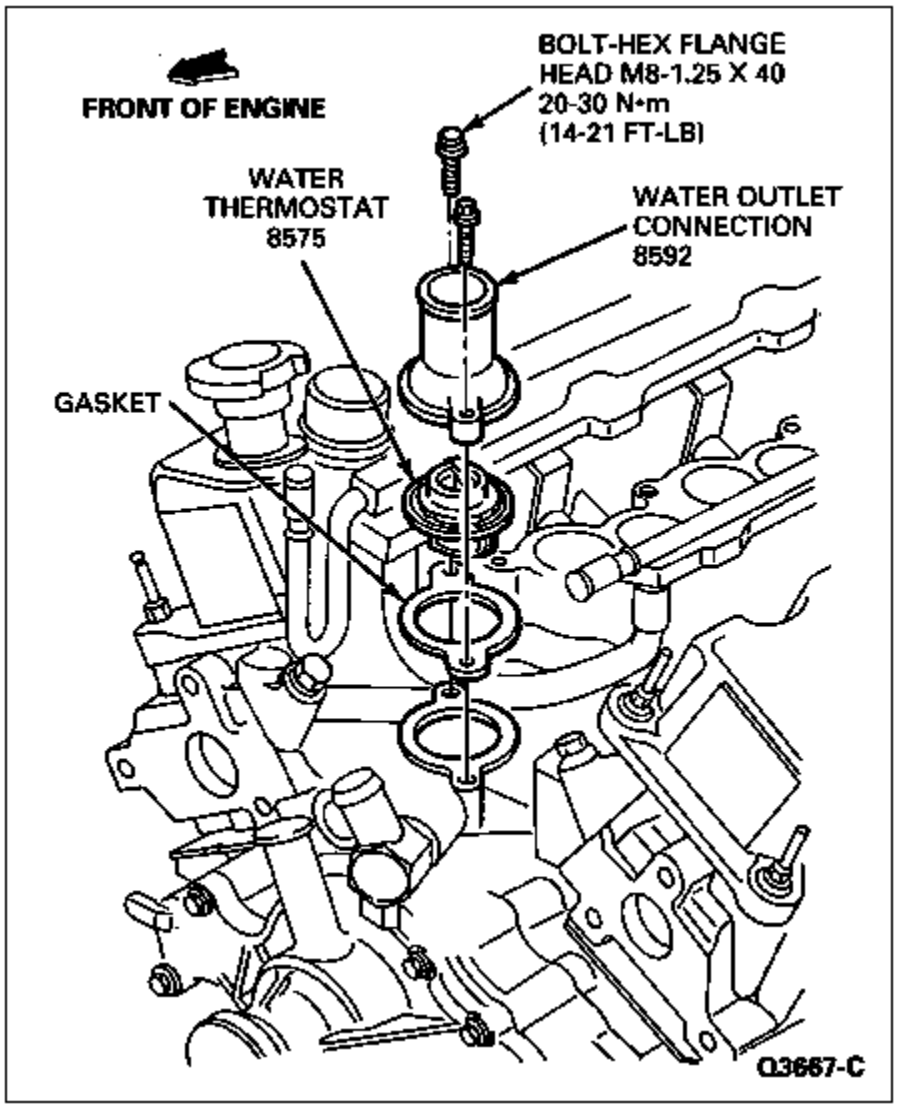
Removal

1. Drain cooling system.
2. Remove upper radiator hose (8260) from water outlet connection.
3. Remove two retaining bolts.
4. Remove water outlet connection and water thermostat (8575) as an assembly.
5. Discard gasket. Clean sealing surfaces with gasket scraper. Gouges in aluminum could form leak paths. Use care when scraping thermostat housing-to-gasket mating surfaces.

Installation

1. Make sure sealing surfaces are totally free of gasket material.
2. Install water thermostat into thermostat housing as illustrated.
3. Position gasket onto thermostat housing using bolts as holding devices. Install water thermostat and tighten bolts to 20-30 Nm (14-21 lb-ft).
4. Install upper radiator hose. Tighten clamp securely.
5. Fill and bleed cooling system with proper amount and mixture.
6. Start engine (6007) and check for coolant leaks.

tomsn048@gmail.com



tomsn048@gmail.com

tomsn048@gmail.com

Thermostat, Water, 3.0L Aerostar and Ranger

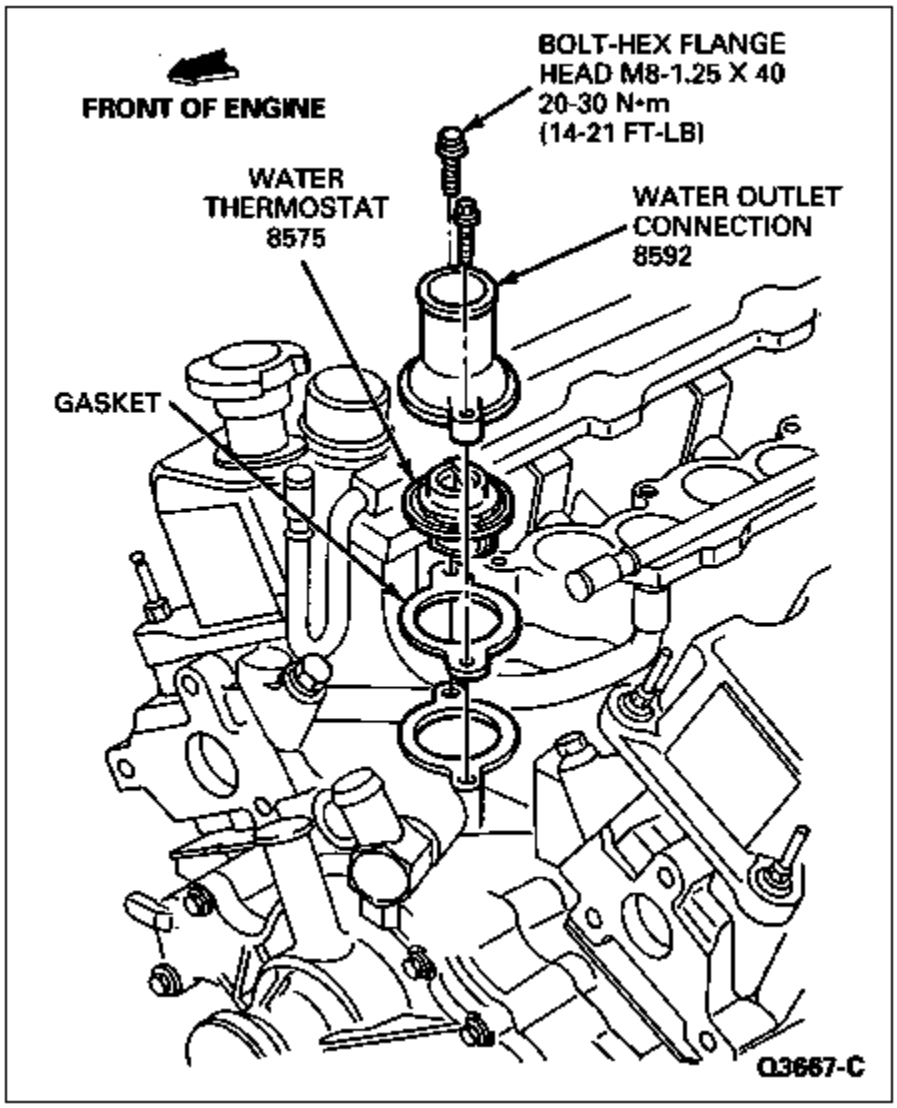
Removal

1. Drain cooling system.
2. Remove upper radiator hose (8260) from water outlet connection.
3. Remove two retaining bolts.
4. Remove water outlet connection and water thermostat (8575) as an assembly.
5. Discard gasket. Clean sealing surfaces with gasket scraper. Gouges in aluminum could form leak paths. Use care when scraping thermostat housing-to-gasket mating surfaces.

Installation

1. Make sure sealing surfaces are totally free of gasket material.
2. Install water thermostat into thermostat housing as illustrated.
3. Position gasket onto thermostat housing using bolts as holding devices. Install water thermostat and tighten bolts to 20-30 Nm (14-21 lb-ft).
4. Install upper radiator hose. Tighten clamp securely.
5. Fill and bleed cooling system with proper amount and mixture.
6. Start engine (6007) and check for coolant leaks.

tomsn048@gmail.com



tomsn048@gmail.com

tomsn048@gmail.com

Radiator Hoses

Collapsing radiator hoses (especially upper radiator hose (8260)) may be an indication of a malfunctioning vacuum relief valve in the radiator cap (8100). Inspect and clean radiator cap. (Refer to Cleaning and Inspection, Radiator Pressure Cap in this section). Also make sure that overflow hose is open between radiator coolant recovery reservoir and radiator (8005).

Removal

Replace the cooling system hoses whenever they become cracked, swelled, deteriorated, or have a tendency to collapse.

Partially drain the cooling system to replace the cooling system upper radiator hose. Drain the cooling system completely to replace the lower radiator hose (8286).

NOTE: In some cases, constant tension spring clamps are used to attach the upper radiator hose and lower radiator hose to the radiator.

1. Drain or partially drain the cooling system by removing the radiator cap and attaching a 9.5mm (3/8-inch) inside diameter hose to the draincock nipple, located at the lower rear corner of the radiator. Then open the radiator draincock (8115) and allow the coolant to flow through the hose into a suitable container.

2. Expand the clamps on each end of the hose(s) to be removed. Slide the hose(s) off the connections.

Installation

WARNING: DO NOT STAND IN LINE WITH OR NEAR THE ENGINE COOLING FAN BLADE WHEN THE ENGINE IS RUNNING.

1. Position the clamps on each end of the new hose. Slide the hose onto the connectors.

2. Slide the clamps toward the ends of the hose until each clamp is completely beyond the beads and is fully seated.

3. Fill the cooling system with a 50/50 mixture of ethylene glycol and water and bleed the system.

4. Operate the engine (6007) for several minutes, then check the hose(s) and connections for leaks.

tomsn048@gmail.com

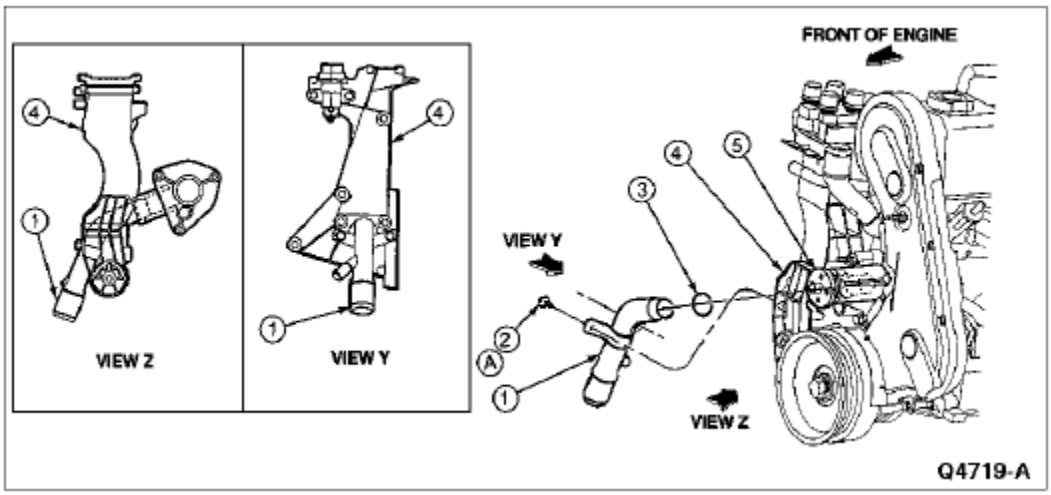
tomsn048@gmail.com

Radiator Lower Hose Tube, 2.3L Engine

Removal and Installation

1. Drain cooling system.
2. Raise vehicle.
3. Remove the lower radiator hose clamp and disconnect the lower radiator hose (8286) from the water pump inlet tube (8290).
4. Disconnect lower heater water hose (18472) from lower radiator hose if necessary.
5. Remove the two screws retaining the lower radiator hose to the generator mounting bracket (10153).
6. Remove lower radiator hose from the radiator (8005).
7. To install, reverse removal procedure. Always use a new O-ring. Apply Ford Multi-Purpose Grease D0AZ-19584-AA or equivalent meeting Ford specification ESE-M99B176-A grease to small diameter of O-ring prior to installation. Tighten screws to 9-12 Nm (78-107 lb-in). Refill and bleed the cooling system as outlined in Cleaning and Inspection, Draining and Filling in this section.

Water Inlet Tube, 2.3L



Item	Part Number	Description
1	8290	Water Pump Inlet Tube
2	N606676-S2	Screw and Washer Assembly, M6-1 x 22.5
3	87056-S100	O-Ring

tomsn048@gmail.com

4	10153	Generator Mounting Bracket
5	8501	Water Pump
A	—	Tighten to 9-12 Nm (78-107 Lb-In)

tomsn048@gmail.com

Bypass Hose

There is no bypass hose on 2.3L, and 4.0L engines. On 2.3L engines coolant bypass with a closed thermostat is achieved through internal passageways in the cylinder blocks (6010) and cylinder head (6049). On 4.0L engines, bypass is achieved through passageways in the lower intake manifold and cylinder blocks.

tomsn048@gmail.com

Engine Oil Cooler

Removal

1. Drain the cooling system. Refer to procedure in this section.
2. Remove the lower radiator hose (8286). Refer to the procedure in this section.
3. Remove the oil bypass filter (6714).
4. Remove the cooler hose clamps (reposition on hose).
5. Remove the oil cooler bolt.
6. Remove the oil cooler (6A642).
7. Remove the engine oil cooler-to-water pump hose.

Installation

CAUTION: Be sure to check and adjust engine oil level to proper levels.

To install, reverse the removal procedure.

Tighten the oil bypass filter one-half turn after gasket contact.

Tighten oil cooler bolt 54-88 Nm (40-65 lb-ft).

tomsn048@gmail.com

tomsn048@gmail.com

EGR Valve Spacer Coolant Hoses

Removal

1. Disconnect the battery ground cable (14301).
2. Partially drain the cooling system.
3. Remove the air cleaner outlet tube (9B659).
4. Disconnect the electrical connector for the EGR external pressure valve (9F483).
5. Disconnect the vacuum hose for the EGR external pressure valve.
6. Remove the two EGR external pressure valve-to-spacer nuts and the EGR external pressure valve.
7. Loosen the hose clamps and remove the coolant supply and return hoses.

Installation

To install, reverse the removal procedure.

Tighten the two EGR external pressure valve nuts 16-24 Nm (12-18 lb-ft).

NOTE: When the battery voltage is removed from the powertrain control module (PCM) (12A650), all learned values will be cleared and reset to predetermined values. When battery voltage is restored to the PCM, the vehicle may exhibit certain driveability concerns. It will be necessary to drive the vehicle to allow the PCM to relearn values for optimum driveability and performance.

tomsn048@gmail.com

tomsn048@gmail.com

Bypass Hose — Aerostar 3.0L

Removal

1. Drain the cooling system by removing the radiator cap (8100) and attaching a 9.5mm (3/8-inch) inside diameter hose to the draincock nipple, located at the lower rear corner of the radiator. Then open the radiator draincock (8115) and allow the coolant to flow through the hose into a suitable container.
2. Loosen the hose clamps on the water bypass tube (8548).
3. Remove the water bypass tube.

Installation

To install, reverse the removal procedure.

tomsn048@gmail.com

Radiator

Aluminum Core, Crossflow

Removal

1. **NOTE: Refer to following illustrations.**

   Drain the cooling system by removing the radiator cap (8100) and attaching a 9.5mm (3/8-inch) inside diameter hose to the draincock nipple, located at the lower rear corner of the radiator tank. Then, open the radiator draincock (8115) and allow the coolant to flow through the hose into a suitable container.

2. Remove the air cleaner outlet tube (9B659).

3. Remove the rubber radiator overflow hose (8075) from the radiator (8005) and store it out of the way.

4. Use Fan Clutch Wrench T96T-6312-A and Fan Hub Wrench T96T-6312-B to remove the fan clutch (8A616) from the water pump pulley (8509).

5. Remove the two upper attaching screws of the fan shroud (8146) or finger guard. Lift the fan shroud out of the lower retaining clips and drape it on the fan blade (8600).

6. Loosen upper and lower hose clamps at the radiator and remove upper radiator hose (8260) and lower radiator hose (8286) from the radiator connectors.

7. For vehicles with automatic transmission (7003):

   a. Disconnect the two transmission cooling lines from the oil cooler fittings on the radiator.
   b. Disconnect the transmission cooler tube support bracket from the bottom flange of the radiator by removing the screw.

8. Remove the two radiator upper attaching screws.

9. Tilt the radiator back (rearward) approximately 25mm (one inch) and lift directly upward, clear of the radiator support bracket (8052) and the fan blade.

10. If either upper radiator hose or lower radiator hose is to be replaced, loosen clamp at the engine end and slip the hose off the connections with a twisting motion.

11. Lift the fan shroud off the fan and remove from the vehicle.

12. Remove the radiator lower support rubber insulators.

Installation

WARNING: DO NOT STAND IN LINE WITH OR NEAR ENGINE COOLING FAN BLADE WHEN

tomsn048@gmail.com

REVVING ENGINE (6007).

1. Position the radiator lower support rubber insulators to radiator support bracket.

2. Position fan shroud on fan assembly before radiator is installed.

3. If either upper radiator hose or lower radiator hose has been replaced, position hose on engine with index arrow in line with mark on fitting at engine.

4. Position radiator into engine compartment to radiator support bracket, being careful to clear fan blade. Make sure that mountings on both tanks are inserted into holes in rubber insulators of radiator support bracket and that the radiator is firmly seated on insulators. Be sure to attach overflow hose to the nipple on filler neck.

5. Install upper attaching bolts to attach the radiator to the radiator support bracket. Tighten to 6-8 Nm (52-71 lb-in).

6. For vehicles with automatic transmission:

    a. Loosely connect the two transmission cooling lines to radiator oil cooler fittings.
    b. Connect the transmission cooler tube support bracket to the bottom flange of the radiator with the attaching screw.
    c. Attach cooler tubes onto plastic clip on tube radiator support bracket.
    d. Tighten cooler tube nuts attaching the cooler tube to radiator connectors. Tighten tube nuts to 16-24 Nm (12-18 lb-ft).

7. Attach upper radiator hose to radiator. Position upper radiator hose on radiator connector so that stripe on hose is at the 12 o'clock position. Slide the hose clamp (8287) into its installed position.

8. Position lower radiator hose to radiator with stripe on lower radiator hose at 6 o'clock position. Slide the hose clamp into its installed position.

9. Position fan shroud in lower retainer clips and attach the top of the fan shroud to radiator with two screw and washer assemblies. Tighten to 6-8 Nm (53-71 lb-in).

10. Attach rubber radiator overflow hose to radiator and radiator coolant recovery reservoir (8A080). Make sure radiator overflow hose is attached to uppermost nipple on filler neck.

11. Fill the cooling system with a 50/50 mixture of ethylene glycol and water, and bleed the system.

12. Operate the engine for several minutes and check hoses and connections for leaks.

Radiator Coolant Recovery Reservoir

Removal

1. Drain the coolant from the radiator coolant recovery reservoir (8A080) by disconnecting the overflow line at the radiator filler neck overflow nipple and allowing it to siphon into a suitable container.

2. Remove the radiator coolant recovery reservoir attachments and remove the combination radiator coolant recovery reservoir.

Installation

WARNING: DO NOT STAND IN LINE WITH OR NEAR THE ENGINE COOLING FAN BLADE (8600) WHEN THE ENGINE (6007) IS RUNNING.

1. Position the radiator coolant recovery reservoir in the vehicle and install attaching screws. Tighten to 6-8 Nm (52-71 lb-in).

2. Connect the overflow tube to the radiator (8005).

3. Fill and bleed the cooling system. Check for coolant leaks and proper coolant level after the engine reaches normal operating temperature.

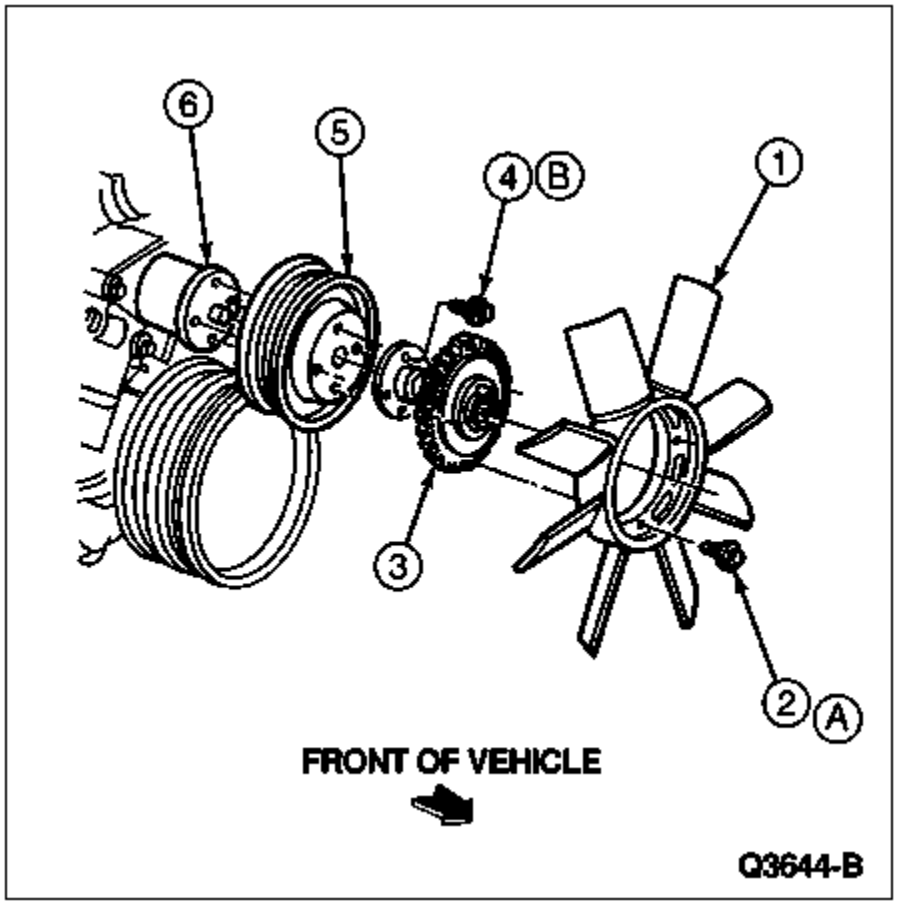
tomsn048@gmail.com

Cooling Fan Blade and Fan Clutch, Mechanical

2.3L

Removal

1. Loosen four screws holding fan clutch (8A616) to water pump pulley (8509).
2. Loosen belt tension. Remove four screws retaining fan clutch and fan blade (8600) to water pump pulley. Remove assembly from vehicle.
3. If equipped with fan shroud (8146), remove two screws, disconnect overflow tube and remove from vehicle. Lift fan shroud off lower retaining clips. Place fan shroud behind fan in order to access fan bolts.
4. Remove four screws retaining fan to fan clutch and separate.



tomsn048@gmail.com

Item	Part Number	Description
1	8600	Fan Blade
2	N602527-S2	Screw and Washer Assembly, M6-1.0 x 14
3	8A616	Fan Clutch

6	8501	Water Pump
A	—	Tighten to 6-8 Nm (53-71 Lb-In)
B	—	Tighten to 16-24 Nm (12-17 Lb-Ft)

Installation

1. Position fan to fan clutch and secure with four screws. Tighten to 6-8 Nm (53-70 lb-in).
2. Install fan shroud to radiator (8005). Tighten screws to 6-8 Nm (53-71 lb-in). Connect the overflow tube.
3. Position fan and fan clutch to water pump pulley and secure with four screws. Tighten to 16-24 Nm (12-17 lb-ft).

3.0L and 4.0L

SPECIAL SERVICE TOOLS DESIRED

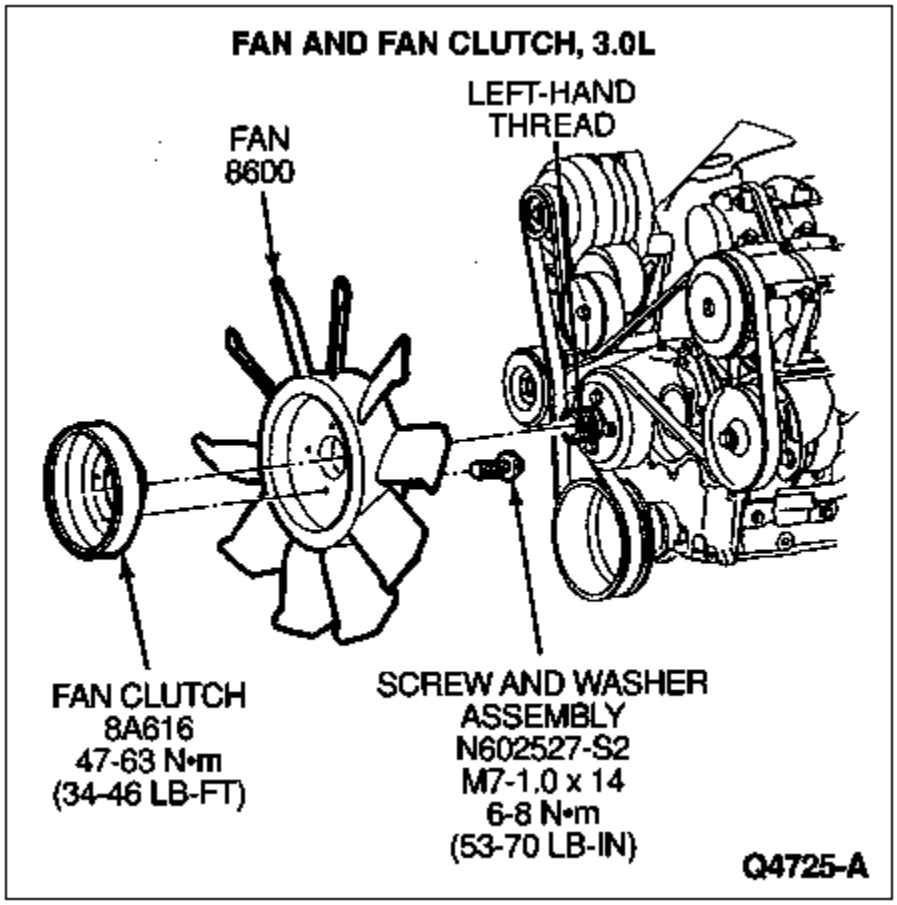
Tool Number	Description
T84T-6312-C	Fan Clutch Holding Tool
T84T-6312-D	Fan Clutch Nut Wrench

Removal

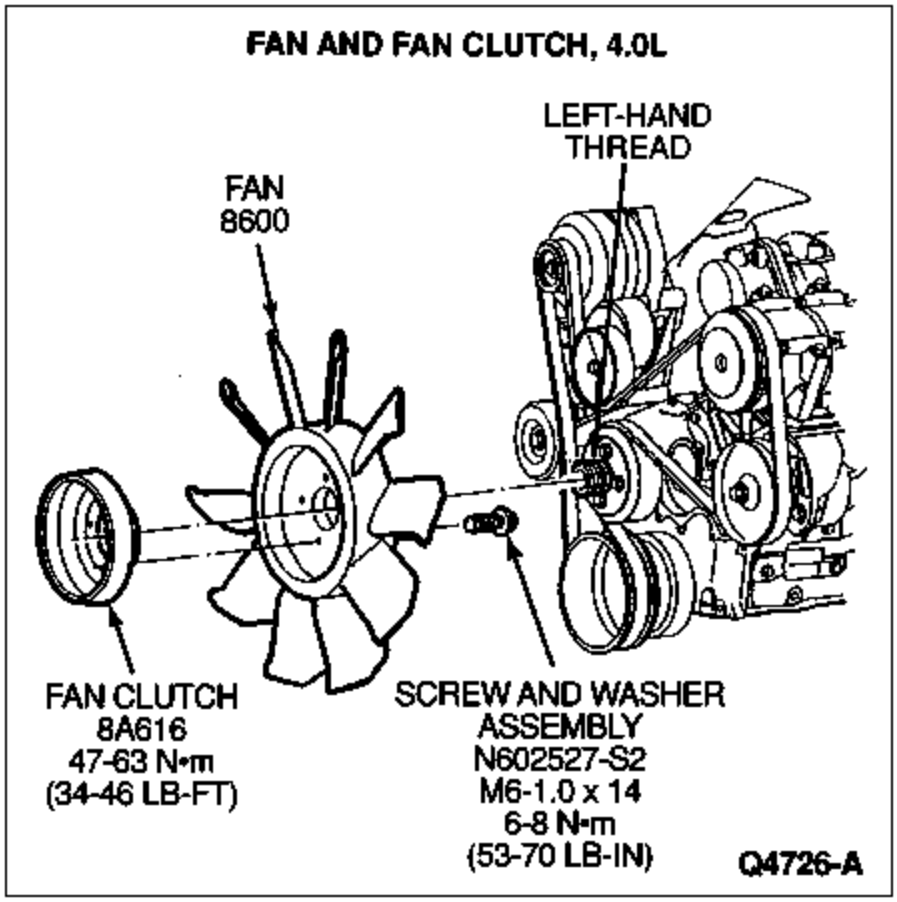
1. Remove the fan shroud as outlined in Removal and Installation, Radiator in this section.
2. **CAUTION: On 3.0L engines only, the large nut which attaches fan clutch to the hub of the water pump shaft has a left-hand thread and must be rotated clockwise for removal.**

   Remove the nut using Fan Clutch Holding Tool T84T-6312-C and Fan Clutch Nut Wrench T84T-6312-D.
3. Remove the fan and fan clutch as an assembly.
4. Remove the bolts attaching the fan to the fan clutch, if necessary.

tomsn048@gmail.com



tomsn048@gmail.com

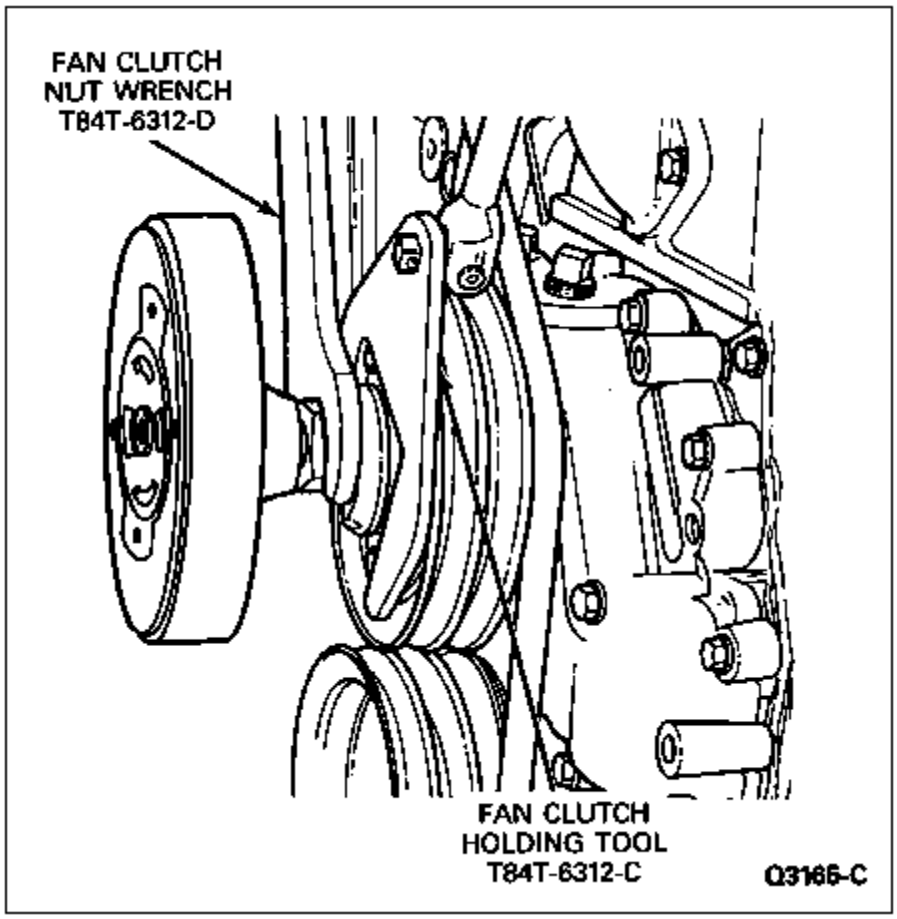


Installation

CAUTION: On 3.0L engines only, the fan clutch nut has a left-hand thread and must be rotated counterclockwise for tightening.

For installation, follow removal steps in reverse order. Tighten the fan-to-clutch bolts to 6-8 Nm (53-71 lb-in). Tighten the fan clutch assembly nut to 47-63 Nm (34-46 lb-ft).

tomsn048@gmail.com



tomsn048@gmail.com

Radiator Draincock

Aluminum Core Radiator

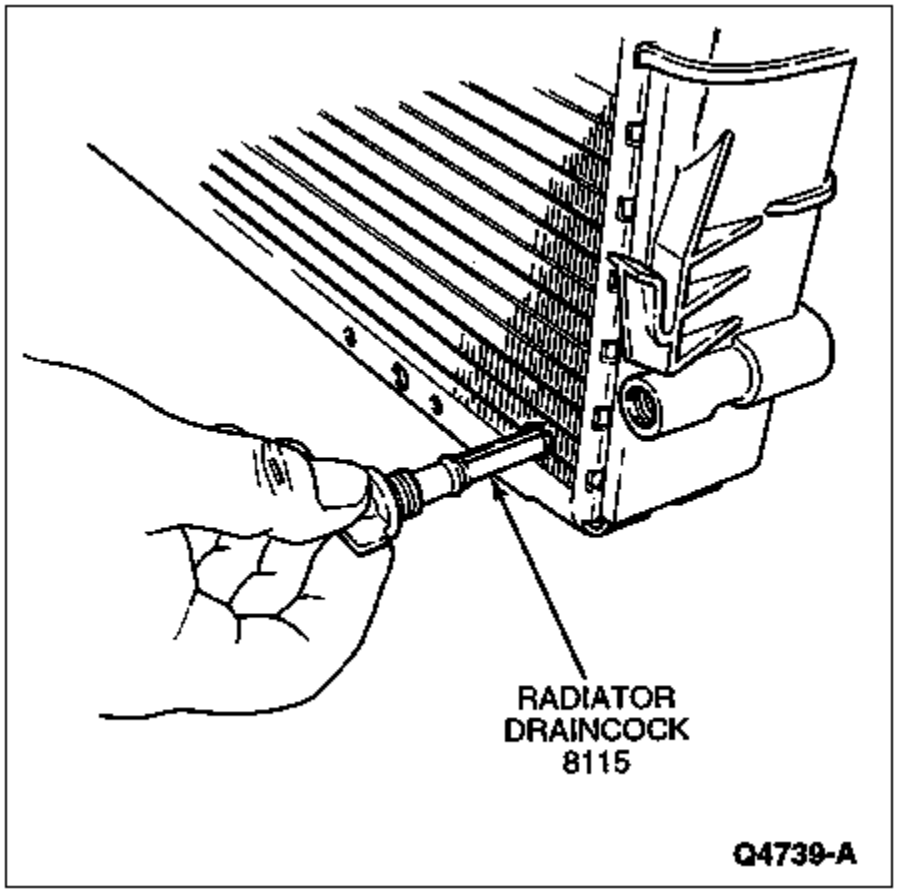
The radiator draincock (8115) is located near the bottom of the inlet tank.

Removal

1. Drain the cooling system by removing the radiator cap (8100) and attaching a 9.5mm (3/8 inch) inside diameter hose to the draincock nipple, located at the lower rear corner of the radiator tank. Then, open the radiator draincock and allow the coolant to flow through the hose into a suitable container.

   Remove the rubber hose from the radiator (8005) and store it out of the way.

2. Unscrew the stem to the ends of the threads. Gently pull the stem from the radiator tank.



Installation

1. Push the radiator draincock into the tank opening until it snaps into place. Continue to push the radiator draincock into the tank until the threads on the draincock engage the threads on the tank.

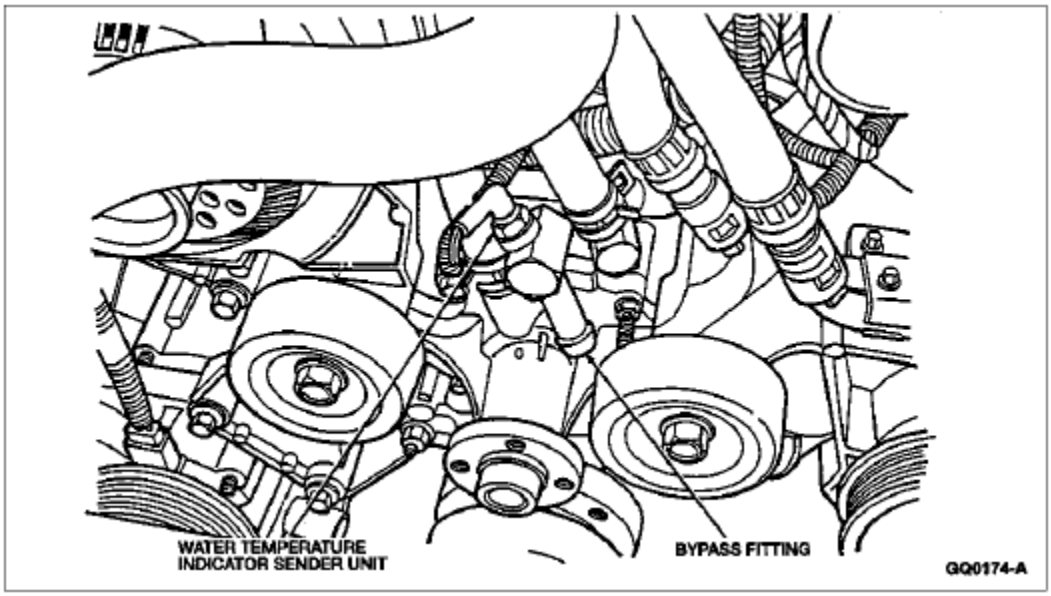
tomsn048@gmail.com

2. Tighten the draincock stem by turning clockwise to 2.0-2.7 Nm (18-25 lb-in).

---

tomsn048@gmail.com

Water Temperature Indicator Sender Unit



Removal and Installation

WARNING: NEVER REMOVE THE RADIATOR CAP UNDER ANY CONDITIONS WHILE THE ENGINE IS OPERATING. FAILURE TO FOLLOW THESE INSTRUCTIONS COULD RESULT IN DAMAGE TO THE COOLING SYSTEM OR ENGINE AND/OR PERSONAL INJURY. TO AVOID HAVING SCALDING HOT COOLANT OR STEAM BLOW OUT OF THE RADIATOR, USE EXTREME CARE WHEN REMOVING THE CAP FROM A HOT RADIATOR. IF POSSIBLE, WAIT UNTIL THE ENGINE HAS COOLED, THEN WRAP A THICK CLOTH AROUND THE RADIATOR CAP AND TURN IT SLOWLY TO THE FIRST STOP. STEP BACK WHILE THE PRESSURE IS RELEASED FROM THE COOLING SYSTEM. WHEN YOU ARE SURE ALL THE PRESSURE HAS BEEN RELEASED, PRESS DOWN ON THE CAP (STILL WITH A CLOTH), TURN AND REMOVE IT.

1. Remove radiator cap (8100) to relieve any pressure and then replace cap. This reduces coolant loss during sender replacement.
2. Disconnect the temperature sending unit wire at the water temperature indicator sender unit (10884).
3. Prepare the new water temperature indicator sender unit for installation by applying Ford Pipe Sealant with Teflon® D8AZ-19554-A or equivalent meeting Ford specification WSK-M2G350-A2 or a small amount of electrically conductive sealer to the threads.
4. Remove the water temperature indicator sender unit and immediately install the new water temperature indicator sender unit. Tighten to 11-24 Nm (8-18 lb-ft).
5. Connect the temperature sending wire to the water temperature indicator sender unit.
6. Refill cooling system to replace lost coolant. Refer to the procedure in this section.

tomsn048@gmail.com

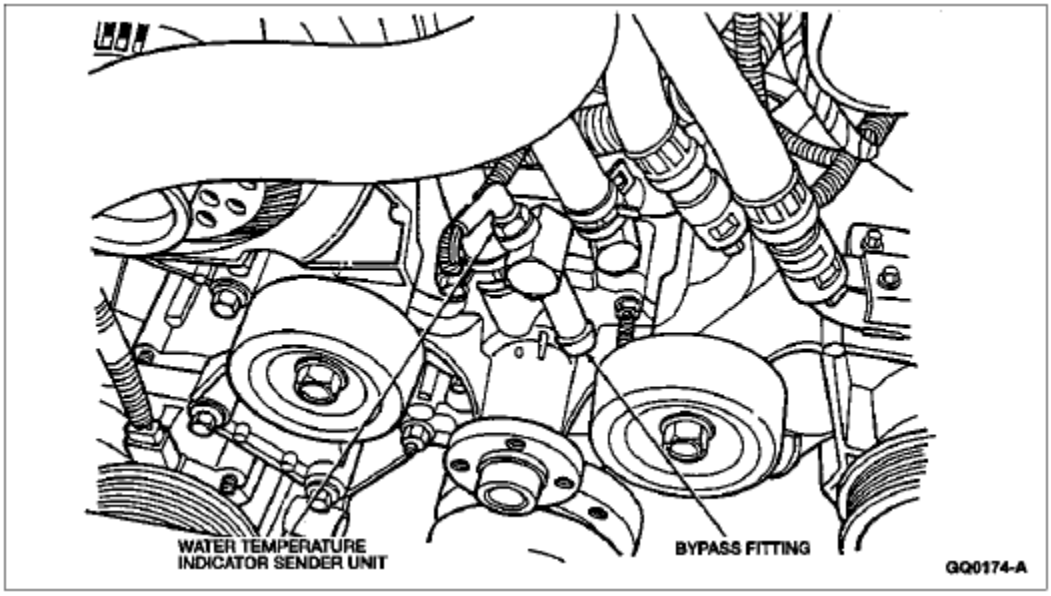
7. Start the engine (6007). Check the water temperature indicator sender unit operation.

---

tomsn048@gmail.com

Engine Coolant Temperature (ECT) Sensor

Removal



1. Disconnect the battery ground cable (14301).
2. Disconnect the spark plug wires at the ignition coils (12029).
3. Disconnect the electrical connectors to the ignition coils.
4. Remove the two ignition coil bracket-to-intake manifold nuts.
5. Disconnect the EGR vacuum regulator solenoid (9J459).
6. Remove the ignition coils.
7. Disconnect the engine coolant temperature (ECT) sensor connector.
8. Remove the engine coolant temperature sensor (ECT sensor) (12A648).

Installation

To install, reverse the removal procedure.

tomsn048@gmail.com

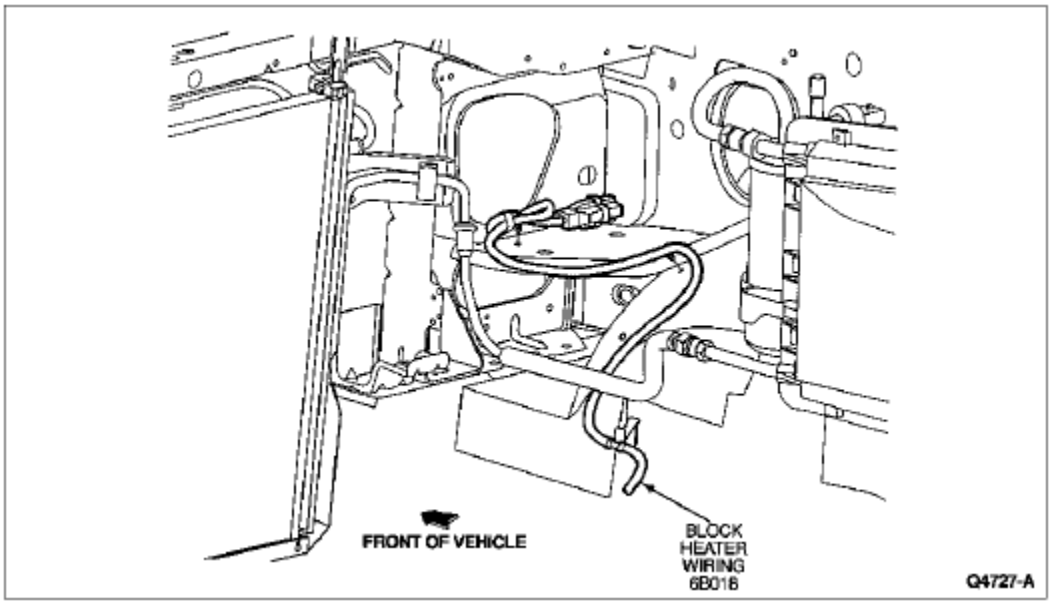
Tighten the engine coolant temperature sensor 13-20 Nm (10-15 lb-ft).

Tighten the ignition coil bracket-to-intake manifold nuts 16-24 Nm (12-18 lb-ft).

tomsn048@gmail.com

Block Heater Wiring

Block Heater Wiring Routing

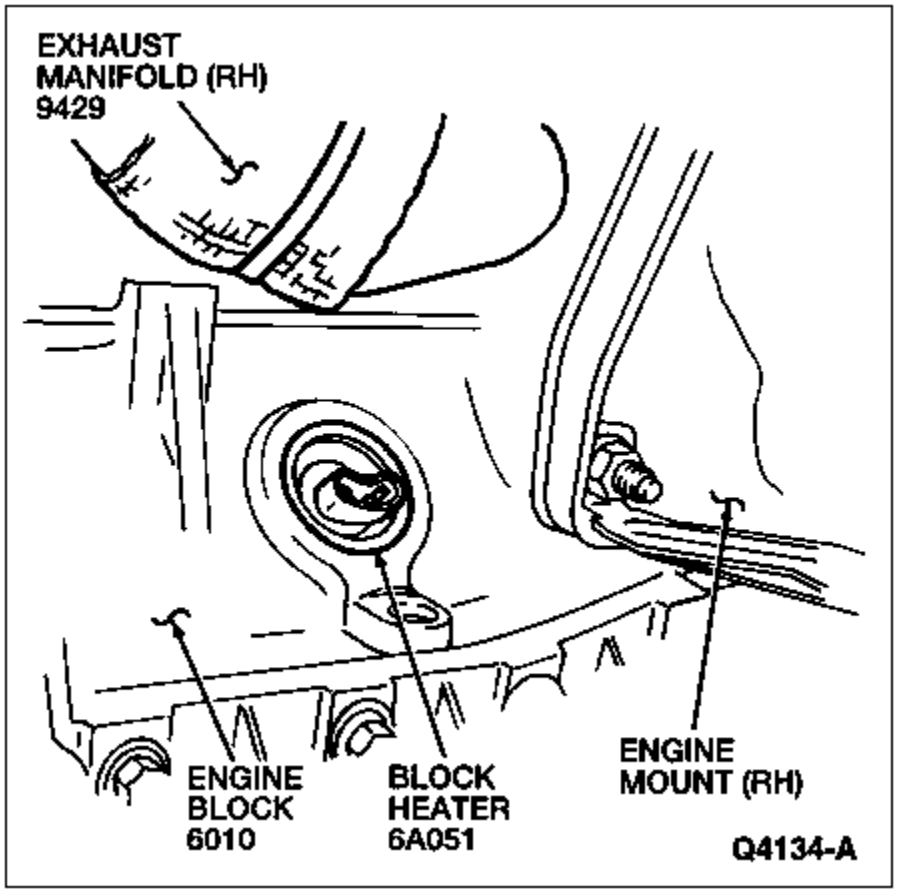


1. Unplug cable from block heater (6A051).
2. Use door trim panel removing tool to remove block heater wiring (6B018) from battery tray (10732), inner fender, engine mount brackets, and cylinder blocks (6010) (if applicable).
3. Remove block heater wiring from vehicle.
4. To install, reverse the removal procedure.

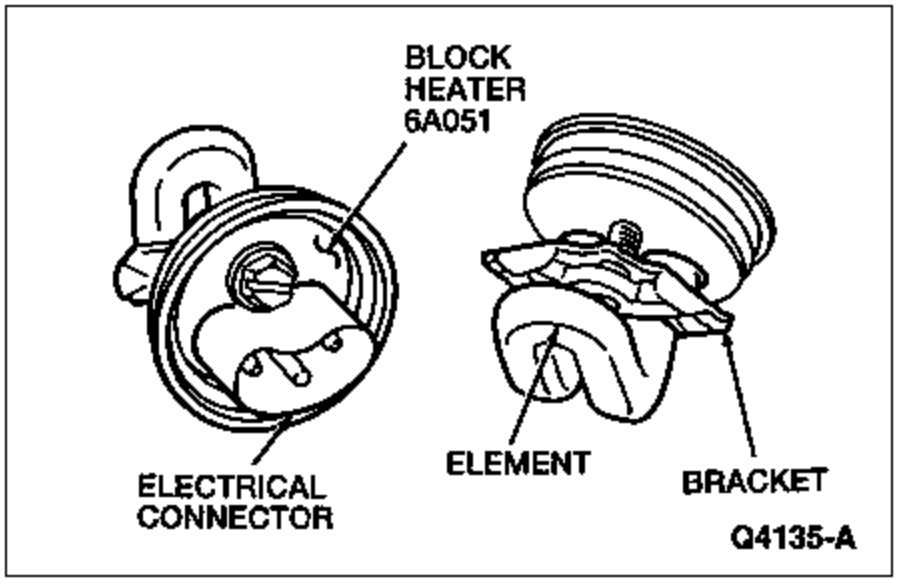
tomsn048@gmail.com

tomsn048@gmail.com

Block Heater



tomsn048@gmail.com



Removal and Installation

CAUTION: Exceeding the block heater (6A051) installation torque specification may damage new part and reduce sealing ability.

CAUTION: During removal threaded parts may fall into engine block cooling passages if excessively loosened.

NOTE: Service block heater by replacement only.

1. Open radiator draincock (8115) and remove coolant from radiator (8005) and engine (6007).
2. Unscrew the block heater screw only the minimum number of turns to gain "pry" access to the outer cup edge. Carefully remove the block heater. Note the position that the element is pointed. (e.g., 12 o'clock, 6 o'clock, etc.)
3. Clean the inside diameter of the core plug hole machined surface and hole entrance. Remove any burrs at the hole entrance to avoid damage to the O-ring.
4. Cover rubber O-ring and core opening with a liberal coating of Ford Premium Long-Life Grease XG-1-C or -K or equivalent meeting Ford specification ESA-M1C75-B.
5. Insert block heater in core plug hole in the same position as it was removed.
6. Tighten screw in normal clockwise direction. Torque to 1.6-1.8 Nm (14-16 lb-in).
7. Close radiator draincock and refill radiator with a mixture of 50/50 ethylene glycol and water.

SPECIFICATIONS

Engine Cooling System Refill Capacities

Engine	Equipment	Approximate Capacity		
		U.S. Quarts	Imperial Quarts	Liters
3.0L V-6	All Transmissions	11.8	9.8	11.2
2.3L I-4	All Transmissions	7.2	6.0	6.8
4.0L V-6	Base Cool — All Transmission and A/C Manual	8.1	6.5	7.6
4.0L V-6	Automatic Transmission — A/C, Super Cool	8.5	7.0	8.0

Cooling System Refill Capacities

Engine	Equipment	Approximate Capacity		
		U.S. Quarts	Imperial Quarts	Liters
3.0L V-6	All Transmissions	11.8	9.8	11.2
5.0L V-8	All Transmissions	13.5	11.2	12.8

Cooling System Pressure Specifications

Operating Pressure	Min. Test Pressure	Max. Operating Pressure
110 kPa (16 psi)	-97 kPa (-14 psi)	124 kPa (18 psi)

Cooling System Part Numbers/Application Chart

Refer to Master Parts List for service part numbers and applications.

Coolant Mixture

Refill recommendations are 50/50 mixture of water and permanent coolant/antifreeze such as Ford Premium Cooling System Fluid E2FZ-19549-AA or -B or equivalent meeting Ford specification ESE-M97B44-A.

Minimum acceptable coolant/water concentration is 45% antifreeze to 55% water. Maximum acceptable is 60% coolant to 40% water. Use only a hand held refractometer such as Rotunda Battery and Antifreeze Tester 014-R1060 or equivalent to check concentration.

In an emergency, ordinary tap water with a low alkali content may be used, provided the system is drained and flushed and filled with the specified coolant/water mixture as soon as possible.

Tips to Avoid Lean Air-Fuel Conditions

Rough idle, hesitation, poor throttle response, induction backfire and stalls during cold start/warm up may be caused by the poor volatility of some high octane premium grade unleaded fuels (91 octane or higher ([R+M]/2). When compared to regular grade unleaded fuel (87 octane ([R+M]/2), high octane premium grade unleaded fuel may cause long crank time.

Use a regular grade unleaded fuel in all vehicles, except where a premium unleaded fuel is recommended in the owner guide. If lean air-fuel type symptoms are experienced, determine the grade and brand of fuel used and offer the following service tips.

- Advise those using a higher octane grade fuel to switch to a regular grade unleaded fuel. For those using a regular grade fuel, advise them to try another brand.
- Do not advise using a higher octane unleaded fuel than is recommended for that specific engine. Ford engines are designed to perform best using a high quality regular grade unleaded fuel.
- Only advise using a higher octane unleaded fuel to avoid potentially damaging spark knock or ping, but do so only after mechanical repairs are ineffective.
- All unleaded gasolines used should contain detergent additives that are advertised as having KEEP CLEAN or CLEAN UP performance for both intake valves (6507) and fuel injectors (9F593).

Pressure Check

SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
Multiport Fuel Injection (MFI) Fuel Pressure Gauge (EFI/CFI)	T80L-9974-B

1. Disconnect electrical connection to inertia fuel shutoff switch (IFS switch) (9341).
2. Crank engine for 15 seconds to reduce system pressure.
3. Remove cap from fuel pressure relief valve (9H321) (Schrader valve).
4. **CAUTION: Use care to prevent combustion from fuel spillage.**

   Install Multiport Fuel Injection (MFI) Fuel Pressure Gauge (EFI/CFI) T80L-9974-B on fuel pressure relief valve.
5. Connect inertia fuel shutoff switch.
6. Start engine (6007) and check fuel pressure.
7. Accelerate engine. Pressure should remain stable throughout acceleration.

Refer to Powertrain Control/Emissions Diagnosis Manual for further diagnosis and testing procedures.

Fuel Charging System

Pre-Service Procedures

SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
Multiport Fuel Injection (MFI) Fuel Pressure Gauge (EFI/CFI)	T80L-9974-B

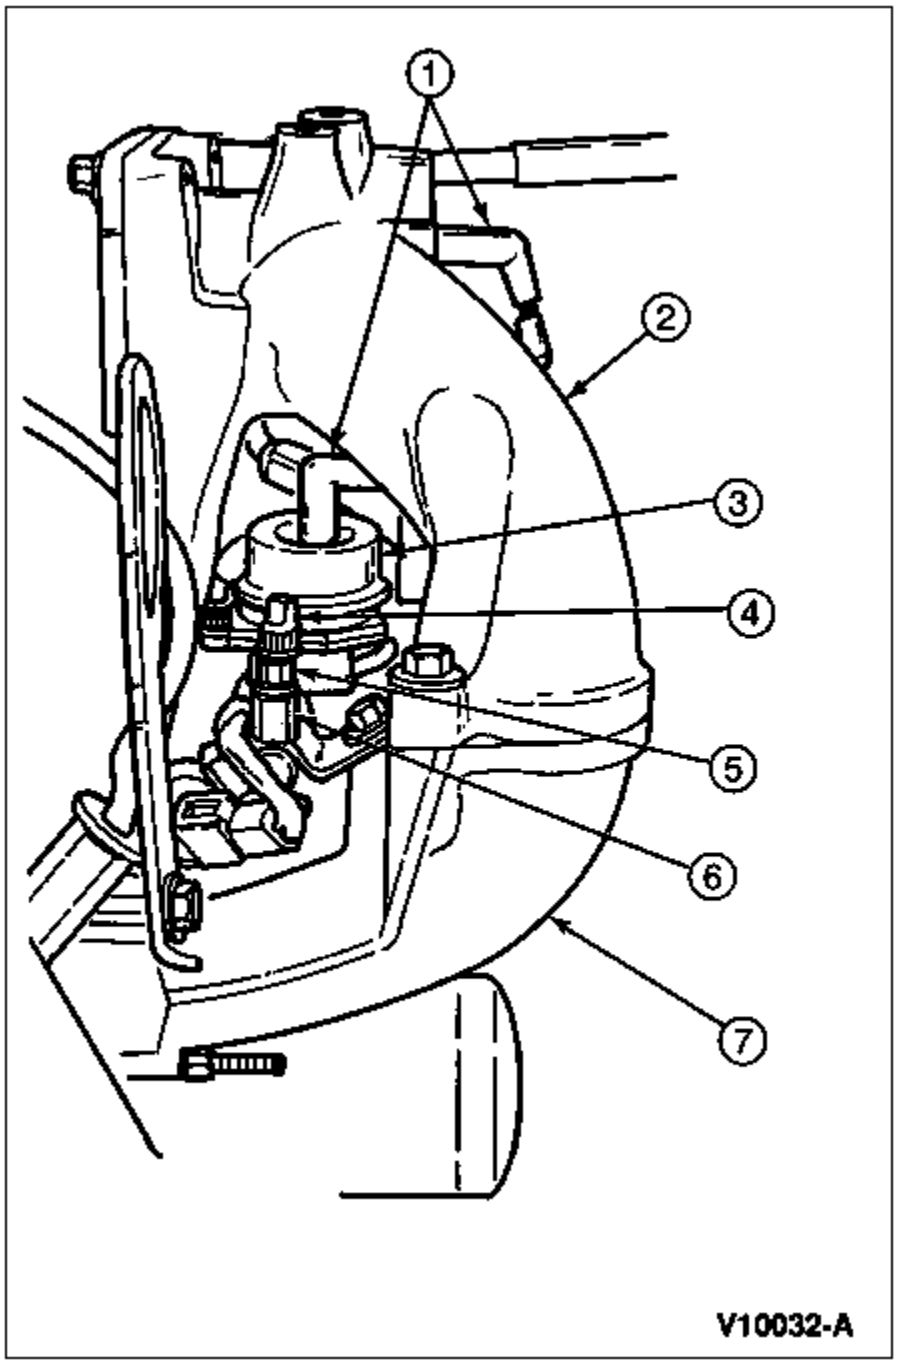
CAUTION: Fuel supply lines on SFI engines will remain pressurized for some period of time after the engine is shut off. This residual pressure must be relieved before servicing of the fuel system is begun.

WARNING: DISCONNECT BATTERY GROUND CABLE (14301) BEFORE PERFORMING ANY MAINTENANCE PROCEDURE WHICH MAY RESULT IN FUEL SPILLAGE OR LEAKING, EVEN IF FUEL IS DIRECTED INTO A SUITABLE CONTAINER. AS LONG AS THE BATTERY (10655) IS CONNECTED, THERE IS THE POSSIBILITY OF SHORTING AND SPARKING ELECTRICAL COMPONENTS AND RESULTING FIRE OR EXPLOSION HAZARD.

NOTE: There are two ways to release residual pressure in the system and prepare the vehicle for fuel system service.

First Method

1. Disconnect battery ground cable.
2. Remove fuel tank filler cap (9030) to relieve tank pressure.
3. Remove fuel pressure relief valve cap (9H323) and connect Multiport Fuel Injection (MFI) Fuel Pressure Gauge (EFI/CFI) T80L-9974-B to the fuel pressure relief valve (9H321) on the fuel injection supply manifold (9D280).



Item	Part Number	Description
1	9E498	Fuel Pressure Regulator Vacuum Tube
2	9424	Upper Intake Manifold
3	9C968	Fuel Pressure Regulator
4	9H323	Fuel Pressure Relief Valve Cap
5	9H321	Fuel Pressure Relief Valve
6	9D280	Fuel Injection Supply Manifold

7	9424	Lower Intake Manifold

4. Direct the drain hose to a suitable container and depress the pressure relief button.

Second Method

1. Disconnect inertia fuel shutoff switch (IFS switch) (9341). Inertia fuel shutoff switch location may be determined from owner's guide.
2. Operate ignition switch to crank the engine (6007) for 15-20 seconds to relieve pressure.
3. Disconnect battery ground cable.
4. Remove fuel tank filler cap to relieve tank pressure.

Post-Service Procedures

After the service is complete and the fuel charging assembly is installed onto engine, the following steps must be taken:

1. Install the fuel tank filler cap.
2. Connect battery ground cable.
3. **NOTE: Check all connections at fuel rails, push-connect fittings, fuel injectors, etc.**

   CAUTION: The fuel system is normally pressurized to 276 kPa (40 psi).

   Turn ignition switch (11572) on and off several times without starting engine to pressurize the fuel system. Check for fuel leaks at fuel pressure regulator (9C968), fuel injectors and fuel connect fittings.
4. Start engine and warm to operating temperature. Check for coolant leak if coolant was removed.
5. **NOTE: When the battery (10653) has been disconnected and reconnected, some abnormal drive symptoms may occur while the powertrain control module (PCM) (12A650) relearns its adaptive strategy. The vehicle may need to be driven 16 km (10 miles) or more to relearn the strategy.**

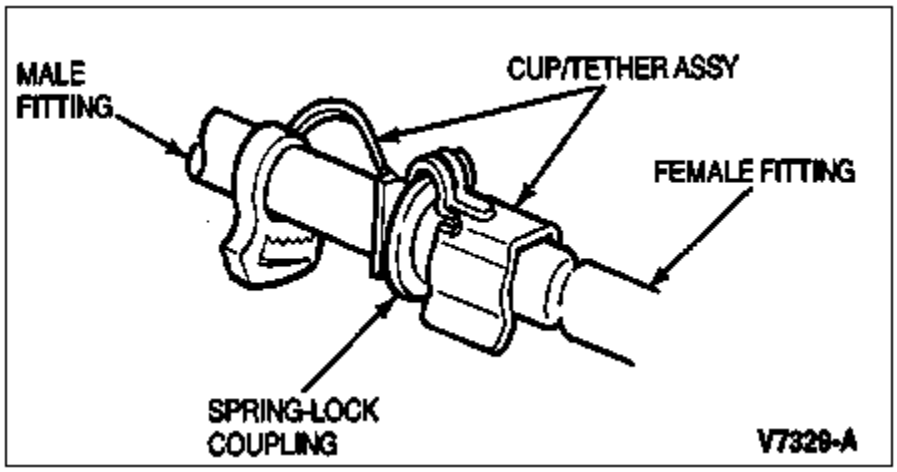
   Perform EEC self-test to check system's function. Refer to Powertrain Control/Emissions Diagnosis Manual. Recheck for fuel leaks.

Spring Lock Coupling

SPECIAL SERVICE TOOL(S) REQUIRED

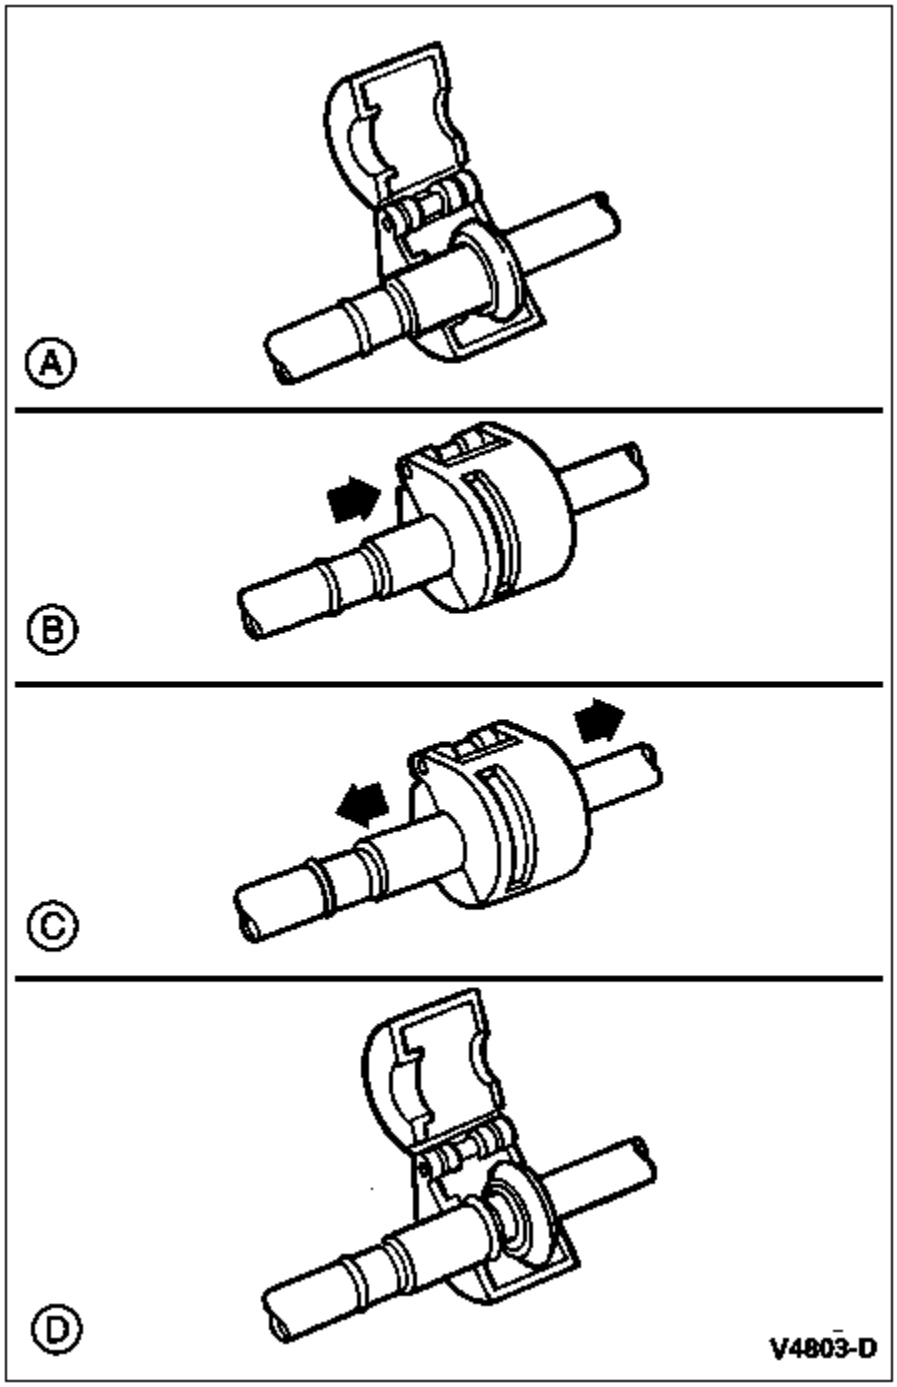
Description	Tool Number
Spring Lock Coupling Disconnect Tool (3/8 Inch)	T81P-19623-G1
Spring Lock Coupling Disconnect Tool (1/2 Inch)	T81P-19623-G2

The spring lock coupling is a fuel line coupling held together by a garter spring inside a circular cage. When the coupling is connected, the flared end of the female fitting slips behind the garter spring inside the cage of the male fitting. The garter spring and cage then prevent the flared end of the female fitting from pulling out of the cage. As a redundant locking feature, a horseshoe shaped retaining clip is incorporated to improve the retaining reliability of the spring lock coupling.



Removal

1. Perform pre-service procedures as outlined in Removal and Installation, Fuel Charging System in this section.
2. Remove retaining clip from spring lock coupling by hand only. Do not use any sharp tool or screwdriver as it may damage the spring lock coupling.
3. Twist fitting to free it from any adhesion at the O-ring seals.
4. Using Spring Lock Coupling Disconnect Tool T81P-19623-G1 (3/8 inch) or T81P-19623-G2 (1/2 inch), disconnect fuel hoses at the fuel rail supply tube and fuel rail return tube.
    a. Fit tool to coupling so tool can enter cage to release garter spring.
    b. Push the tool into the cage opening to release female fitting from garter spring.
    c. Pull the coupling male and female fittings apart.
    d. Remove the tool from the disconnected coupling.



Installation

1. Make sure the garter spring is in cage of male fitting. If garter spring is missing, install a new spring by pushing it into cage opening. If garter spring is damaged, remove it from cage with a small wire hook (do not use a screwdriver) and install a new spring.

2. Clean all dirt or foreign material from both pieces of coupling.

3. **WARNING: USE ONLY THE SPECIFIED O-RINGS AS THEY ARE MADE OF A SPECIAL MATERIAL. THE USE OF ANY O-RING OTHER THAN THE SPECIFIED O-RING MAY ALLOW**

THE CONNECTION TO LEAK INTERMITTENTLY DURING VEHICLE OPERATION.

Replace missing or damaged O-rings. Use only O-rings listed for spring lock couplings.

4. Lubricate male fitting and O-rings and inside of female fitting with clean engine oil XO-10W30-QSP or equivalent meeting Ford specification ESE-M2C153-E.

5. Fit female fitting to male fitting and push until garter spring snaps over flared end of female fitting.

6. Ensure coupling engagement by pulling on fitting and visually checking to make sure garter spring is over flared end of female fitting.

7. **NOTE: All vehicles require the large black clip to be installed on the supply side fuel line and the small gray clip to be installed on the return side fuel line.**

   Position retaining clip over metal portion of spring lock coupling. Firmly push retaining clip onto spring lock coupling. Make sure horseshoe portion of clip is over the coupling. Do not install retaining clip over rubber fuel line.

Fuel Charging Assembly

SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
Spring Lock Coupling Disconnect Tool (3/8 Inch)	T81P-19623-G1
Spring Lock Coupling Disconnect Tool (1/2 Inch)	T81P-19623-G2

Removal

1. **NOTE: Not all assemblies may be serviceable while on the engine. In some cases, removal of the fuel charging assembly may facilitate service of the various subassemblies. To remove the entire fuel charging assembly, the following procedure should be performed.**

   NOTE: If removing upper intake manifold for access to other components only, throttle body may remain attached.

   Perform pre-service procedures as outlined in Removal and Installation, Fuel Charging System in this section.

2. Disconnect intake air temperature sensor (IAT sensor) (12A697) and mass air flow sensor (MAF sensor) (12B579).

3. Remove air cleaner outlet tube (9B659).

4. Remove accelerator control splash shield (9E766).

5. Disconnect electrical connections to:

   a. Throttle position sensor (TP sensor) (9B989)
   b. Idle air control valve (IAC valve) (9F715)
   c. EGR vacuum regulator solenoid (9J459)

6. Disconnect accelerator cable (9A758).

7. Remove accelerator cable bracket bolts and tie bracket and cables out of the way.

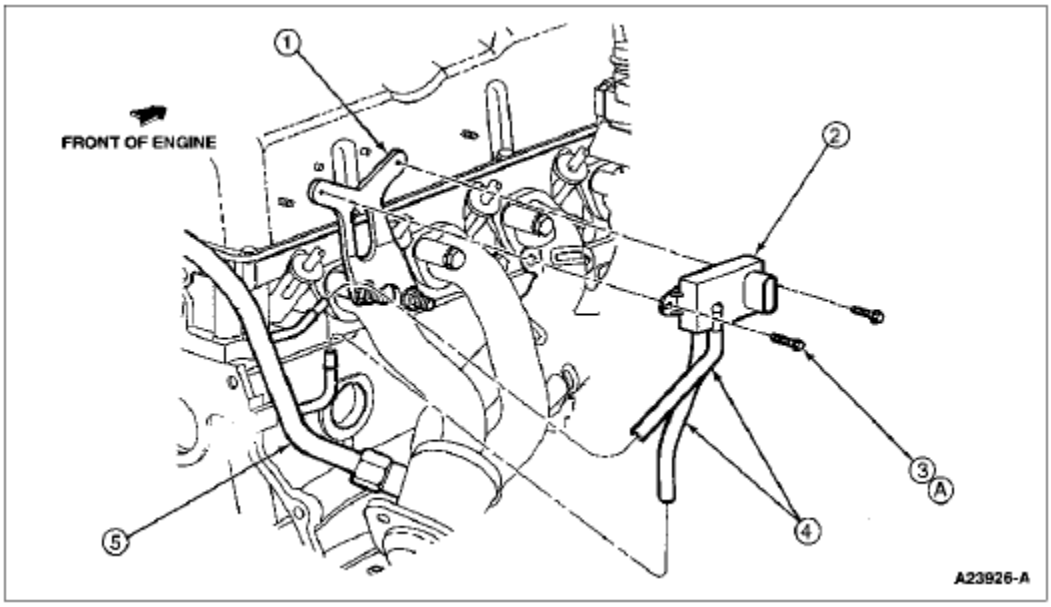
8. Disconnect crankcase ventilation hose (6853) from upper intake manifold.

9. Tag and disconnect vacuum hoses from manifold vacuum tee:

   a. Power brakes
   b. EGR
   c. Speed control
   d. Fuel pressure regulator

10. Disconnect EGR transducer hoses from EGR valve to exhaust manifold tube (9D477).

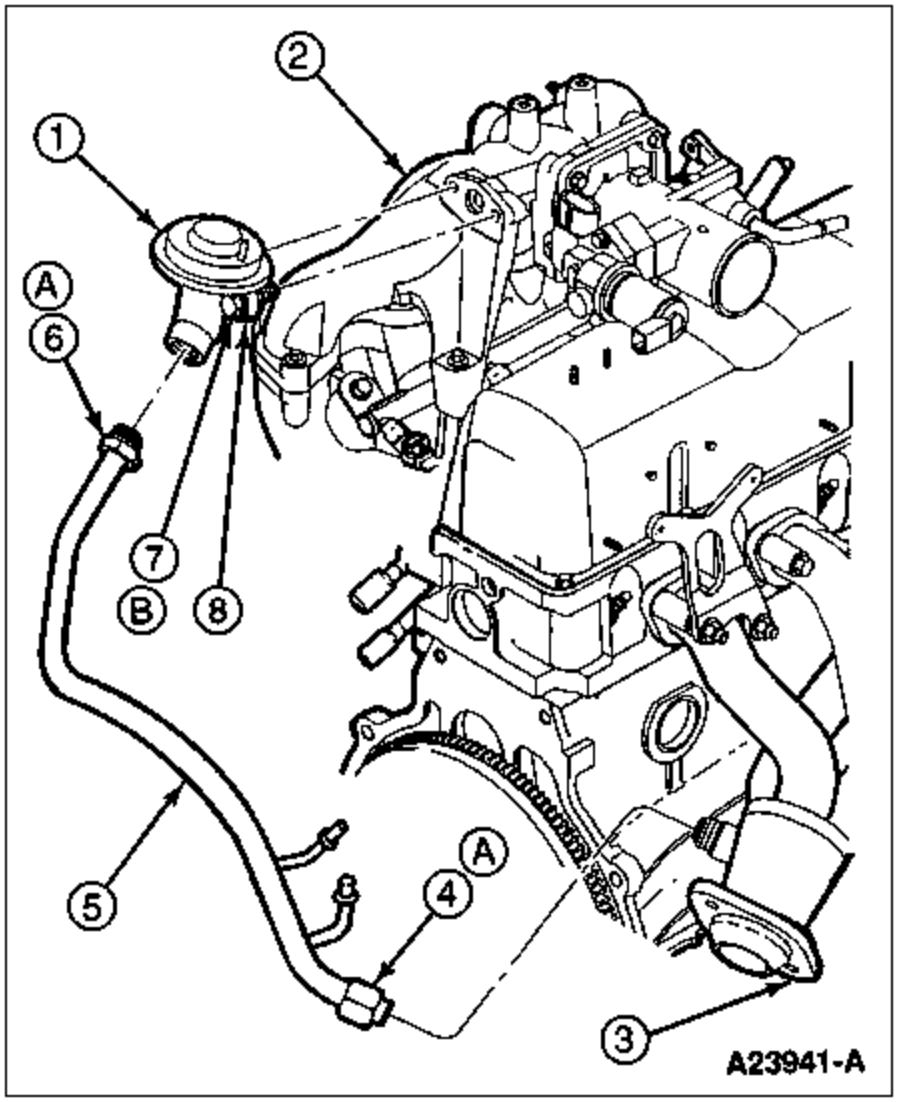
EGR Transducer



Item	Part Number	Description
1	17A084	Engine Lifting Eye
2	9J433	EGR Transducer
3	N807202-S36	Bolt, M5-0.8x16
4	—	Hoses (Part of 9J433)
5	9D477	EGR Valve to Exhaust Manifold Tube
A	—	Tighten to 2.7-3.7 Nm (24-32 Lb-Ft)

11. Apply Professional Choke and Linkage Cleaner E8AZ-19A501-AA, or equivalent penetrating lubricant meeting Ford specification ESR-M14P10-A to EGR tube nuts. Unscrew nuts and remove EGR valve to exhaust manifold tube.

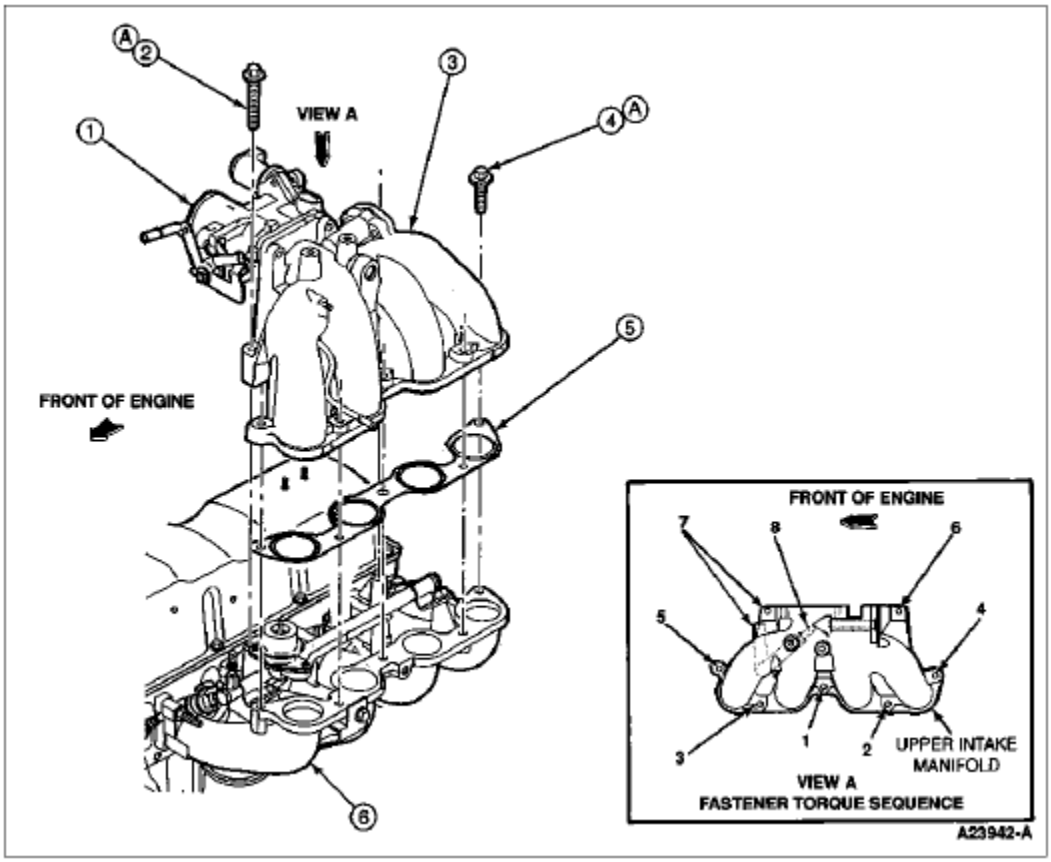
12. Remove two bolts and EGR valve (EGR valve) (9D475) and EGR valve gasket (9D476).



Item	Part Number	Description
1	9D475	EGR Valve
2	9424	Upper Intake Manifold
3	9430	Exhaust Manifold
4	—	Nut (Part of 9D477)
5	9D477	EGR Valve to Exhaust Manifold Tube
6	—	Nut (Part of 9D477)
7	N806781-S2	Screw, M8-1.25 x 35
8	9D476	EGR Valve Gasket
A	—	Tighten to 34-47 Nm (25-35 Lb-Ft)
B	—	Tighten to 20-30 Nm (15-22 Lb-Ft)

13. Remove six bolts and upper intake manifold and intake manifold upper gasket (9H486) from intake manifold (9424).

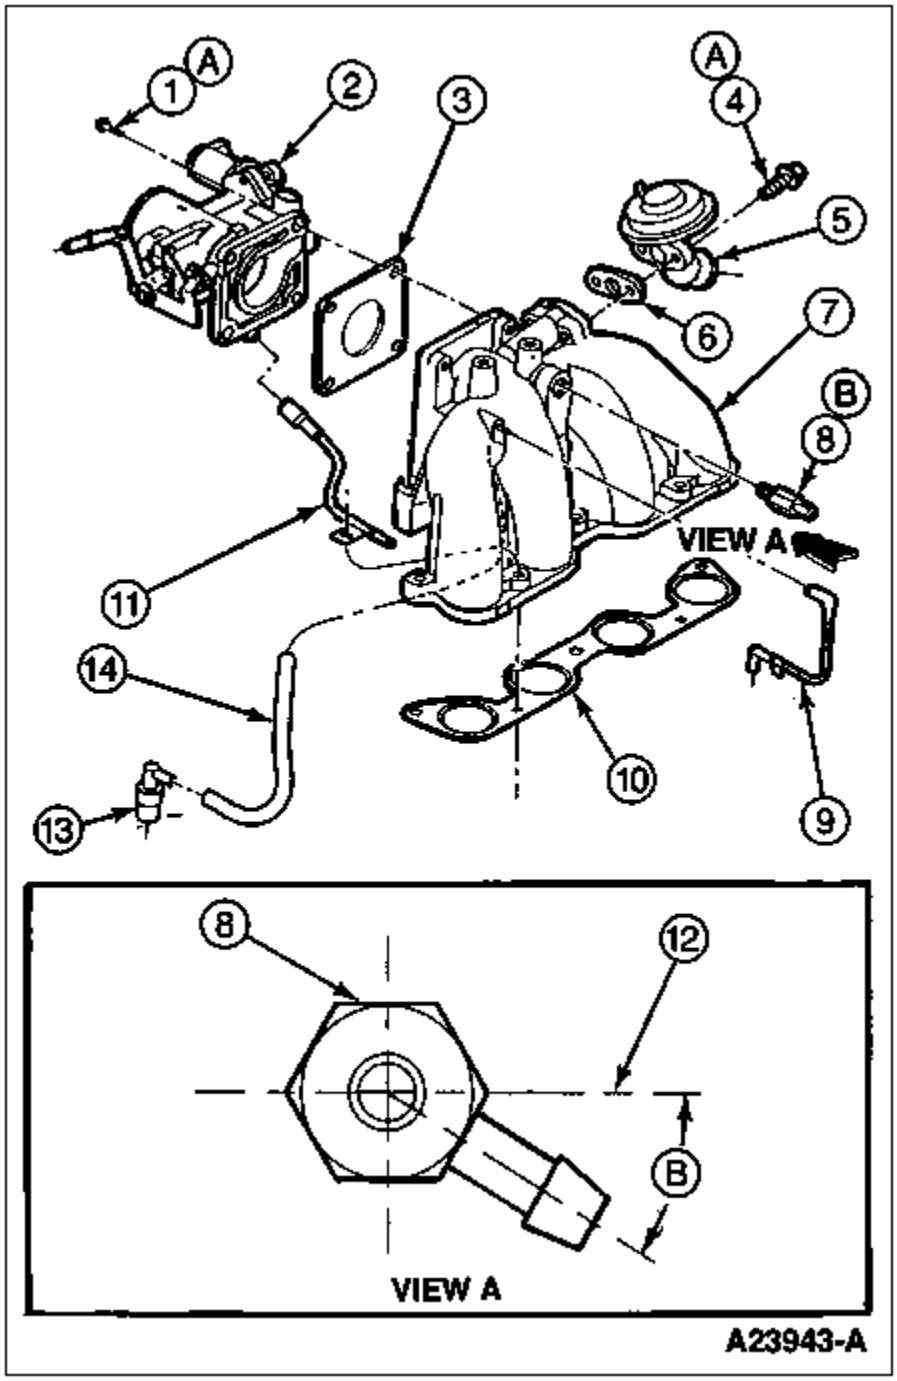
Upper Intake Manifold



Item	Part Number	Description
1	9E926	Throttle Body
2	N807462-S2	Bolt, M8-1.25 x 67.2
3	9424	Upper Intake Manifold
4	N807461-S2	Bolt, M8-1.25 x 45
5	9H486	Intake Manifold Upper Gasket
6	9424	Intake Manifold, Lower
A	—	Tighten According to Procedure in Text

14. If necessary, remove evaporative emission return tube (9G271) from throttle body (9E926) and upper intake manifold.

15. If necessary, remove four bolts, throttle body, and throttle body gasket (TB gasket) (9E936) from upper intake manifold.

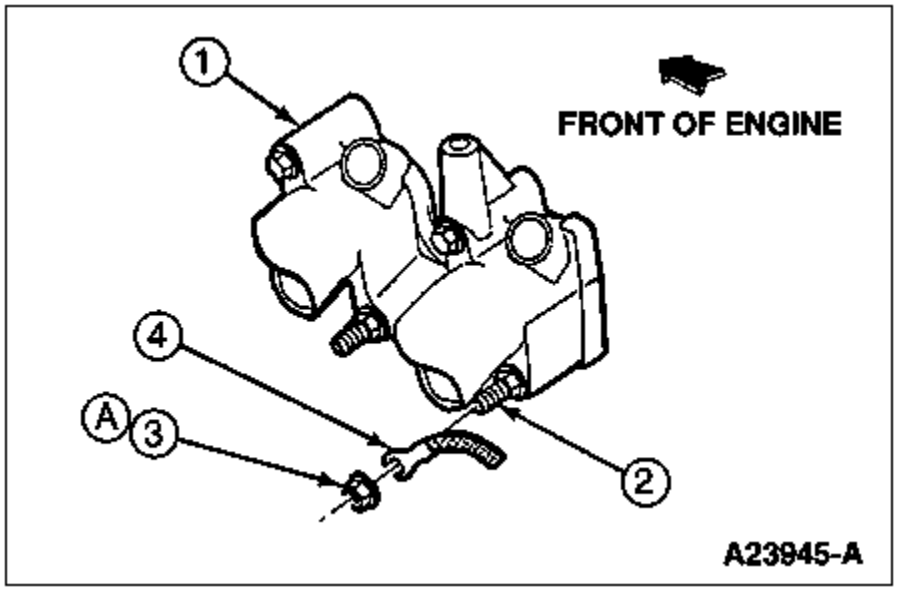


Item	Part Number	Description
1	N605788-S36	Bolt, M8-30
2	9E926	Throttle Body
3	9E936	Throttle Body Gasket

4	N806781-S2	Bolt
5	9D475	EGR Valve
6	9D476	EGR Valve Gasket
7	9425	Upper Intake Manifold
8	9A474	Intake Manifold Vacuum Outlet Fitting and Cap
9	9E498	Fuel Pressure Regulator Vacuum Tube
10	9H486	Intake Manifold Upper Gasket
11	9G271	Evaporative Emission Return Tube
12	—	Horizontal Reference
A	—	Tighten to 20-30 Nm (15-22 Lb-Ft)
B	—	Tighten to 6-12 Nm (54-106 Lb-In) then rotate so side nipple is 30 degrees below centerline of nipple parallel with engine crankshaft.

16. If necessary, remove intake manifold vacuum outlet fitting and cap (9A474) from upper intake manifold.

17. Remove nut and dash panel ground cable (14303) from No. 7 stud.

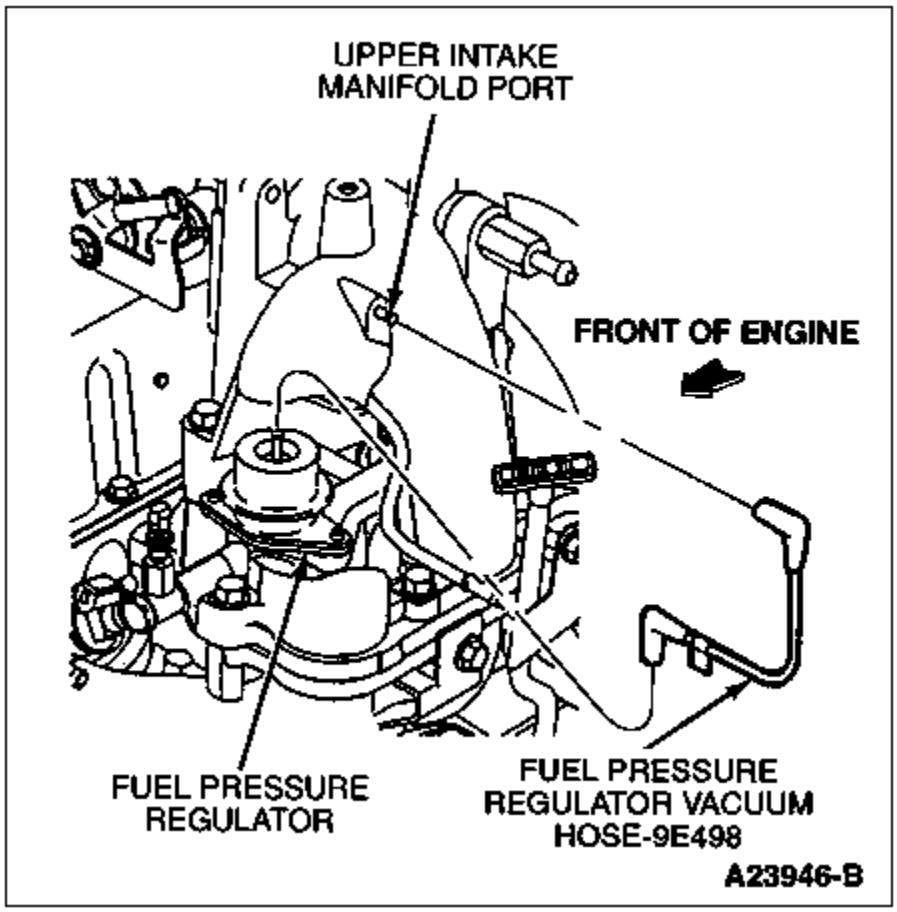


Item	Part Number	Description
1	9424	Intake Manifold
2	N807458-S101	Stud, M8-1.25 x 1.25 x 96.2
3	N620481-S2	Nut, M8 x 1

4	14303	Dash Panel Ground Cable
A	—	Tighten to 8-12 Nm (79-106 Lb-In)

18. Remove wiring harness clip from No. 6 stud.

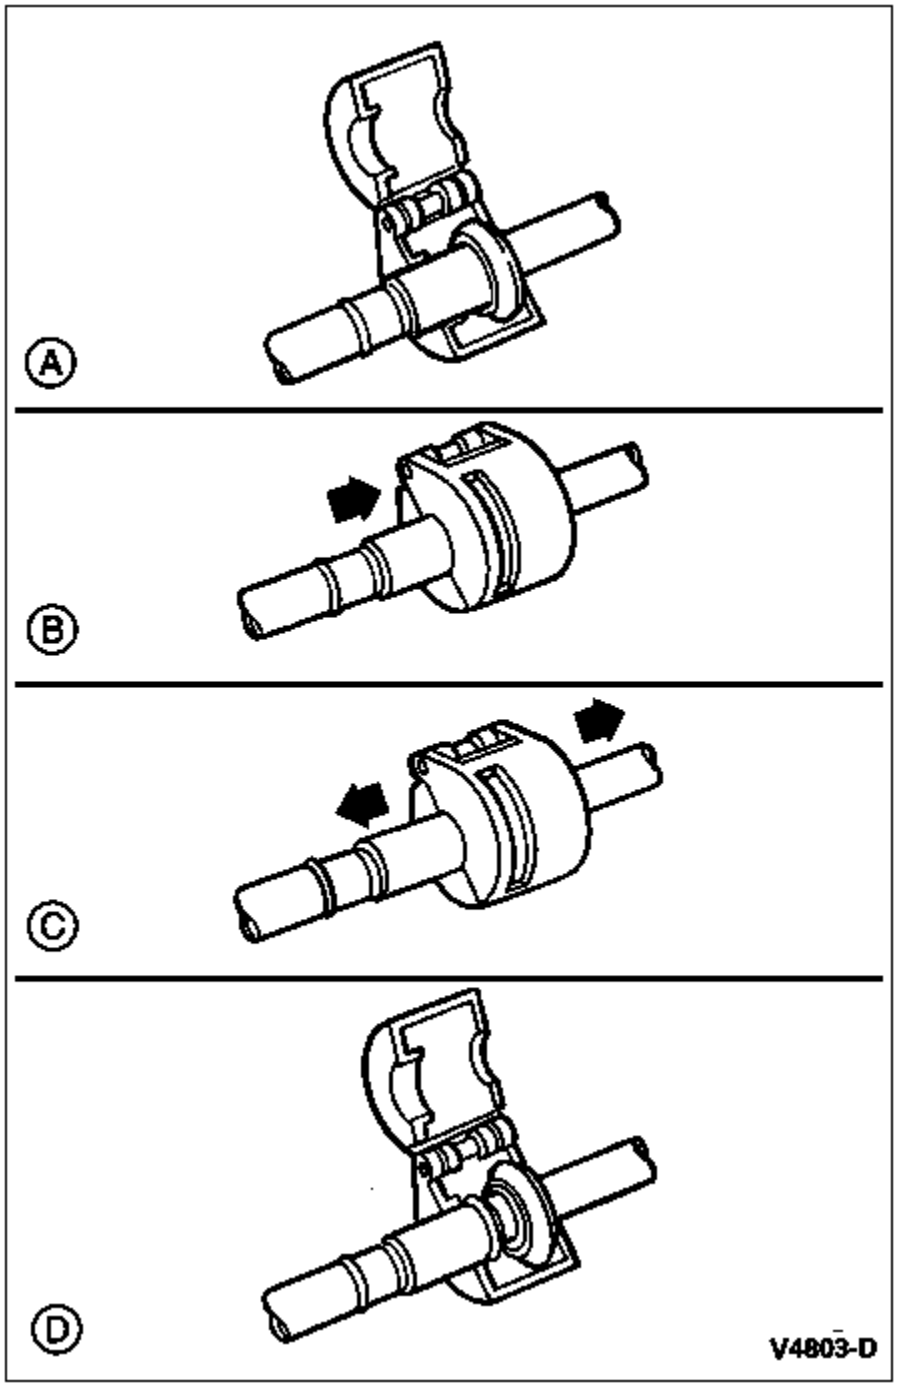
19. Disconnect vacuum hose from fuel pressure regulator (9C968).



20. Remove fuel tube clip (9A317) from fuel inlet and return fittings.

21. Using Spring Lock Coupling Disconnect Tool T81P-19623-G1 (3/8 Inch) or T81P-19623-G2 (1/2 inch), disconnect fuel hoses at the fuel rail supply tube and fuel rail return tube.

    a. Fit tool to coupling so tool can enter cage to release garter spring.
    b. Push the tool into the cage opening to release female fitting from garter spring.
    c. Pull the coupling male and female fittings apart.
    d. Remove the tool from the disconnected coupling.



22. Disconnect the electrical connectors from all four fuel injectors and move fuel charging wiring (9D930) aside.

23. Remove four bottom retaining bolts from lower manifold.

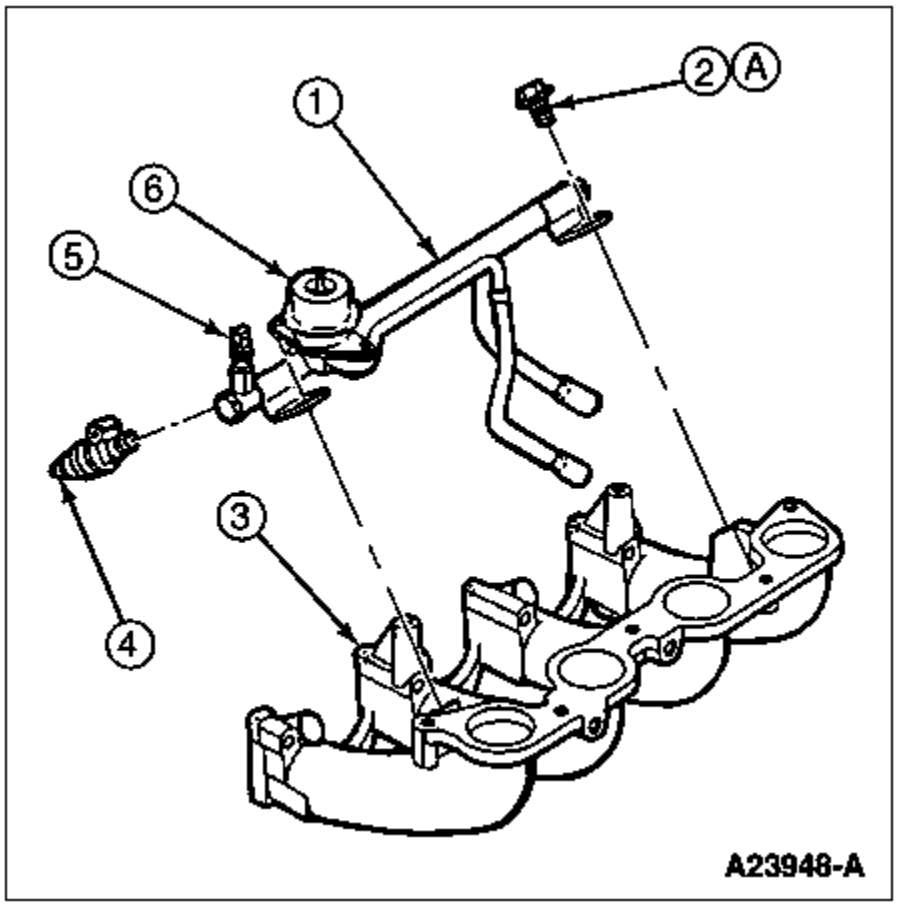
24. Remove four upper retaining bolts from lower manifold. Remove lower intake manifold assembly.

25. Remove two screws and fuel injection supply manifold (9D280) from lower intake manifold, if necessary.

26. Remove fuel injectors (9F593) from lower intake manifold, if necessary. Grasping injector body, pull

up while gently rocking injector from side to side.

27. If necessary, remove screw and 42-pin connector bracket.



Item	Part Number	Description
1	9D280	Fuel Injection Supply Manifold
2	N807897-S100	Bolt, M8-1.25 x 31
3	9424	Intake Manifold, Lower
4	9F593	Fuel Injector
5	9H321	Fuel Pressure Relief Valve
6	9C968	Fuel Pressure Regulator
A	—	Tighten to 20-30 Nm (15-22 Lb-Ft)

Installation

1. Clean and inspect the mounting faces of the intake manifold assembly and the cylinder heads (6049). Both surfaces must be clean and flat.

2. If fuel injectors were removed:

    a. Inspect injector O-rings (two per injector) for signs of deterioration.
    b. If replacing, lubricate new O-rings with 10W-30 motor oil such as XO-10W30-QSP or equivalent meeting Ford specification ESE-M2C153-E and install two on each injector.
    c. Install fuel injectors into lower intake manifold.

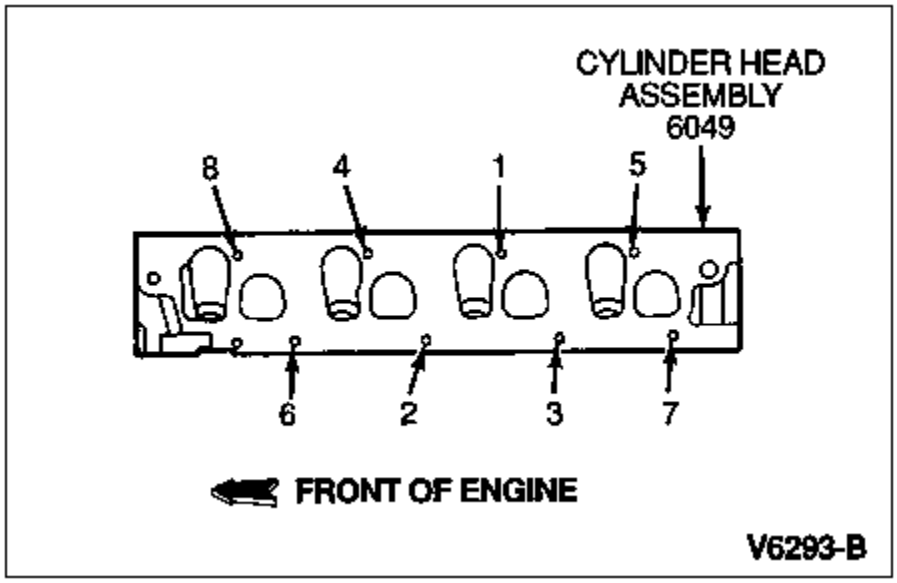
3. If removed, install fuel injection supply manifold. Tighten bolts to 20-30 Nm (15-22 lb-ft).

4. Clean and lightly oil manifold bolt threads.

5. Install a new intake manifold gasket (9439).

6. Position the lower manifold assembly to cylinder head. Install four upper manifold retaining bolts finger-tight.

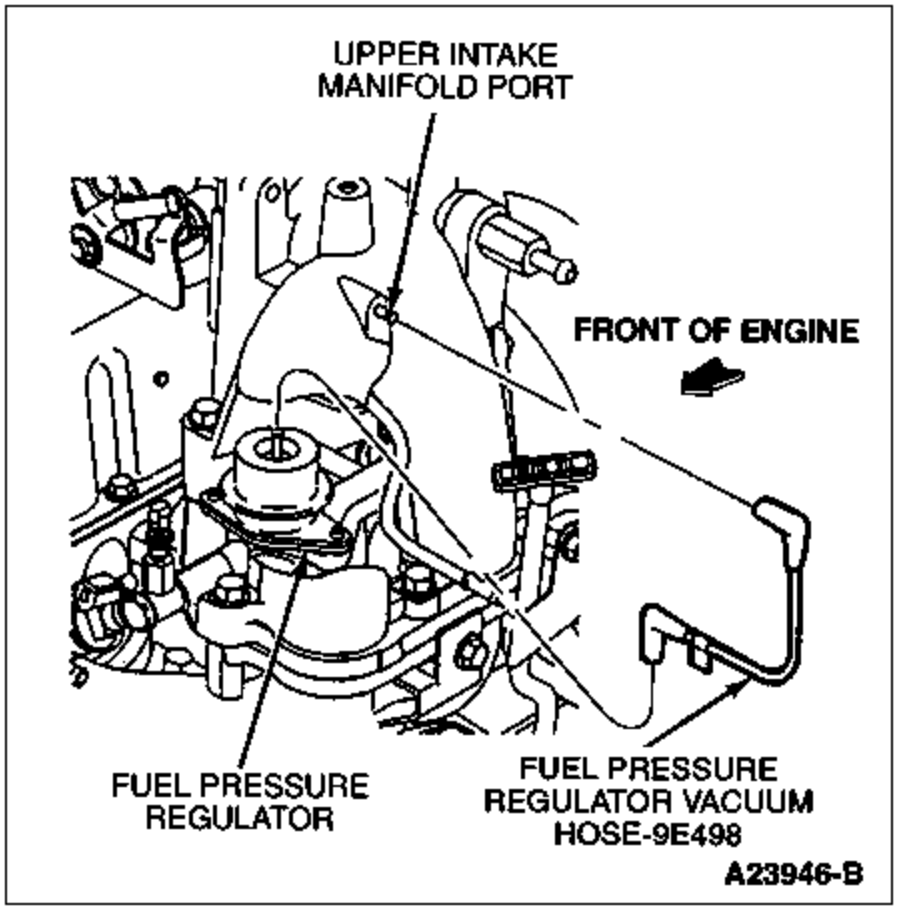
7. Install four remaining manifold bolts. Tighten all bolts to 26-38 Nm (19-28 lb-ft) following the tightening sequence.



8. Install the fuel injection supply manifold and fuel injectors with two retaining bolts. Tighten bolts to 20-30 Nm (15-22 lb-ft).

9. Connect electrical connectors to fuel injectors.

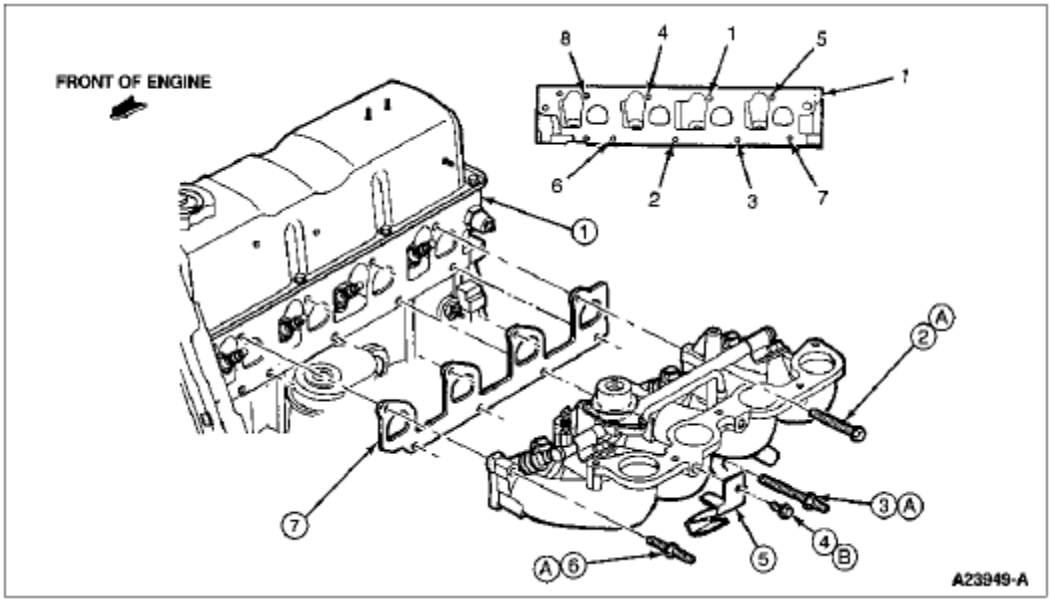
10. Connect vacuum hose to fuel pressure regulator.



11. Push wiring harness clip onto front bottom intake manifold stud.

12. Install dash panel ground cable on rear bottom intake manifold stud and tighten nut to 8-12 Nm (79-106 lb-in).

Lower Intake Manifold



Item	Part Number	Description
1	6049	Cylinder Head
2	N807462-S101	Bolt, M8-1.25 x 67.2 (Holes 1, 2, 4, and 5)
3	N807458-S101	Stud, M8-1.25 x 1.25 x 96.2 (Holes 3, 6, and 7)
4	N605904-S36	Bolt, M8-1.25 x 16.6
5	14A004	42-Pin Connector Bracket
6	N808163-S100	Stud, M8-1.25 x 1.25 x 63.7 (Hole 8)
7	9439	Intake Manifold Gasket
A	—	Refer to Procedure in Text
B	—	Tighten to 20-30 Nm (15-22 Lb-In)

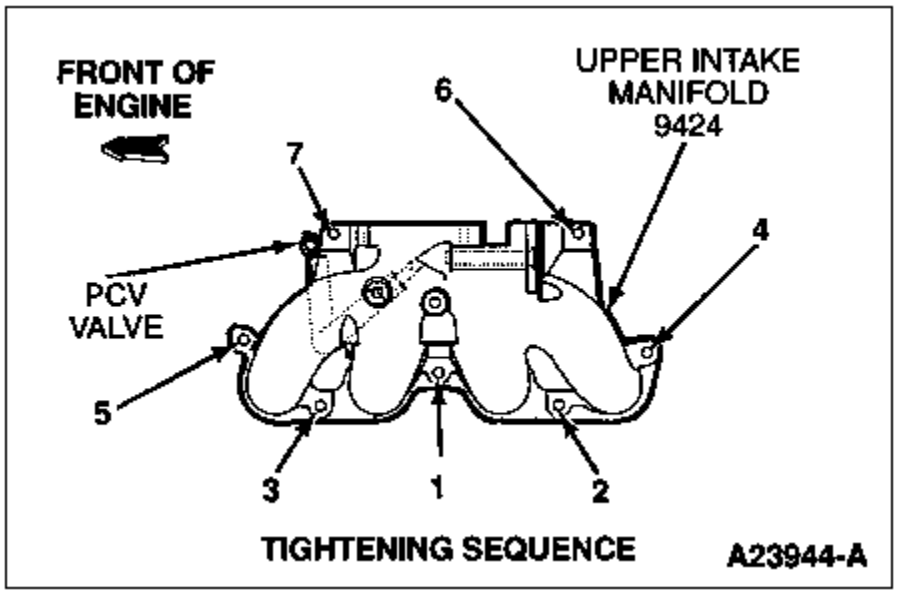
13. If removed, install intake manifold vacuum outlet fitting and cap. Tighten to 6-12 Nm (54-106 lb-in). Rotate clockwise so side nipple is 30 degrees below centerline of nipple parallel with engine crankshaft (6303) (bottom of upper intake manifold).

14. If removed, install throttle body gasket, throttle body and four bolts to upper intake manifold. Alternately tighten to 20-30 Nm (15-22 lb-ft).

15. If removed, install evaporative emission return tube on throttle body tube and position on upper intake manifold.

16. Position intake manifold upper gasket and upper intake manifold.

17. Start bolts. Tighten in sequence to 7-10 Nm (61-88 lb-in) then tighten in sequence to 26-38 Nm (19-28 lb-ft).



18. Install EGR valve and EGR valve gasket and tighten bolts to 20-30 Nm (15-22 lb-ft).

19. Install EGR valve to exhaust manifold tube and tighten nuts to 34-47 Nm (25-34 lb-ft).

20. Connect vacuum hoses to intake manifold vacuum tee:

    a. Fuel pressure regulator
    b. Speed control
    c. EGR valve
    d. Power brakes

21. Connect EGR transducer (9J433) hoses to correct nipples on EGR valve to exhaust manifold tube.

22. Connect crankcase ventilation hose to throttle body.

23. Install accelerator cable bracket (9723) to throttle body and tighten bolts to 21-28 Nm (16-20 lb-ft).

24. Connect accelerator cable.

25. Connect throttle body and upper intake manifold electrical connections:

    a. EGR vacuum regulator solenoid
    b. Ignition control module (ICM) (12A199)
    c. Idle air control valve
    d. Throttle position sensor

26. Connect intake air temperature sensor and mass air flow sensor.

27. Install accelerator control splash shield.

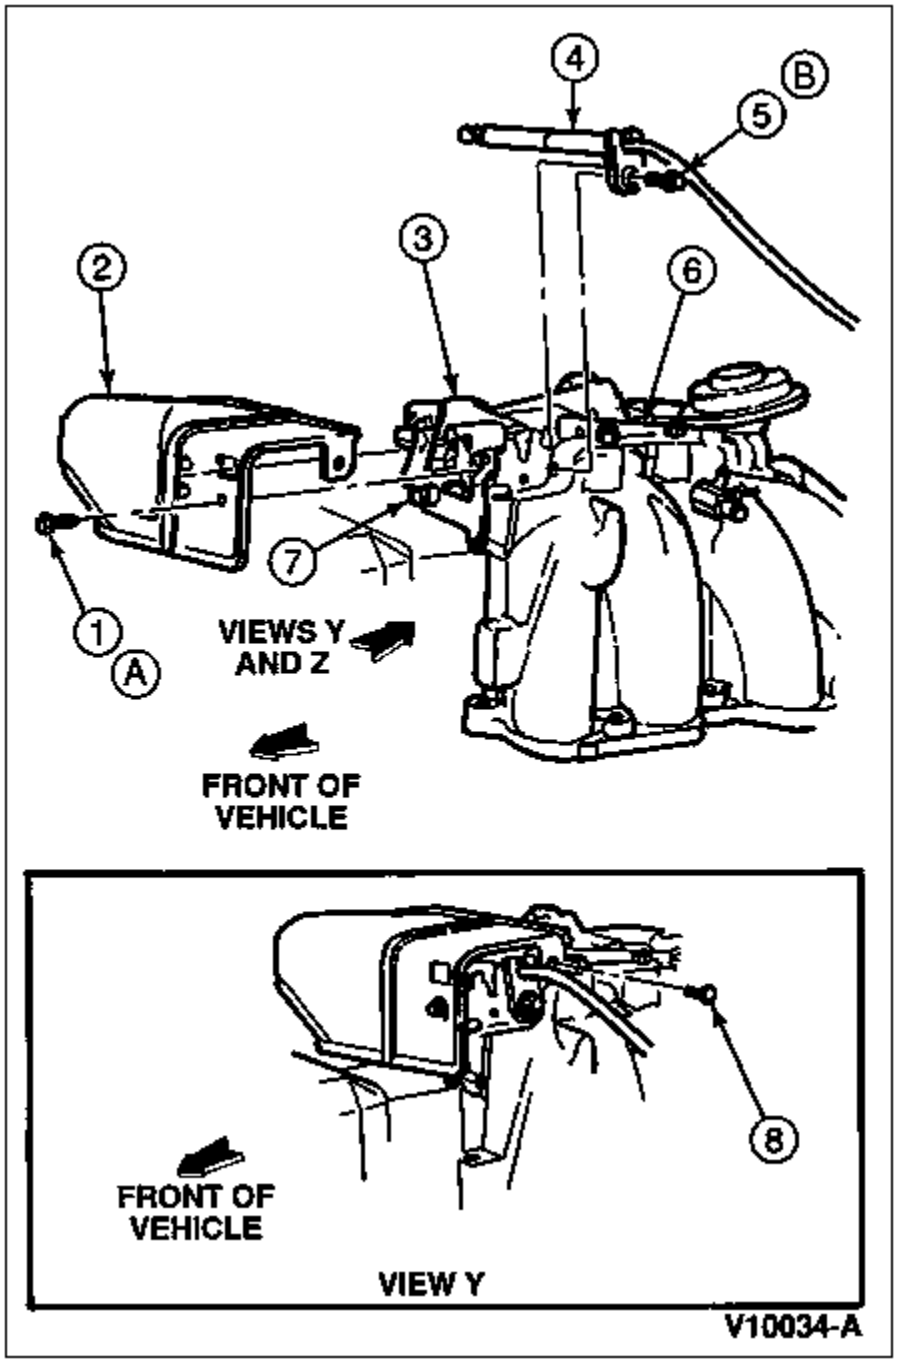
28. Install air cleaner outlet tube.

29. Start engine (6007) and check for leaks.

Throttle Body

Removal

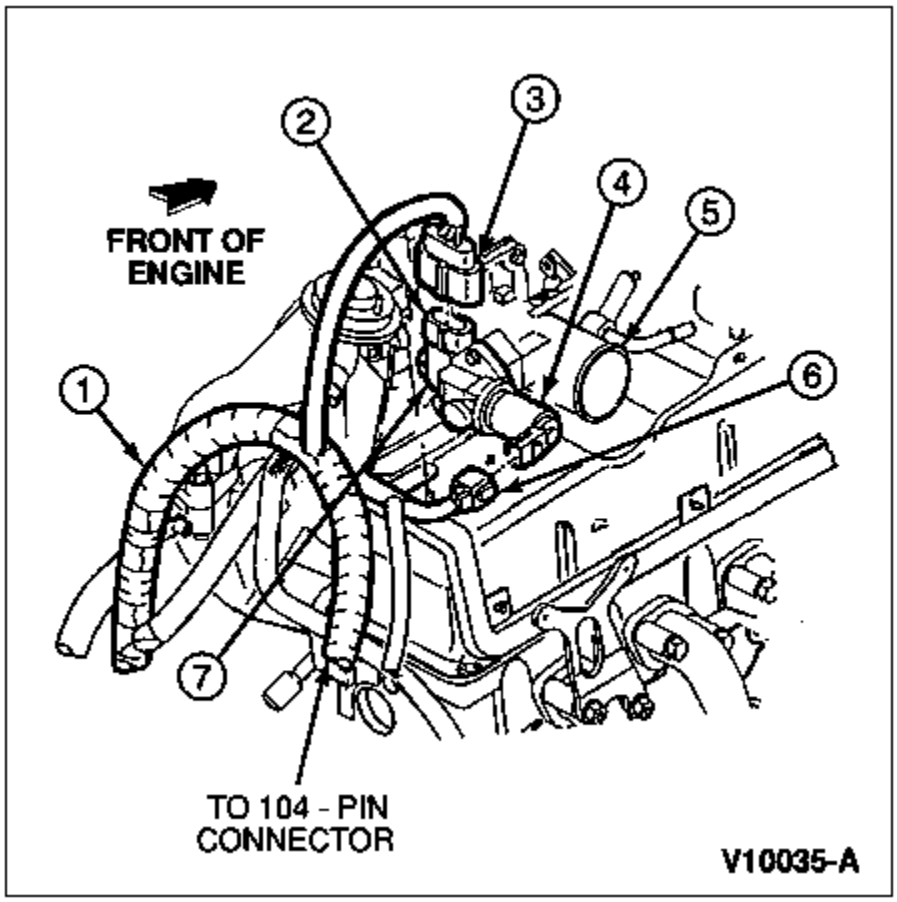
1. Remove the accelerator control splash shield (9E766). Using a screwdriver pry the accelerator cable (9A758) and cruise control cable off throttle lever ball stud. Unbolt the accelerator cable and bracket from the throttle body (9E926) and position out of the way.



Item	Part Number	Description
1	N610959-S2	Screw, M6.3-19
2	9E766	Accelerator Control Splash Shield
3	9E926	Throttle Body
4	9A758	Accelerator Cable
5	N610959-S2	Screw, M6.3-19
6	9723	Accelerator Cable Bracket

7	—	Ball Stud (Part of 9E926)
8	N804527-S100	Pushpin
A	—	Tighten to 6-8 Nm (52-71 Lb-In)
B	—	Tighten to 7-9 Nm (60-81 Lb-In)

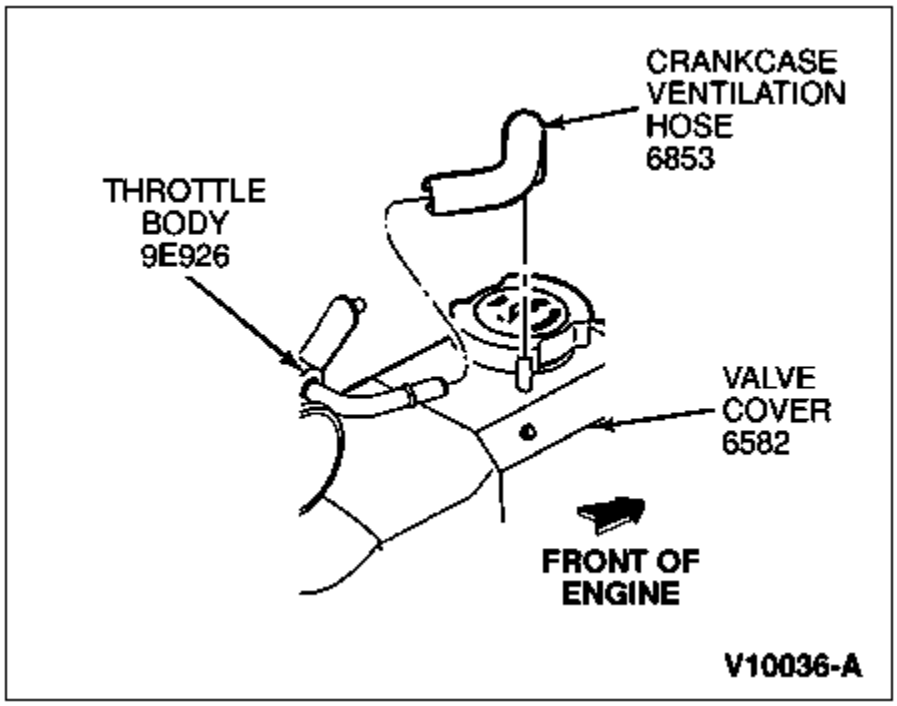
2. Disconnect the wire connectors at the throttle position sensor (TP sensor) (9B989) and the idle air control valve (IAC valve) (9F715).



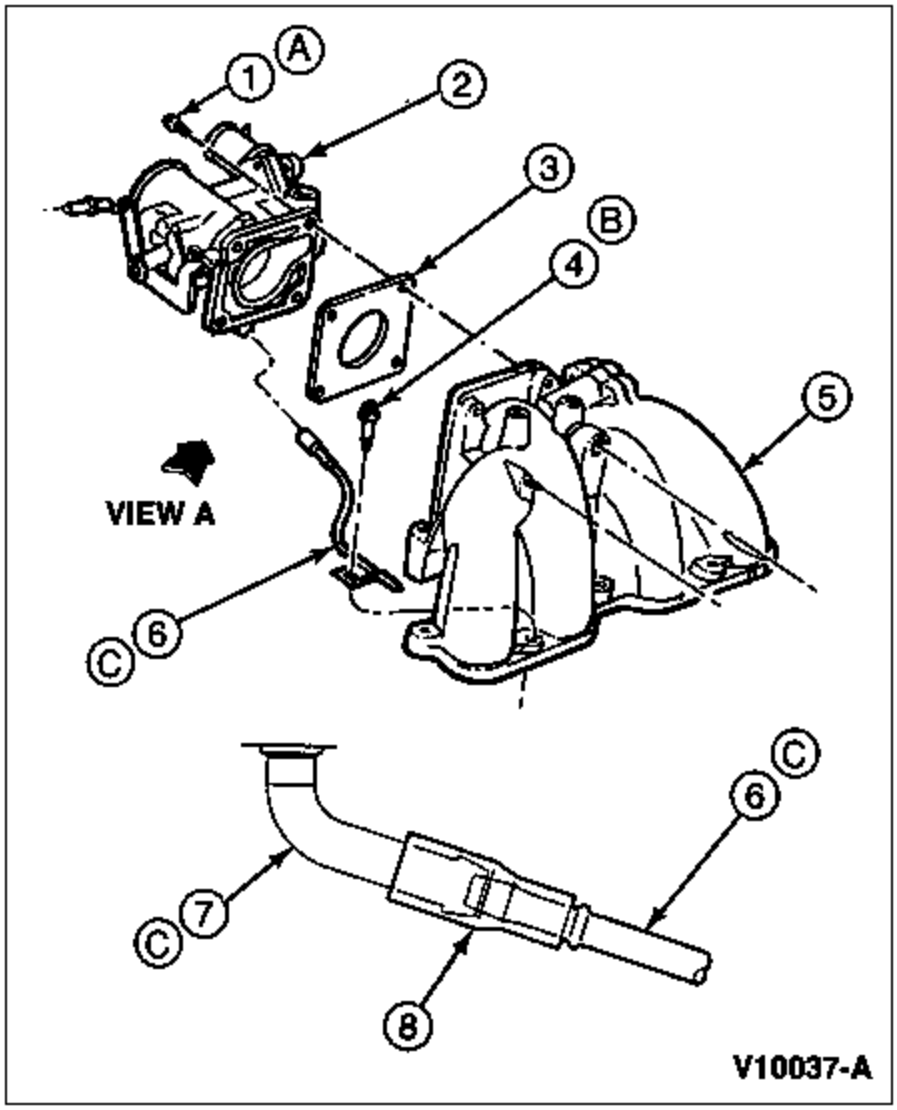
Item	Part Number	Description
1	12A581	Engine Control Sensor Wiring
2	9B989	Throttle Position Sensor
3	—	Throttle Position Sensor Connector (Part of 12A581)
4	9F715	Idle Air Control Valve
5	9E926	Throttle Body
6	—	Idle Air Control Valve Connector (Part of 12A581)
7	9B989	Throttle Position Sensor

3. Loosen the clamp and disconnect the engine air cleaner intake tube and duct (9A673) from the throttle body.

4. Disconnect the crankcase ventilation hose.



5. Remove the four bolts securing the throttle body to the upper intake manifold (9424), and remove the throttle body and disconnect throttle body from evaporative emission return tube (9G271).



Item	Part Number	Description
1	N605788-S36	Bolt, M8-30
2	9E926	Throttle Body
3	9E936	Throttle Body Gasket
4	N807461-S2	Bolt, M8-1.25 x 45
5	9425	Upper Intake Manifold
6	9G271	Evaporative Emission Return Tube
7	—	Fuel Vapor Port (Part of 9E926)
8	—	Connector Hose (Part of 9G271)
A	—	Tighten to 20-30 Nm

		(15-22 Lb-Ft)
B	—	If removed by itself, tighten to 26-38 Nm (19-28 lb-ft). If part of installing entire upper intake manifold, refer to Upper Intake Manifold Installation text, Section 03-01A .
C	—	Fully press together so connecting hose is firmly seated on both tube and port.

Installation

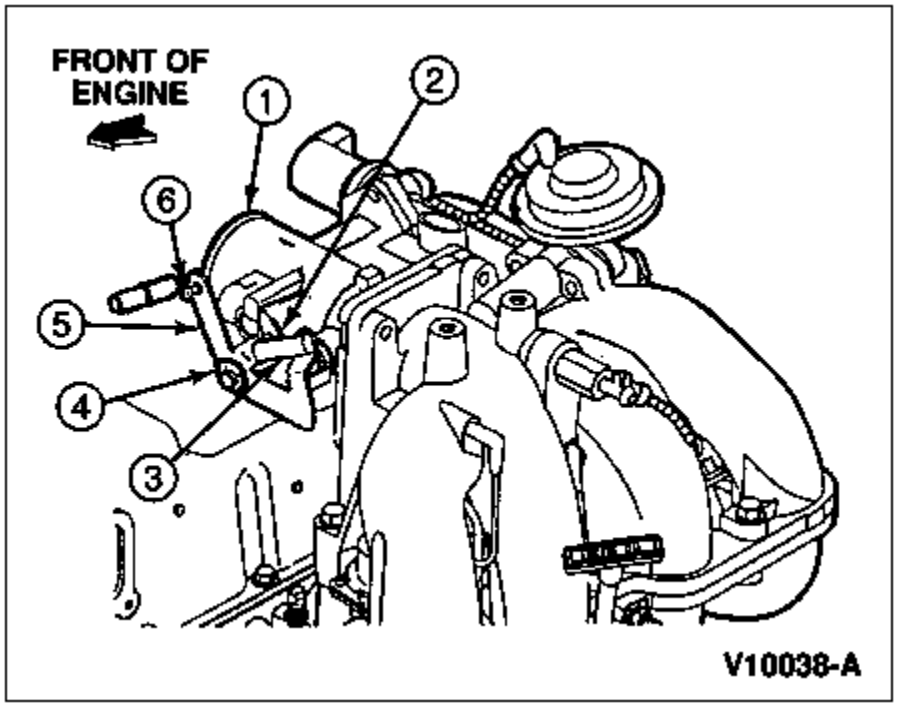
1. Push throttle body fuel vapor port into fuel vapor return tube connector hose.
2. Position the throttle body and new gasket to the upper intake manifold, and hand-start all four bolts. Tighten the bolts evenly to 20-30 Nm (15-25 lb-ft).
3. Connect the crankcase ventilation hose.
4. Connect the engine air cleaner intake tube and duct to the throttle body and tighten the clamp to 2-3 Nm (18-27 lb-in).
5. Connect the wire connectors at the throttle position sensor and the idle air control valve.
6. Connect the throttle linkage and cruise control. Bolt accelerator cable and bracket and oil pressure sensor to throttle body. Install the accelerator control splash shield and tighten screw to 6-8 Nm (52-71 lb-in).
7. Make sure that nothing interferes with the operation of the accelerator linkage and that the accelerator cable does not bind. With engine (6007) running and vehicle in park (automatic transmission) or neutral (manual transmission) and parking brake set, quickly step on and release accelerator pedal. Engine should return to idle without hesitation or accelerator cable binding. Relocate components or replace accelerator cable as needed.

Secondary Throttle Lever

Removal and Installation

1. Remove accelerator control splash shield (9E766).
2. Remove retaining bolt and move accelerator cable out of the way.
3. Disconnect and remove rod connecting primary and secondary lever assemblies.
4. Remove E-ring and steel and plastic washers, noting the location of each for reassembly.
5. Remove secondary lever assembly.

For installation, follow removal procedures in reverse order. Tighten accelerator cable retaining bolt to 7-9 Nm (60-81 lb-in). Tighten accelerator splash shield retaining screw to 6-8 Nm (52-71 lb-in).



Item	Part Number	Description
1	9E926	Throttle Body
2	—	Primary Throttle Lever (Part of 9E926)
3	—	Connecting Rod (Part of 9E926)
4	—	E-Clip (Part of 9E926)

5	—	Secondary Throttle Lever (Part of 9E926)
6	—	Ball Stud (Part of 9E926)

Idle Air Control Valve

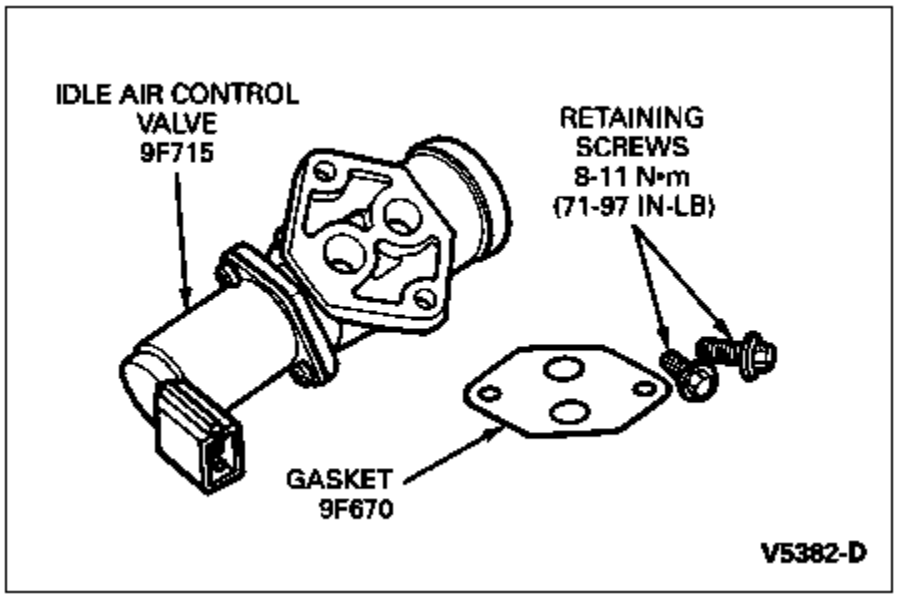
Removal

1. Remove accelerator control splash shield (9E766).
2. Disconnect idle air control valve connector from idle air control valve (IAC valve) (9F715).
3. Remove two idle air control valve retaining screws.
4. **NOTE: If scraping is necessary, be careful not to damage idle air control valve or throttle body gasket surfaces, or drop material into throttle body (9E926).**

   Remove idle air control valve and gasket.

Installation

1. Make sure that both throttle body and idle air control valve gasket surfaces are clean.



2. Install gasket on throttle body surface and mount idle air control valve, securing it with two retaining screws. Tighten to 8-11 Nm (71-97 lb-in).
3. Connect electrical connector for idle air control valve.
4. Install accelerator control splash shield and tighten screw to 6-8 Nm (52-71 lb-in).

Throttle Position Sensor

Removal

1. **NOTE: The throttle position sensor (TP sensor) (9B989) can only be removed after the idle air control valve (IAC valve) (9F715) has been removed from the throttle body (9E926).**

   Remove the idle air control valve as described in Removal and Installation, Idle Air Control Valve in this section.

2. Disconnect throttle position sensor from the wiring harness.

3. Remove the two throttle position sensor retaining screws.

4. Remove the throttle position sensor and gasket.

Installation

1. Make sure that both throttle body and idle air control valve gasket surfaces are clean.

2. **CAUTION: Slide rotary tangs into position over throttle shaft blade, then rotate throttle position sensor CLOCKWISE ONLY to installed position. Failure to install the throttle position sensor in this manner may result in excessive idle speeds.**

   Position the throttle position sensor and gasket on the throttle body. Make sure that rotary tangs on sensor are in proper alignment with the throttle shaft blade.

3. **NOTE: This throttle position sensor is non-adjustable.**

   Secure throttle position sensor to throttle body with two retaining screws. Tighten to 3-4 Nm (27-35 lb-in).

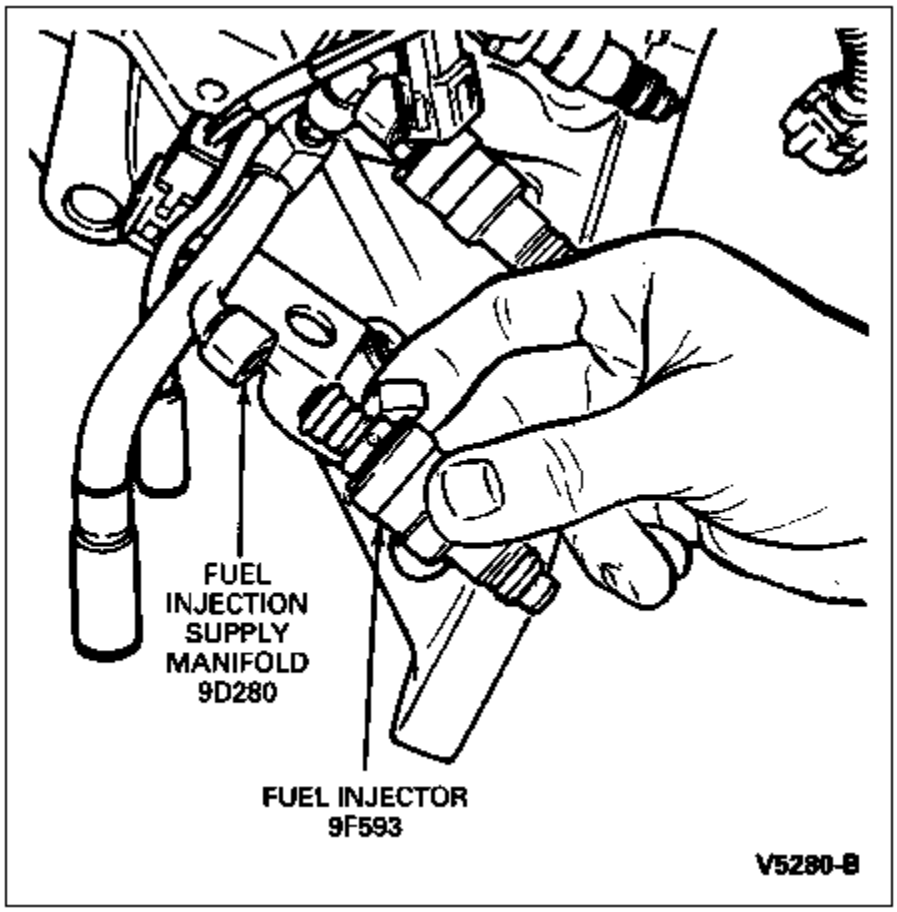
4. Connect electrical connector from the harness to the sensor.

Fuel Injector

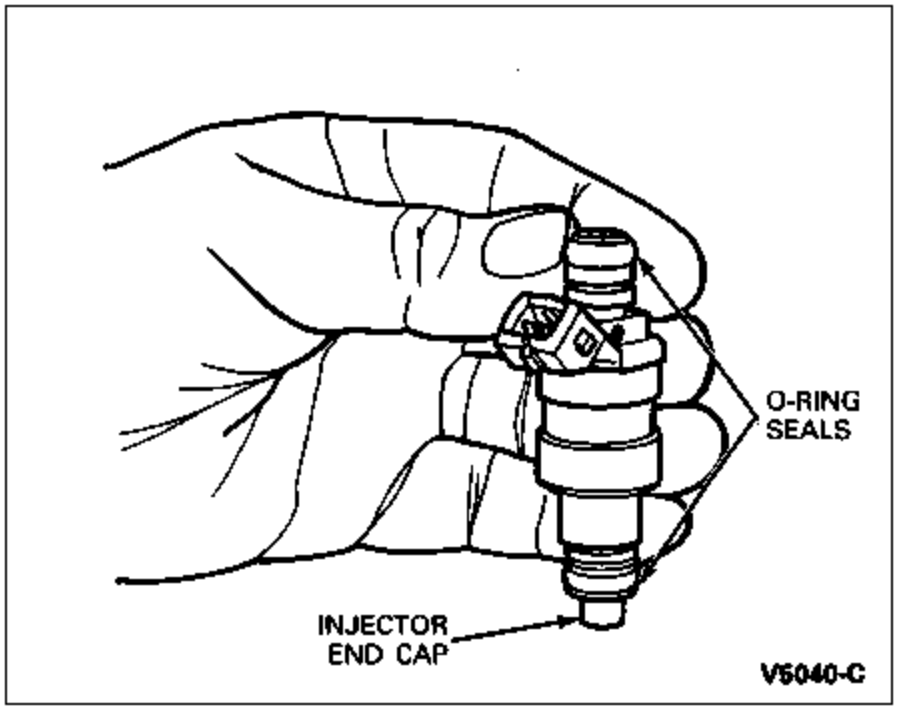
Removal and Installation

1. Remove fuel injection supply manifold (9D280) as outlined in Removal and Installation, Fuel Injection Supply Manifold in this section.

2. Grasping injector body, pull up while gently rocking fuel injector from side to side.



3. Inspect fuel injector O-rings (two per injector) for signs of deterioration. Replace as required.



For installation, follow removal procedures in reverse order. Refer to Removal and Installation, Fuel Injection Supply Manifold in this section.

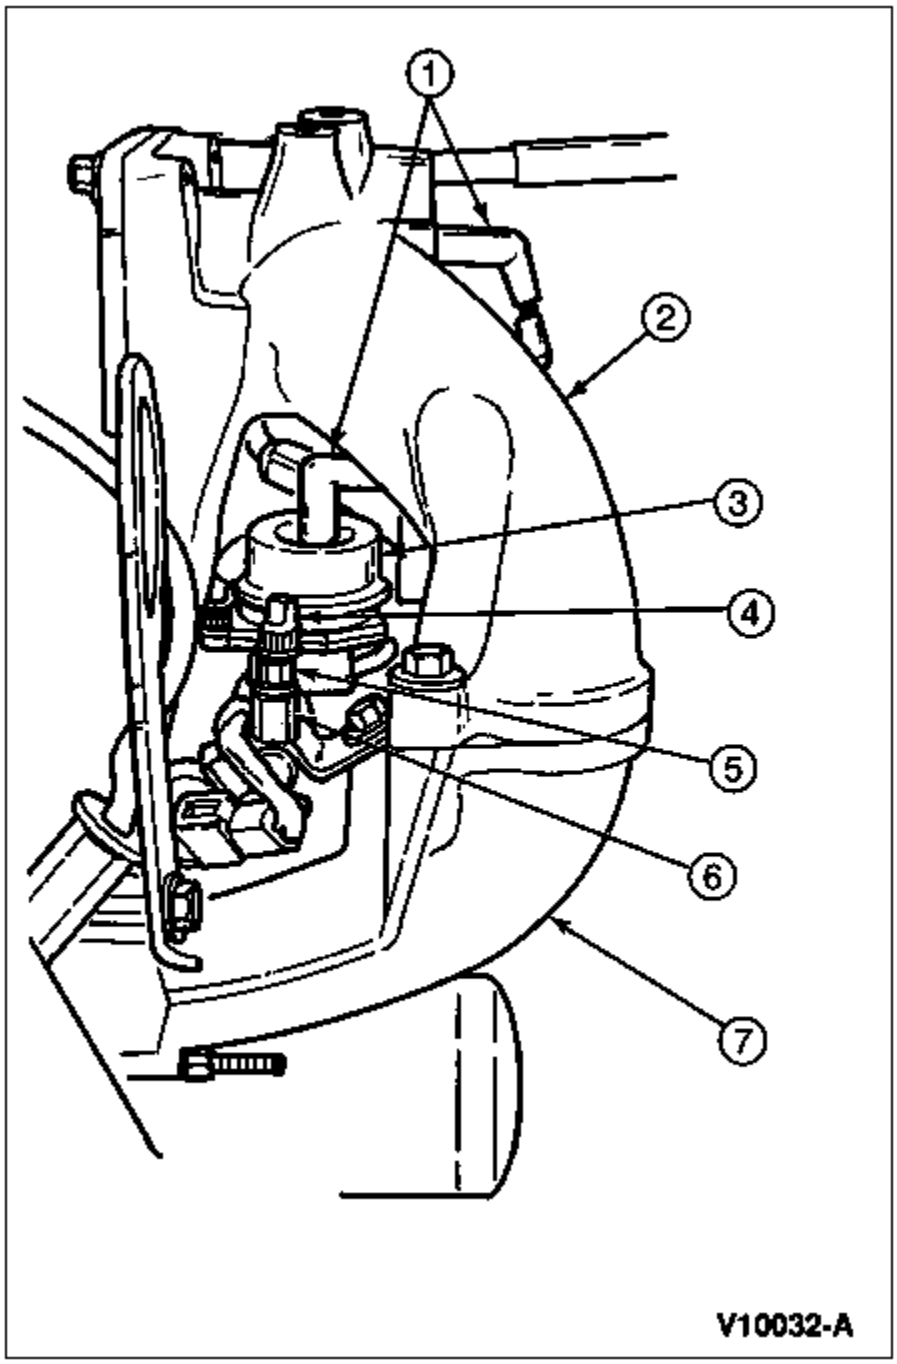
Fuel Pressure Relief Valve

SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
Multiport Fuel Injection (MFI) Fuel Pressure Gauge (EFI/CFI)	T80L-9974-B

Removal and Installation

1. Perform pre-service procedures as outlined in Removal and Installation, Fuel Charging System in this section.
2. If not removed, remove fuel pressure relief valve cap (9H323).
3. Using an open-end wrench, remove fuel pressure relief valve (9H321).
4. Install fuel pressure relief valve and cap. Tighten valve to 6-10 Nm (53-89 lb-in). Install cap onto fuel pressure relief valve.



Item	Part Number	Description
1	9E498	Fuel Pressure Regulator Vacuum Tube
2	9424	Upper Intake Manifold
3	9C968	Fuel Pressure Regulator
4	9H323	Fuel Pressure Relief Valve Cap
5	9H321	Fuel Pressure Relief Valve
6	9D280	Fuel Injection Supply Manifold

7	9424	Lower Intake Manifold

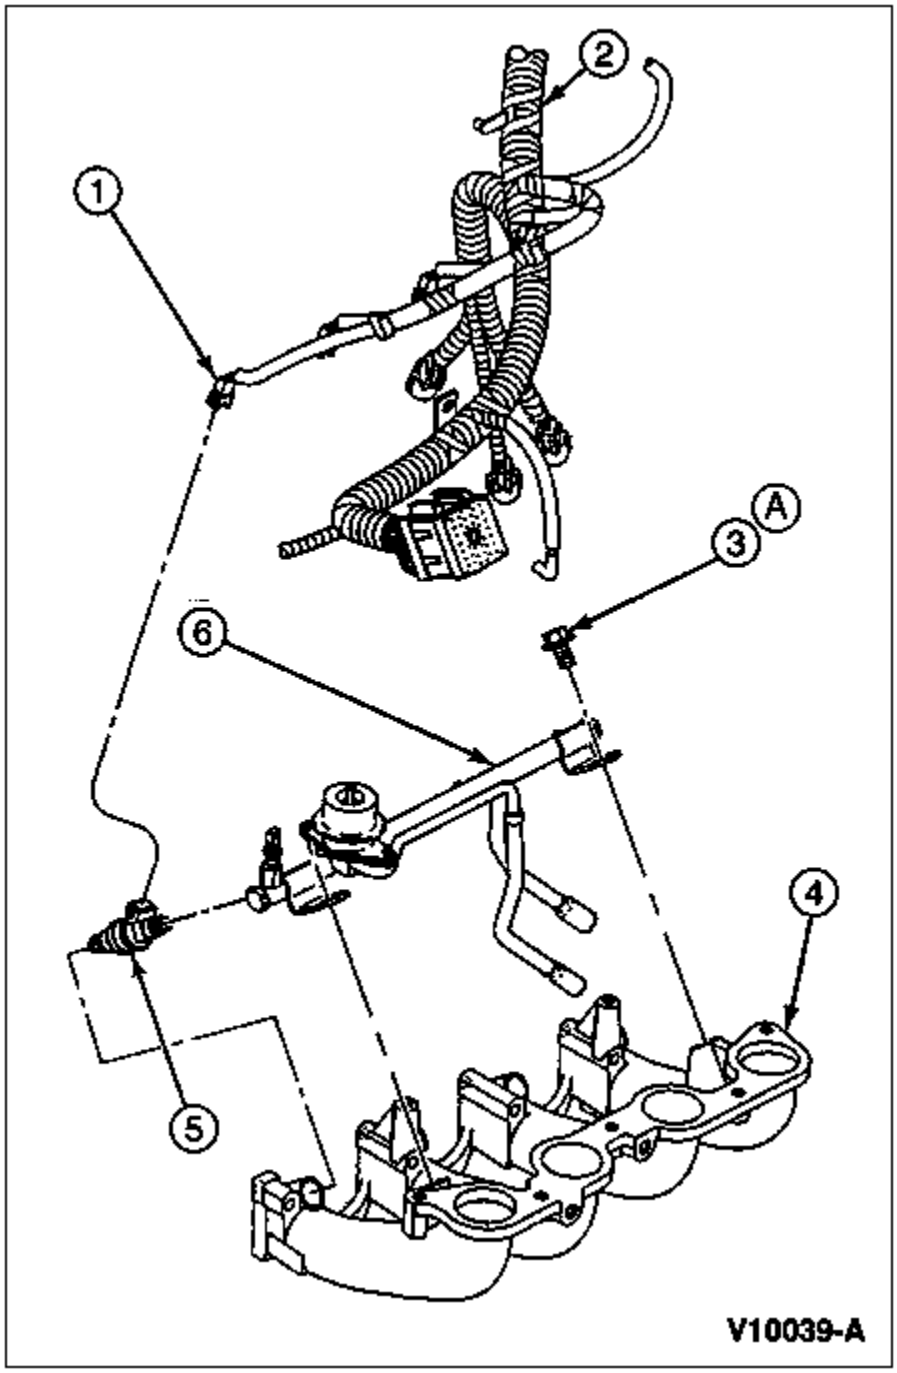
Fuel Injection Supply Manifold

SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
Spring Lock Coupling Disconnect Tool (3/8 Inch)	T81P-19623-G1
Spring Lock Coupling Disconnect Tool (1/2 Inch)	T81P-19623-G2

Removal

1. Perform pre-service procedures as outlined in Removal and Installation, Fuel Charging System in this section.



Item	Part Number	Description
1	—	Fuel Injector Connector (Part of 12A581)
2	12A581	Engine Control Sensor Wiring
3	N807897-S100	Bolt, M8-1.25 x 31
4	9424	Lower Intake Manifold
5	9F593	Fuel Injector
6	9D280	Fuel Injection Supply Manifold

A	—	Tighten to 20-30 Nm (15-22 Lb-Ft)

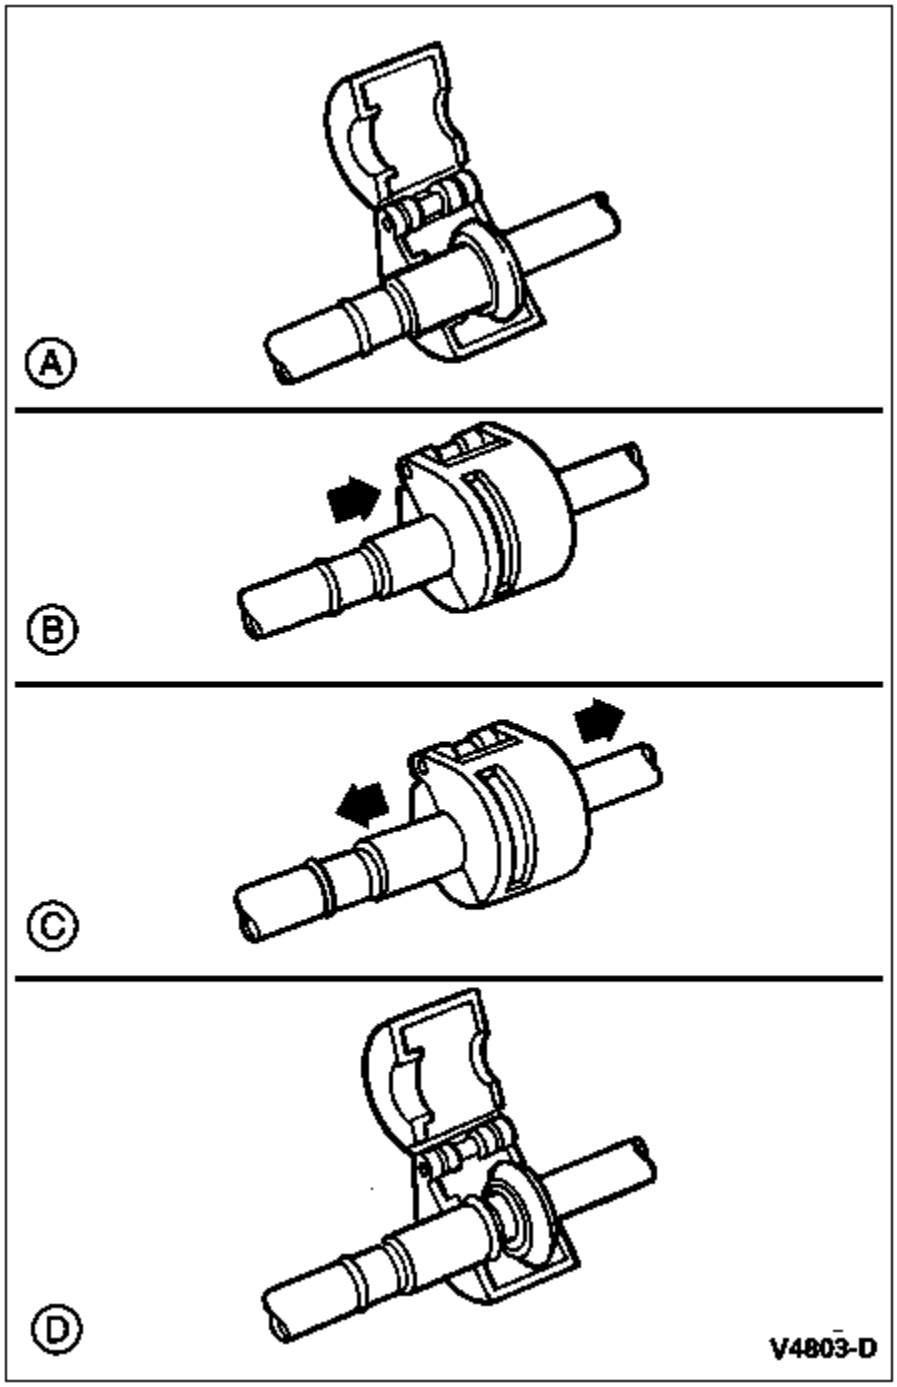
2. Remove the upper intake manifold (9424) as described in Section 03-01A .

3. Disconnect fuel injector electrical connectors.

4. Remove spring lock coupling retainer clips from fuel inlet and return fittings.

5. Using Spring Lock Coupling Disconnect Tool, T81P-19623-G1 (3/8 inch) or T81P-19623-G2 (1/2 inch), disconnect fuel hoses at the fuel rail supply tube and fuel rail return tube.

    a. Fit tool to coupling so tool can enter cage to release garter spring.
    b. Push the tool into the cage opening to release female fitting from garter spring.
    c. Pull the coupling male and female fittings apart.
    d. Remove the tool from the disconnected coupling.



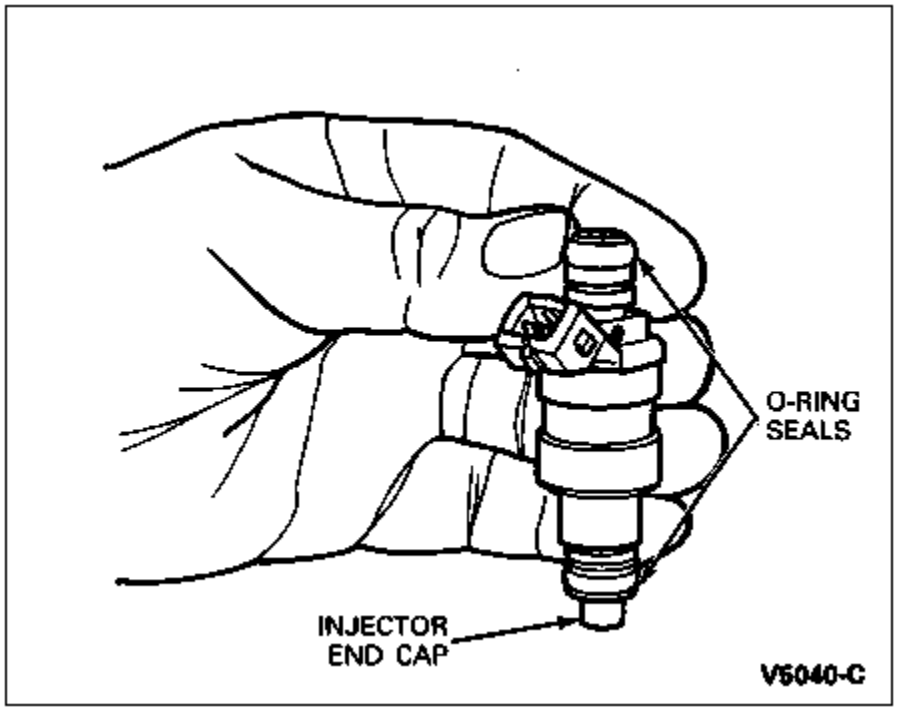
6. Remove two fuel supply manifold retaining bolts.
7. Carefully disengage fuel injection supply manifold (9D280) and fuel injectors from engine and remove fuel injection supply manifold and fuel injectors.

Installation

1. **CAUTION: Never use silicone grease. It will clog the fuel injectors. Make sure the injector**

end caps are clean and free of contamination.

Lubricate new O-rings with 10W-30 oil such as XO-10W30-QSP or equivalent meeting Ford specification ESE-M2C153E and install two on each injector (one per injector if injectors were not removed from fuel injection supply manifold).



2. Install the fuel injection supply manifold and fuel injectors into the intake manifold.
3. Push the fuel injection supply manifold down to make sure that all the fuel injector O-rings are fully seated in the fuel rail cups and intake manifold.
4. Secure the fuel injection supply manifold using two retaining bolts, while holding the fuel injection supply manifold down. Tighten to 20-30 Nm (15-22 lb-ft).
5. Connect fuel supply and return lines to fuel injection supply manifold.
6. Reinstall spring lock coupling retainer clips on fuel inlet and return fittings.
7. After the fuel injection supply manifold has been installed and before the fuel injector wire connectors have been connected, turn the ignition switch lock cylinder (11582) to the ON position. This will cause the fuel pump to run for two to three seconds and pressurize the fuel system.
8. Using a clean paper towel, check for leaks where the fuel injector is installed into the fuel injection supply manifold.
9. Install the upper intake manifold as described under Removal and Installation, Fuel Charging Assembly .
10. Install the cap on the fuel pressure relief valve (9H321).

11. Connect the fuel injector wire connectors. Start the engine and let it idle for two minutes.

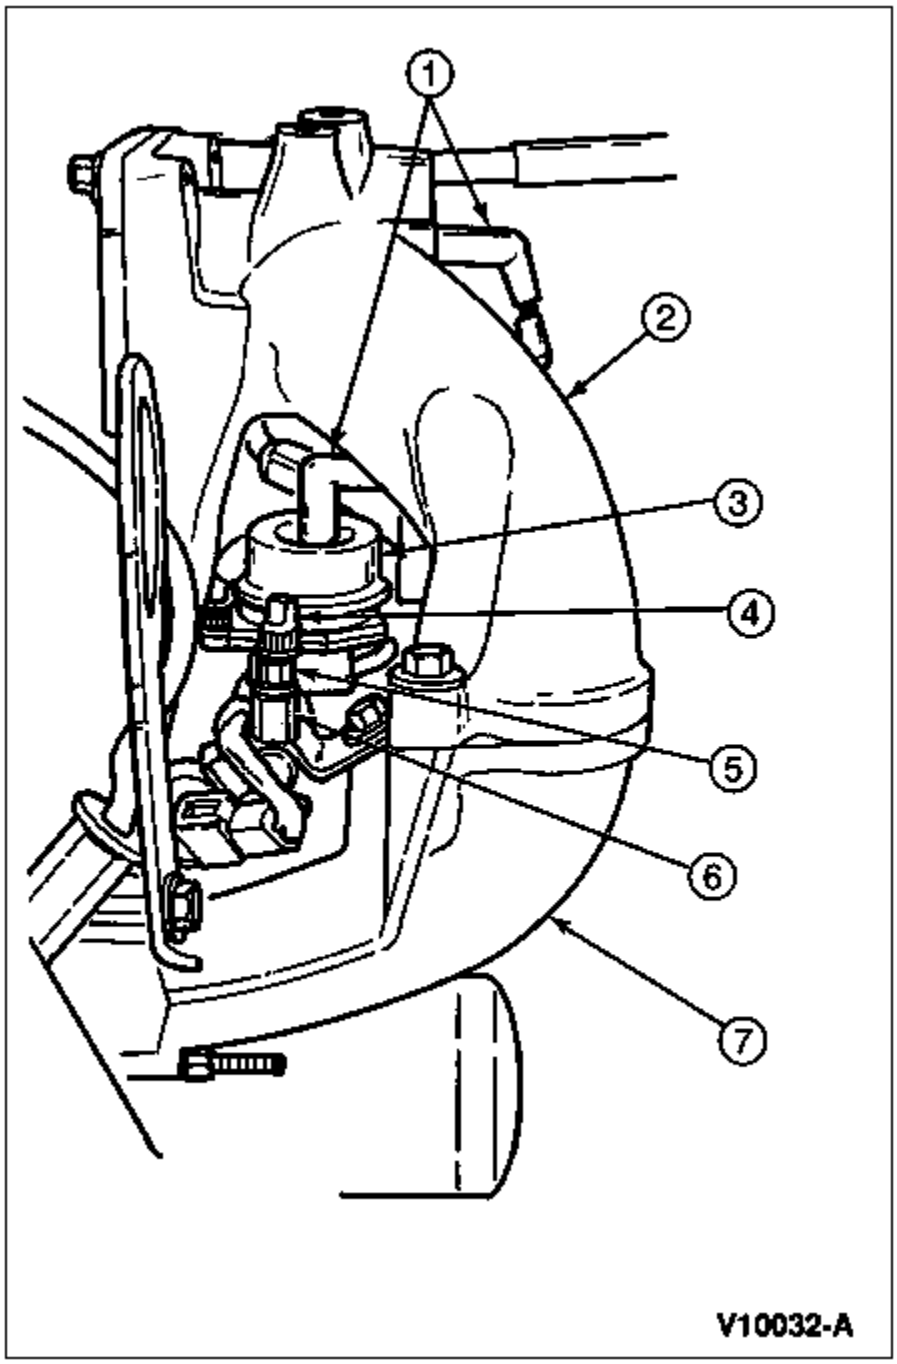
12. Turn the engine off and check for fuel leaks where the fuel injector (9F593) is installed in the fuel injection supply manifold. Also check for any leakage at the intake manifold and cylinder head.

Fuel Pressure Regulator

Removal

1. Perform pre-service procedures as outlined in this section.
2. Remove vacuum line at fuel pressure regulator (9C968).
3. Remove two Allen retaining screws from fuel pressure regulator housing and discard.
4. **NOTE: If scraping is necessary, be careful not to damage fuel pressure regulator or fuel supply line return seal surfaces.**

   Remove fuel pressure regulator, return seal and O-rings. Discard return seal and O-rings.



Item	Part Number	Description
1	9E498	Fuel Pressure Regulator Vacuum Tube
2	9424	Upper Intake Manifold
3	9C968	Fuel Pressure Regulator
4	9H323	Fuel Pressure Relief Valve Cap
5	9H321	Fuel Pressure Relief Valve
6	9D280	Fuel Injection Supply Manifold

7	9424	Lower Intake Manifold

Installation

1. **NOTE: Never use silicone grease. It will clog the injectors.**

   Lubricate new fuel pressure regulator O-rings with light oil SAE 30 XO-30-QSD or equivalent meeting Ford specification ESE-M2C153-E.

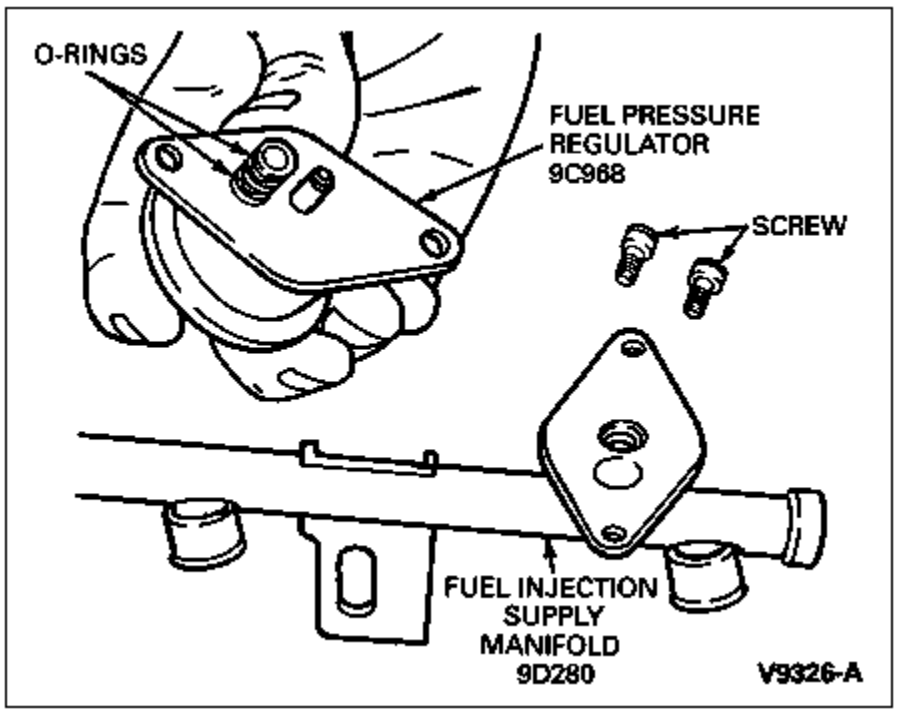
2. Make sure return seal surfaces of fuel pressure regulator and fuel injection supply manifold (9D280) are clean.

3. Install new O-rings and new return seal on fuel pressure regulator.

4. Place return seal in the recess of the regulator mounting plate. Make sure regulator return tube does not cut or damage return seal when installing fuel pressure to fuel injector supply manifold.

5. Using new Allen head retaining screws, install fuel pressure regulator on fuel injection supply manifold. Tighten three retaining screws to 3-5 Nm (27-44 lb-in).

6. Install fuel pressure regulator vacuum tube at fuel pressure regulator.

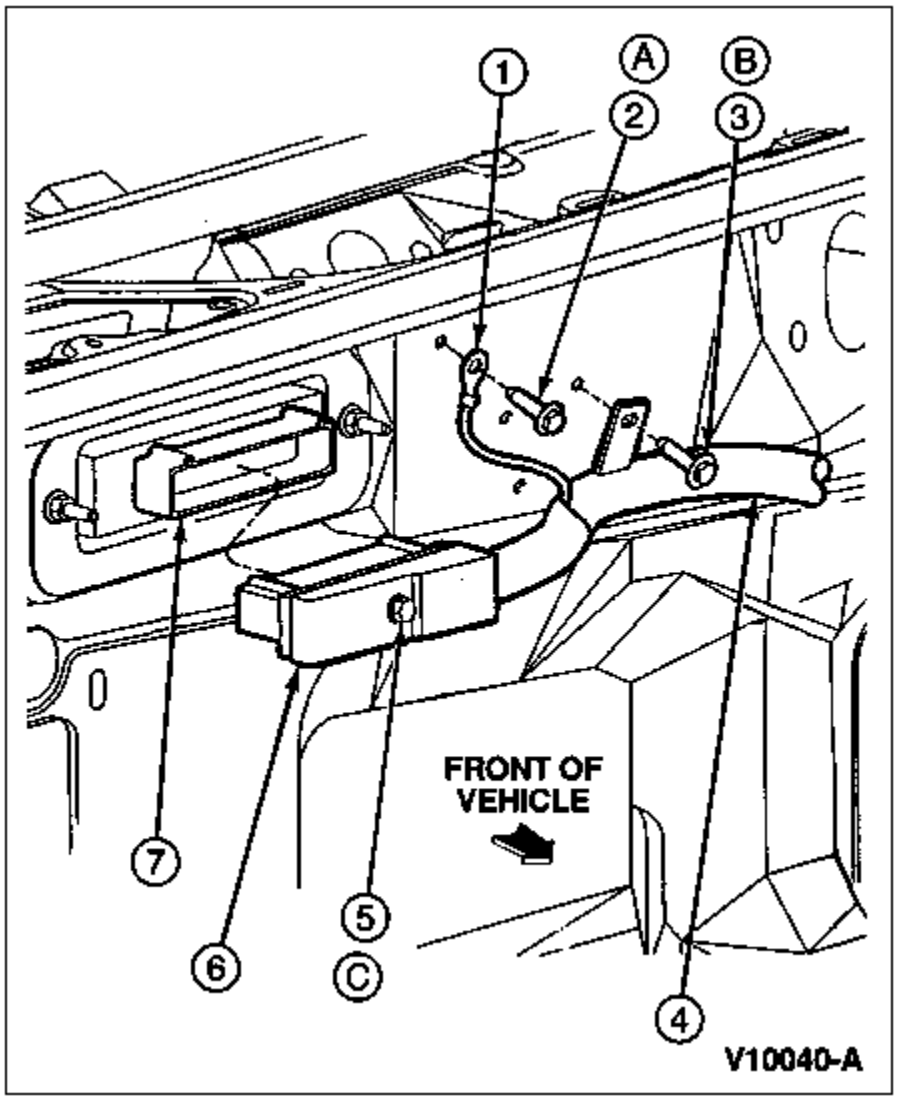


Engine Control Sensor Wiring

NOTE: A single engine control sensor wiring harness connects all engine sensors and engine mounted fuel system components including the fuel injectors.

Removal

1. Perform pre-service procedures as outlined in Removal and Installation, Fuel Charging System in this section.
2. Disconnect mass airflow sensor connector and intake air temperature sensor connector.
3. Loosen clamps and remove air cleaner outlet tube (9B659).
4. Remove upper intake manifold as outlined in Section 03-01A .
5. Remove screw attaching PCM ground cable to dash.
6. Unscrew center bolt and disconnect PCM connector.
7. Remove screw attaching engine control sensor wiring (12A581) to dash assembly.

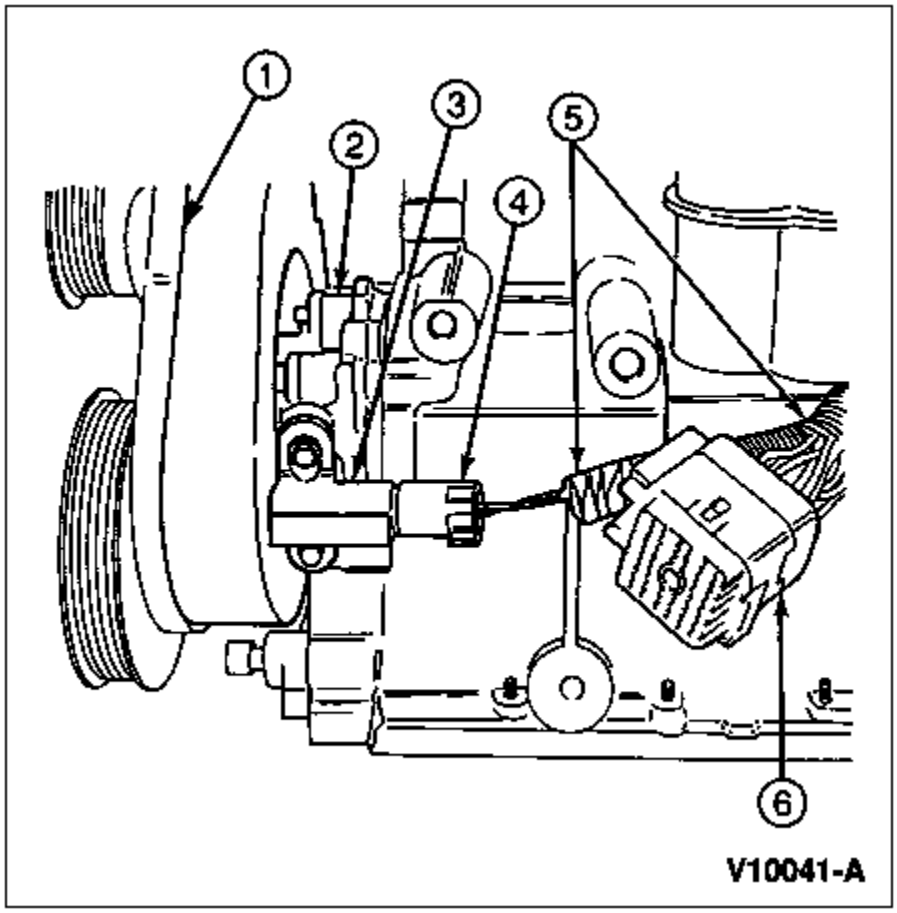


Item	Part Number	Description
1	—	PCM Ground Cable (Part of 12A581)
2	N805375-S36MG	Screw
3	N805375-S36MG	Screw
4	12A581	Engine Control Sensor Wiring
5	—	Bolt (Part of 12A581)
6	—	PCM Connector (Part of 12A581)
7	12A650	Powertrain Control Module
A	—	Tighten to 8-12 Nm (79-107 Lb-In)
B	—	Tighten to 4 Nm (36 Lb-In)
C	—	Tighten to 6-7 Nm

		(46-63 Lb-In)

8. Disconnect connector to camshaft position sensor (CMP sensor) (6B288). Remove retainer from intake manifold stud.

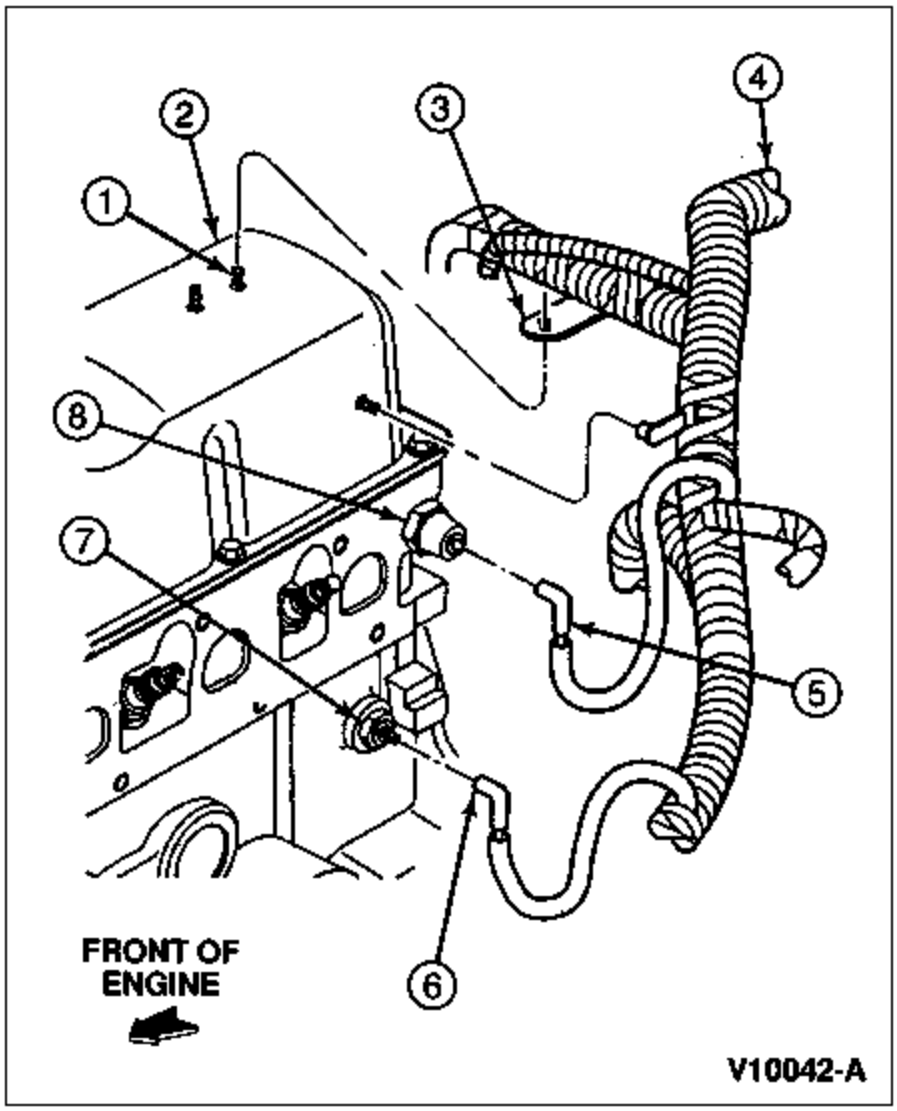
9. Unscrew bolt and disconnect 42-pin connector from engine compartment wiring.



Item	Part Number	Description
1	6019	Timing Belt Inner Cover
2	6600	Oil Pump
3	6B288	Camshaft Position Sensor
4	—	Camshaft Position Sensor Connector (Part of 12A581)
5	12A581	Engine Control Sensor Wiring
6	—	42-Pin Connector (Part of 12A581)

10. Disconnect water temperature indicator sender unit (10884).

11. Disconnect heated oxygen sensor leads.
12. Disconnect transmission lead connector.
13. Disconnect four fuel injectors.
14. Disconnect oil pressure sensor (9278).

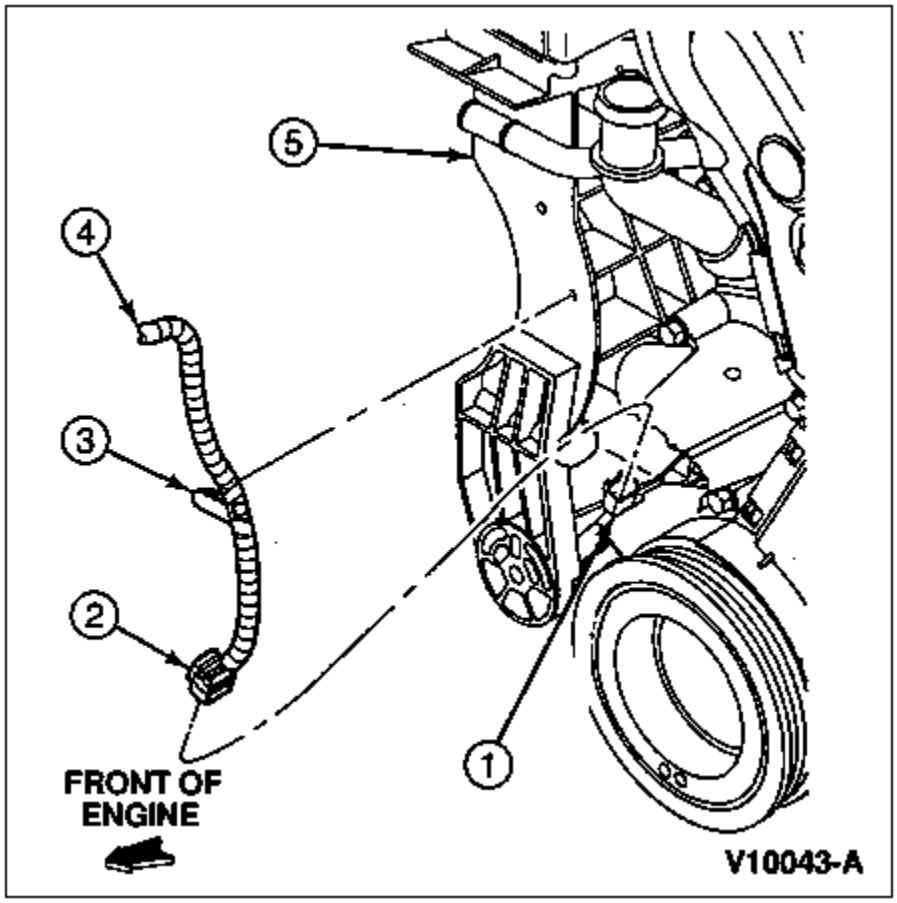


Item	Part Number	Description
1	—	Stud (Part of 6582)
2	6582	Valve Cover
3	—	Retainer — 3 Places (Part of 12A581)
4	12A581	Engine Control Sensor Wiring

5	—	Oil Pressure Sender Connector (Part of 12A581)
6	—	Water Temperature Sender Connector (Part of 12A581)
7	10884	Water Temperature Indicator Sender Unit
8	9278	Oil Pressure Sensor

15. Unsnap clips retaining harness to fuel injection supply manifold (9D280) and remove retainers from studs on valve cover (6582) and lay left branch of engine control sensor wiring on top of valve cover.

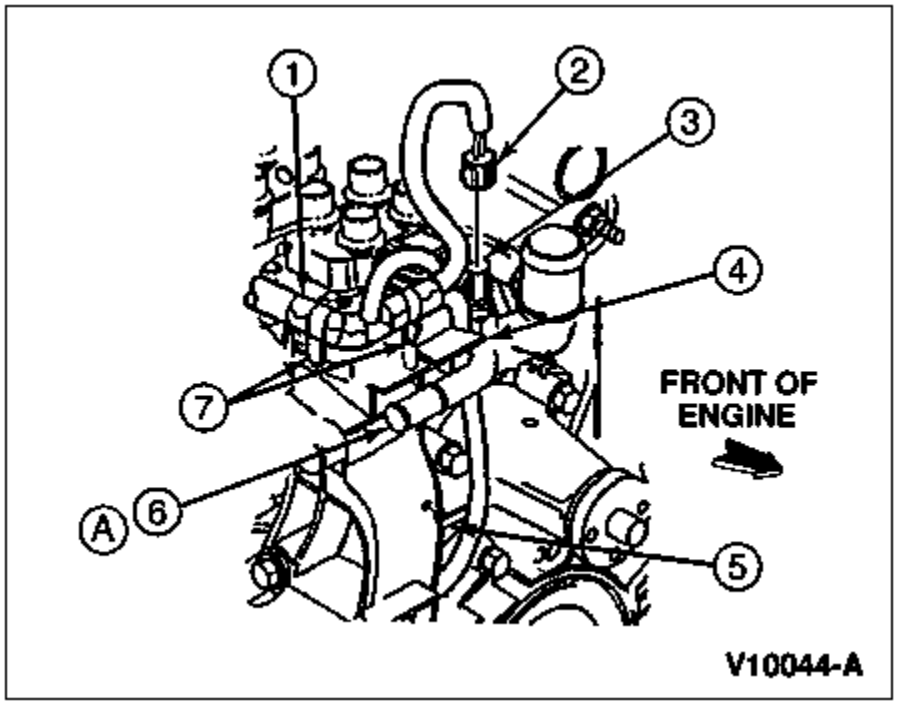
16. Disconnect crankshaft position sensor connector and pull retainer loose from generator mounting bracket (10153).



Item	Part Number	Description
1	6C315	Crankshaft Position Sensor
2	—	Crankshaft Position Sensor Connector (Part of 12A581)
3	—	Retainer (Part of 12A581)
4	12A581	Engine Control Sensor Wiring

5	10153	Generator Mounting Bracket

17. Disconnect engine coolant temperature sensor connector.

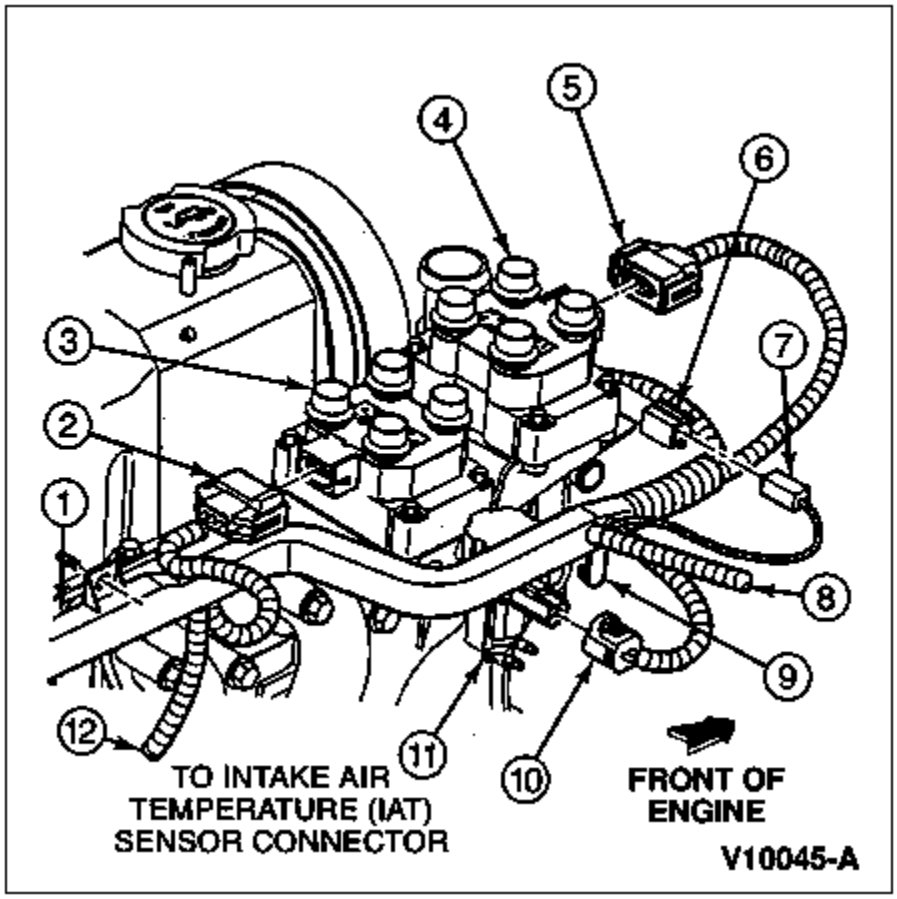


Item	Part Number	Description
1	12A581	Engine Control Sensor Wiring
2	—	Engine Coolant Temperature Sensor Connector (Part of 12A581)
3	12A648	Engine Coolant Temperature Sensor
4	10153	Generator Mounting Bracket
5	—	Retainer (Part of 12A581)
6	8594	Water Outlet Connection
7	—	Retainer (Part of 12A581)
A	—	Route engine control sensor wiring branch to crankshaft position sensor behind water outlet connection.

18. Route crankshaft position sensor branch of engine control sensor wiring out from behind generator mounting bracket.

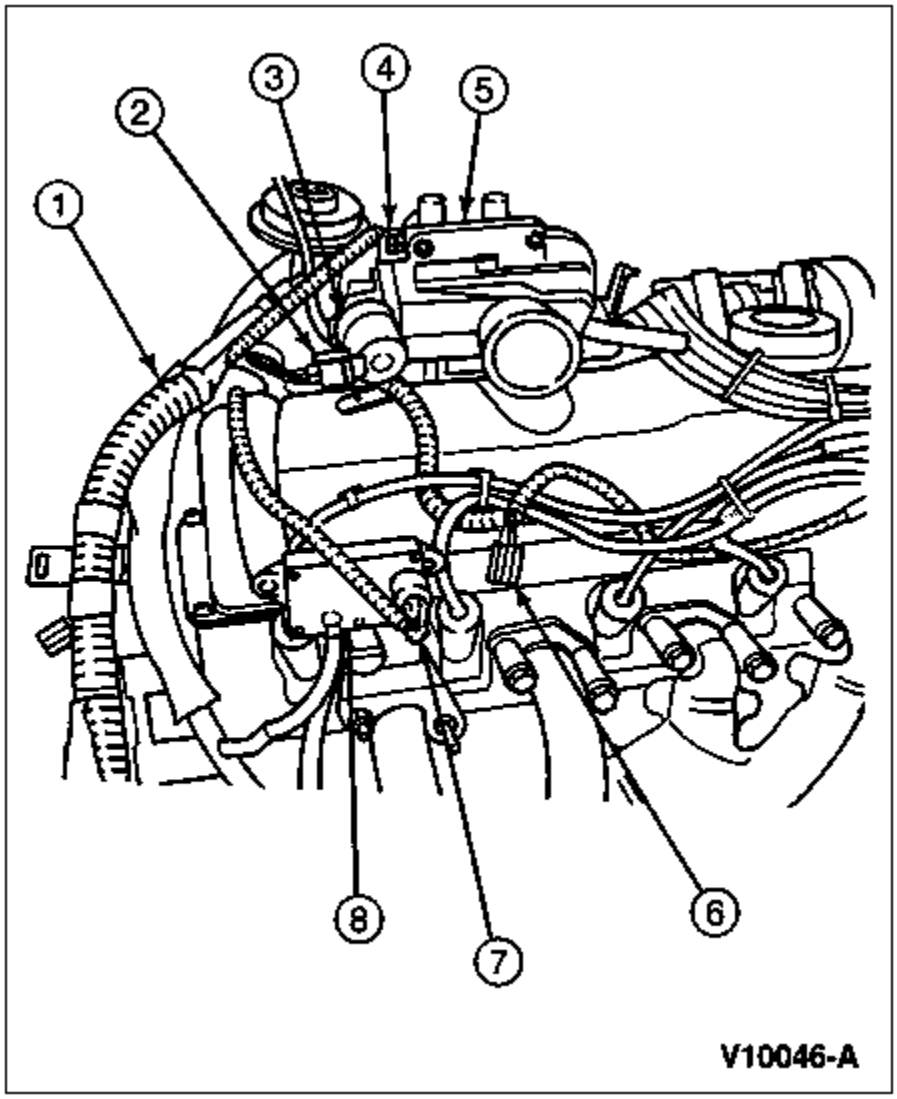
19. Disconnect radio interference capacitor and front ignition coil connector.

20. Disconnect EGR regulator control connector and rear coil connector.



Item	Part Number	Description
1	12A581	Engine Control Sensor Wiring
2	—	Rear Ignition Coil Connector (Part of 12A581)
3	12029	Ignition Coil (Rear)
4	12029	Ignition Coil (Front)
5	—	Front Ignition Coil Connector (Part of 12A581)
6	18801	Radio Ignition Interference Capacitor
7	—	Radio Capacitor Connector (Part of 12A581)
8	—	Branch to Mass Airflow Sensor (Part of 12A581)
9	—	Retainer (Part of 12A581)
10	—	EGR Vacuum Regulator Control Connector (Part of 12A581)
11	9J459	EGR Vacuum Regulator Control
12	—	Branch to Intake Air Temperature Sensor (Part of 12A581)

21. Disconnect throttle position sensor and idle air control connectors at the throttle body (9E926).



Item	Part Number	Description
1	12A581	Engine Control Sensor Wiring
2	—	Idle Air Control Valve Connector (Part of 12A581)
3	9F715	Idle Air Control Valve
4	—	Throttle Position Sensor Connector (Part of 12A581)
5	9E926	Throttle Body
6	—	Intake Air Temperature Sensor Connector (Part of 12A581)
7	—	EGR Transducer Connector (Part of 12A581)
8	9J459	EGR Vacuum Regulator Solenoid

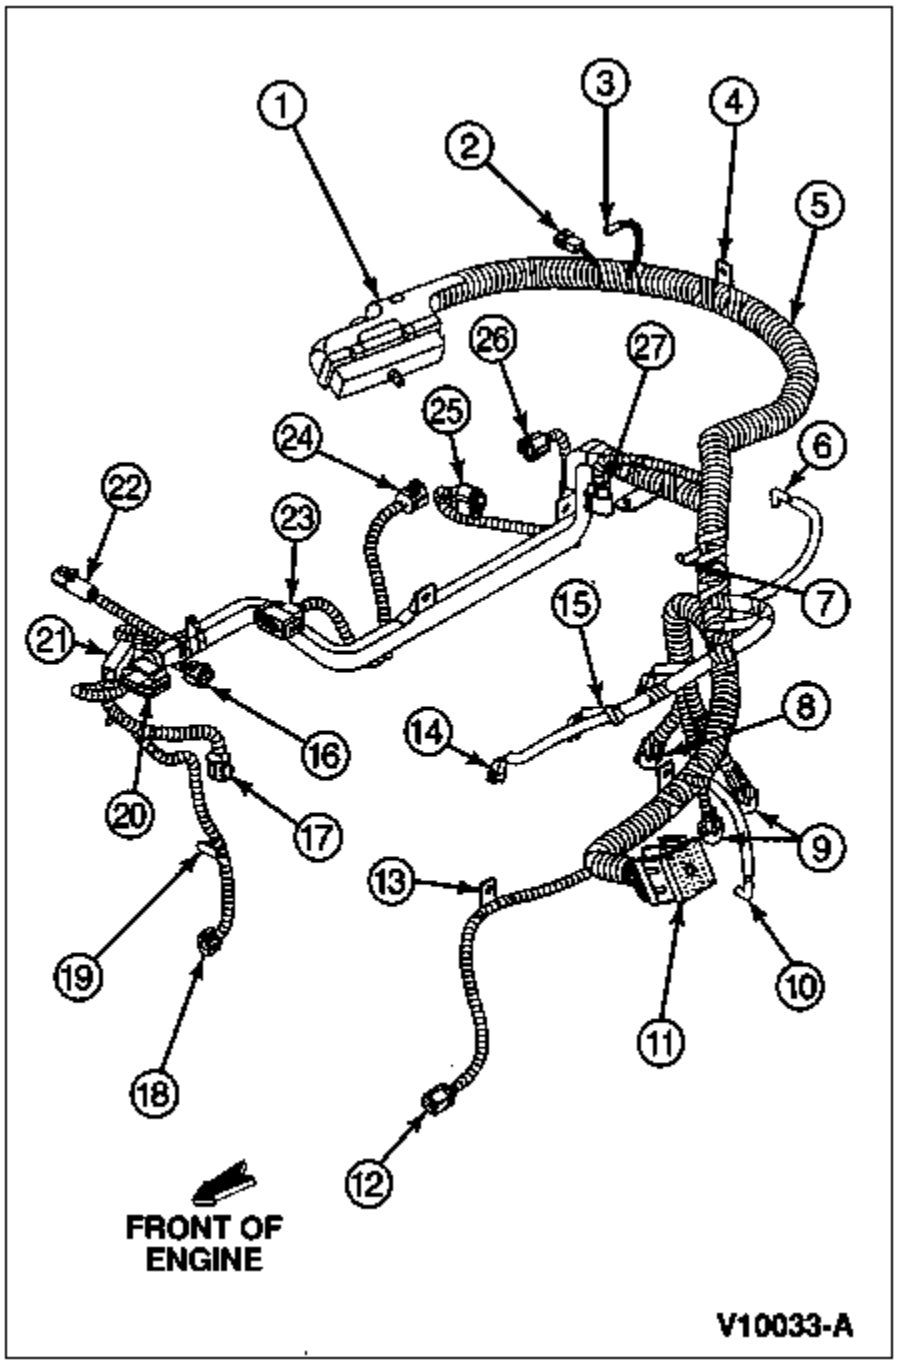
22. Disconnect EGR transducer connector.

23. Remove retainers from studs on valve cover.

24. Remove engine control sensor wiring from vehicle.

Installation

1. Position engine control sensor wiring.
2. Snap retainers onto studs on valve cover.
3. Connect EGR transducer connector.
4. Connect throttle position sensor (TP sensor) (9B989) and idle air control sensor connectors on throttle body.
5. Connect EGR regulator control connector and rear coil connector.
6. Route crankshaft position sensor branch behind generator mounting bracket.
7. Connect radio interference capacitor and front ignition coil connectors.
8. Plug in crankshaft position sensor connector. Push retainer into hole in generator mounting bracket.
9. Route left branch of engine control sensor wiring into place and snap retainers onto fuel injection supply manifold. Snap retainers onto studs on valve cover.
10. Connect oil pressure sensor.
11. Connect four fuel injectors.
12. Connect transmission lead connector.
13. Connect two heated oxygen sensor leads to engine control sensor wiring.
14. Connect water temperature sensor leads.
15. Connect 42-pin connector to engine compartment wiring harness and tighten bolts to 4-5 Nm (36-49 lb-in).
16. Route branch to camshaft position sensor and connect. Push retainers onto intake manifold studs.
17. Connect PCM connector. Tighten bolt to 6-7 Nm (46-63 lb-in).
18. Install screw attaching engine control sensor wiring to dash assembly. Tighten to 4 Nm (36 lb-in).
19. Clean surface of dash to ensure good connection where PCM ground cable attaches. Connect PCM ground cable to dash and tighten screw to 8-12 Nm (79-107 lb-in).



Item	Part Number	Description
1	—	104-Pin Connector to PCM (Part of 12A581)
2	—	Octane Adjust Switch (Part of 12A581)
3	—	PCM Ground Cable (Part of 12A581)
4	—	Retainer (Part of 12A581)
5	12A581	Engine Control Sensor Wiring

6	—	Oil Pressure Sensor Connector (Part of 12A581)
7	—	Retainer, Attaches to Valve Cover Stud (Part of 12A581)
8	—	Connector to Transmission Harness (Part of 12A581)
9	—	Connectors to Heated Oxygen Sensor Wiring (Part of 12A581)
10	—	Water Temperature Sensor Connector (Part of 12A581)
11	—	42-Pin Connector to Engine Compartment Wiring (Part of 12A581) (Attaches to Bracket on Lower Intake Manifold)
12	—	Camshaft Position Sensor Connector (Part of 12A581)
13	—	Retainer, Attaches to Intake Manifold Stud
14	—	Fuel Injector Connector, 4 Places (Part of 12A581)
15	—	Clip, 2 Places, Attaches to Fuel Injection Supply Manifold (Part of 12A581)
16	—	Connector to EGR Vacuum Regulator Control (Part of 12A581)
17	—	Connector to Engine Coolant Temperature Sensor (Part of 12A581)
18	—	Connector to Crankshaft Position Sensor
19	—	Retainer, 3 Places, Attaches to Generator Bracket (Part of 12A581)
20	—	Ignition Coil Connector (Part of 12A581)
21	—	Connector to Radio Ignition Interference Capacitor (Part of 12A581)
22	—	Connector to Mass Airflow Sensor (Part of 12A581)
23	—	Ignition Coil Connector (Part of 12A581)
24	—	Connector to Intake Air Temperature Sensor (Part of 12A581)
25	—	Connector to EGR Transducer (Part of 12A581)
26	—	Connector to Idle Air Control Valve (Part of 12A581)
27	—	Connector to Throttle Position Sensor (Part of 12A581)

20. Install upper intake manifold as outlined in Section 03-01A .
21. Install air cleaner outlet tube are tighten clamps to 1.4-2 Nm (13-17 lb-in).
22. Connect intake air temperature sensor (IAT sensor) (12A697) and mass air flow sensor (MAF sensor) (12B579).
23. Perform fuel system post-service procedures as outlined in Removal and Installation, Fuel Charging System in this section.

SPECIFICATIONS

TORQUE SPECIFICATIONS

Description	Nm	Lb-Ft	Lb-In
Throttle Body to Upper Intake Manifold	20-30	15-22	—

[a] Refer to Upper Intake Manifold Installation, Section 03-01A .
[b] Tighten to 6-12 Nm (54-106 lb-in) then rotate so side outlet is 30 degrees below centerline.
[c] Refer to Lower Intake Manifold Installation, Section 03-01A .

Tips to Avoid Lean Air-Fuel Conditions

Rough idle, hesitation, poor throttle response, induction backfire and stalls during cold start/warm-up may be caused by the poor volatility of some high octane premium grade unleaded fuels (91 octane or higher [R+M]/2). When compared to regular grade unleaded fuel (87 octane [R+M]/2), high octane premium grade unleaded fuel may cause long crank time.

Use a regular grade unleaded fuel in all vehicles, except where a premium unleaded fuel is recommended in the owner guide. If lean air-fuel type symptoms are experienced, determine the grade and brand of fuel used and offer the following service tips.

- Advise those using a higher octane grade fuel to switch to a regular grade unleaded fuel. For those using a regular grade fuel, advise them to try another brand.
- Do not advise using a higher octane unleaded fuel than is recommended for that specific engine. Ford engines are designed to perform best using a high quality, regular grade unleaded fuel.
- Only advise using a higher octane unleaded fuel to avoid potentially damaging spark knock or ping, but do so only after mechanical fixes are ineffective.
- All unleaded gasolines used should contain detergent additives that are advertised as having KEEP CLEAN or CLEANUP performance for intake valves (6507).

Refer to Powertrain Control/Emissions Diagnosis Manual for further diagnosis and testing procedures.

Pressure Check

SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
Fuel Pressure Gauge	T80L-9974-B

1. Disconnect electrical connection to inertia fuel shutoff switch (IFS switch) (9341).
2. Crank engine for 15 seconds to reduce system pressure.
3. Remove cap from fuel pressure relief valve (9H321) (Schrader valve).
4. **CAUTION: Use care to prevent combustion from fuel spillage.**

   Install Fuel Pressure Gauge T80L-9974-B on fuel pressure relief valve.
5. Connect inertia fuel shutoff switch.
6. Start engine (6007) and check fuel pressure.
7. Accelerate engine. Pressure should remain stable throughout acceleration.

Refer to Powertrain Control/Emissions Diagnosis Manual for further diagnosis and testing procedures.

Fuel Charging System

Pre-Service Procedures

SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
Fuel Pressure Gauge	T80L-9974-B

WARNING: DISCONNECT BATTERY GROUND CABLE (14301) BEFORE PERFORMING ANY MAINTENANCE PROCEDURE WHICH MAY RESULT IN FUEL SPILLAGE OR LEAKING, EVEN IF FUEL IS DIRECTED INTO A SUITABLE CONTAINER. AS LONG AS THE BATTERY IS CONNECTED, THERE IS THE POSSIBILITY OF SHORTING AND SPARKING ELECTRICAL COMPONENTS AND RESULTING FIRE OR EXPLOSION HAZARD.

CAUTION: Fuel supply lines on SFI and MFI engines will remain pressurized for some period of time after the engine is shut off. This residual pressure must be relieved before servicing of the fuel system is begun.

There are two ways to release residual pressure in the system and prepare the vehicle for fuel system service.

First Method

1. Disconnect battery ground cable.
2. Remove fuel tank filler cap (9030) to relieve tank pressure.
3. Remove fuel pressure relief valve cap (9H323) and connect tool T80L-9974-B to the fuel pressure relief valve (9H321) on the fuel injection supply manifold (9F792).
4. Direct the drain hose to a suitable container and depress the pressure relief button.

Second Method

1. Disconnect inertia fuel shutoff switch (IFS switch) (9341). Inertia fuel shutoff switch location may be determined from owner guide.
2. Operate ignition switch (11572) to crank the engine for 15-20 seconds to relieve pressure.
3. Disconnect battery ground cable.
4. Remove fuel tank filler cap to relieve tank pressure.

Post-Service Procedures

CAUTION: The fuel system is normally pressurized to 276 kPa (40 psi).

After the service is compete and the fuel charging assembly is installed onto engine (6007), the following steps must be taken:

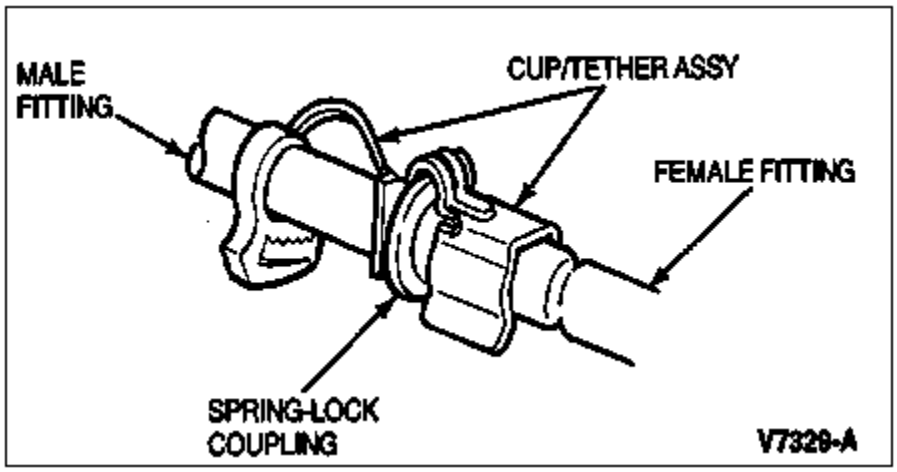
1. Install the fuel tank filler cap.
2. Connect battery ground cable.
3. Check all connections at fuel rails, push-connect fittings, fuel injectors, etc.
4. Turn ignition switch on and off several times without starting engine to pressurize the fuel system. Check for fuel leaks at fuel pressure regulator (9C968), fuel injector and fuel connect fittings.
5. Start engine and warm up to operating temperature. Check for coolant leak if coolant was removed.
6. Perform EEC self test to check system's function. Refer to Powertrain Control/Emissions Diagnosis Manual. Recheck for fuel leaks.

Spring Lock Coupling

SPECIAL SERVICE TOOL(S) REQUIRED

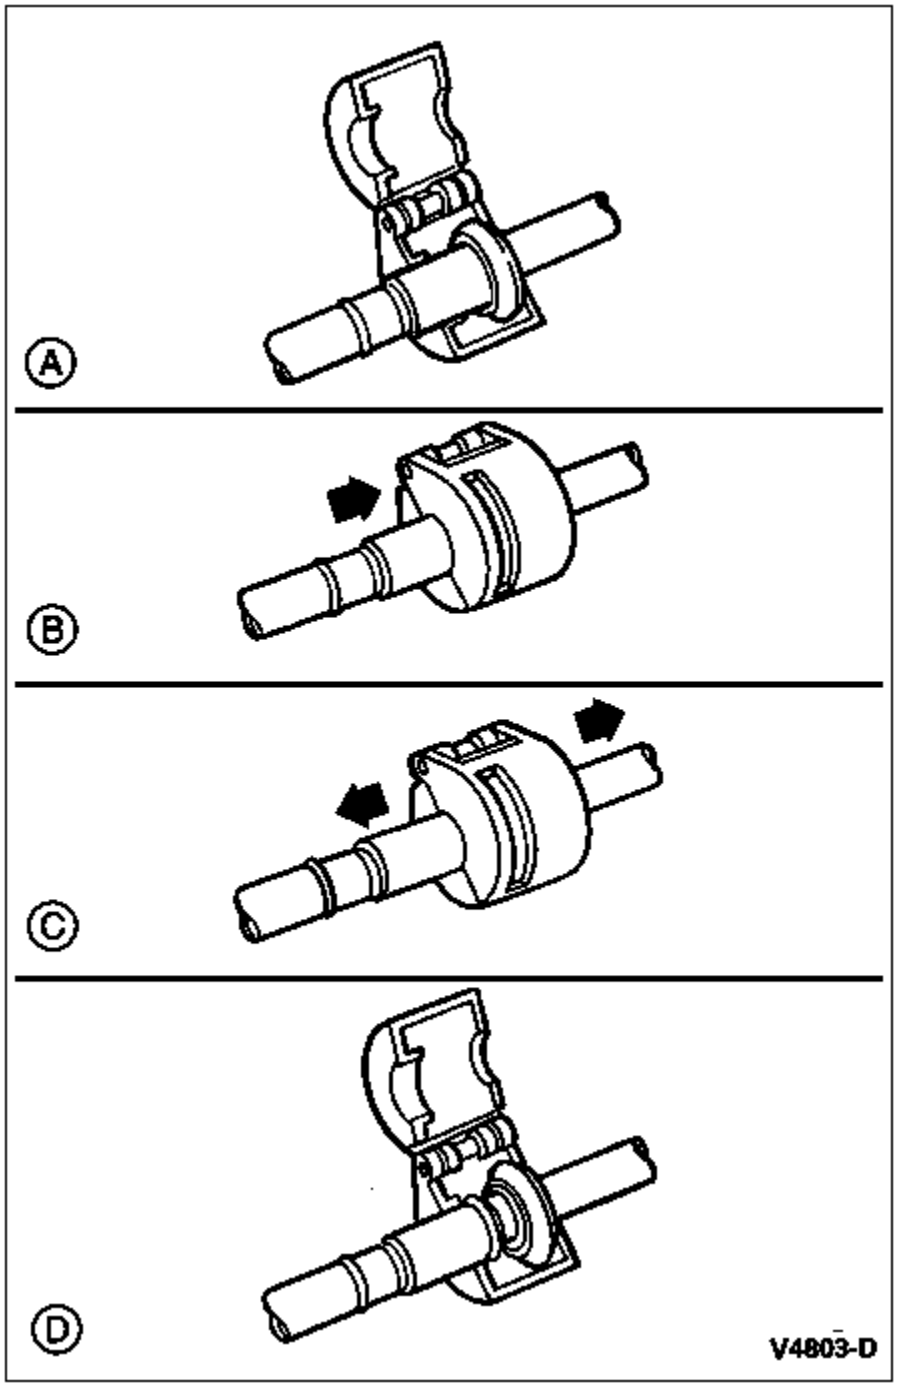
Description	Tool Number
Spring Lock Coupling Disconnect Tool (3/8-Inch)	T81P-19623-G1
Spring Lock Coupling Disconnect Tool (1/2-Inch)	T81P-19623-G2

The spring lock coupling is a fuel line coupling held together by a garter spring inside a circular cage. When the coupling is connected, the flared end of the female fitting slips behind the garter spring inside the cage of the male fitting. The garter spring and cage then prevent the flared end of the female fitting from pulling out of the cage. As a redundant locking feature, a horseshoe shaped retaining clip is incorporated to improve the retaining reliability of the spring lock coupling.



Removal

1. Perform Pre-Service procedures as described in this section.
2. Remove retaining clip from spring lock coupling by hand. Do not use any sharp tool or screwdriver as it may damage the spring lock coupling.
3. Twist fitting to free it from any adhesion at the O-ring seals.
4. Using Spring Lock Coupling Disconnect Tool, disconnect fuel hoses at the fuel rail supply tube and fuel rail return tube.
    a. Fit tool to coupling so tool can enter cage to release garter spring.
    b. Push the tool into the cage opening to release female fitting from garter spring.
    c. Pull the coupling male and female fittings apart.
    d. Remove the tool from the disconnected coupling.



Installation

1. Make sure the garter spring is in cage of male fittings. If garter spring is missing, install a new spring by pushing it into cage opening. If garter spring is damaged, remove it from cage with a small wire hook (do not use a screwdriver) and install a new spring.

2. Clean all dirt or foreign material from both pieces of coupling.

3. **WARNING: USE ONLY THE SPECIFIED O-RINGS, AS THEY ARE MADE OF A SPECIAL MATERIAL. THE USE OF AN O-RING OF THE IMPROPER MATERIAL MAY ALLOW THE CONNECTION TO LEAK INTERMITTENTLY DURING VEHICLE OPERATION.**

   Replace missing or damaged O-rings. Use only O-rings listed in spring lock coupling illustration.

4. Lubricate male fitting and O-rings and inside of female fitting with clean engine oil.

5. Fit female fitting to male fitting and push until garter spring snaps over flared end of female fitting.

6. Ensure coupling engagement by pulling on fitting and visually checking to make sure garter spring is over flared end of female fitting.

7. **NOTE: All vehicles require the large black clip to be installed on the supply side fuel line and the small gray clip to be installed on the return side fuel line.**

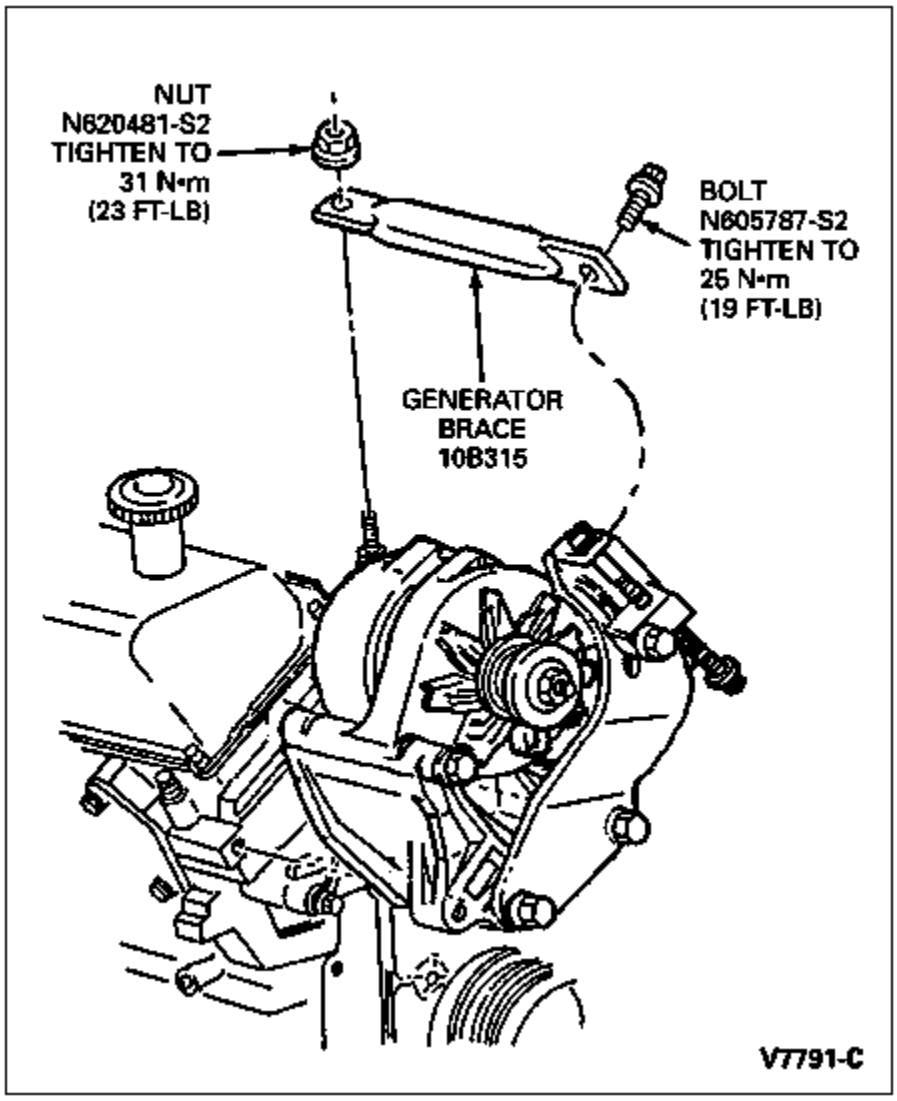
   Position retaining clip over metal portion of spring lock coupling. Firmly push retaining clip onto spring lock coupling. Make sure horseshoe portion of clip is over the coupling. Do not install retaining clip over rubber fuel line.

Throttle Body and Upper Intake Manifold — Aerostar

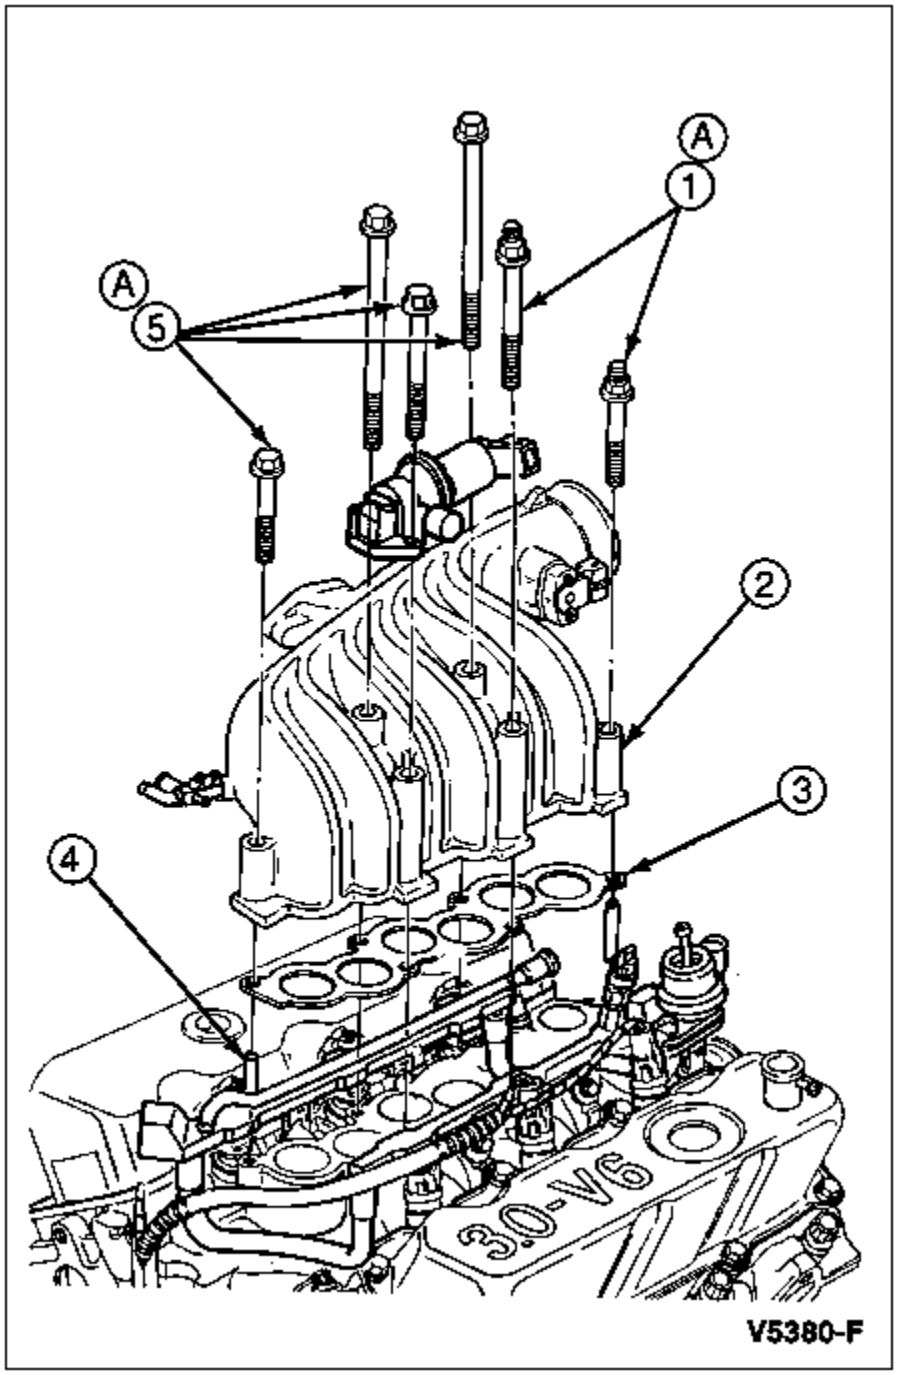
Removal

NOTE: The 3.0L throttle body (9E926) and upper intake manifold are combined in one piece.

1. Disconnect the battery negative lead.
2. Disconnect intake air temperature sensor (IAT sensor) connector.
3. Remove engine air cleaner intake tube and duct (9A673) between air cleaner and throttle body by loosening two clamps.
4. Remove fuel supply manifold shield (9J314) by removing three plastic push retainers which attach the fuel supply manifold shield to the power steering pump bracket and accelerator cable bracket.
5. Mark and disconnect PCV hose and vacuum hoses at vacuum fittings on intake manifold.
6. Disconnect and remove accelerator and speed control cables from accelerator mounting bracket and throttle lever.
7. Remove generator brace (10B315).



8. Remove wiring harness connector carefully at throttle position sensor (TP sensor) (9B989) and idle air control valve (IAC valve) (9F715).
9. Remove retainer and position aside coil assembly and bracket.
10. Remove EGR tube.
11. Remove retainer for transmission fluid level indicator tube and position aside.
12. Disconnect vacuum hoses for EGR valve, brake booster and EGR vacuum regulator solenoid.
13. Disconnect EGR differential pressure feedback transducer electrical connector.
14. Disconnect EGR vacuum regulator solenoid electrical connector.
15. Remove four bolts and two stud bolts retaining throttle body to intake manifold (9424). Lift throttle body from intake manifold.



Item	Part Number	Description
1	—	Stud Bolts (Part of 9E926)
2	9E926	Throttle Body
3	9H486	Intake Manifold Upper Gasket
4	—	Guide Pin (2 Req'd) (Part of 9E926)
5	—	Bolts (Part of 9E926)

A	—	Tighten to 25 Nm (19 Lb-Ft)

16. Remove and discard gasket from intake manifold.

Installation

1. **NOTE: If scraping is necessary, be careful not to damage throttle body, intake manifold, or allow material to fall into intake manifold.**

   Clean and inspect mounting faces of throttle body and intake manifold. Both surfaces must be clean and flat.

2. Clean and lightly oil bolt and stud threads.

3. Install a new gasket.

4. Install throttle body to intake manifold using guide pins as locators.

5. Install stud bolts and four retaining bolts in sequence positions shown in illustration. Hand-tighten.

6. Tighten bolts to 25 Nm (19 lb-ft) in sequence as numbered.

7. Connect EGR vacuum regulator solenoid electrical connector.

8. Connect EGR differential pressure feedback transducer electrical connector.

9. Connect vacuum hoses for EGR, brake booster, and EGR vacuum regulator solenoid.

10. Install retainers for transmission fluid level indicator tube.

11. Install EGR tube.

12. Install coil bracket and coil assembly.

13. Reinstall spring lock coupling retaining clips on fuel inlet and return fittings.

14. Connect wiring harness to throttle position sensor, intake air temperature sensor and idle air control valve.

15. Install accelerator cable and speed control cable, if so equipped.

16. Install vacuum hoses to vacuum fittings.

17. Connect the battery negative lead.

18. Use EEC self test to check for proper sensor function. Refer to the Powertrain Control/Emissions Diagnosis Manual .

19. Install engine air cleaner intake tube and duct.

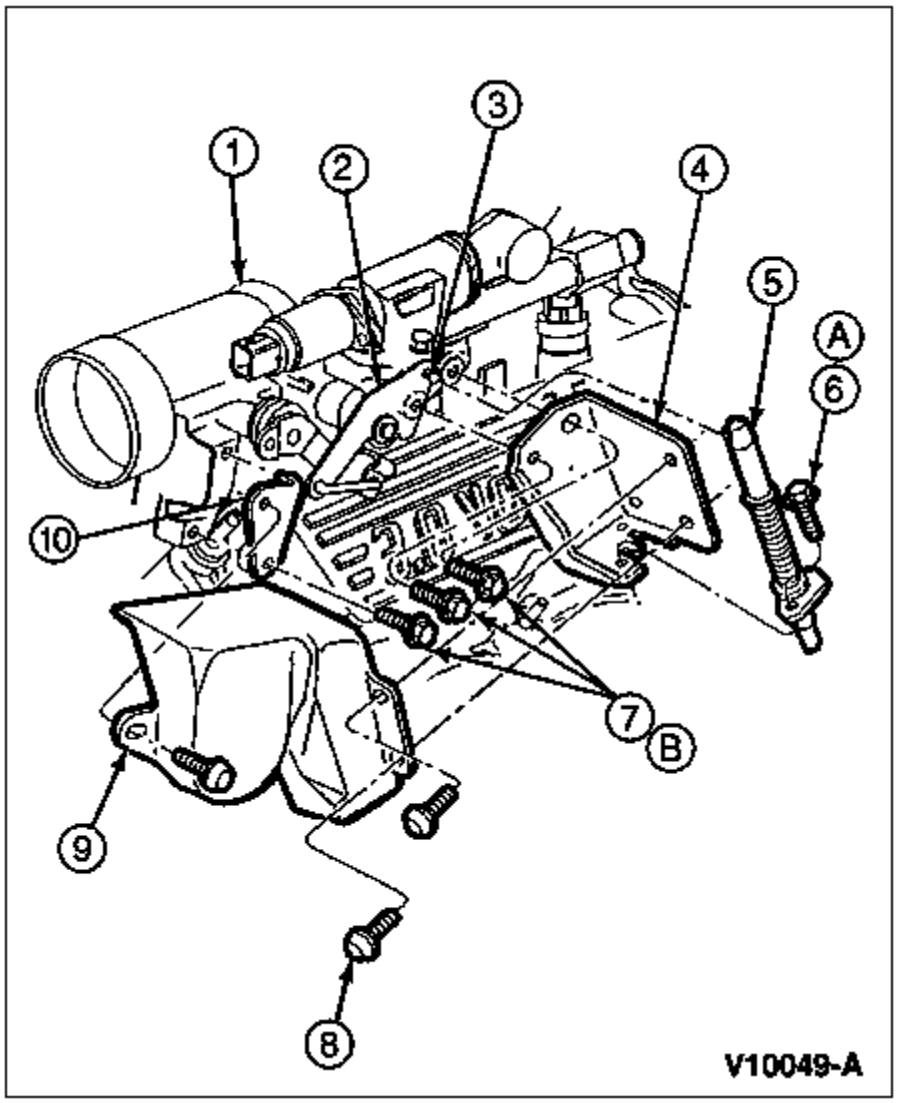
20. Run engine and check idle. Refer to the Powertrain Control/Emissions Diagnosis Manual. Install fuel supply manifold shield.

Throttle Body and Upper Intake Manifold — Ranger

Removal

NOTE: The 3.0L throttle body (9E926) and upper intake manifold are combined in one piece.

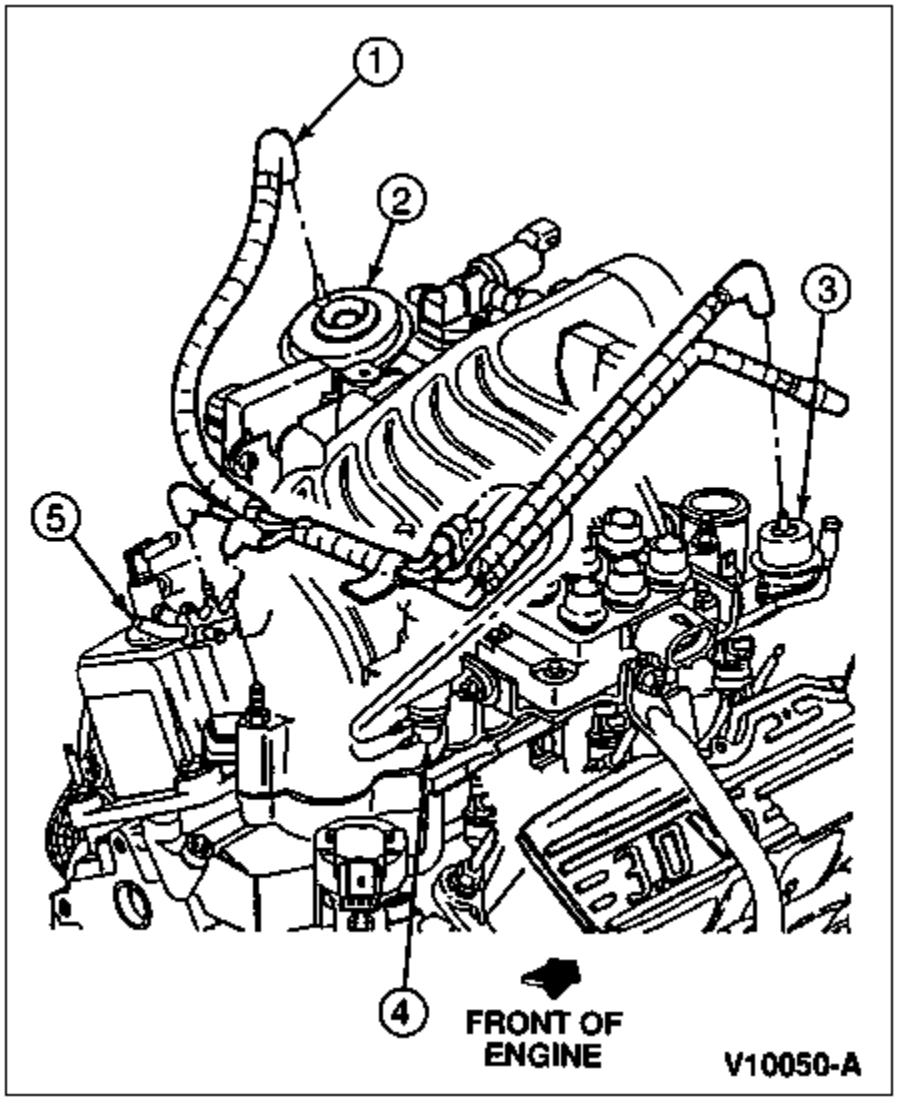
1. Perform Pre-Service procedures as described in this section.
2. Disconnect electrical connectors to the intake air temperature sensor (IAT sensor) (12A697) and mass air flow sensor (MAF sensor) (12B579).
3. Disconnect air crankcase ventilation hose (6853) from nipple on valve cover (6582).
4. Loosen clamps and remove air cleaner outlet tube (9B659).
5. Using trim removing tool, remove pushpins and accelerator control splash shield (9E766).
6. Disconnect accelerator cable (9A758) from throttle body. Remove three screws and accelerator cable bracket (9723) and position assembled accelerator cable and accelerator cable bracket out of the way.



Item	Part Number	Description
1	9E926	Throttle Body
2	—	Secondary Throttle Lever (Part of 9E926)
3	—	Ball Stud (Part of 9E926)
4	9728	Accelerator Cable Bracket
5	9A758	Accelerator Cable
6	N610959-S2	Screw, M6.3 x 13
7	N605786-S2	Bolt, M8-1.25 x 20
8	N804527-S100	Pushpin
9	9E766	Accelerator Control Splash Shield
10	9N818	Accelerator Shield Bracket
A	—	Tighten to 7-9 Nm (60-81 Lb-In)
B	—	Tighten to 8-10 Nm

		(67-92 Lb-In)

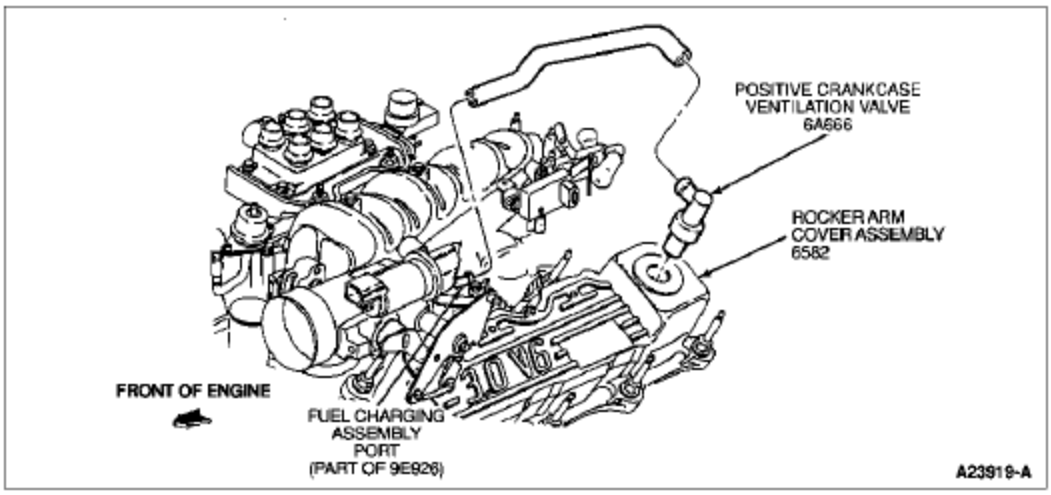
7. Tag and disconnect connectors of emission control vacuum harness and remove.



Item	Part Number	Description
1	9E498	Emission Control Vacuum Harness
2	9D475	EGR Valve
3	9C968	Fuel Pressure Regulator
4	9J459	EGR Vacuum Regulator Solenoid
5	9A474	Intake Manifold Vacuum Outlet Fitting and Cap

8. Disconnect PCV hose from throttle body.

PCV Hose

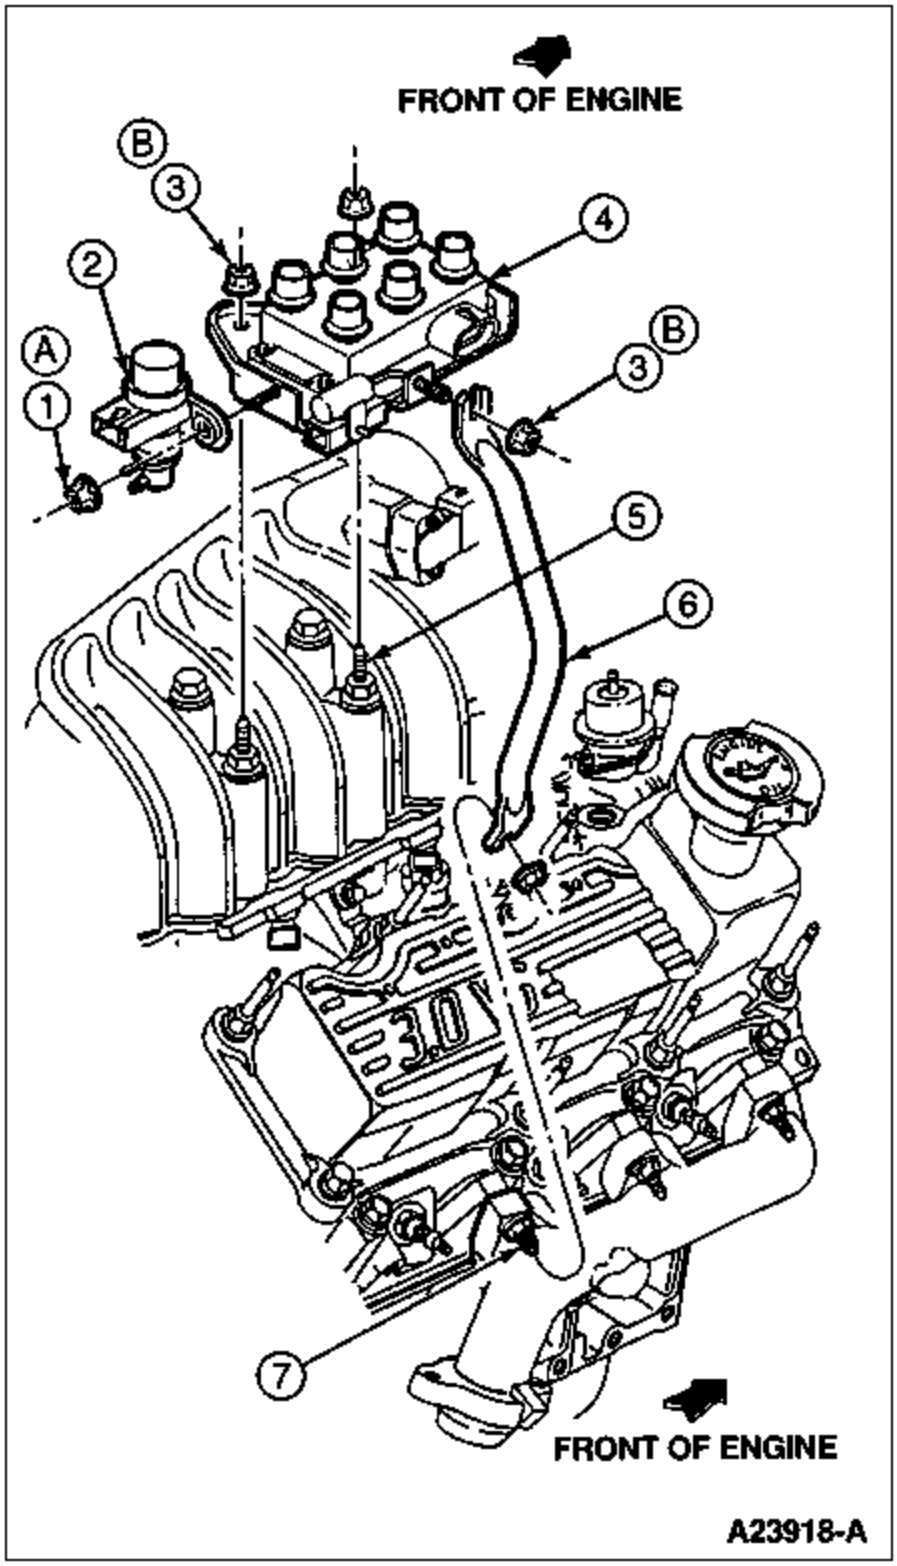


9. Disconnect spark plug wires from ignition coil (12029) and position out of the way.

10. Disconnect electrical connections from ignition coil, EGR vacuum regulator solenoid (9J459), EGR transducer (9J433), idle air control valve (IAC valve) (9F715), and throttle position sensor (TP sensor) (9B989).

11. Remove two nuts and ignition coil mounting bracket (12N004).

12. Remove two nuts and ignition coil with assembled bracket, EGR vacuum regulator solenoid and radio ignition interference capacitor (18801).



Item	Part Number	Description
1	—	Nut, M8 x 1.25 (Part of 12A310)

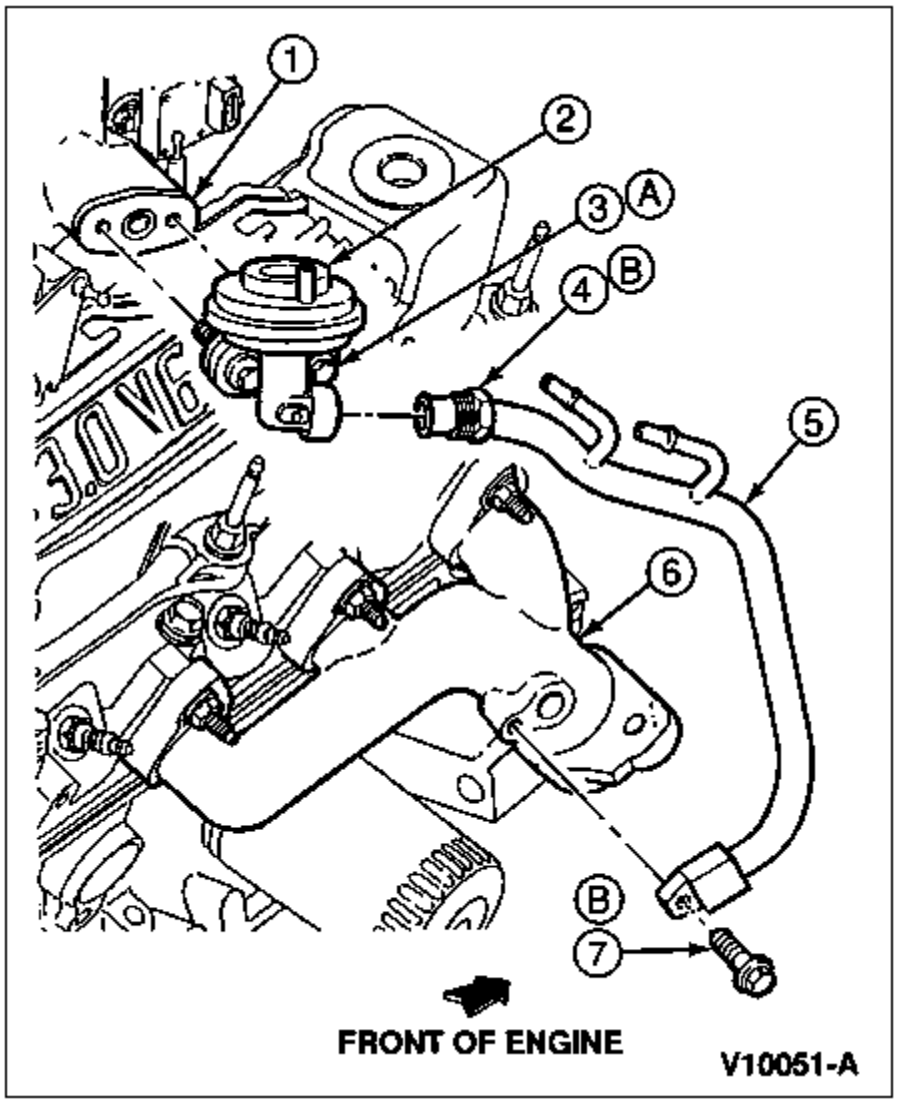
2	9J459	EGR Vacuum Regulator Solenoid
3	—	Nut, M8 x 1.25 (Part of 12A310)
4	12A310	Ignition Coil and Bracket Assembly (Includes 12029 Ignition Coil)
5	—	Stud (Part of 9430)
6	12N004	Ignition Coil Support Bracket
7	—	Exhaust Manifold Stud
A	—	Tighten to 8-12 Nm (71-106 Lb-In)
B	—	Tighten to 16-20 Nm (12-15 Lb-Ft)

13. Disconnect two hoses from EGR valve to exhaust manifold tube (9D477) which go to the EGR transducer.

14. Remove bolt securing EGR valve (EGR valve) (9D475) to EGR valve to exhaust manifold tube.

15. Loosen EGR valve to exhaust manifold tube to EGR valve nut and remove EGR valve to exhaust manifold tube.

Ranger Only

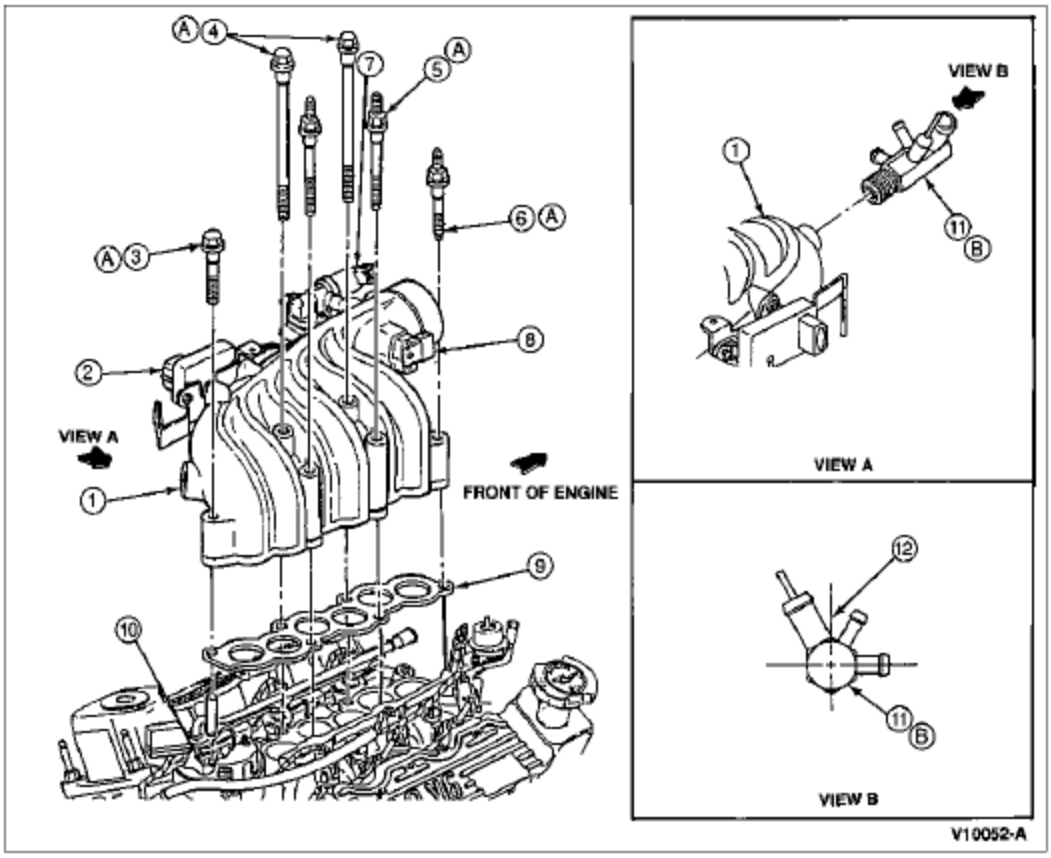


Item	Part Number	Description
1	9E926	Throttle Body
2	9D475	EGR Valve
3	—	Bolt, M8-1.25 x 39 (Part of 9D475)
4	—	Nut (Part of 9D477)
5	9D477	EGR Valve to Exhaust Manifold Tube
6	9430	Exhaust Manifold (LH)
7	—	Bolt, M8-1.25 x 25 (Part of 9D477)
A	—	Tighten to 20-30 Nm (15-22 Lb-Ft)
B	—	Tighten to 35-65 Nm (26-47 Lb-Ft)

16. Disconnect remaining hoses from EGR vacuum regulator solenoid.

17. Remove bolts and studs, upper intake manifold, and intake manifold upper gasket (9H486).

Upper Intake Manifold — Ranger



Item	Part Number	Description
1	9E926	Throttle Body
2	9J433	EGR Transducer
3	—	Bolt, M8-1.25 x 68 (Part of 9E926)
4	—	Bolt, M8-1.25 x 130 (Part of 9E926)
5	—	Stud, M8-1.25 x 129.3 (Part of 9E926)
6	—	Stud, M8-1.25 x 99.3
7	9F715	Idle Air Control Valve
8	9B989	Throttle Position Sensor
9	9H486	Intake Manifold Upper Gasket

10	9424	Lower Intake Manifold
11	9A474	Intake Manifold Vacuum Outlet Fitting and Cap
12	—	Parallel to Vertical Centerline of Manifold Hose (Part of 9A474)
A	—	Refer to Text for Tightening Instructions
B	—	Tighten to 8-13 Nm (71-115 Lb-In). Then Advance to Position Shown (Less Than One Full Turn, No Backup Allowed).

18. If necessary, remove EGR transducer, throttle position sensor, idle air control valve, EGR valve and intake manifold vacuum outlet fitting and cap (9A474) from upper intake manifold.

Installation

1. If removed, install intake manifold vacuum outlet fitting and cap and tighten to 8-13 Nm (71-115 lb-in), then advance to position shown. No backup allowed.

2. If removed, install new EGR valve gasket and EGR valve onto upper intake manifold. Tighten EGR valve screws to 20-30 Nm (15-22 lb-ft).

3. **CAUTION: Slide throttle position sensor rotary tangs into position over throttle shaft blade, then rotate throttle position sensor clockwise to installed position only. Failure to install the throttle position sensor in this manner may result in excessive idle speeds.**

   If removed, install throttle position sensor. Make sure rotary tangs on throttle position sensor are in proper alignment and that the red seal is inside the connector housing.

4. Secure throttle position sensor to throttle body with two retaining screws and tighten to 2.8-3.8 Nm (25-33 lb-in).

5. If removed, install idle air control valve, idle air control gasket (IAC gasket) (9F670), and two retaining screws. Tighten screws to 10 Nm (89 lb-in).

6. If removed, install EGR transducer on upper intake manifold and tighten screws.

7. Install intake manifold upper gasket on lower intake manifold.

8. Position upper intake manifold on lower intake manifold.

9. Install two central bolts and two studs, and hand-tighten.

10. Install remaining bolt and remaining stud bolt, and hand-tighten.

11. Tighten all fasteners in sequence shown to 25 Nm (18 lb-ft).

12. Connect hoses to intake manifold vacuum outlet fitting and cap.

13. Install EGR valve to exhaust manifold tube to EGR valve and tighten nut finger-tight.

14. Install EGR valve to exhaust manifold tube to exhaust manifold bolt and tighten to 20-30 Nm (15-22 lb-ft).

15. Tighten EGR tube nut to 35-65 Nm (26-47 lb-ft).

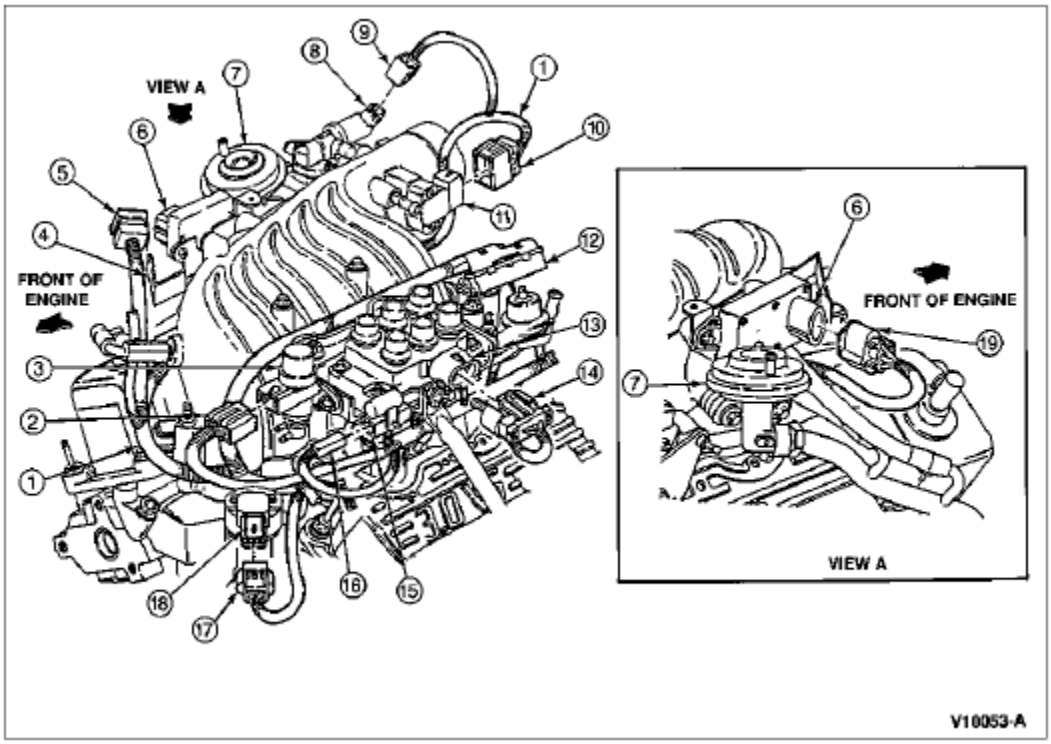
16. Connect two hoses from EGR transducer to EGR valve to exhaust manifold tube.

17. Install ignition coil with assembled bracket to upper intake manifold and tighten nuts finger-tight.

18. Install ignition coil support bracket and nuts and tighten to 16-20 Nm (11-14 lb-ft). Tighten ignition coil bracket-to-throttle body nuts to 16-20 Nm (11-14 lb-ft).

19. Attach electrical connections to ignition coil, EGR vacuum regulator solenoid, EGR transducer, idle air control valve and throttle position sensor.

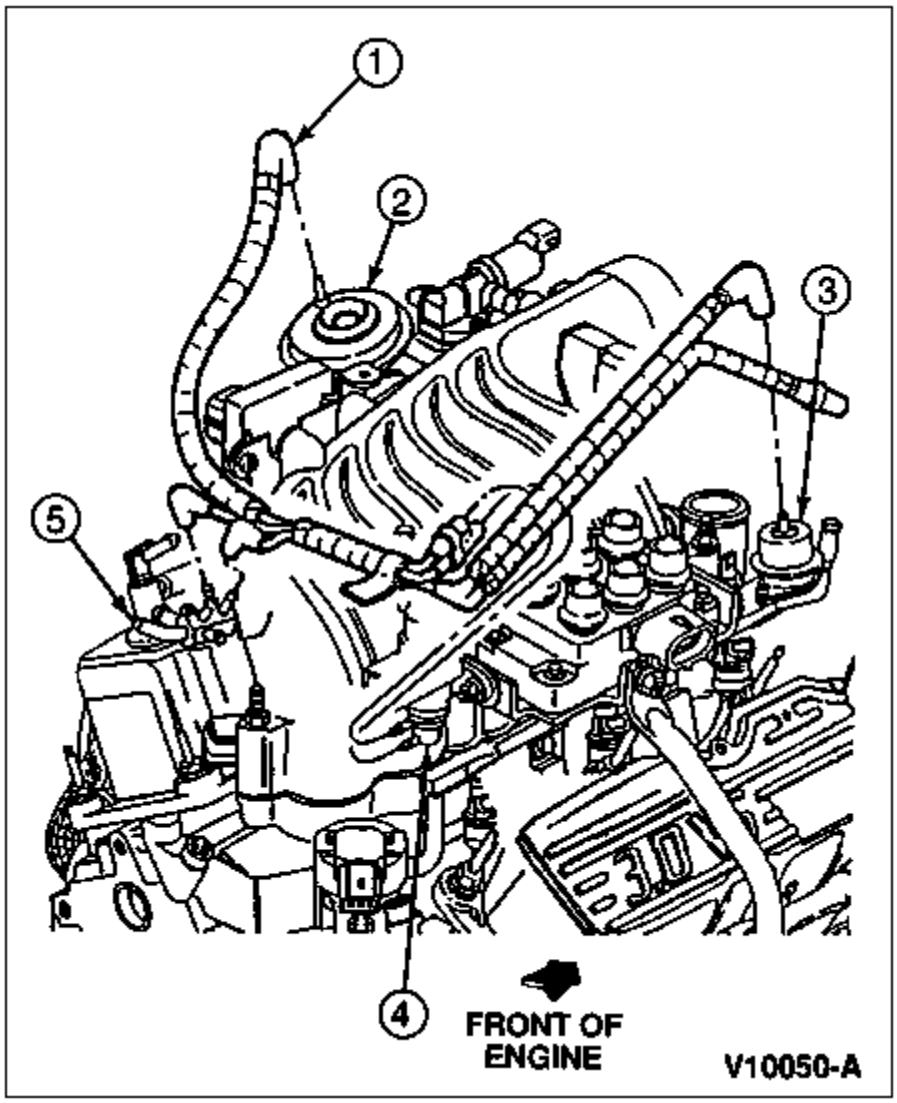
Sensor Electrical Connections — Ranger



Item	Part Number	Description
1	12A581	Engine Control Sensor Wiring
2	—	Connector to EGR Vacuum Regulator Control (Part of 12A581)
3	9J459	EGR Vacuum Regulator Solenoid
4	—	EGR Transducer Bracket (Part of 9J433)
5	—	42-Pin Connector to Engine Compartment Wiring

		Assembly (Part of 12A581)
6	9J433	EGR Transducer
7	9D475	EGR Valve
8	9F715	Idle Air Control Valve
9	—	Connector to Idle Air Control Valve (Part of 12A581)
10	—	Connector to Throttle Position Sensor (Part of 12A581)
11	9B989	Throttle Position Sensor
12	—	PCM Connector (Part of 12A581)
13	12029	Ignition Coil
14	—	Connector to Ignition Coil (Part of 12A581)
15	18801	Radio Ignition Interference Capacitor
16	—	Connector to Radio Interference Capacitor (Part of 12A581)
17	—	Connector to Camshaft Position Sensor (Synchronizer) (Part of 12A581)
18	12A112	Camshaft Position Sensor
19	—	Connector to EGR Transducer (Part of 12A581)

20. Connect spark plug wires to ignition coil.
21. Connect PCV hose to throttle body.
22. Position emission control vacuum harness and connect vacuum connections.



Item	Part Number	Description
1	9F498	Emission Control Vacuum Harness
2	9D475	EGR Valve
3	9C968	Fuel Pressure Regulator
4	9J459	EGR Vacuum Regulator Solenoid
5	9A474	Intake Manifold Vacuum Outlet Fitting and Cap

23. Install assembled accelerator cable and bracket. Tighten bracket-to-upper intake manifold bolts to 8-10 Nm (67-92 lb-in).

24. Install accelerator control splash shield and pushpins.

25. Install air air cleaner outlet tube to air filter and throttle body and tighten clamps.

26. Connect crankcase ventilation hose to valve cover.

27. Attach electrical connectors to the intake air temperature sensor and mass air flow sensor.

28. Make sure that nothing interferes with the operation of the accelerator linkage and that the accelerator cable does not bind. With engine running and vehicle in park (automatic transmission) or neutral (manual transmission) and parking brake set, quickly step on and release accelerator pedal. Engine (6007) should return to idle without hesitation or cable binding. Relocate components or replace accelerator cable as needed.

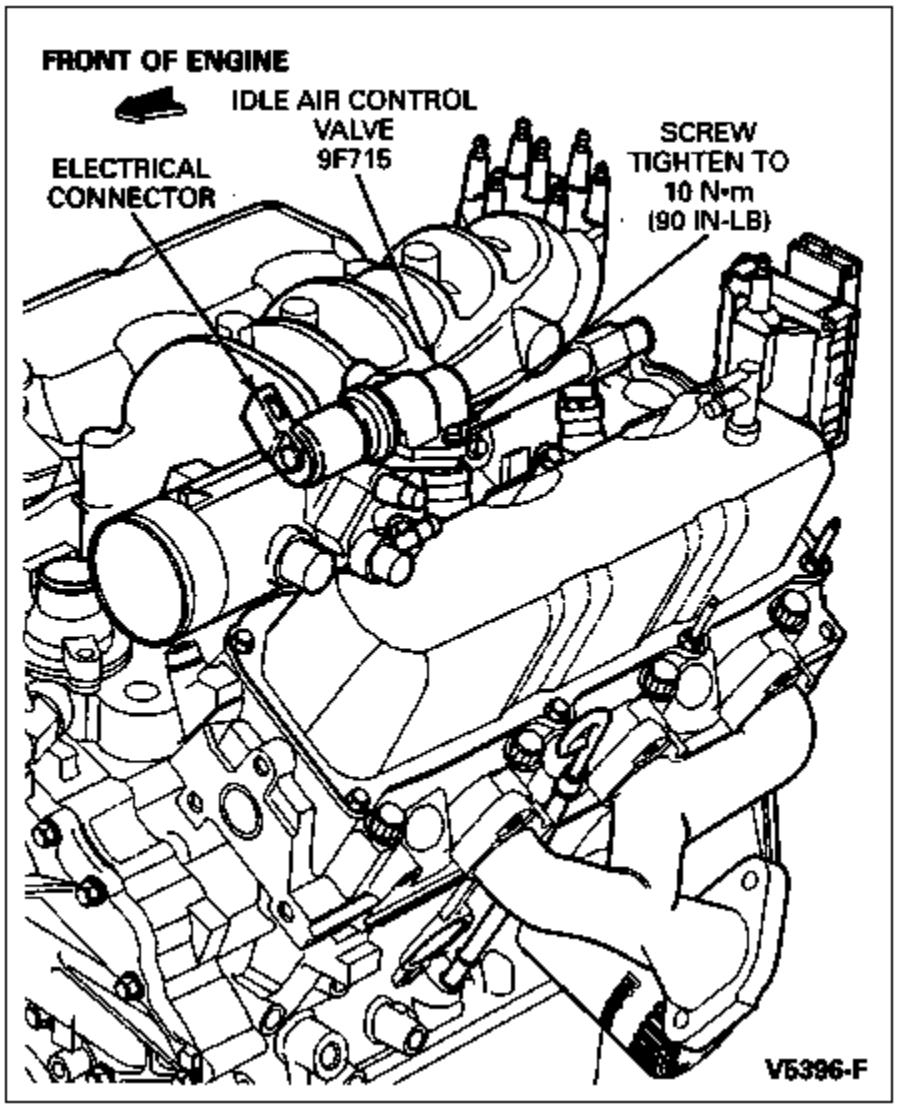
29. Perform Fuel System Post-Service procedures as described in this section.

Idle Air Control Valve

Removal

1. Disconnect idle air control valve connector from wiring harness.
2. Remove two idle air control valve retaining screws.

Idle Air Control Valve — Aerostar Shown, Ranger Similar

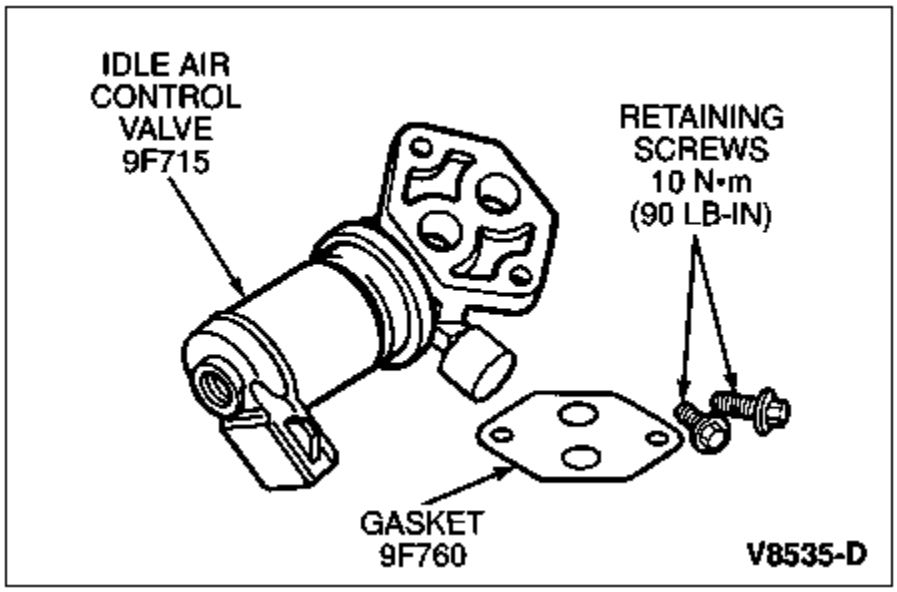


3. Remove idle air control valve (IAC valve) (9F715) and fuel charging gasket kit (9F760).

Installation

1. **NOTE: If scraping is necessary, be careful not to damage throttle body (9E926), throttle body gasket surfaces or drop material into throttle body.**

   Make sure both throttle body and idle air control valve gasket surfaces are clean.



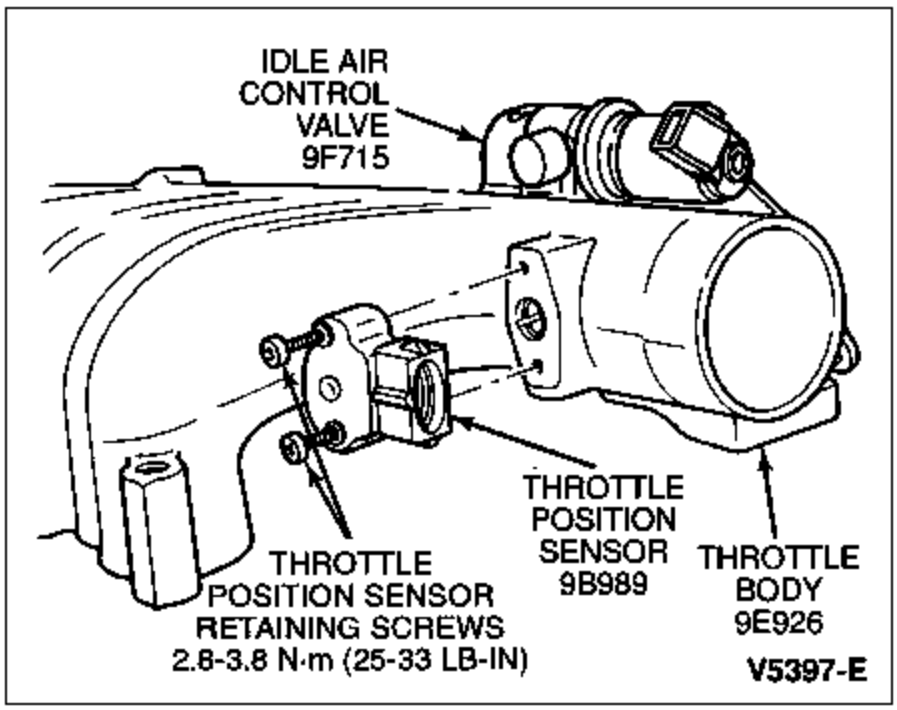
2. Install gasket on surface of throttle body and mount idle air control valve, securing it with two retaining screws. Tighten to 10 Nm (90 lb-in).

3. Install electrical connector to idle air control valve.

Throttle Position (TP) Sensor

Removal

1. Disconnect throttle position sensor (TP sensor) (9B989) from wiring harness.
2. Remove two throttle position sensor retaining screws.
3. Remove throttle position sensor.



Installation

1. **CAUTION: Slide rotary tangs into position over throttle shaft blade, then rotate throttle position sensor clockwise to installed position only. Failure to install the throttle position sensor in this manner may result in excessive idle speeds.**

   Install throttle position sensor. Make sure rotary tangs on throttle position sensor are in proper alignment and that the red seal is inside the connector housing.

2. **NOTE: This throttle position sensor is not adjustable.**

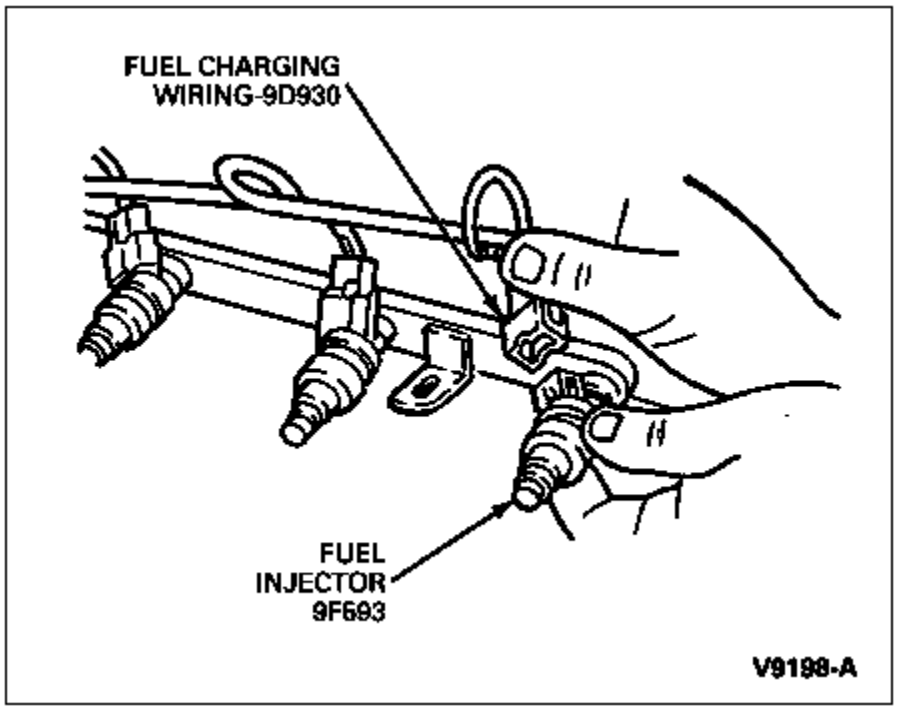
   Secure throttle position sensor to throttle body (9E926) assembly with two retaining screws. Tighten to 2.8-3.8 Nm (25-33 lb-in).

3. Install electrical connector to throttle position sensor.

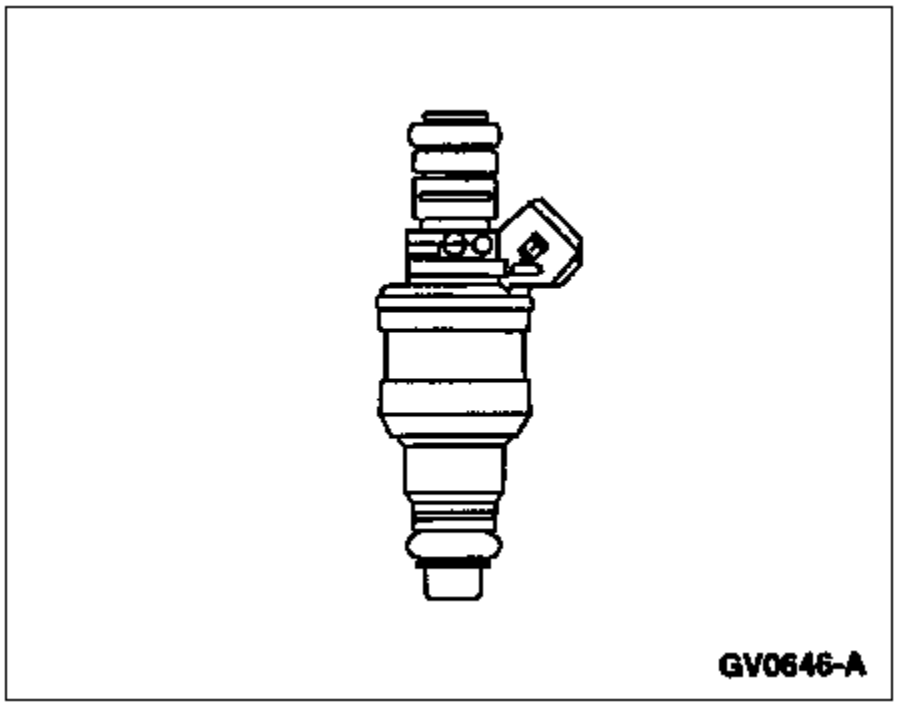
Fuel Injector

Removal

1. Perform Pre-Service procedures as described in this section.
2. Remove throttle body (9E926) as described in this section.
3. Remove fuel injection supply manifold (9F792) as described in this section.
4. Remove fuel injector retaining clips as required.
5. Carefully remove electrical harness connectors from individual fuel injectors as required.



6. Grasping fuel injector body, pull up while gently rocking fuel injection from side to side.
7. Inspect fuel injector O-rings (two per injector) for signs of deterioration. Replace as required.
8. Inspect fuel injector body, end cap and washer for signs of dirt and deterioration.



Installation

1. **NOTE: Never use silicone grease. Silicone grease will clog the fuel injectors.**

   Lubricate fuel injector top O-rings with clean engine oil XO-10W30-WSP or equivalent meeting Ford specification ESE-M2C153-E.

2. Install fuel injectors. Use a light, twisting, pushing motion to install them.

3. Reconnect fuel injector retaining clips as required.

4. Install fuel injection supply manifold as described in this section.

5. Install fuel charging wiring connectors to fuel injectors.

6. Install throttle body as described in this section.

7. Perform Post-Service procedures as described in this section.

Fuel Pressure Relief Valve (Schrader Valve)

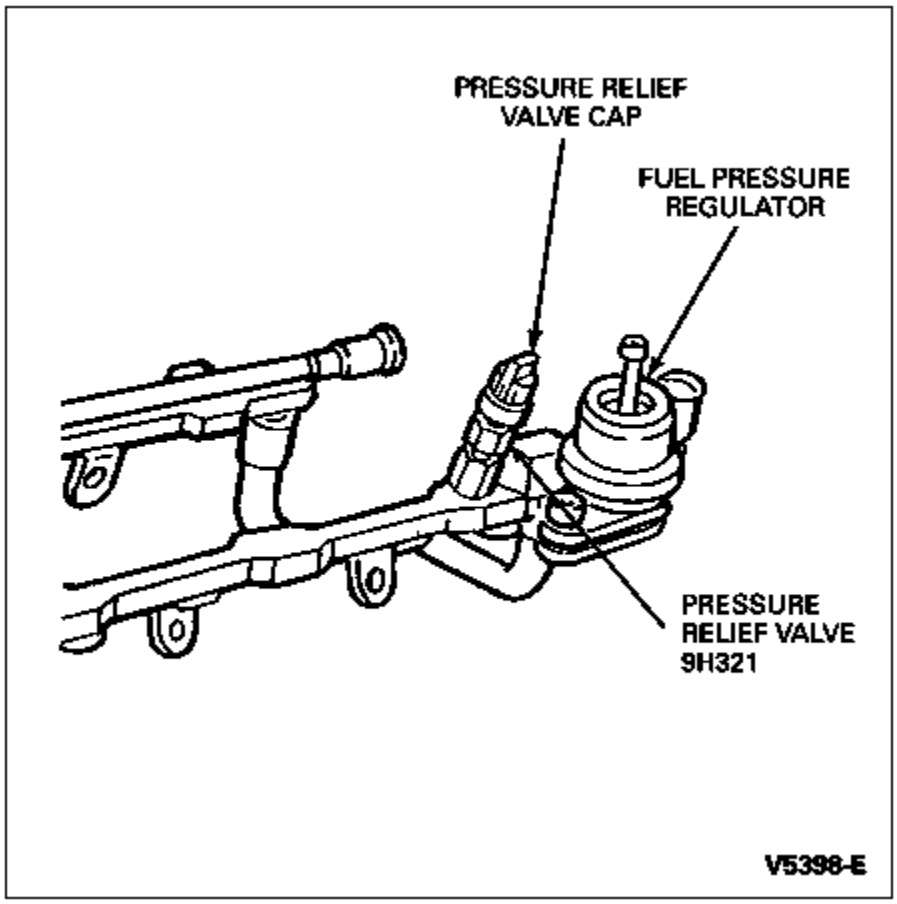
Removal

SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
Fuel Pressure Gauge	T80L-9974-B

CAUTION: Fuel supply lines on MFI and SFI engines will remain pressurized for some period of time after the engine is shut off. This residual pressure must be relieved before servicing of the fuel system is begun.

1. Perform Pre-Service procedures as described in this section.



2. Using a socket wrench, remove fuel pressure relief valve (9H321) from fuel injection supply manifold (9D280).

Installation

1. Install fuel pressure relief valve and cap. Tighten fuel pressure relief valve to 8 Nm (71 lb-in) and the cap to 1 Nm (9 lb-in).

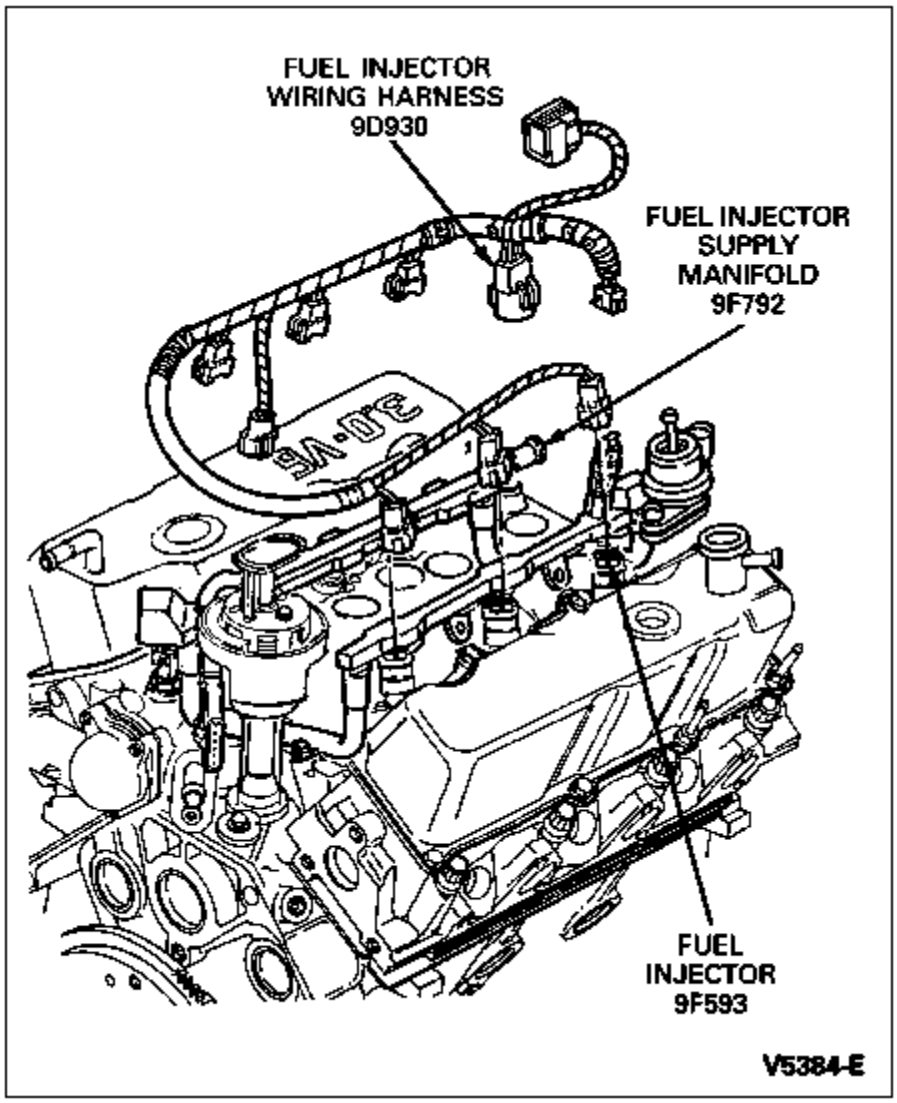
2. Perform Post-Service fuel system procedures as described in this section.

Fuel Injection Supply Manifold

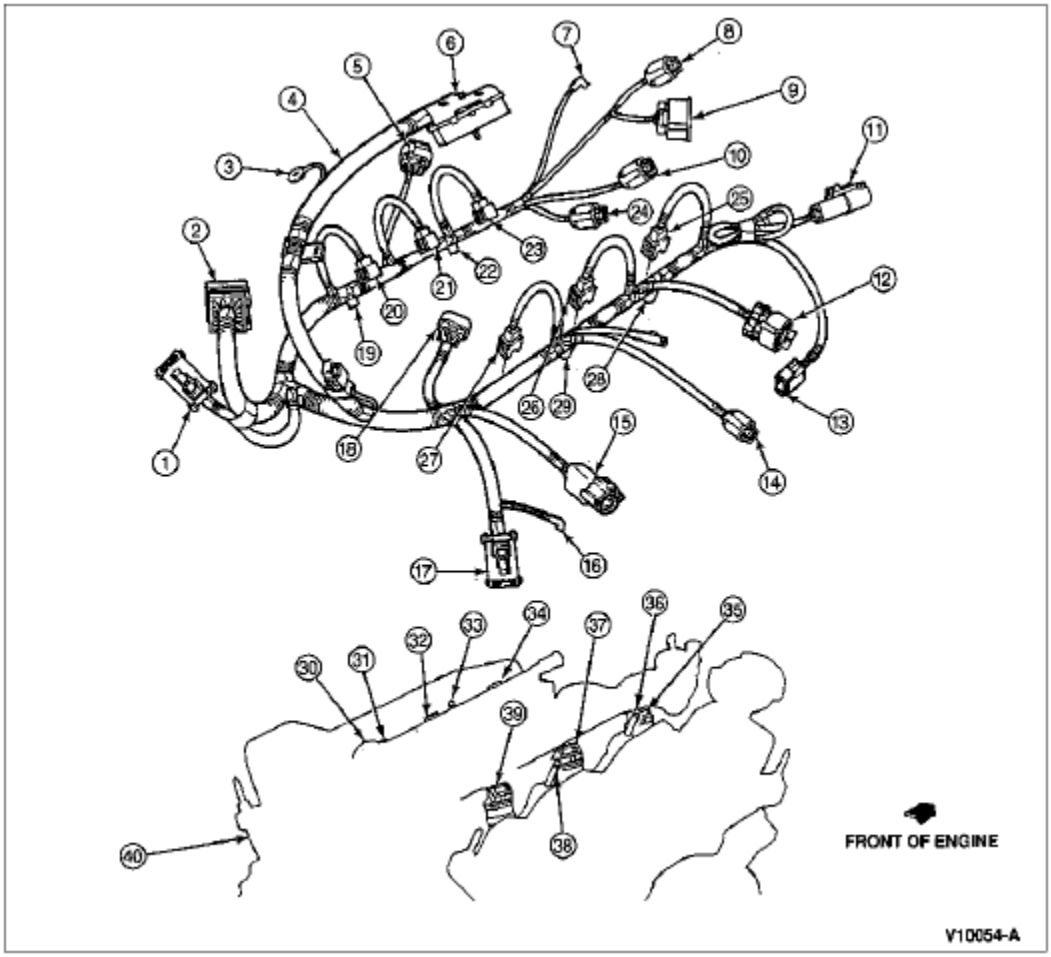
Removal

1. Remove throttle body (9E926) as described in this section.
2. Remove fuel line safety clips. Disconnect fuel supply and fuel return lines using appropriate spring lock coupling disconnect tool as described in this section.
3. Carefully disconnect fuel charging wiring (9D930) (Aerostar) or engine control sensor wiring (12A581) (Ranger) from fuel injectors.

Fuel Charging Wiring — Aerostar



Fuel Charging Wiring — Ranger



Item	Part Number	Description
1	—	Connector to Engine Control Sensor Extension Harness (Part of 12A581)
2	—	42-Pin Connector to Engine Compartment Wiring Assembly (Part of 12A581)
3	—	Ground Cable (Part of 12A581)
4	12A581	Engine Control Sensor Wiring
5	—	Connector to EGR Transducer (Part of 12A581)
6	—	Connector to PCM (Part of 12A581)
7	—	Connector to Water Temperature Sensor (Part of 12A581)
8	—	Connector to Idle Air Control Valve (Part of 12A581)
9	—	Connector to Throttle Position Sensor (Part of 12A581)
10	—	Connector to Intake Air Temperature Sensor (Part of 12A581)

11	—	Connector to Mass Airflow Sensor (Part of 12A581)
12	—	Connector to Ignition Coil (Part of 12A581)
13	—	Connector to Crankshaft Position Sensor (Part of 12A581)
14	—	Connector to EGR Vacuum Regulator Control (Part of 12A581)
15	—	Connector to Oxygen Sensors (Part of 12A581)
16	—	Connector to Oil Pressure Sender (Part of 12A581)
17	—	Connector to Engine Control Sensor Extension Harness (Part of 12A581)
18	—	Connector to Camshaft Position Sensor (Synchronizer) (Part of 12A581)
19	—	Retainer to Valve Cover Stud (Part of 12A581)
20	—	Connector to Fuel Injector Number 6 (Part of 12A581)
21	—	Connector to Fuel Injector Number 5 (Part of 12A581)
22	—	Retainer to Valve Cover Stud (Part of 12A581)
23	—	Connector to Fuel Injector Number 4 (Part of 12A581)
24	—	Connector to Engine Coolant Temperature Sensor (Part of 12A581)
25	—	Connector to Fuel Injector Number 1 (Part of 12A581)

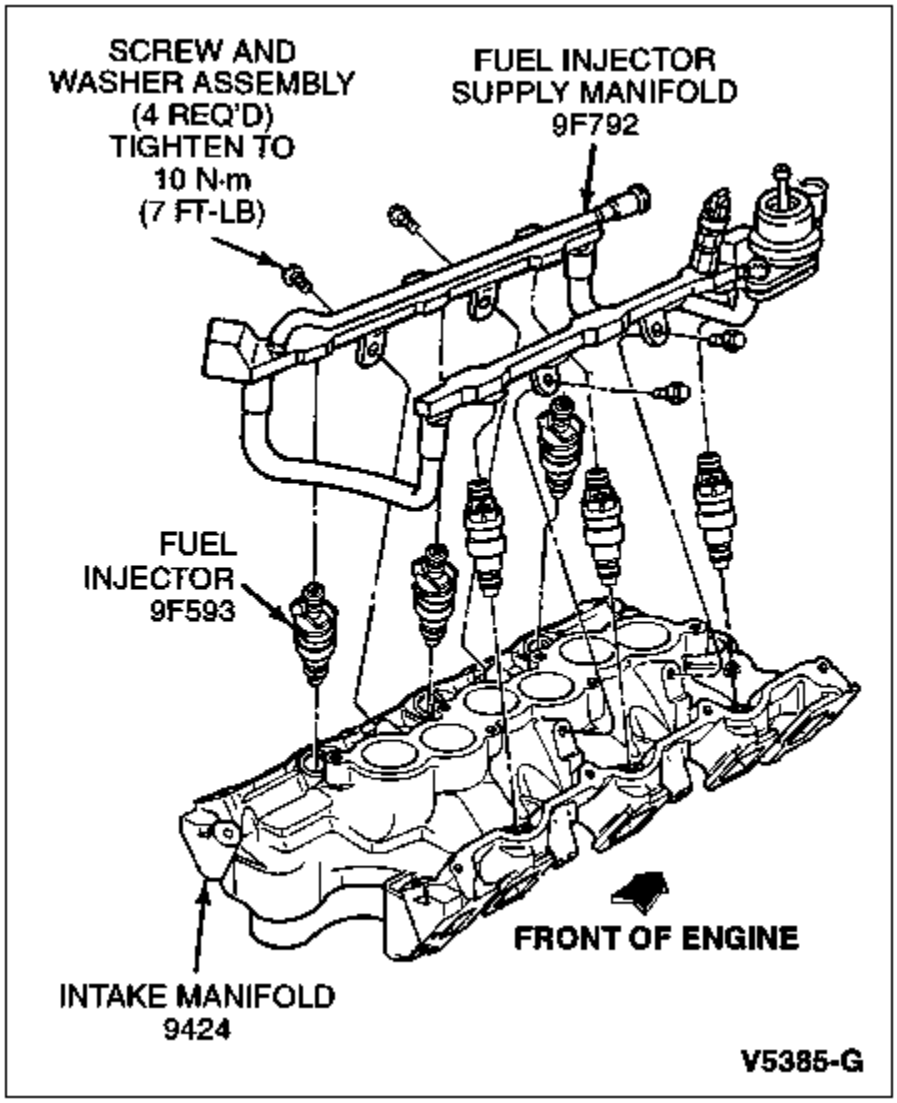
37	—	Fuel Injector Number 2
38	—	Valve Cover Stud (Part of 6007)
39	—	Fuel Injector Number 3
40	6007	Engine

4. Remove four fuel injection supply manifold retaining bolts (two on each side).



5. Carefully disengage fuel injection supply manifold (9F792) by lifting and gently rocking the fuel injection supply manifold.

6. **CAUTION: Fuel injectors and fuel injection supply manifold must be handled with extreme care to prevent damage to sealing areas and sensitive fuel metering orifices.**

   Remove fuel injectors by lifting while gently rocking side to side.

7. Place removed components in a clean container to avoid contamination.

Installation

1. **WARNING: USE ONLY THE SPECIFIED O-RINGS AS THEY ARE MADE OF A SPECIAL MATERIAL. THE USE OF ANY O-RING OTHER THAN THE SPECIFIED O-RING MAY ALLOW**

THE CONNECTION TO LEAK INTERMITTENTLY DURING VEHICLE OPERATION.

NOTE: When reinstalling fuel injection supply manifold with new or used fuel injectors, particular attention should be paid to proper O-ring seating to make sure that no fuel leaks exist.

Examine O-ring for deterioration. Install new O-ring if required (two per injector).

2. Make sure fuel injector end caps are clean and free of contamination or damage.

3. Lubricate all top O-rings with clean XO-10W 30-WSP oil or equivalent meeting Ford specification ESE-M2C153-E.

4. Install fuel injectors in fuel injection supply manifold using a light, twisting, pushing motion.

5. **CAUTION: Do not use silicone grease to lubricate O-rings. Silicone grease can plug fuel injectors.**

   Lubricate all lower O-rings with clean engine oil.

6. Carefully install fuel injection supply manifold and fuel injectors into lower intake manifold, one side at a time. Push the fuel injection supply manifold down to make sure that all injector O-rings are fully seated in the fuel injection supply manifold cups and lower intake manifold.

7. While holding fuel injection supply manifold in place, install two retaining bolts hand-tight and then tighten to 8-12 Nm (6-8 lb-ft).

8. Repeat Steps 6 and 7 for other side of fuel injection supply manifold.

9. Connect fuel supply and return line couplings as described in this section.

10. Connect fuel charging wiring on Aerostar or engine control sensor wiring on Ranger to fuel injectors.

11. Install throttle body as described in this section.

12. Turn the ignition switch (11572) to the ON position. This will cause the fuel pump (9350) to run for 2-3 seconds and pressurize the fuel system.

13. Use a clean paper towel to check for leaks where the fuel injector is installed into the fuel injection supply manifold.

14. Connect the fuel injector wiring connector, start the engine and let it idle for two minutes.

15. Turn the ignition switch off and check for fuel leaks where the fuel injector is installed in the fuel injection supply manifold and lower intake manifold.

16. Connect vacuum line to fuel pressure regulator (9C968).

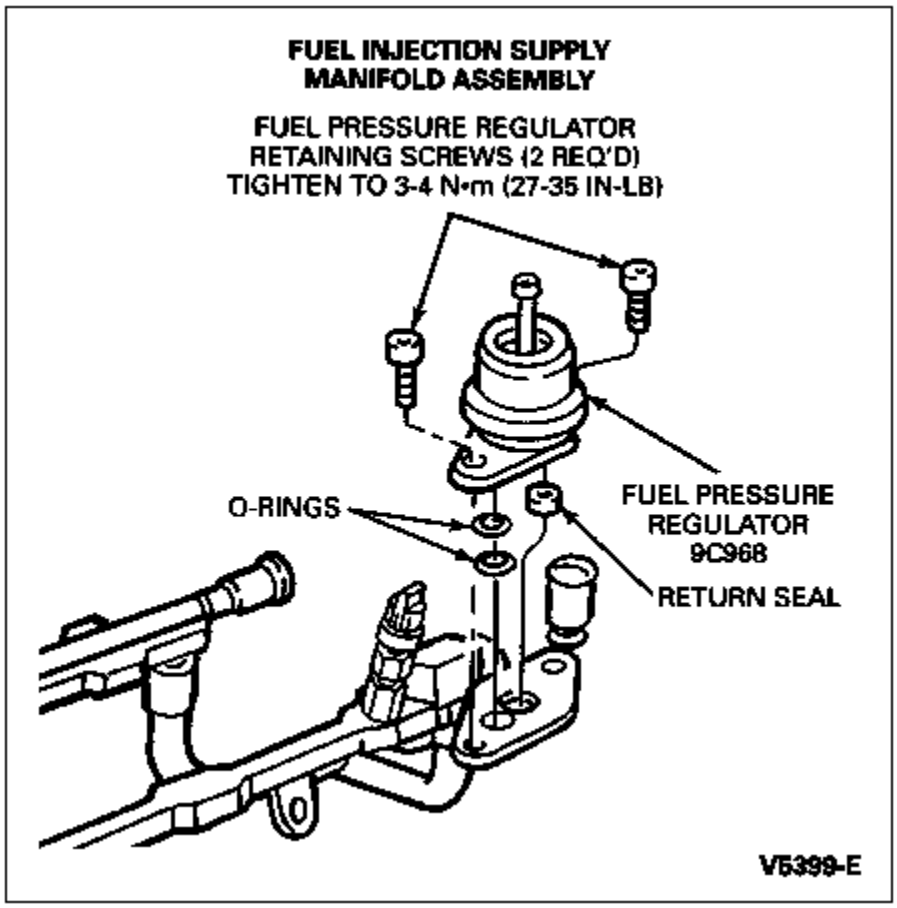
Fuel Pressure Regulator

SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
Fuel Pressure Gauge	T80L-9974-B

Removal

1. Perform Pre-Service procedures as described in this section.
2. Remove vacuum line from fuel pressure regulator (9C968).
3. In order to gain access to fuel pressure regulator screws, loosen or remove fuel injection supply manifold to intake manifold mounting bolt(s) as required and carefully lift fuel pressure regulator side of fuel injection supply manifold (9F792).
4. Remove two socket head retaining screws from regulator housing, and discard.
5. Remove fuel pressure regulator, return seal and O-rings. Discard return seal and O-rings.
    - If scraping is necessary, be careful not to damage fuel pressure regulator or fuel supply line sealing surfaces.



Installation

1. Lubricate new fuel pressure regulator O-rings with clean engine oil.
2. Make sure return seal surfaces of fuel pressure regulator and fuel injection supply manifold are clean.
3. Install new O-rings and new return seal on fuel pressure regulator.
4. Using new Allen head retaining screws, install fuel pressure regulator on fuel injection supply manifold. Tighten two retaining screws to 3-4 Nm (27-35 lb-in).
5. Install fuel pressure regulator side of fuel injection supply manifold to fuel injectors and lower intake manifold. Make sure fuel injection supply manifold is fully seated on all three fuel injectors and that the injector O-rings are seated at the top and bottom of each fuel injectors. While pushing down on fuel injection supply manifold, tighten fuel injection supply manifold to intake manifold bolt(s) to 8-12 Nm (6-8 lb-ft).
6. Connect vacuum line to fuel pressure regulator.
7. Perform Fuel System Post-Service procedures as described in this section.

Fuel Charging Wiring — Aerostar

Removal

1. Perform Pre-Service procedures as described in this section.
2. Disconnect electrical connectors from fuel injectors.
3. Disconnect connectors from fuel charging wiring (9D930) and throttle position sensor (TP sensor) (9B989), intake air temperature sensor (IAT sensor) (12A697) and idle air control valve (IAC valve) (9F715).
4. Remove fuel charging wiring.

Installation

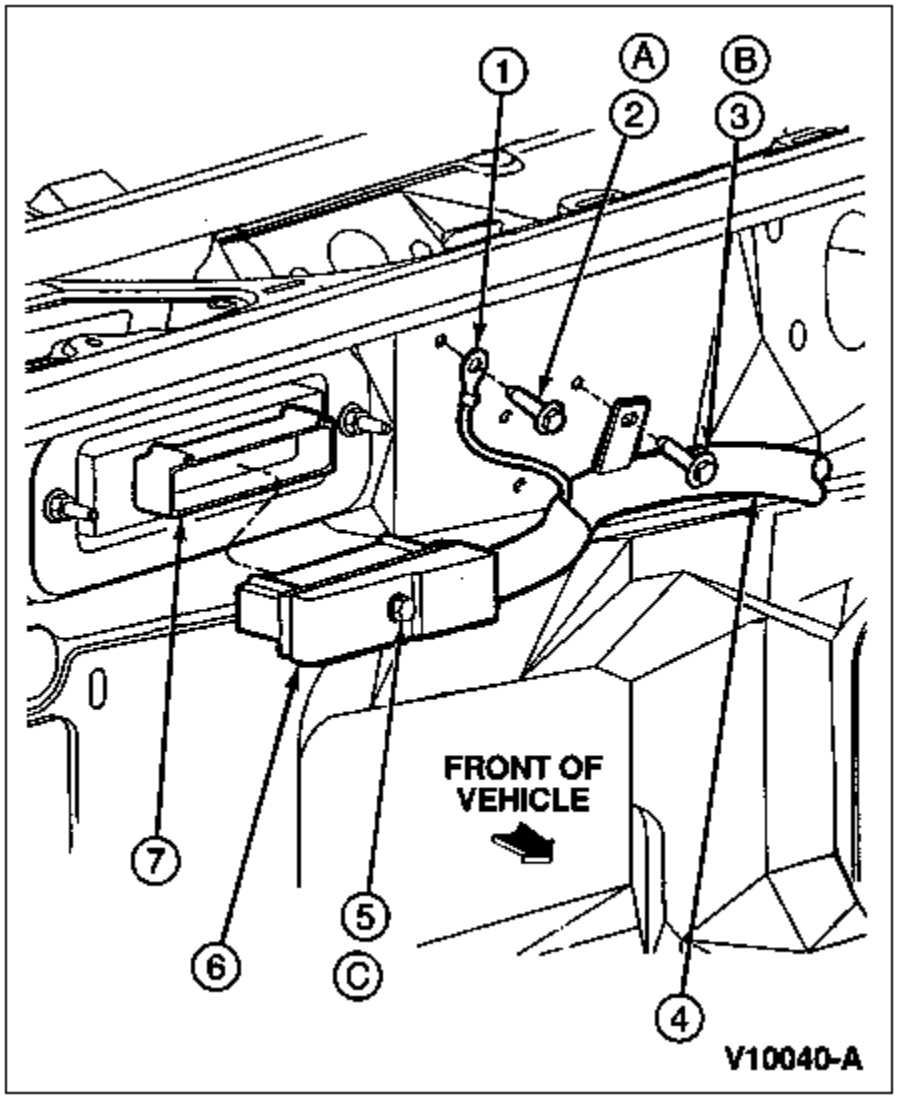
1. Position fuel charging wiring alongside fuel injectors.
2. Snap electrical connectors into position on fuel injectors.
3. Connect throttle position sensor, intake air temperature sensor, idle air control valve and fuel injector harness connectors.
4. Verify that all electrical connectors are firmly seated.
5. Perform Fuel System Post-Service procedures as described in this section.
6. Use EEC self test connector and procedure to check for sensor function. Refer to Powertrain Control/Emissions Diagnosis Manual.

Engine Control Sensor Wiring — Ranger

NOTE: A single engine control sensor wiring harness connects all engine sensors and engine mounted fuel system components including the fuel injectors.

Removal

1. Perform Pre-Sirvice procedures as described in this section.
2. Disconnect mass airflow sensor connector and intake air temperature sensor connector.
3. Loosen clamps and remove air cleaner outlet tube (9B659).
4. Remove throttle body (9E926) as described in this section.
5. Unscrew center bolts and disconnect PCM connector.
6. Remove screw attaching engine control sensor wiring (12A581) to dash assembly.

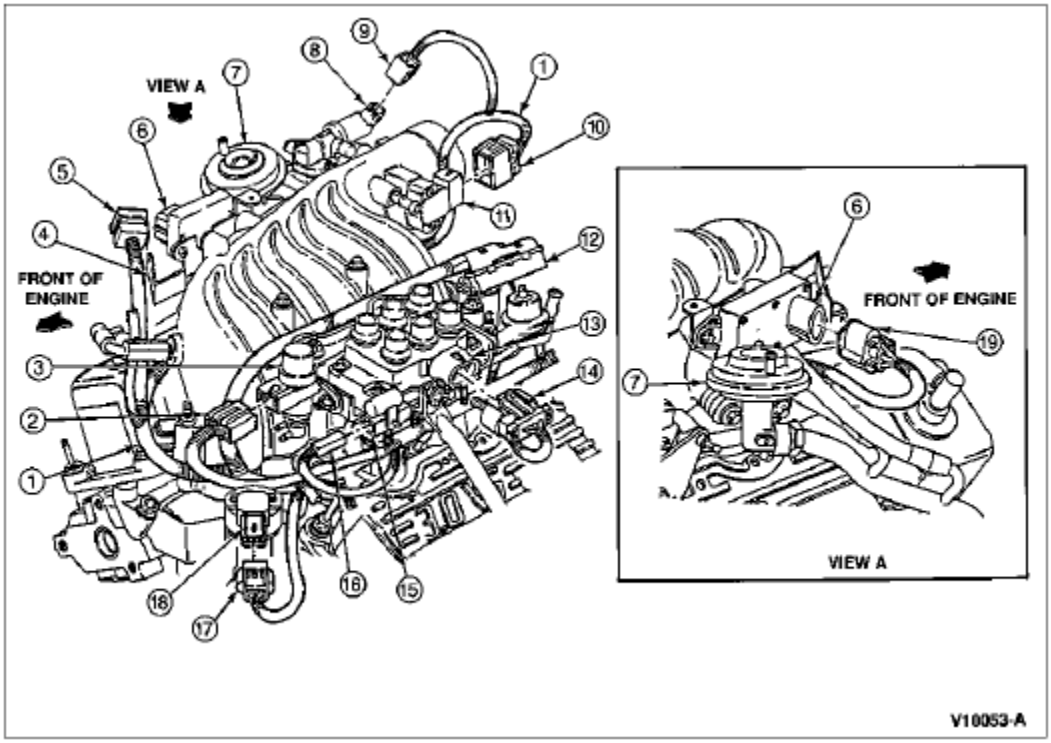


Item	Part Number	Description
1	—	PCM Ground Cable (Part of 12A581)
2	N805375-S36MG	Screw
3	N805375-S36MG	Screw
4	12A581	Engine Control Sensor Wiring
5	—	Bolt (Part of 12A581)
6	—	PCM Connector (Part of 12A581)
7	12A650	Powertrain Control Module
A	—	Tighten to 8-12 Nm (79-107 Lb-In)
B	—	Tighten to 4 Nm (36 Lb-In)
C	—	Tighten to 6-7 Nm

		(46-63 Lb-In)

7. Unscrew bolt and disconnect 42-pin connector from engine compartment wiring.
8. Disconnect two connectors to engine control sensor extension wiring (12A690).
9. Disconnect connectors to camshaft position sensor (synchronizer), water temperature indicator sender unit (10884), engine coolant temperature sensor (ECT sensor) (12A648), crankshaft position sensor (CKP sensor) (6C315), and fuel injectors.
10. Remove engine control sensor wiring from vehicle.

Engine Sensor Electrical Connections — Ranger



Item	Part Number	Description
1	12A581	Engine Control Sensor Wiring
2	—	Connector to EGR Vacuum Regulator Control (Part of 12A581)

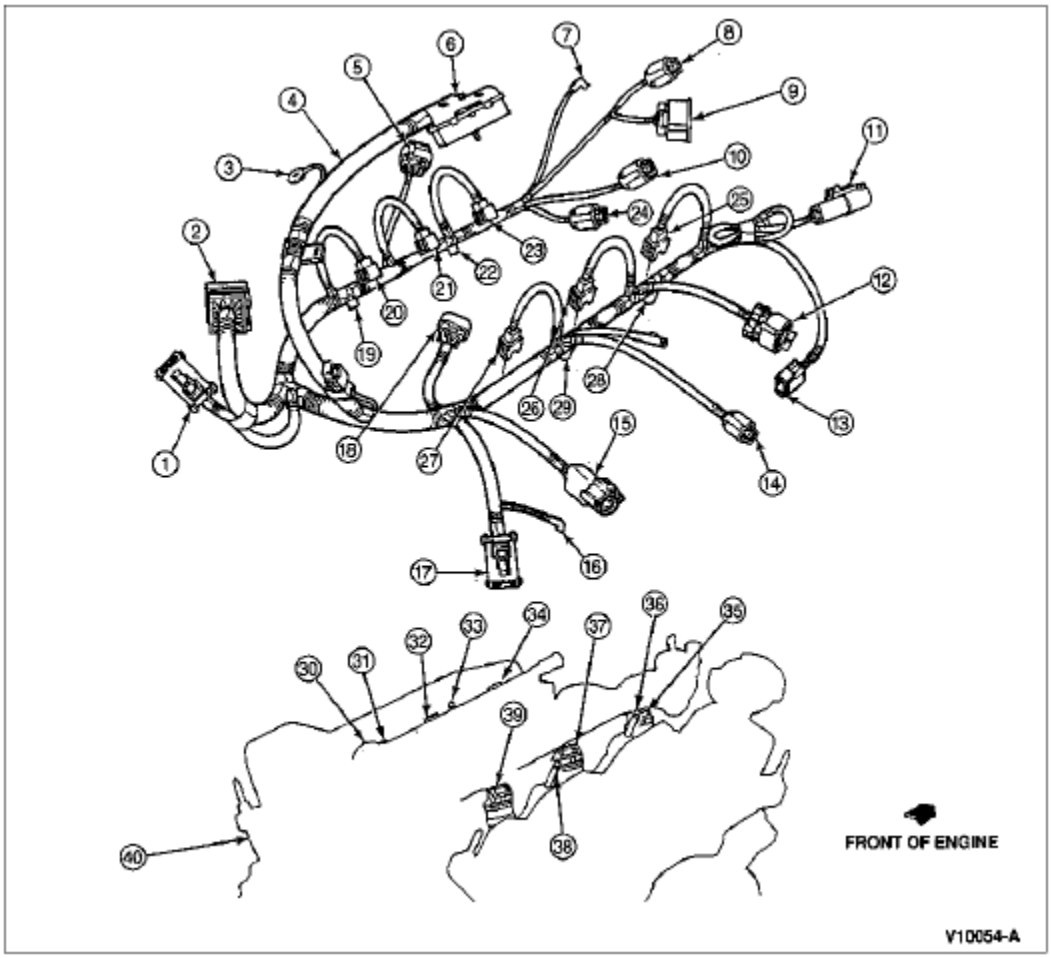
7	9D475	EGR Valve
8	9F715	Idle Air Control Valve
9	—	Connector to Idle Air Control Valve (Part of 12A581)
10	—	Connector to Throttle Position Sensor (Part of 12A581)
11	9B989	Throttle Position Sensor
12	—	PCM Connector (Part of 12A581)
13	12029	Ignition Coil
14	—	Connector to Ignition Coil (Part of 12A581)
15	18801	Radio Ignition Interference Capacitor
16	—	Connector to Radio Interference Capacitor (Part of 12A581)
17	—	Connector to Camshaft Position Sensor (Synchronizer) (Part of 12A581)
18	12A112	Camshaft Position Sensor
19	—	Connector to EGR Transducer (Part of 12A581)

Installation

1. Position engine control sensor wiring.
2. Attach connectors to fuel injectors, crankshaft position sensor, engine coolant temperature sensor, water temperature indicator sender unit and camshaft position sensor (synchronizer).
3. Attach two connectors to engine control sensor extension wiring.
4. Attach 42-pin connector to engine compartment wiring harness and tighten bolt to 4-5 Nm (36-49 lb-in).
5. Attach PCM connector. Tighten bolt to 6-7 Nm (46-63 lb-in).
6. Install screw attaching engine control sensor wiring to dash assembly. Tighten to 4 Nm (36 lb-in).
7. Clean surface of dash to ensure good connection where PCM ground cable attaches. Connect PCM ground cable to dash and tighten screw to 8-12 Nm (79-107 lb-in).
8. Install throttle body as described in this section.
9. Install air cleaner outlet tube and tighten clamps to 1.4-2 Nm (13-17 lb-in).
10. Connect intake air temperature sensor (IAT sensor) (12A697) and mass air flow sensor (MAF sensor) (12B579).
11. Perform Fuel System Post-Service procedures as described in this section.

Engine Control Sensor Wiring — Ranger



Item	Part Number	Description

Fuel Pump Relay

Removal and Installation

1. Disconnect battery ground cable (14301).
2. Open power distribution box.
3. Unplug and remove fuel pump relay from socket 7.
4. Plug in new fuel pump relay.
5. Close power distribution box cover.
6. **NOTE: When the battery has been disconnected and reconnected, some abnormal drive symptoms may occur while the powertrain control module (PCM) (12A650) relearns it adaptive strategy. The vehicle may need to be driven 16 km (10 miles) to relearn the strategy.**

   Reconnect battery ground cable.
7. Turn on ignition switch (11572) without starting engine and listen for fuel pump operation.

Fuel Charging System

SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
Fuel Pressure Gauge	T80L-9974-B

Pre-Service Procedures

The fuel charging assembly consists of the throttle body (9E926), and the upper and lower intake manifolds (9424). Prior to service or removal of the fuel charging assembly, the following steps must be taken:

1. Disconnect battery ground cable battery lead and secure it out of the way. Remove the fuel supply manifold shield (9J314).
2. Remove engine air cleaner intake tube and duct (9A673) from air cleaner to throttle body.
3. Remove fuel tank filler cap (9030) to relieve tank pressure.
4. Release pressure from fuel system at fuel pressure relief valve (9H321) (Schrader) on fuel injection supply manifold (9D280). Use Fuel Pressure Gauge T80L-9974-B. To gain access to fuel pressure relief valve, valve cap must first be removed.

Post-Service Procedures

After the service is complete and the fuel charging assembly is installed onto engine, the following steps must be taken:

1. Install engine air cleaner intake tube and duct to throttle body.
2. Install the fuel tank filler cap.
3. **NOTE: When the battery has been disconnected and reconnected, some abnormal drive symptoms may occur while the powertrain control module (PCM) (12A650) relearns its adaptive strategy. The vehicle may need to be driven 16 km (10 miles) or more to relearn the strategy.**

   Connect battery ground cable.
4. **NOTE: Check all connections at fuel rails, push-connect fittings, fuel injectors, etc.**

   CAUTION: The fuel system is normally pressurized to 276 kPa (40 psi).

   Turn ignition switch (11572) on and off several times without starting engine to pressurize the fuel system. Check for fuel leaks at fuel pressure regulator (9C968), fuel injectors and fuel connect fittings.

5. Start engine and warm to operating temperature. Check for coolant leak if coolant was removed.

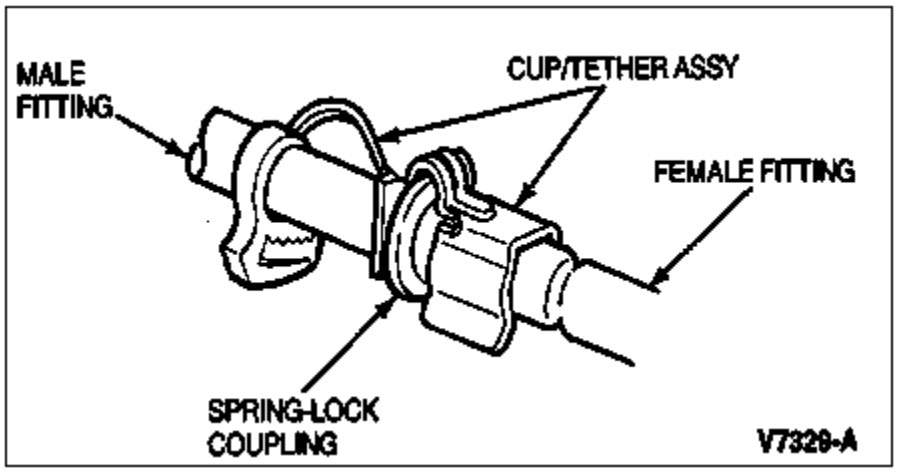
6. Perform EEC Self Test to check system's function. Refer to Powertrain Control/Emissions Diagnosis Manual. Recheck for fuel leaks.

Spring Lock Coupling

SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
Spring Lock Coupling Disconnect Tool Set	T84L-19623-B

The spring lock coupling is a fuel line coupling held together by a garter spring inside a circular cage. When the coupling is connected, the flared end of the female fitting slips behind the garter spring inside the cage of the male fitting. The garter spring and cage then prevent the flared end of the female fitting from pulling out of the cage. As a redundant locking feature, a horseshoe shaped retaining clip is incorporated to improve the retaining reliability of the spring lock coupling.



Removal

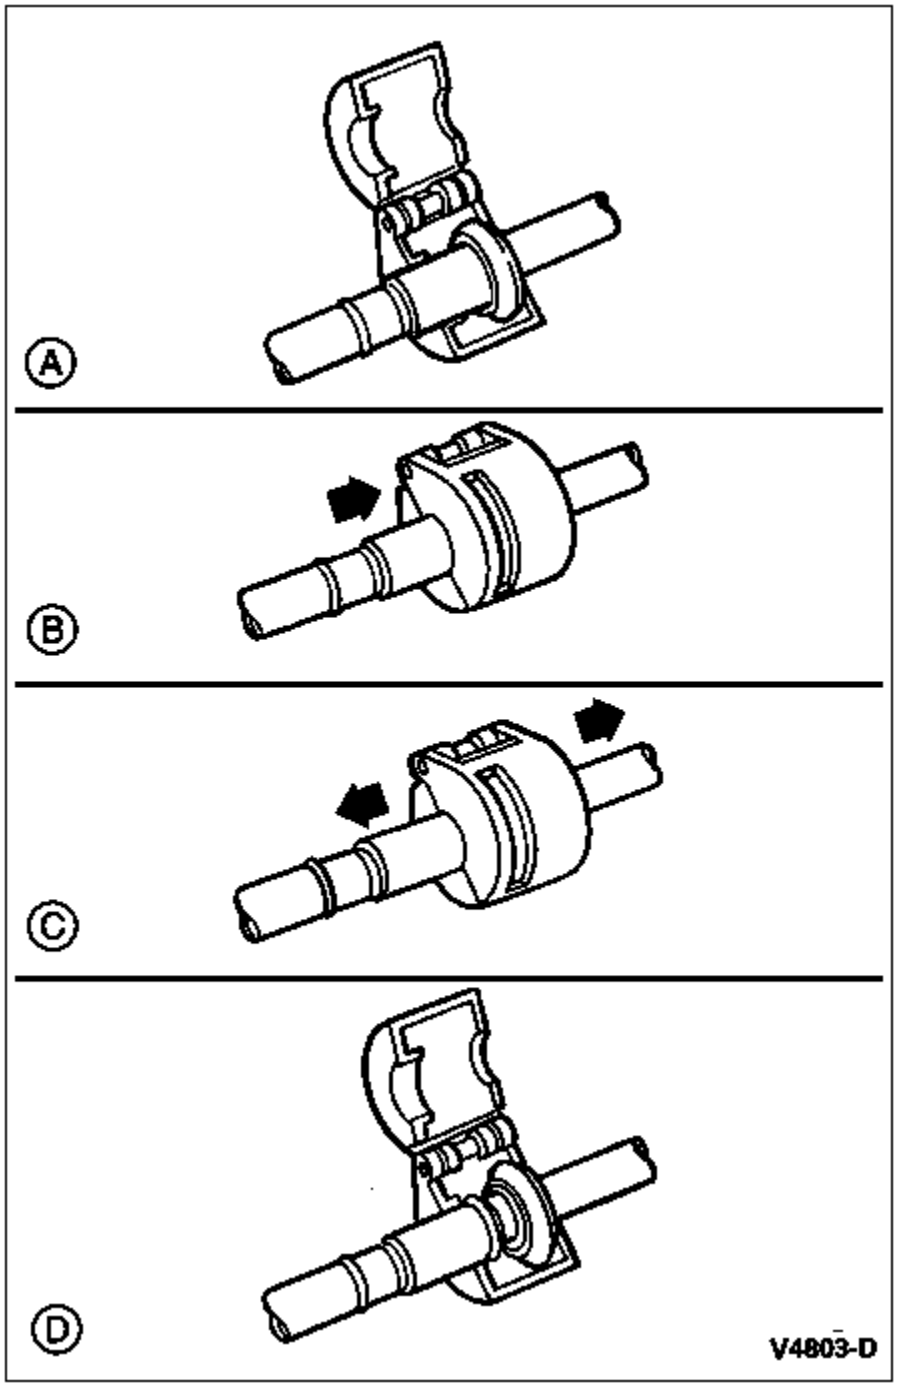
1. Release fuel system pressure. Refer to Section 10-00 for fuel system pressure relief procedures. A fuel pressure relief valve (9H321) on the fuel injection supply manifold (9D280) is provided for this procedure.

2. Remove retaining clip from spring lock coupling by hand only. Do not use any sharp tool or screwdriver as it may damage the spring lock coupling.

3. Twist fitting to free it from any adhesion at the O-ring seal.

4. Using Spring Lock Coupling Disconnect Tool T81P-19623-G1 (3/8 Inch) or T81P-19623-G2 (1/2 Inch) (part of Spring Lock Disconnect Tool Set T84L-19623-B), disconnect fuel hoses at the fuel rail supply tube and fuel rail return tube.

    a. Fit tool to coupling so tool can enter cage to release garter spring.
    b. Push the tool into the cage opening to release female fitting from garter spring.
    c. Pull the coupling male and female fittings apart.
    d. Remove the tool from the disconnected coupling.



Installation

1. Make sure the garter spring is in cage of male fitting. If garter spring is missing, install a new spring by pushing it into cage opening. If garter spring is damaged, remove it from cage with a small wire hook (do not use a screwdriver) and install a new spring.

2. Clean all dirt or foreign material from both pieces of coupling.

3. **WARNING: USE ONLY THE SPECIFIED O-RINGS AS THEY ARE MADE OF A SPECIAL MATERIAL. THE USE OF ANY O-RING OTHER THAN THE SPECIFIED O-RING MAY ALLOW**

THE CONNECTION TO LEAK INTERMITTENTLY DURING VEHICLE OPERATION.

Replace missing or damaged O-rings. Use only O-rings specified for spring lock couplings.

4. Lubricate male fitting and O-rings and inside of female fitting with clean engine oil XO-10W30-QSP or equivalent meeting Ford specification ESE-M2C153-E.

5. Fit female fitting to male fitting and push until garter spring snaps over flared end of female fitting.

6. Check coupling engagement by pulling on fitting and visually checking to make sure garter spring is over flared end of female fitting.

7. **NOTE: All vehicles require the large black clip to be installed on the supply side fuel line and the small gray clip to be installed on the return side fuel line.**

   Position retaining clip over metal portion of spring lock coupling. Firmly push retaining clip onto spring lock coupling. Make sure horseshoe portion of clip is over the coupling. Do not install retaining clip over rubber fuel line.

Fuel Injection Supply Manifold, Upper

Ranger

Removal

1. Disconnect the negative battery cable.
2. Disconnect the intake air temperature (IAT) sensor electrical connector.
3. Remove the crankcase ventilation hose from the right valve cover. Loosen the induction tube clamps and remove the tube.
4. Remove the accelerator control splash shield.
5. Remove the throttle cable from the retaining clip, located on top of the upper manifold. Unclip the throttle/speed control cables from the throttle body. Separate the cables and remove them from the mounting bracket. Position the cables out of the way.
6. Remove the 42-pin engine connector from the mounting bracket.
7. Disconnect the ignition coil and the coil capacitor electrical connectors. Disconnect the engine harness locator from the coil bracket and position the harness out of the way.
8. Disconnect the ignition wires from the ignition coil pack.
9. Disconnect the throttle position (TP) sensor electrical connector.
10. Disconnect the differential pressure feedback EGR system, intake air control (IAC) valve and EGR vacuum regulator solenoid electrical connectors.
11. Disconnect the vacuum harness from the upper intake manifold and EGR vacuum regulator solenoid.
12. Remove the positive crankcase ventilation (PCV) and the brake booster hose from the upper intake manifold.
13. Remove the engine harness locator from the rear of the intake manifold.
14. Disconnect the differential pressure feedback EGR system hoses from the sensor.
15. Disconnect the canister purge hose from the throttle body.
16. Remove the upper intake manifold retaining nuts.
17. Position the alternator wiring harness bracket out of the way.
18. Lift up and forward to disengage the EGR inlet tube from the upper intake manifold. Route the left

ignition wires through the manifold opening while removing the manifold from the engine.

19. **WARNING: THE FUEL SUPPLY LINES ON VEHICLES EQUIPPED WITH FUEL INJECTED ENGINES REMAIN PRESSURIZED FOR LONG PERIODS OF TIME, AFTER ENGINE SHUT DOWN. FUEL SYSTEM PRESSURE MUST BE RELIEVED PRIOR TO FUEL SYSTEM SERVICE, TO PREVENT POSSIBLE INJURY.**

    Connect the Multiport Fuel Injection Fuel Pressure Gauge T80L-9974-B to the fuel pressure relief valve, located on the fuel supply manifold. Open the manual valve on the gauge to release the fuel system pressure. Once the pressure is released, close the valve and remove the gauge from the supply manifold.

20. Disconnect the fuel injector electrical connectors.

21. Disconnect the fuel pressure regulator vacuum hose.

22. Remove the fuel supply manifold and the fuel injectors as an assembly. Install protective tape and caps to the engine openings.

23. Disconnect the fuel supply line from the fuel supply manifold and install a protective cap.

24. **CAUTION: Do not use metal scrapers, wire brushes, power abrasive discs, or other abrasive means to clean the sealing surfaces.**

    NOTE: It is important that the gasket surfaces are free from all dirt, oil and debris. Remove and discard the gaskets. Clean the gasket surfaces. Clean the gasket sealing surfaces with Metal Surface Cleaner F4AZ-19A536-RA or equivalent meeting Ford specification WSE-M5B392-A. Allow the surfaces to dry until there is no sign of wetness.

    Remove the gaskets and clean the gasket surfaces.

Installation

1. **WARNING: DO NOT CARRY AN OPEN FLAME OF ANY TYPE WHEN WORKING ON OR NEAR AN OPEN FUEL SYSTEM. OVER A PERIOD OF TIME THE FUEL SYSTEM MAY BUILD PRESSURE, USE CAUTION WHEN REMOVING THE PROTECTIVE CAPS. INSPECT THE FUEL LINE O-RING SEALS FOR DAMAGE PRIOR TO ASSEMBLY. REPLACE THE O-RINGS ONLY WITH APPROPRIATE REPLACEMENT PARTS. LUBRICATE THE O-RINGS WITH CLEAN ENGINE OIL PRIOR TO ASSEMBLY. FAILURE TO FOLLOW THESE INSTRUCTIONS MAY RESULT IN PERSONAL INJURY.**

    NOTE: Install a new gasket.

    To install, reverse the removal procedure.

Aerostar

Removal

1. Disconnect the negative battery cable. For additional information, refer to Section 14-01 .

2. Loosen the induction tube hose clamps and disconnect the intake air temperature (IAT) electrical connector. Disconnect the crank case-ventilation hose from the induction tube and remove the induction tube.
3. Remove the accelerator control splash shield.
4. Disconnect the throttle and speed control cables from the throttle body. Remove the throttle cable-mounting bracket and the cable-retaining clip from the upper manifold. Position the cables out of the way.
5. Disconnect the canister purge hose, located below the throttle body, and position it aside.
6. Disconnect the throttle position (TP) sensor, differential pressure feedback EGR system, idle air control (IAC) valve and EGR vacuum regulator solenoid electrical connectors.
7. Disconnect the vacuum harness from the upper intake manifold and the EGR vacuum regulator solenoid sensor.
8. Disconnect the differential pressure feedback EGR system hoses from the sensor.
9. Partially raise the vehicle and remove the ignition coil bracket-retaining bolt from the exhaust manifold through the right side wheel-well. For additional information, refer to Section 00-02 .
10. Raise the vehicle. For additional information, refer to Section 00-02 .
11. Remove the EGR tube-nut from the exhaust manifold.
12. Lower the vehicle. For additional information, refer to Section 00-02 .
13. Remove the retaining screw from the floor mount cup holder and pull upward to release the retaining clips.
14. Remove the anti-lock electronic control module and disconnect the electrical connector.
15. Unclip the three retaining clips and remove the interior engine access cover.
16. Disconnect the heater hose retaining bracket and position the heater hoses out of the way.
17. Remove the transmission fluid level indicator. Remove the transmission filler tube from the support bracket and position aside.
18. Disconnect the ignition wires four, five and six from the ignition coil pack. Remove the ignition wires from the locator on the upper intake manifold and position the wires out of the way.
19. Remove the ignition coil bracket and position out of the way.
20. Remove the positive crankcase ventilation (PCV) and brake booster hoses from the upper intake manifold.
21. Remove the oil level indicator. Remove the oil indicator tube retaining nuts and position the tube aside.
22. Remove the exhaust gas recirculation (EGR) inlet tube bracket retaining bolt from the exhaust manifold. Remove the EGR inlet tube from the upper intake manifold.

23. Remove the upper intake manifold retaining nuts. Remove the transmission filler tube support bracket and the upper intake manifold from the vehicle.

24. **WARNING: FUEL SUPPLY LINES ON VEHICLES EQUIPPED WITH FUEL INJECTED ENGINES REMAIN PRESSURIZED FOR LONG PERIODS OF TIME AFTER ENGINE SHUT DOWN. FUEL SYSTEM PRESSURE MUST BE RELIEVED PRIOR TO FUEL SYSTEM SERVICE TO PREVENT POSSIBLE INJURY.**

    Connect the Multiport Fuel Injection Fuel Pressure Gauge T80L-9974-B to the fuel pressure relief valve, located on the fuel supply manifold. Open the manual valve on the gauge to relieve the fuel system pressure. Once the pressure is relieved, close the valve and remove the gauge from the supply manifold.

25. Disconnect the fuel pressure regulator vacuum hose.

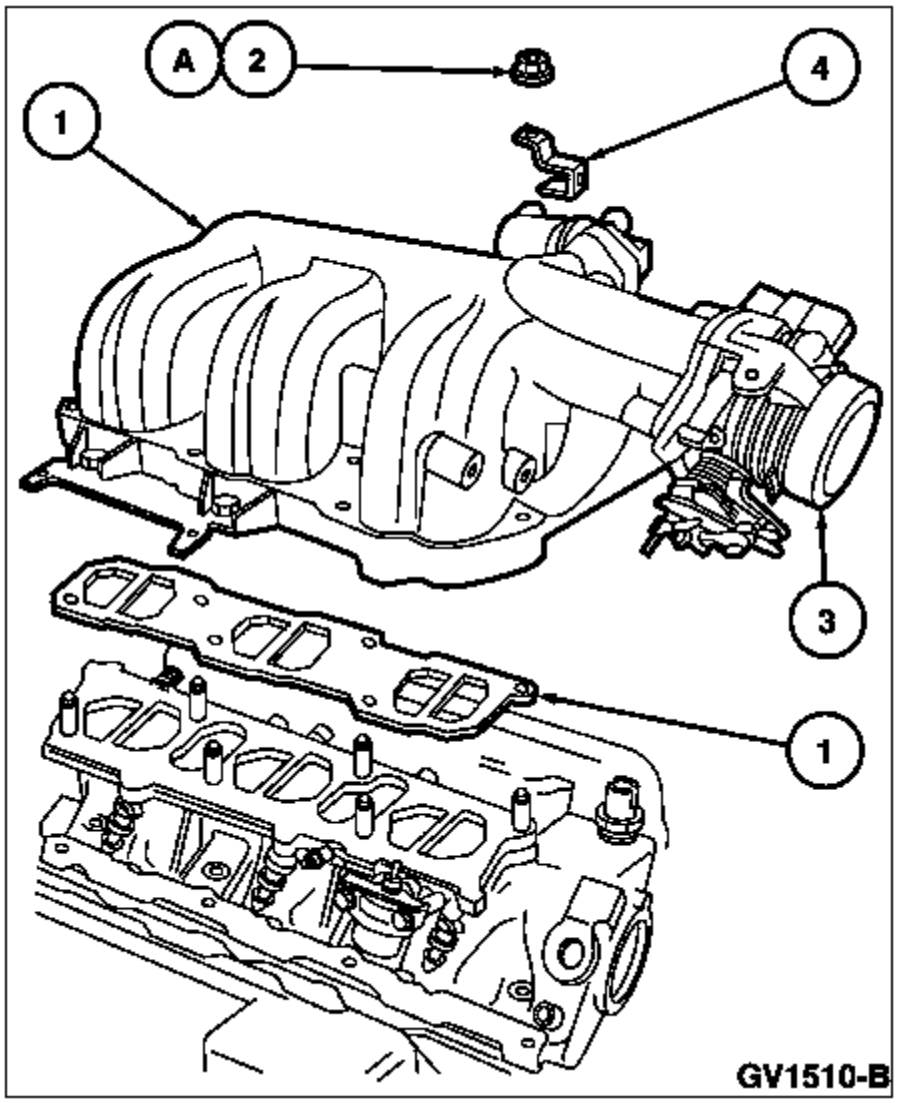
26. Disconnect the fuel line fittings from the fuel supply manifold. Positon the fuel lines out of the way.

27. Remove the fuel supply manifold.

28. **CAUTION: Do not use metal scrapers, wire brushes, power abrasive discs, or other abrasive means to clean the sealing surfaces.**

    NOTE: It is important that the gasket surfaces are free from all dirt, oil and debris.

    Remove and discard the gaskets and clean the gasket surfaces. Clean the gasket sealing surfaces with Metal Surface Cleaner F4AZ-19A536-RA, or equivalent, meeting Ford specification WSE-M5B392-A. Allow to dry until there is no sign of wetness. Remove the gaskets and clean the gasket surfaces.



Item	Part Number	Description
1	9424	Intake Manifold (Upper)
2	E822110-S72	Nut (6 Req'd)
3	9E926	Throttle Body
4	14N063	Bracket
5	9E463	Gasket
A	—	Tighten to 20-25 Nm (15-18 Lb-Ft)

Installation

1. **CAUTION: Do not use silicone grease to lubricate O-rings. Silicone grease can plug fuel injectors.**

   NOTE: Inspect the fuel injectors O-ring seals for damage, prior to assembly. Replace the O-

rings with the appropriate replacement parts only. Lubricate the O-rings with clean engine oil, prior to assembly.

Install the fuel supply manifold spacer plate and the new gaskets. Install the supply manifold and tighten the retaining studs to 12 Nm (9 lb-ft).

2. **WARNING: DO NOT CARRY AN OPEN FLAME OF ANY TYPE WHEN WORKING ON OR NEAR AN OPEN FUEL SYSTEM. OVER A PERIOD OF TIME, THE FUEL SYSTEM MAY BUILD PRESSURE. USE CAUTION WHEN REMOVING THE PROTECTIVE CAPS.**

   Connect the supply and return fuel line fittings to the fuel rail. Tighten the fittings to 22 Nm (17 lb-ft).

3. Connect the fuel pressure regulator vacuum hose.

4. Replace the upper intake manifold gasket. Install the upper intake manifold and the transmission filler tube support bracket. Tighten the upper intake manifold retaining nuts to 23 Nm (17 lb-ft).

5. Connect the canister purge hose to the bottom side of the throttle body.

6. Connect the TP sensor, differential pressure feedback EGR system, IAC valve and EGR vacuum regulator solenoid electrical connectors.

7. **NOTE: Lubricate the EGR O-ring, prior to assembly. Inspect the EGR inlet tube O-ring for damage and replace if necessary.**

   Position the EGR inlet tube to the upper intake manifold and to the exhaust manifold. Install the EGR inlet tube bracket retaining bolt and tighten to 22 Nm (18 lb-ft).

8. Position the oil indicator tube and install the retaining nuts. Tighten the lower retaining nut to 22 Nm (18 lb-ft). Tighten the upper retaining nut to 5 Nm (44 lb-in). Install the oil level indicator.

9. Connect the differential pressure feedback EGR system hoses to the sensor.

10. Connect the vacuum harness to the upper intake manifold and the EGR vacuum regulator solenoid.

11. Install the PCV and brake booster hoses to the upper intake manifold.

12. Install the coil pack bracket and tighten the upper retaining bolts to 23 Nm (17 lb-ft).

13. Raise the vehicle.

14. Install the EGR tube-nut to the exhaust manifold and tighten the nut to 40 Nm (30 lb-ft).

15. Partially lower the vehicle.

16. Through the right side wheel-well, install the ignition coil bracket-retaining bolt to the exhaust manifold. Tighten the retaining bolt to 23 Nm (17 lb-ft).

17. Lower the vehicle.

18. Connect the ignition wires to the ignition coil pack. Install the ignition wires to the ignition wire locator.

19. Install the transmission filler tube to the support bracket and securely tighten the retaining bolt. Install

the transmission fluid level indicator.

20. Position the heater hoses to the heater hose-retaining bracket. Connect the retaining bracket.

21. Install the interior engine access cover.

22. Connect the anti-lock electronic control module electrical connector and install the control module. Securely tighten the retaining nuts.

23. Install the floor mount cup holder. Securely tighten the retaining screw.

24. Install the throttle cable-mounting bracket. Tighten the mounting bracket to 11 Nm (9 lb-ft).

25. Connect the throttle and speed control cables to the throttle body. Install the throttle cable-retaining clip.

26. Install the accelerator control splash shield and securely tighten the retaining bolts.

27. Install the air induction tube and securely tighten the retaining clamps. Connect the crank case-ventilation hose and the IAT sensors.

28. **NOTE: When the battery is disconnected and reconnected, some abnormal drive symptoms may occur while the vehicle relearns its adaptive strategy. The vehicle may need to be driven 16 km (10 mi) or more to relearn the strategy.**

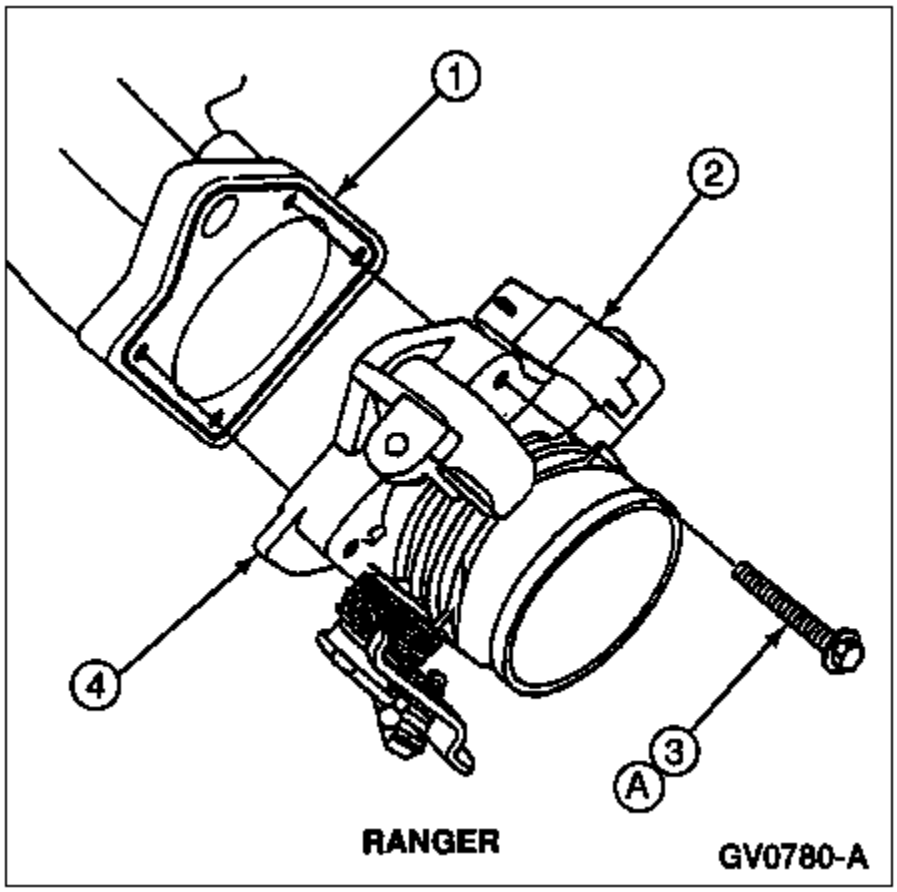
    Connect negative battery cable.

29. Turn the ignition switch on and off several times without starting engine to pressurize the fuel system. Check for fuel leaks at fuel injectors and fuel connections. Start the engine and check for leaks.

Throttle Body

Removal

1. Remove fuel supply manifold shield (9J314) and disconnect throttle cable from ball stud.
2. Disconnect throttle position sensor electrical connector.
3. Remove engine air cleaner intake tube and duct (9A673) at throttle body (9E926).
4. Disconnect canister purge hose from the fitting beneath throttle body.
5. Remove four screws retaining throttle body to upper intake manifold (9424).
6. Carefully separate throttle body from upper intake manifold.
7. Remove and discard gasket between throttle body and upper intake manifold.



Item	Part Number	Description
1	9424	Intake Manifold (Upper)
2	9B989	Throttle Position Sensor
3	N801610-S72	Bolt
4	9E926	Throttle Body
A	—	Tighten to 8-12 Nm (70-106 Lb-In)

Installation

1. **NOTE: If scraping is necessary, be careful not to damage gasket surfaces of throttle body and upper intake manifolds, or allow material to drop into intake manifold.**

   Make sure that both throttle body and upper intake manifold gasket surfaces are clean.

2. Install throttle body gasket on two screws installed in the throttle body.

3. Install throttle body to upper intake manifold.

4. Secure throttle body to upper intake manifold with two remaining screws. Tighten all to 8-12 Nm (70-106 lb-in).

5. Connect throttle position sensor electrical connector.

6. Connect canister purge hose to fitting beneath throttle body.

7. Install the fuel supply manifold shield.

Throttle Position Sensor

Removal

1. Disconnect throttle position sensor (TP sensor) (9B989) from wiring harness.
2. Remove two throttle position sensor retaining screws.
3. Remove throttle position sensor and discard gasket.

Installation

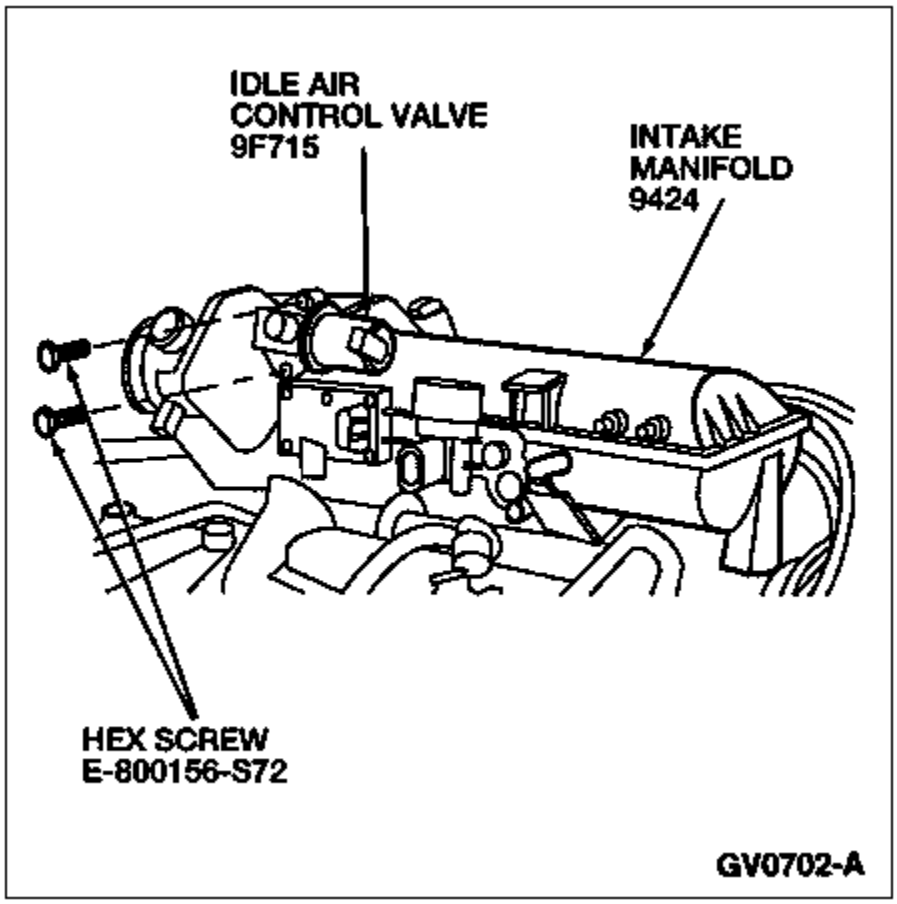
1. Using a new gasket, position throttle position sensor with connector facing rearward.
2. Secure throttle position sensor to throttle body (9E926) with two retaining screws. Tighten to 2.8-3.8 Nm (24-33 lb-in).
3. Connect electrical connector to harness.

Idle Air Control Valve

Removal and Installation

1. Disconnect the idle air control valve connector from the wiring harness.
2. Remove the two idle air control valve retaining bolts.
3. Remove the idle air control valve (IAC valve) (9F715) and gasket.

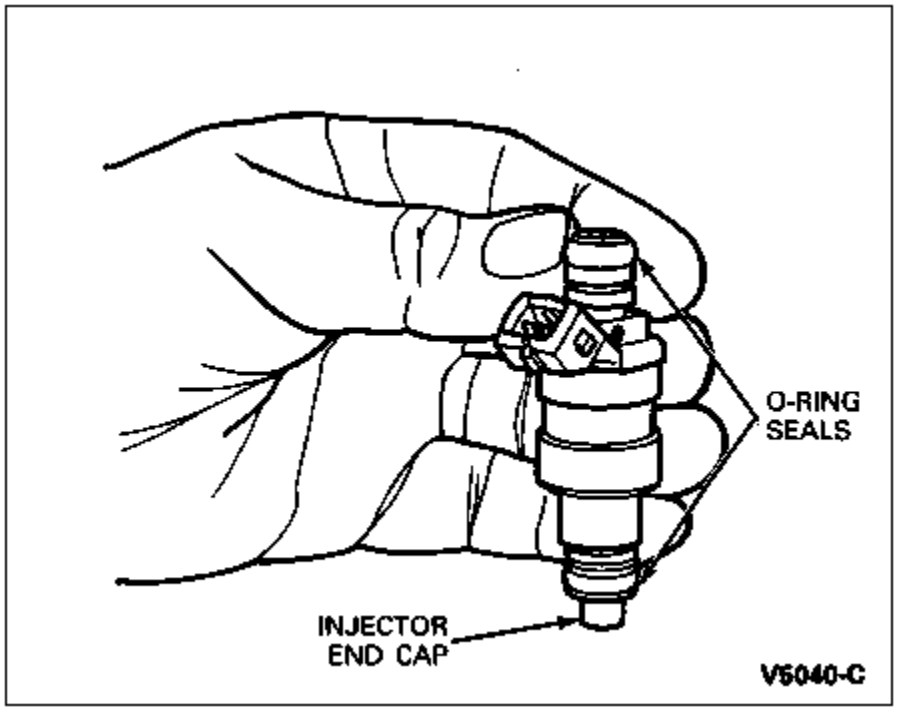
   For installation, follow removal steps in reverse order. Make sure gasket surfaces are clean. If scraping is necessary, be careful not to damage gasket surfaces. Tighten retaining screws to 9-11 Nm (80-97 lb-in).



Fuel Injector

Removal

1. Release pressure from fuel system as described in Section 10-00 .
2. Remove upper intake manifold (9424) as described in Removal and Installation, Fuel Injection Supply Manifold, Upper in this section.
3. Remove fuel injection supply manifold (9D280) as described in Removal and Installation, Fuel Injection Supply Manifold, Lower in this section.
4. Carefully remove electrical harness connectors from individual fuel injectors as required.
5. Remove injector retaining clips as required.
6. Grasping fuel injector body, pull up while gently rocking fuel injector from side to side.
7. Inspect fuel injector O-rings (two per fuel injector) for signs of deterioration. Replace as required.



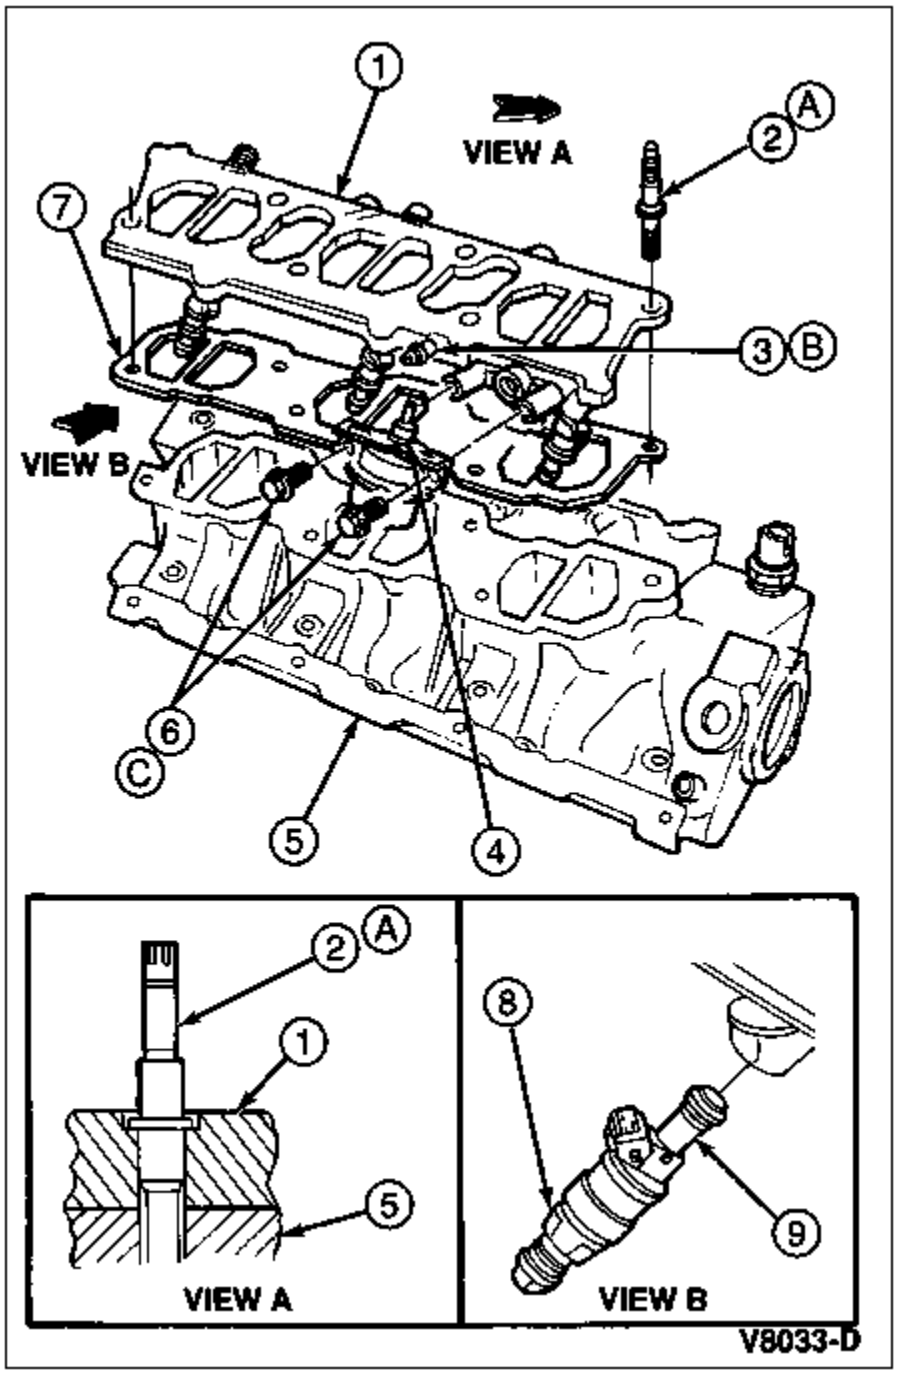
Installation

1. **CAUTION: Never use silicone grease. It will clog the fuel injectors.**

Lubricate new O-rings with a light grade oil such as X0-10W-30-QSP or equivalent meeting Ford specification ESE-M2C153-E and install two on each fuel injector.

2. Install fuel injectors, using a light, twisting, pushing motion.

3. Install fuel injection supply manifold as described in Removal and Installation, Fuel Injection Supply Manifold, Lower in this section. Replace retainer clips if distorted.



Item	Part Number	Description
1	9D280	Fuel Injection Supply Manifold
2	E805674	Stud (6 Req'd)
3	9H321	Fuel Pressure Relief Valve
4	9C968	Fuel Pressure Regulator
5	9424	Intake Manifold
6	E801274	Bolt (2 Req'd)
7	9E436	Gasket
8	9V550	Noise Isolator
9	—	Fuel Injector
A	—	Tighten to 10-14 Nm (89-124 Lb-In)
B	—	Tighten to 3-6 Nm (27-53 Lb-In)
C	—	Tighten to 8-11 Nm (70-97 Lb-In)

4. Install electrical harness connectors to fuel injectors (9F593).

5. Install upper intake manifold as described in Removal and Installation, Fuel Injection Supply Manifold, Upper in this section. Perform fuel charging assembly Post-Service .

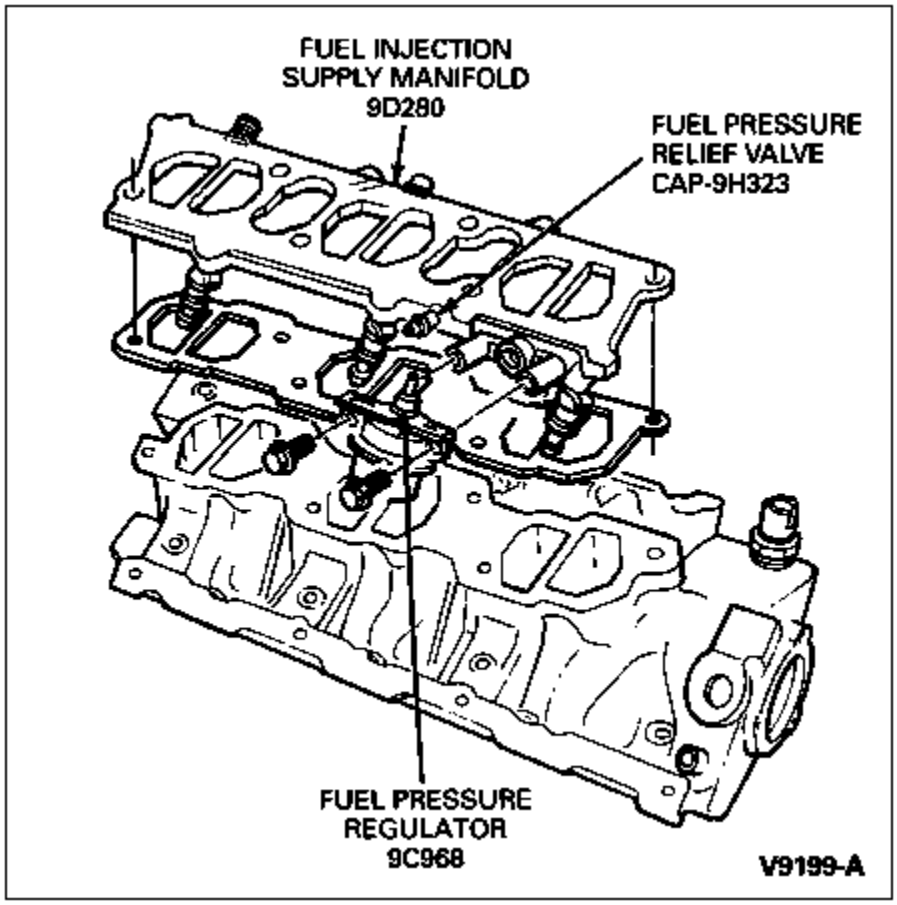
Fuel Pressure Relief Valve (Schrader Valve)

SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
Fuel Pressure Gauge	T80L-9974-B

Removal

1. If fuel injection supply manifold (9D280) is mounted to engine, remove fuel tank filler cap (9030), then release pressure from system at fuel pressure relief valve (9H321) on fuel injection supply manifold using Fuel Pressure Gauge T80L-9974-B. Cap on fuel pressure relief valve must be removed.



2. Using a socket wrench, remove fuel pressure relief valve from fuel injection supply manifold.

Installation

1. Install fuel pressure relief valve and cap. Tighten fuel pressure relief valve to 3-6 Nm (27-53 lb-in) and the cap to 1 Nm (9 lb-in).

Fuel Injection Supply Manifold, Lower

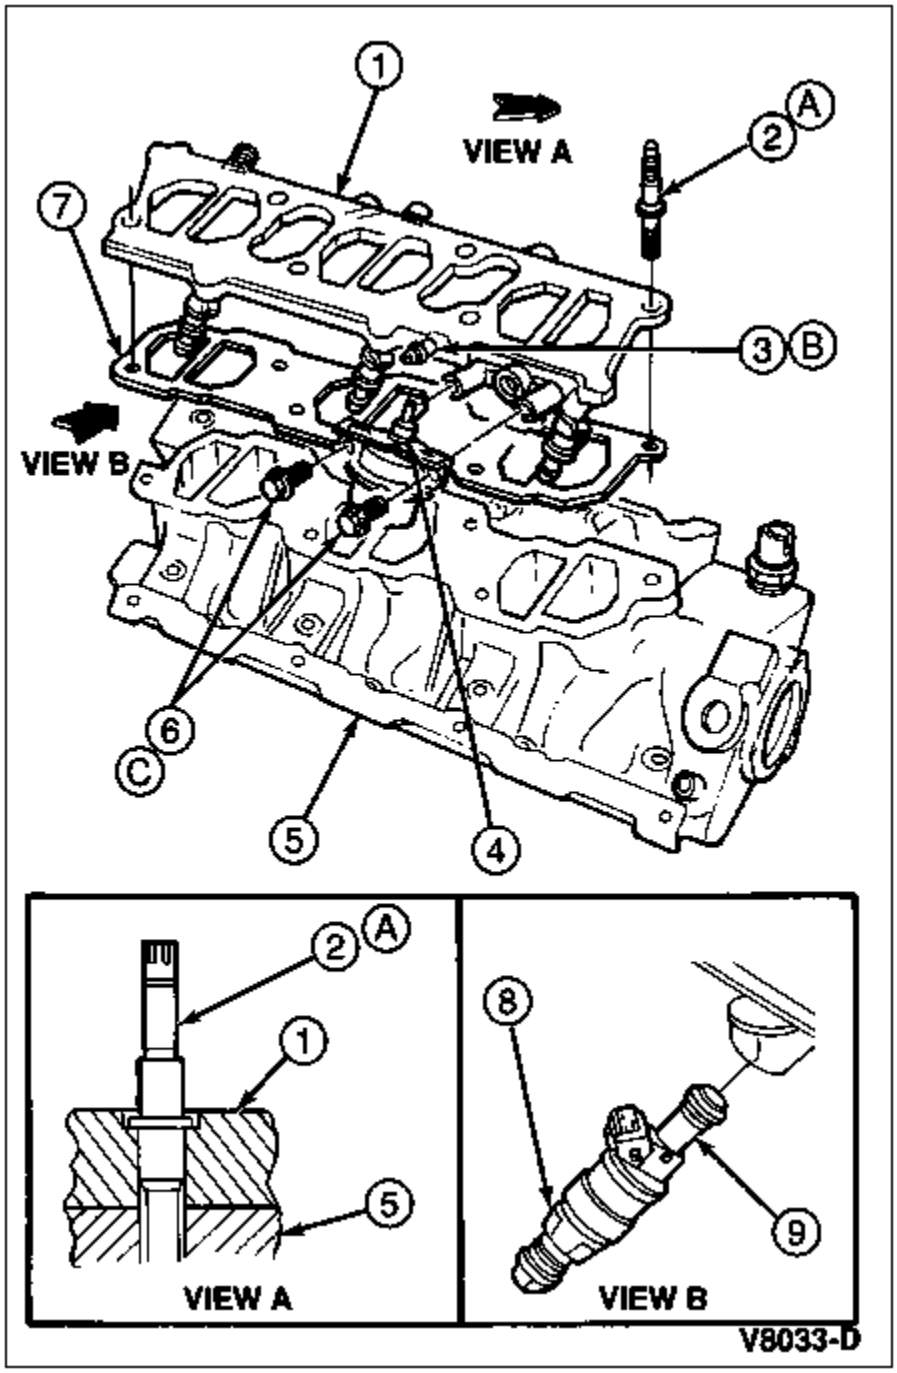
Removal

1. Thoroughly clean the engine.
2. Release pressure from fuel system as described in Section 10-00 .
3. Remove the upper intake manifold assembly as described in Removal and Installation, Fuel Injection Supply Manifold, Upper in this section.
4. Disconnect the fuel supply line fitting at the fuel injection supply manifold (9D280)
5. Disconnect the fuel return line at the fuel pressure regulator.
6. Remove the six Torx® head stud bolts retaining the lower fuel injection supply manifold and remove the manifold. Be sure to clean off the gasket material from the upper and lower fuel injection supply manifolds.
7. Remove the fuel injectors from the fuel injection supply manifold (9F792) and wipe cup clean with a clean, dry cloth.

Installation

1. Check that all holes in the lower fuel injection supply manifold are clean and clear of debris.
2. Position new gaskets on the lower fuel injection supply manifold mounting surface.
3. Make sure the fuel injector end caps are clean and free of contamination. Inspect fuel injector O-rings. Replace if required.
4. **CAUTION: Do not use silicone grease to lubricate O-rings. Silicone grease can plug fuel injectors.**

   Carefully wipe the fuel injector recesses in the intake manifold and make sure they are free of contamination. Lubricate the recesses with light grade oil XO-10W30-QSP or equivalent meeting Ford specification ESE-M2C153-E.
5. Locate the three fuel injectors on the right side recesses of the intake manifold (9424) . Then locate the three on the left.
6. Position the fuel injection supply manifold and press down firmly until the fuel injectors are fully seated in the fuel injection supply manifold and lower intake manifold. The fuel injection supply manifold should be fully seated on the lower intake manifold.
7. Install the six Torx® head stud bolts and tighten to 12-16 Nm (107-125 lb-in).



Item	Part Number	Description
1	9D280	Fuel Injection Supply Manifold
2	E805674	Stud (6 Req'd)
3	9H321	Fuel Pressure Relief Valve
4	9C968	Fuel Pressure Regulator
5	9424	Intake Manifold

6	E801274	Bolt (2 Req'd)
7	9E436	Gasket
8	9V550	Noise Isolator
9	—	Fuel Injector
A	—	Tighten to 10-14 Nm (89-124 Lb-In)
B	—	Tighten to 3-6 Nm (27-53 Lb-In)
C	—	Tighten to 8-11 Nm (71-97 Lb-In)

8. Install the fuel supply line and tighten the fitting to 25-30 Nm (19-22 lb-ft).
9. Install the fuel return line and tighten to 18-22 Nm (14-16 lb-ft).
10. Install the upper intake manifold as described in Removal and Installation, Fuel Injection Supply Manifold, Upper in this section.
11. Refer to Removal and Installation, Fuel Charging System, Post-Service procedure in this section.

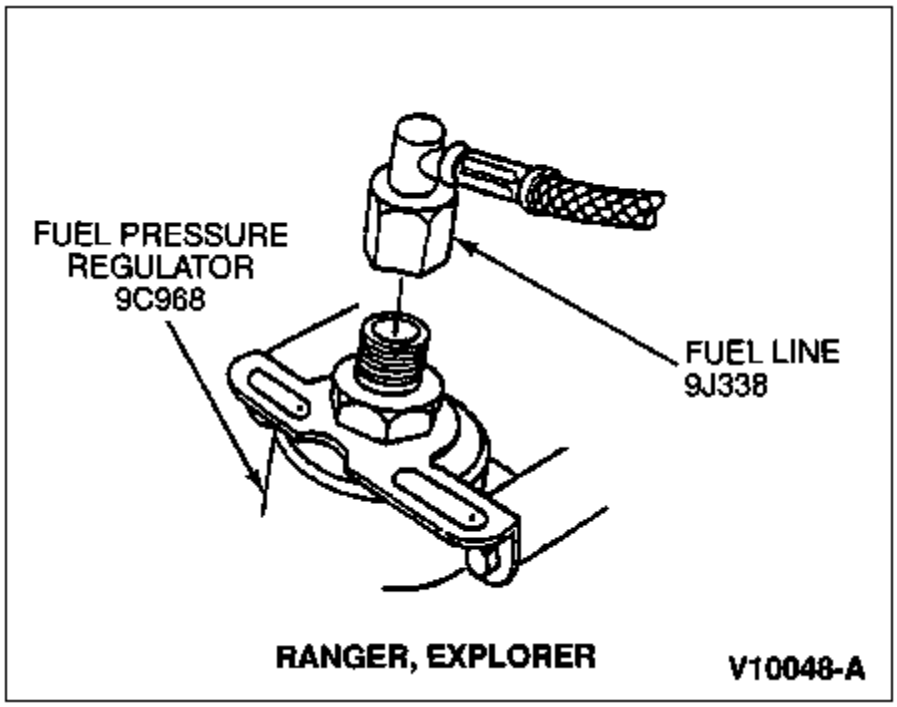
Fuel Pressure Regulator

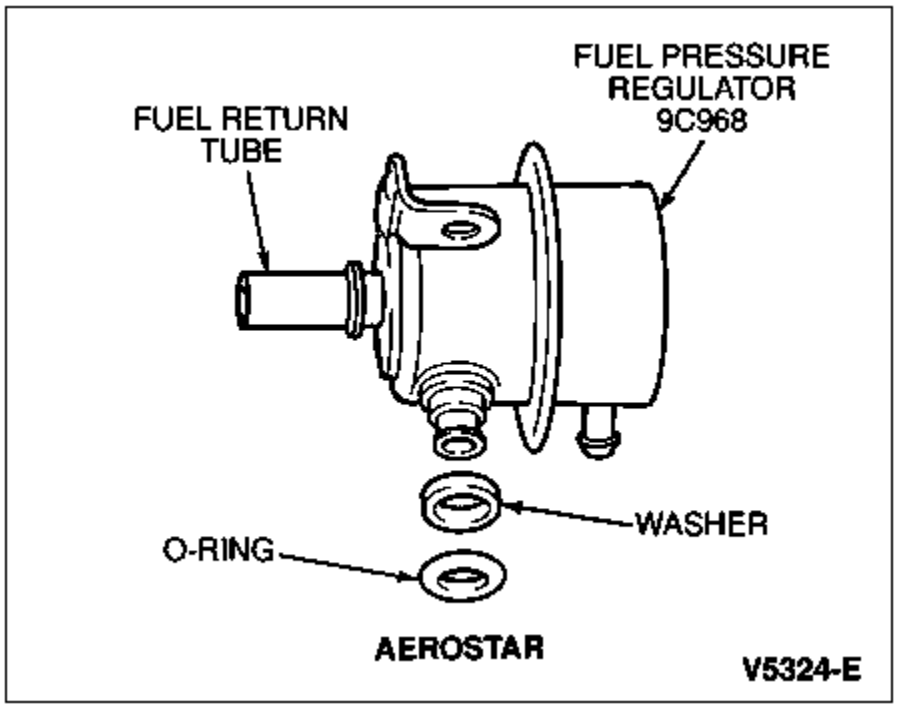
SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
Fuel Line Coupling Tool	T90T-9550-A

Removal

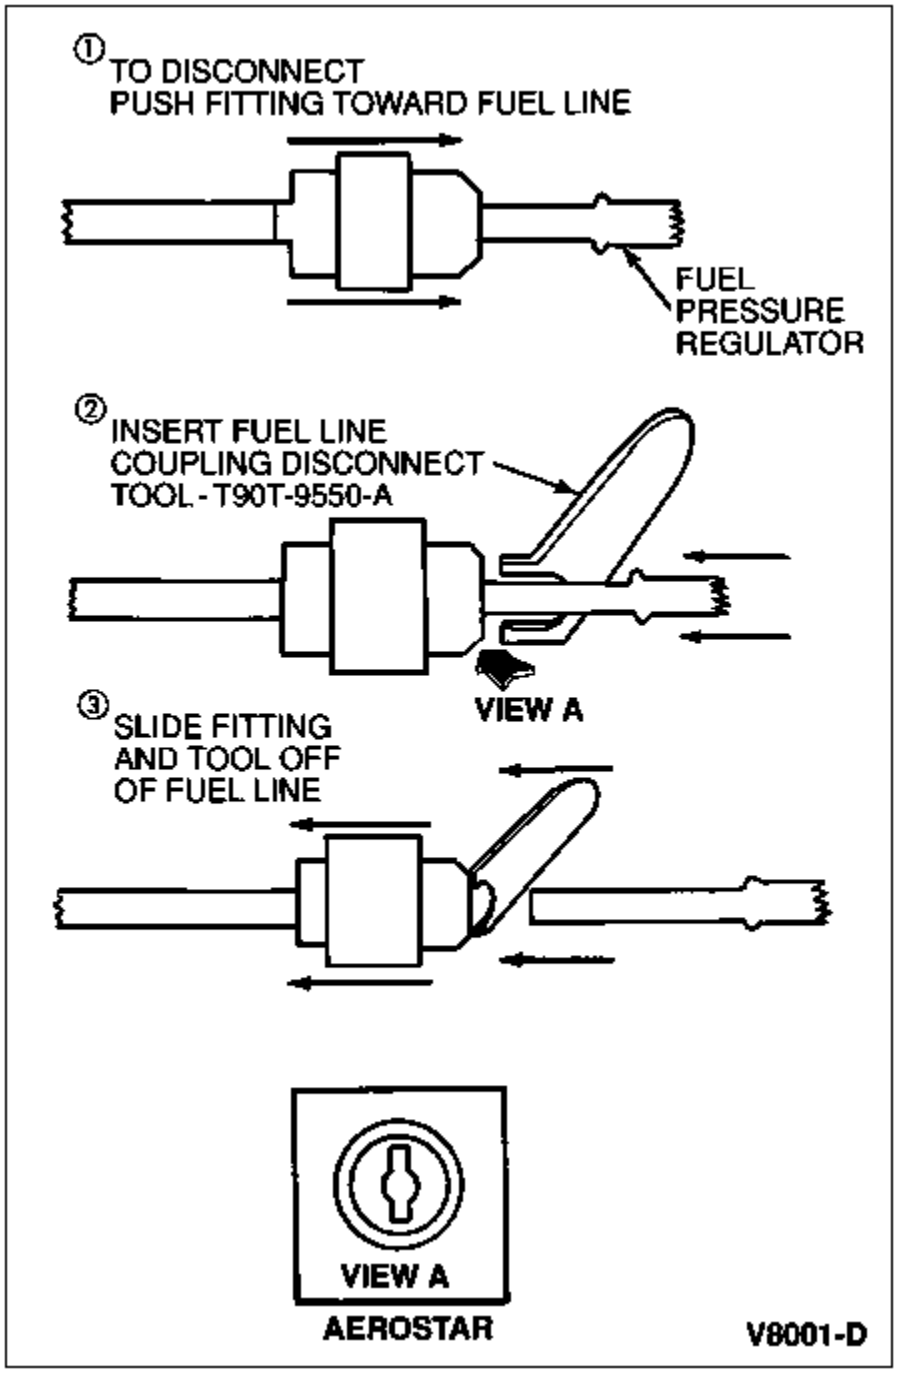
1. If removing fuel pressure regulator (9C968) while fuel injection supply manifold (9D280) is installed on engine, release pressure from fuel system as described in Section 10-00 .
2. Remove vacuum line at fuel pressure regulator.





3. On Aerostar, disconnect the fuel return line from the fuel pressure regulator as follows:

    a. Disengage the locking tabs on the connector retainer and separate the retainer halves.
    b. Inspect the visible internal portion of the fitting for dirt accumulation. Clean the fitting before disassembly.
    c. To disengage the fitting from the fuel pressure regulator, insert the fingers on Fuel Line Coupling Tool T90T-9550-A into the slots in the coupling.
    d. Using the tool, pull the fitting from the fuel pressure regulator.
        - If the fitting has been properly disengaged, the fitting should slide off the regulator with minimum effort.



4. On Ranger remove nut securing fuel line to regulator.
5. Remove two retaining screws from fuel pressure regulator housing.
6. Remove fuel pressure regulator O-ring and washer. Discard washer and inspect O-ring for signs of cracks or deterioration.
7. Inspect fuel return tube for kinks and abrasions.

Installation

1. Install new washer and O-ring on fuel pressure regulator.
2. **NOTE: Never use silicone grease. It will clog the fuel injectors.**

   Lubricate fuel pressure regulator O-ring with light oil ESF-M6C2-A or equivalent.
3. Make sure surfaces of fuel pressure regulator and fuel injection supply manifold are clean.
4. Install fuel pressure regulator on fuel injection supply manifold. Tighten two retaining screws to 8-11 Nm (70-97 lb-in).
5. Install vacuum line to fuel pressure regulator.
6. Install the fuel return line as described in Removal and Installation, Fuel Injection Supply Manifold, Lower in this section.

Fuel Charging Wiring

Removal

1. **NOTE: Make sure ignition switch (11572) is in OFF position and fuel system is depressurized.**

   Disconnect electrical connectors from fuel injectors.

2. Disconnect connectors from main wiring harness and throttle position sensor (TP sensor) (9B989), intake air temperature sensor (IAT sensor) (12A697) and idle air control valve (IAC valve) (9F715).

3. Remove wiring assembly.

Installation

1. Position wiring harness alongside fuel injectors.

2. Snap electrical connectors into position on fuel injectors.

3. Connect throttle position sensor, intake air temperature sensor, idle air control valve and main harness connectors.

4. Verify that all electrical connectors are firmly seated.

5. Use EEC Self Test connector and procedure to check for sensor function.

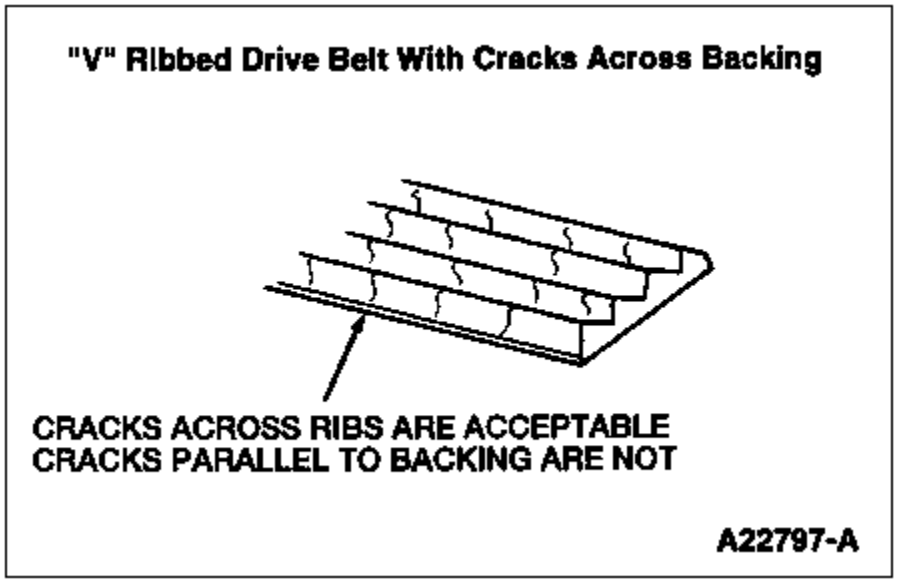
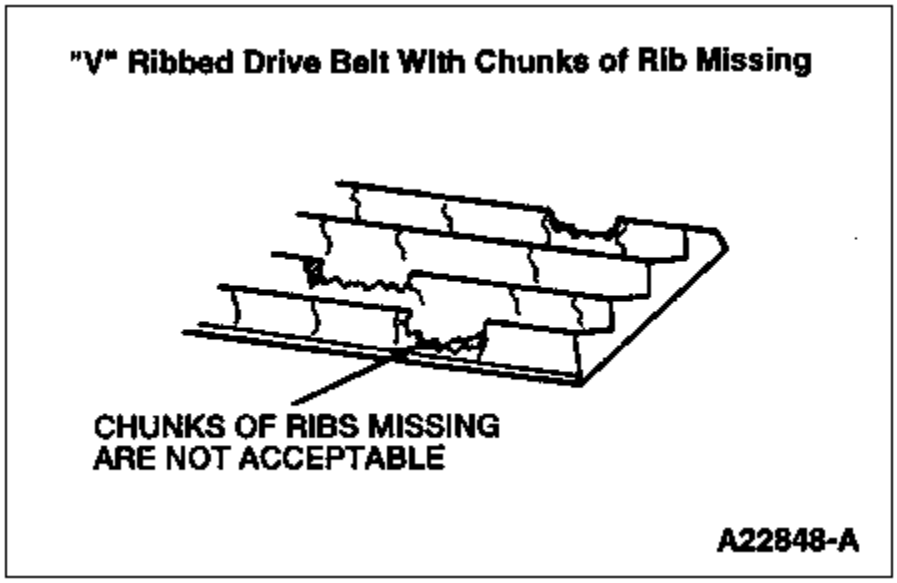
Inspection and Verification

Drive Belt Cracking/Chunking/Wear

Under severe operating conditions (high temperatures, low humidity), drive belt rib cracking can occur at less than 96,000 km (60,000 miles). Drive belt rib cracking across backing is not a reason for concern and has no detrimental effect on belt performance. Cracks parallel to backing are not acceptable.



Drive belt "chunking" occurs when the rubber material actually chunks out between the cracks. Replace the drive belt (8620) if chunking occurs.



Drive Belt Noise/Flutter

Drive belt "chirp" is a regularly occurring chirping noise that occurs due to pulley misalignment or excessive pulley runout. It can be a result of a damaged pulley or an improperly replaced pulley that was not properly aligned.

To correct, determine the area where the noise comes from. Then check each of the pulleys in that area with a straightedge to the crankshaft pulley and look for the accessory pulleys to be out of position in the fore/aft direction or at an angle to the straightedge.

Belt squeal is an intermittent noise that occurs when the drive belt slips on a pulley during certain conditions such as engine start up, rapid engine acceleration, or A/C clutch engagement.

Drive belt squeal can occur under the following conditions:

1. If the A/C discharge pressure goes above 2895 kPa (420 psi). This can occur if:

    a. The A/C system is overcharged.
    b. The A/C condenser core airflow is blocked.
    c. The engine fan blade (8600) is not engaging fully at idle.

2. If A/C OFF equalized pressure (the common discharge and suction pressure that occurs after several minutes) exceeds 965 kPa (140 psi), which is a rare occurrence at high ambient temperatures with a hot engine, turn A/C OFF for a few seconds and then back ON after fan blade begins to cool A/C condenser core.

3. If any of the accessories are damaged, or have a worn or damaged bearing or internal torsional resistance above normal for any reason. All of the accessories should be rotatable by hand in the unloaded condition. If any are not, the accessory should be inspected.

4. If fluid gets on the drive belt. These would include power steering fluid, engine coolant, engine oil or air conditioning system lubricant.

    If fluid does get on the drive belt during service, the best policy is to clean the drive belt with soap and water and thoroughly rinse with clean water. The drive belt does not have to be replaced if no apparent damage has occurred.

5. If drive belt is too long. A drive belt that is too long will allow the drive belt tensioner arm to go all the way to drive belt tensioner arm travel stop under certain load conditions, which will untension the drive belt. If the drive belt tensioner (6B209) is resting on the stop, replace the drive belt.

6. If the drive belt tensioner is worn or damaged. The drive belt tensioner arm should rotate freely without binding.

Symptom Chart — Noise Diagnosis Guide

NOISE DIAGNOSIS GUIDE

Condition	Possible Source	Action
• Excessive Noise/Belt Squeal	• Seized accessory.	• CHECK all accessories for free rotation and REPLACE accessory if necessary. REPLACE drive belt.
	• Loose drive belt.	• CHECK condition of drive belt. REPLACE drive belt. • CHECK that automatic drive belt tensioner is within the indicator marks. CHECK for correct drive belt length if drive belt tensioner is out of operating range.
• Rattle	• Loose accessory pulley or accessory.	• CHECK for looseness and TIGHTEN.
• Noisy Tensioner Pulley Bearing	• Worn tensioner pulley bearing.	• REPLACE drive belt tensioner.
• Belt Chirp	• Misaligned accessory or accessory pulley.	• ALIGN or REPLACE accessory or accessory pulley.

Component Tests

Drive Belt Tensioner, Automatic

The drive belt tensioner (6B209) can be checked as follows:

1. With the engine running, observe drive belt tensioner movement. The drive belt tensioner should move (respond) when the A/C compressor cycles or when the engine (6007) is accelerated rapidly. If the drive belt tensioner movement is constant and excessive, a pulley or shaft is probably bent or a pulley is out of round. In rare cases, excessive belt rideout (uneven depth of grooves in belt) can cause excessive drive belt tensioner movement. This condition can be checked by replacing the suspect drive belt (8620) with a known good original equipment drive belt and repeating the observation.

2. With engine off, check for proper drive belt routing. Refer to the illustrations under Removal and Installation . Service as required.

3. Visually inspect the wear indicator on the drive belt tensioner to ensure the drive belt is within operating range. Replace the drive belt as required.

4. Rotate the drive belt tensioner and check for a binding or frozen condition. Replace components as required.

Drive Belt Misalignment

CAUTION: Incorrect drive belt installation will cause excessive drive belt wear and may cause the drive belt to come off the drive pulleys.

NOTE: Original equipment drive belts are made of a special cord construction and are subjected to special testing before they are approved for use.

Replacement drive belts, other than O.E.M., may track differently/improperly. If a replacement drive belt tracks improperly, the drive belt should be replaced with an O.E.M. drive belt to avoid performance failure or loss of drive belt during cold operation.

NOTE: 4.0L does not have flat idler on tensioner.

With the engine running, check drive belt tracking (the position of the drive belt on one of the grooveless pulleys, idlers or drive belt tensioner. If the edge of the drive belt rides beyond the edge of the pulley, noise and premature wear may result). If a drive belt tracking condition exists, visually check the drive belt tensioner for damage, especially the mounting pad surface. If the drive belt tensioner is not installed correctly with the locating pins in the locating holes, the mounting surface pad will be out of position. This will result in abnormal drive belt tension and chirp and squeal noises.

If the above procedures do not correct the drive belt noise, try replacing the drive belt with a known good original equipment drive belt. However, the drive belt noise may return (with mileage) if one of the above

conditions still exists uncorrected.

- With engine running, visually observe the grooves in the pulleys (not the pulley flanges) for excessive wobble. Replace components as required.
- Check all accessories, mounting brackets and drive belt tensioner, for any interference that would prevent the component from mounting properly. Correct any interference condition and recheck belt tracking.
- Tighten all accessories, mounting brackets and drive belt tensioner retaining hardware to specification. Recheck drive belt tracking.

Drive Belt Replacement

Drive Belt, Serpentine

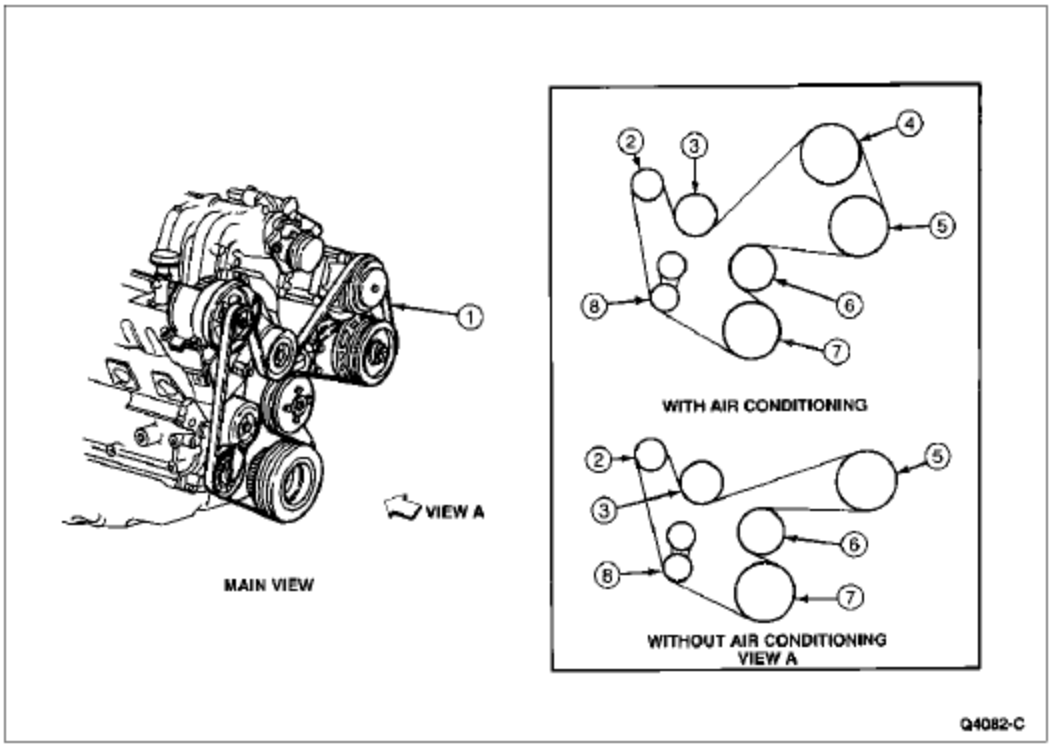
NOTE: Conditions requiring replacement of drive belt (8620) are excessive cracking or wear, severe glazing or frayed cords. Replace drive belts exhibiting any of these conditions. Minor cracks in the back of the drive belt are considered acceptable.

NOTE: The 2.3L, 3.0L, and 4.0L engines (6007) are equipped with drive belt tensioners (6B209) that indicate when the drive belt is worn (stretched). A pointer and gauge are built into the drive belt tensioner. When the pointer no longer registers within the range limits of the gauge, the drive belt must be replaced.

Removal

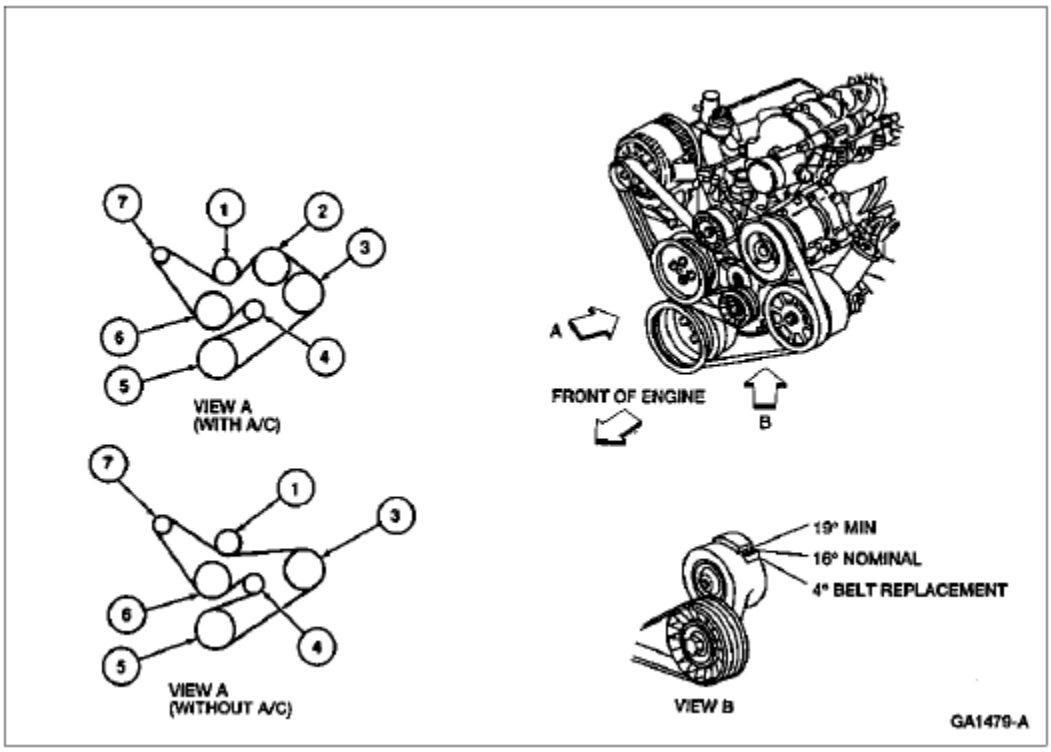
1. Disconnect the intake air temperature (IAT) sensor electrical connector.
2. On Aerostar, disconnect the mass air flow (MAF) sensor electrical connector.
3. Disconnect crankcase ventilation hose.
4. Loosen air cleaner outlet tube clamps and remove tube.
5. Lift drive belt tensioner by rotating it counterclockwise and remove the drive belt. (For 3.0L Aerostar and Ranger, rotate clockwise.)

Belt Installation — Aerostar, Ranger 4.0L



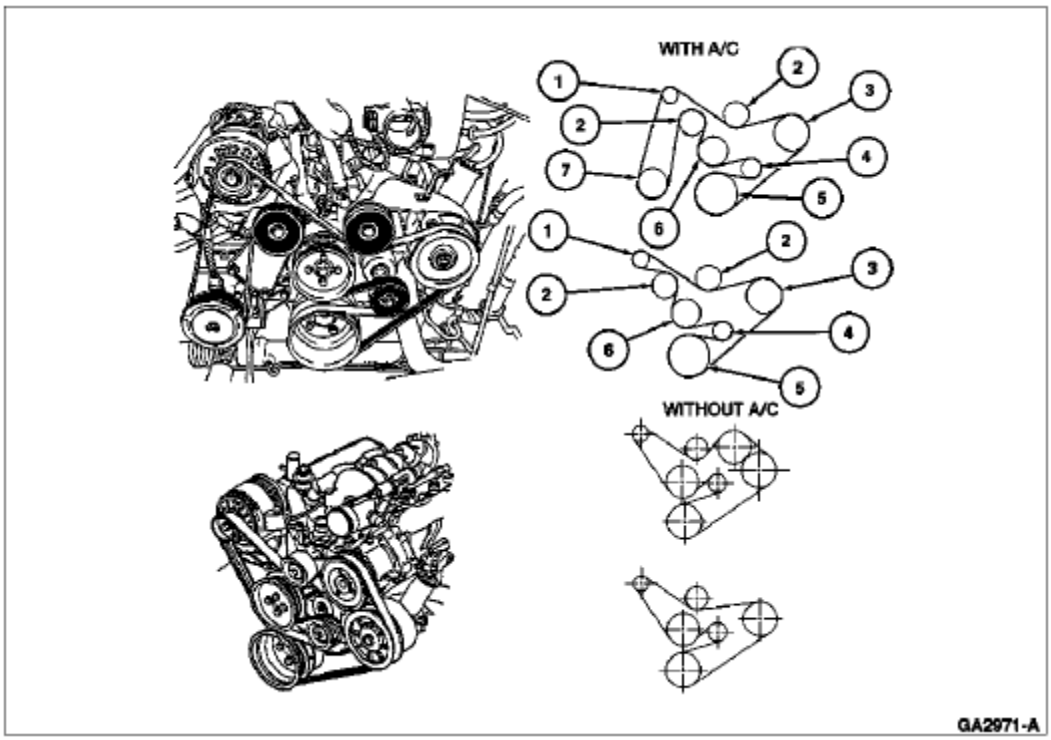
Item	Part Number	Description
1	8620	Drive Belt
2	10300	Generator
3	8678	Belt Idler Pulley
4	19703	A/C Compressor
5	3A733	Power Steering Pump Pulley
6	8501	Water Pump
7	6312	Crankshaft Pulley
8	6B209	Drive Belt Tensioner

Belt Installation — Ranger 3.0L



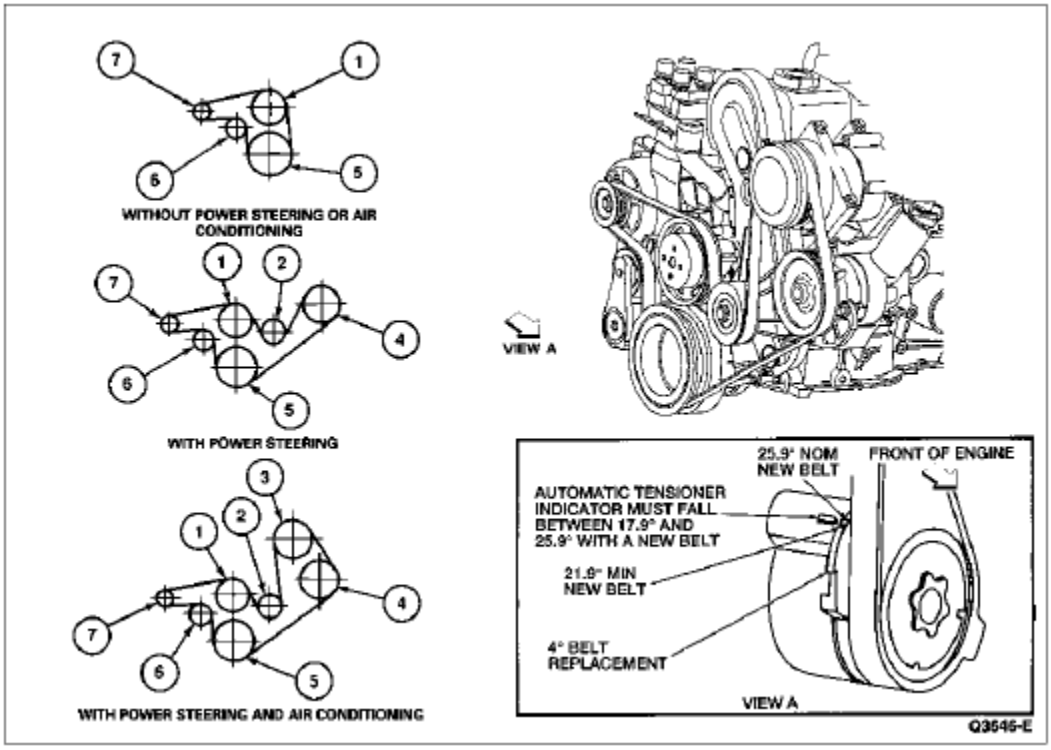
Item	Part Number	Description
1	3F671	Belt Idler Pulley
2	19D629	A/C Compressor
3	3D673	Power Steering Pump Pulley
4	6B209	Drive Belt Tensioner
5	6312	Crankshaft Pulley
6	8A528	Water Pump Pulley
7	10300	Generator

Belt Installation — Aerostar 3.0L



Item	Part Number	Description
1	10300	Generator
2	3F671	Belt Idler Pulley
3	3D673	Power Steering Pump Pulley
4	6B209	Drive Belt Tensioner
5	6312	Crankshaft Pulley
6	8A528	Water Pump Pulley
7	19D629	A/C Compressor

Belt Installation — Ranger 2.3L



Item	Part Number	Description
1	8509	Water Pump Pulley
2	3F671	Belt Idler Pulley
3	2E884	A/C Clutch Pulley
4	3D673	Power Steering Pump Pulley
5	6312	Crankshaft Pulley
6	6B209	Drive Belt Tensioner
7	10300	Generator

Installation

1. Position new drive belt over pulleys.
   - Make sure that all V-grooves make proper contact with the pulley.
   - Make sure that drive belts are properly seated on the pulleys. One revolution of the engine with an incorrectly seated drive belt may snap the drive belt cords.
2. On all engines, lift drive belt tensioner and route drive belt under drive belt tensioner pulley. Release drive belt tensioner to rest on drive belt.
3. Install air cleaner outlet tube (9B659) and tighten clamps to 2-3 Nm (18-26 lb-in).
4. Connect crankcase ventilation hose.

5. On Aerostar, connect the mass air flow (MAF) sensor electrical connector.
6. Connect the intake air temperature (IAT) sensor electrical connector.

Drive Belt Tensioner, Automatic

Removal

1. Remove drive belt (8620). Refer to the procedure in this section.
2. On 2.3L and 4.0L engines (6007), remove drive belt tensioner bolt and drive belt tensioner (6B209).

Installation

To install, reverse removal procedure.

On Ranger 2.3L, 3.0L and all 4.0L engines tighten the drive belt tensioner bolt to 40-55 Nm (30-40 lb-ft). On Aerostar 3.0L and Ranger 3.0L engines tighten to 23-32 Nm (17-23 lb-ft).

Drive Belt Tensioner, Automatic

The drive belt tensioner (6B209) has no provision for adjustment and will be damaged if forced to travel beyond its operating range.

Automatic tensioners are calibrated at the factory to provide the correct amount of tension to the belt for a given FEAD system. Unless a spring within the tensioner assembly breaks or some other mechanical part of the tensioner fails, there is no need to check tensioner for proper tension.

The only mechanical check that needs to be made, if you have any doubt to the tensioner function, would be to remove the belt in the area of the tensioner, then using the proper tool, rotate the tensioner from its relaxed position thru its full stroke and back to the relaxed position to assure there is no "stick, grab, bind," and to assure that there is tension on the tensioner spring. If the tensioner meets these criteria, it should be assumed to be a good tensioner.

Inspection and Verification

WARNING: WHEN SERVICING STARTER MOTOR (11001) OR PERFORMING OTHER UNDERHOOD WORK IN THE VICINITY OF THE STARTER MOTOR, BE AWARE THAT THE HEAVY GAUGE BATTERY INPUT LEAD AT THE STARTER SOLENOID (11390) IS "ELECTRICALLY HOT" AT ALL TIMES. A PROTECTIVE CAP OR BOOT IS PROVIDED OVER THE TERMINAL OF THIS LEAD AND MUST BE REPLACED AFTER SERVICING. BE SURE TO DISCONNECT BATTERY NEGATIVE CABLE BEFORE SERVICING STARTER.

WARNING: WHEN WORKING IN AREA OF THE STARTER MOTOR, BE CAREFUL TO AVOID TOUCHING HOT EXHAUST COMPONENTS.

CAUTION: When disconnecting the plastic hardshell connector at the solenoid S terminal, grasp the plastic connector and pull lead off. DO NOT pull separately on lead wire.

1. Inspect starting system for loose connections.
2. If system does not operate properly, note condition and continue diagnosis using the symptom chart.

tomsn048@gmail.com

Symptom Chart — Starting System

NOTE: Use Rotunda 73 Digital Multimeter 105-R0051 or equivalent to perform electrical pinpoint tests.

STARTING SYSTEM

Condition	Possible Source	Action
• Engine Cranks Slowly	• Loose connections in starter solenoid battery feed or ground circuit. • Undercharged battery. • Malfunctioning starter motor.	• GO to Pinpoint Test A .
• Engine Does Not Crank	• Loose or corroded battery cable connections. • Undercharged battery. • Starter motor. • Starter motor solenoid relay switch. • Transmission range (TR) sensor. • Anti-theft relay. • RAP module. • Ignition switch.	• GO to Pinpoint Test B .
• Unusual Starter Noise	• Starter motor improperly mounted. • Malfunctioning starter motor. • Improper starter drive engagement.	• GO to Pinpoint Test C .

tomsn048@gmail.com

Pinpoint Tests — Starting System

CAUTION: Remove plastic safety cap on starter solenoid and disconnect hardshell connector at solenoid S-terminal as described under Removal and Installation in this section.

NOTE: Hoist vehicle (if necessary) to access terminals of starter solenoid (11390).

PINPOINT TEST A: ENGINE CRANKS SLOWLY

A1 CHECK CONNECTIONS AT BATTERIES

- Inspect all battery cable connections for looseness and corrosion.

Are battery connections clean and tight?

Yes	No
GO to **A2**.	CLEAN and TIGHTEN connections at battery.

A2 STARTER LOAD TEST

- Perform starter load test. Refer to Component Tests in this section.

Did starter pass load test?

Yes	No
GO to **A3**.	TEST battery. REFER to Section 14-00. If battery is OK, GO to **A4**.

A3 CHECK FOR EXCESSIVE RESISTANCE

- Perform voltage drop tests. Refer to Component Tests in this section.

Did starter circuit pass voltage drop test?

Yes	No
GO to **A4**.	CLEAN circuit connection as necessary.

tomsn048@gmail.com

A4 STARTER NO-LOAD TEST

- Perform starter no-load test. Refer to Component Tests in this section.

Did starter pass no-load test?

Yes	No
Slow cranking is caused by excessive engine drag.	REPAIR or REPLACE starter.

PINPOINT TEST B: ENGINE DOES NOT CRANK

B1 CHECK BATTERY CONNECTIONS

- Inspect battery terminals for loose or corroded connections.

Are the battery terminals clean and tight?

Yes	No
GO to **B2** .	CLEAN and TIGHTEN battery terminals.

B2 CHECK BATTERY

- Check battery. Refer to Section 14-00 .

Is the battery OK?

Yes	No
GO to **B3** .	CHARGE or REPLACE the battery.

B3 CHECK STARTER MOTOR

- Turn ignition key to START position.

Does the starter motor spin?

Yes	No
GO to **B20** .	GO to **B4** .

B4 CHECK CIRCUIT PROTECTION

tomsn048@gmail.com

- Check fuse 1 (60A) in the Power Distribution Box.

Is fuse OK?

Yes	No
GO to **B5** .	REPLACE fuse.

B5 CHECK BATTERY FEED TO FUSE

- Remove fuse 1 (60A) from the Power Distribution Box.
- Measure voltage between the fuse battery feed terminal and battery ground terminal.

Is battery voltage present?

Yes	No
GO to **B6** .	REPAIR (BK) wire from starter motor solenoid relay switch to Power Distribution Box.

B6 CHECK GROUND AT THE ENGINE BLOCK

- Measure voltage between battery positive terminal and engine block.

Is there battery voltage?

Yes	No
GO to **B8** .	CLEAN and TIGHTEN battery ground cable at the engine block. GO to **B7** .

B7 VERIFY GROUND AT THE ENGINE BLOCK

- Measure voltage between battery positive terminal and engine block.

Is there battery voltage?

Yes	No
GO to **B8** .	REPLACE battery ground cable.

B8 CHECK POWER SUPPLY TO STARTER MOTOR B TERMINAL

- Key in OFF position.
- Measure voltage at the starter B terminal.

Is battery voltage present?

tomsn048@gmail.com

Yes	No
GO to **B9** .	REPLACE battery positive cable.

B9 CHECK POWER SUPPLY TO STARTER MOTOR S TERMINAL

- Vehicle in PARK.
- With key in START position, check for battery voltage at the starter S-terminal.

Is battery voltage present?

Yes	No
REPLACE starter motor.	GO to **B10** .

B10 CHECK POWER FOR BATTERY VOLTAGE AT THE STARTER MOTOR SOLENOID RELAY SWITCH

- With the key in START position, check for battery voltage at the starter motor solenoid relay switch terminal.

Is battery voltage present?

Yes	No
REPLACE R wire between the starter motor solenoid relay switch and starter motor.	GO to **B11** .

B11 CHECK GROUND AT THE STARTER MOTOR SOLENOID RELAY SWITCH

- Measure voltage between the battery positive terminal and the starter motor solenoid relay switch case ground.

Is battery voltage present?

Yes	No
GO to **B12** .	REPAIR poor ground to the vehicle body, or CLEAN surface between the starter motor solenoid relay switch and vehicle body.

B12 CHECK FOR BATTERY VOLTAGE AT THE STARTER MOTOR SOLENOID RELAY SWITCH

- Measure voltage between the battery negative terminal and battery positive cable at the starter motor solenoid relay switch.

Is battery voltage present?

tomsn048@gmail.com

Yes	No
GO to **B13** .	REPLACE battery positive cable.

B13 CHECK FOR BATTERY VOLTAGE ON CIRCUIT 32 (R/LB)

- With ignition key in START position, measure voltage on Circuit 32 (R/LB) at the starter motor solenoid relay switch.

Is battery voltage present?

Yes	No
REPLACE starter motor solenoid relay switch.	GO to **B14** .

B14 CHECK BATTERY FEED TO STARTER MOTOR SOLENOID RELAY SWITCH AT THE TRANSMISSION RANGE SENSOR

- With ignition key in START position, measure voltage on Circuit 32 (R/LB) at the transmission range (TR) sensor.

Is battery voltage present?

Yes	No
REPAIR open in Circuit 32 (R/LB).	GO to **B15** .

B15 CHECK FOR BATTERY FEED TO THE TRANSMISSION RANGE SENSOR

- With ignition key in START position, measure voltage on Circuit 329 (PK) at the transmission range (TR) sensor.

Is battery voltage present?

Yes	No
REPLACE transmission range (TR) sensor.	GO to **B16** .

B16 CHECK FOR BATTERY VOLTAGE AT THE ANTI-THEFT RELAY

- With ignition key in START position, measure voltage on Circuit 329 (PK) at the anti-theft relay.

Is battery voltage present?

Yes	No
REPAIR open in Circuit 329 (PK). Vehicles equipped with the wiring connector plug, check	GO to **B17** .

tomsn048@gmail.com

wiring connector plug for continuity. REPLACE as necessary.	

B17 CHECK BATTERY FEED TO ANTI-THEFT RELAY

- With ignition key in START position, measure voltage on Circuit 32 (R/LB), at anti-theft relay.

Is battery voltage present?

Yes	No
GO to **B18** .	GO to **B19** .

B18 CHECK FOR GROUND IN CIRCUIT 342 (LG/P)

- With one multimeter lead connected to a known good B+, connect second lead to Circuit 342 (LG/P) at the anti-theft relay.

Is there ground present?

Yes	No
REFER to Section 18-04B .	REPLACE anti-theft relay.

B19 CHECK FUSE

- Check fuse 24 (10A) in the instrument panel.

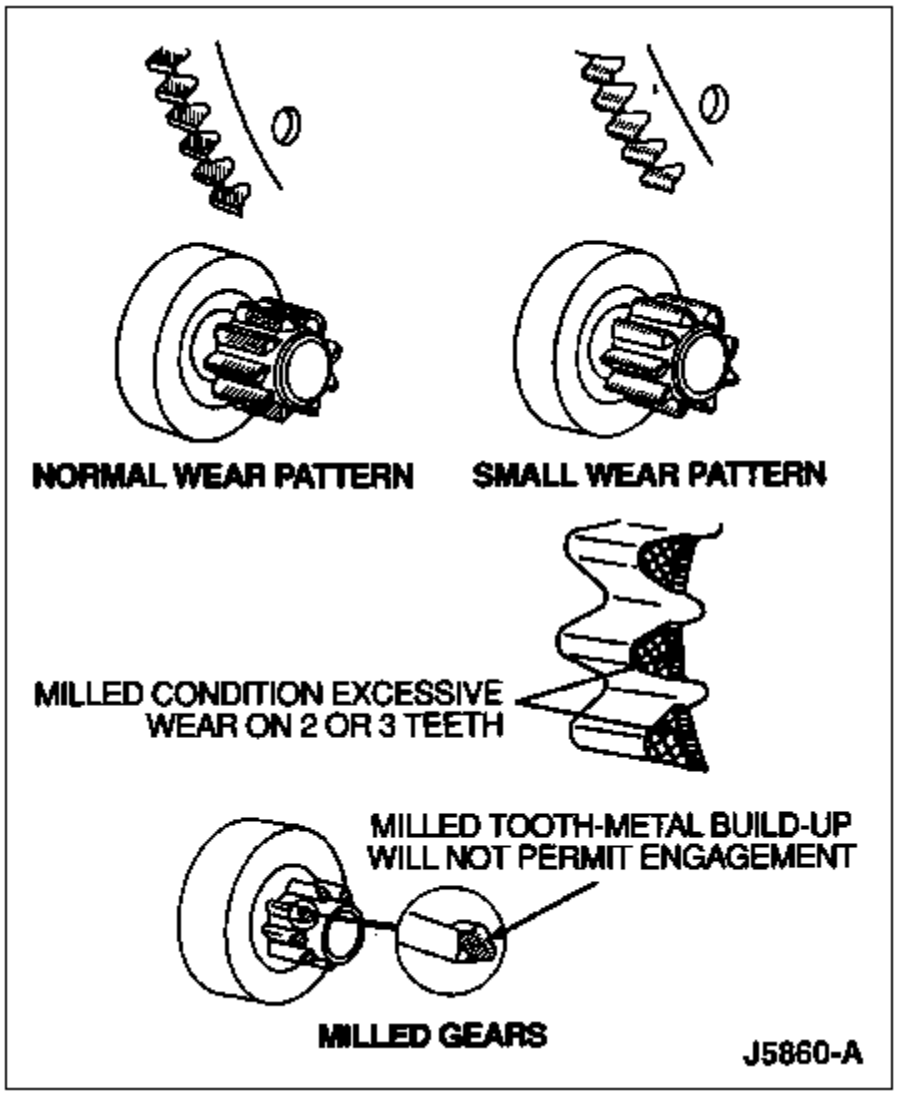
Is fuse OK?

Yes	No
REFER to Section 18-04B .	REPLACE fuse.

B20 CHECK FLYWHEEL

- Remover the starter motor.
- Inspect flywheel and drive pinion for damage or excessive wear.

tomsn048@gmail.com



Is flywheel or drive pinion worn or damaged?

Yes	No
REPLACE the flywheel and drive pinion. REFER to appropriate engine section in Group 03.	GO to **B21** .

B21 OVERRUNNING CLUTCH

- Check operation of overrunning clutch. Refer to Drive Pinion Test in Component Tests in this section.

Does overrunning clutch operate properly?

Yes	No
DISASSEMBLE starter and INSPECT starter.	REPLACE overrunning clutch.

tomsn048@gmail.com

PINPOINT TEST C: UNUSUAL STARTER NOISE

C1 CHECK STARTER MOTOR MOUNTING

- Inspect the starter motor mounting.
- Check the starter motor mounting bolts for looseness.

Is the starter motor mounted properly?

Yes	No
GO to **C2** .	REMOUNT or REPLACE the starter motor.

C2 CHECK STARTER DRIVE ENGAGEMENT

- Remove the starter motor.
- Inspect the starter drive and flywheel for damage. Refer to Pinpoint Test Step B20 in this section.

Are the starter drive and flywheel OK?

Yes	No
CHECK drive pinion overrunning clutch. REFER to Component Tests procedures in this section.	REPLACE as necessary.

tomsn048@gmail.com

Component Tests

Starter

Load Test

Batteries (10655) must be fully charged and serviceable before performing a starter load test. Refer to Section 14-00 for battery inspection and test procedures.

1. Set parking brake and shift transmission (7003) into neutral.
2. Prevent engine (6007) from starting by disconnecting wiring at ignition coil.
3. Connect Rotunda Alternator, Regulator, Battery and Starter Tester (ARBST) 010-00725 or equivalent. Make sure that current is not flowing through ammeter and heavy-duty carbon pile rheostat portion of circuit (rheostat at maximum counterclockwise position).
4. Connect remote starter switch across starter relay S and battery terminal.
5. Key to run.
6. Crank engine and determine exact reading on voltmeter.
7. Stop cranking engine and reduce resistance of carbon pile until voltmeter indicates same reading as that obtained while starter motor (11001) cranked the engine. The ammeter will indicate starter current draw under load. Check this with value listed in Specifications .

Starter Motor Load Test

6	11001	Starter Motor
7	010-00725	Alternator, Regulator, Battery and Starter Tester
8	10655	Battery

Drive Pinion Test

If the overrunning clutch in the starter drive (11350) does not operate, the starter motor will engage but will

tomsn048@gmail.com

not crank the engine.

The starter motor must be removed to check the overrunning clutch. Using a small pry bar, turn the drive pinion clockwise and counterclockwise. In one direction, the pinion should freewheel. In the other direction, the overrunning clutch should lock the pinion to the armature shaft. If the pinion freewheels in both directions, replace the starter drive.

NOTE: The above check can be misleading. An overrunning clutch may lock when manually rotated, but will not hold under engine cranking torque. Replace the starter drive if indicated by reasonable diagnostic procedures.

No-Load Test

1. Remove starter motor.
2. Connect a fully charged battery, a Rotunda Alternator, Regulator, Battery and Starter Tester 010-00725 or equivalent and a remote starter switch to starter motor as shown in following electrical schematic.
3. Close remote starter switch. Pinion should shift to crank position and motor should run smoothly.
4. While the starter motor is running, check voltmeter and ammeter readings.
5. Voltage should be greater than 11.0 volts and the amperage should be no more than 70 amps.
6. If voltage is lower than specified voltage, or amperage is higher than specified amperage, refer to following chart to determine cause and corrective action.

Starter Motor No-Load Test Electrical Schematic

STARTER MOTOR NO-LOAD TEST RESULTS

TEST RESULT	POSSIBLE SOURCE	ACTION TO TAKE
• Normal Current and Speed	• Cranking motor OK.	• RECHECK battery, switches and wiring, including voltage drop tests, if cranking motor operation on engine is slow or sluggish.
• Current Flow With Test Circuit Switch Open	• Solenoid contacts stuck closed.	• TEST and, if necessary, REPLACE solenoid assembly.
• Failure to Operate With Very Low or No Current	• Open solenoid winding. • Open field circuit.	• INSPECT and TEST solenoid assembly. • INSPECT and TEST frame and field assembly.
	• Open armature coil(s) or high insulation between commutator bars. • Broken brush spring(s) or worn brushes.	• INSPECT armature. • INSPECT brushes and brush springs.
• Failure to Operate With High Current	• Frozen bearing, or other damage to drivetrain. • Direct ground in terminals or fields.	• INSPECT bearings, armature, driveshaft and related drive parts. • INSPECT and TEST frame and field assembly, solenoid assembly, armature and brush installations for shorts.
• Low Speed With High Current	• Excessive friction in bushings or gear reduction unit, bent armature shaft or loose pole shoe, bent driveshaft.	• INSPECT bearings, armature, driveshaft, and gear reduction gears.
	• Shorted armature. • Grounded armature or fields.	• INSPECT and TEST armature. • INSPECT and TEST frame and field coil assembly and armature.
• Low Speed With Normal (or Low) Current	• High internal electrical resistance caused by poor connections, defective leads or dirty commutator.	• INSPECT internal wiring, electrical connections and armature commutator.

tomsn048@gmail.com

	• Open solenoid winding.	• INSPECT and TEST solenoid assembly.
	• Open field circuit.	• INSPECT and TEST frame and field assembly.
	• Open armature coil(s) or high insulation between commutator bars.	• INSPECT armature.
	• Broken brush spring(s) or worn brushes.	• INSPECT brushes and brush springs.
• High Speed With High Current	• Shorted fields.	• INSPECT and TEST field and frame assembly.

Voltage Drop Tests

If the starter motor cranks slowly and the battery is satisfactory, there may be a malfunction of the starter or in the cranking circuit wiring. To determine if the problem is in the wiring, a voltage drop test must be performed on the following:

- motor feed circuit.
- motor ground circuit.
- individual cables.

These tests are performed to determine if there is excessive resistance in the starter motor circuit. Always make the multimeter connections at the component terminal rather than at the cable wiring end connector. Making a connection at the wiring end connector could result in false readings because the meter will not pick up a high resistance between the wiring connector and the component.

Motor Feed Circuit

A motor feed circuit test checks all wiring and connections between battery positive terminal and starter motor for excessive resistance.

1. Prevent engine from starting by disconnecting wiring at ignition coil.
2. Connect a remote starter switch between starter solenoid S-terminal and battery terminal.
3. Connect Rotunda 73 Digital Multimeter 105-R0051 or equivalent positive lead to battery positive (+) post. Connect Rotunda 73 Digital Multimeter 105-R0051 or equivalent negative lead to solenoid M-terminal.
4. Engage remote starter switch. Read and record voltage. Voltage reading should be 0.5 volt or less.
5. If voltage reading is higher than this, indicating excessive resistance, move the Rotunda 73 Digital Multimeter 105-R0051 or equivalent negative lead to starter solenoid B-terminal and repeat test. If voltage reading at B-terminal is lower than 0.5 volt, concern is either in connections at the starter solenoid (11390) or in solenoid contacts.
6. Remove cables from solenoid B-, S-, and M-terminals. Clean cables and connections and reinstall cables to proper terminals. Repeat Steps 1 through 5 above. If voltage drop reading is still higher than

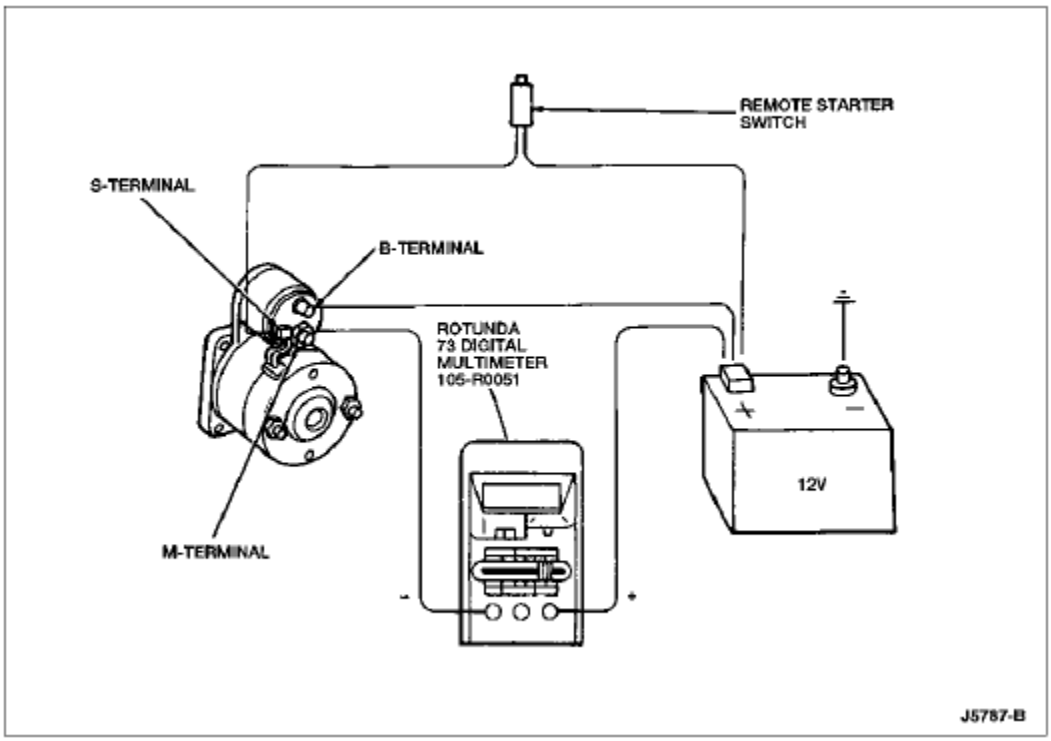
tomsn048@gmail.com

0.5 volt when checked at M-terminal or lower when checked at B-terminal, concern is in solenoid contacts. Remove and replace starter motor or starter solenoid, if available.

7. If the voltage reading taken at the starter solenoid B-terminal is still higher than 0.5 volt after cleaning cables and connections at starter solenoid, concern is either in positive (+) battery cable connection, or in positive battery cable itself.

8. By moving the Rotunda 73 Digital Multimeter 105-R0051 or equivalent negative lead toward battery and checking each mechanical connection point, excessive voltage drop can be located. When high reading disappears, last mechanical point that was checked is concern.

Motor Feed Circuit Voltage Drop Test



Motor Ground Circuit

A slow cranking condition can be caused by resistance in the ground or return portion of the cranking circuit. A starter motor ground circuit test checks the circuit between the starting motor ground and the battery negative terminal. Check the voltage drop in the ground circuit as follows.

1. Prevent engine from starting by disconnecting wiring at ignition coil.

2. Connect a remote starter switch between starter solenoid S-terminal and the battery terminal.

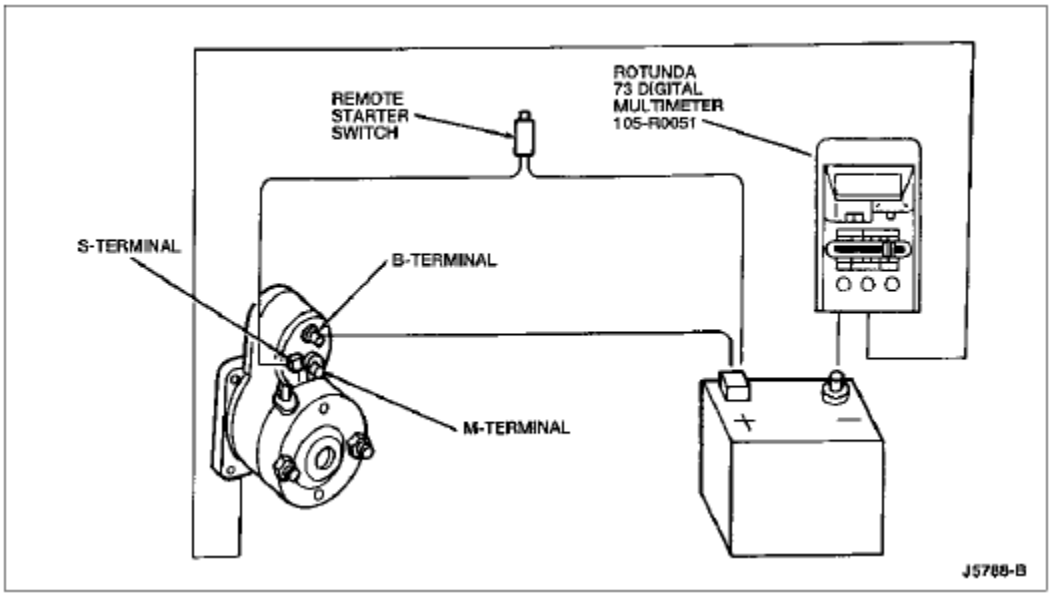
3. Connect a Rotunda 73 Digital Multimeter 105-R0051 or equivalent positive lead to starter motor housing (connection must be clean and free of rust or grease). Connect Rotunda 73 Digital Multimeter 105-R0051 or equivalent negative lead to negative (-) battery terminal.

tomsn048@gmail.com

4. Engage remote starter switch and crank engine. Read and record the multimeter reading. Reading should be 0.2 volt or less.

5. If voltage drop is more than 0.2 volt, clean negative cable connections at battery and body connections, and retest. If voltage drop is still too high, test individual cables.

Motor Ground Circuit Voltage Drop Test



Individual Cable

A battery cable problem can produce symptoms similar to a dead battery, bad solenoid, or weak starting motor. If the cables do not allow enough current flow, the starter will turn slowly or not at all.

1. Connect positive (+) lead of Rotunda 73 Digital Multimeter 105-R0051 or equivalent to battery positive (+) post. Connect negative (-) lead to starter solenoid B-terminal.

2. To locate excessive voltage drop in cable, move multimeter negative (-) lead toward battery and check each mechanical connection point. When high reading disappears, last mechanical connection point that was checked is the problem.

Starter Solenoid

1. Disconnect battery ground cable (14301).

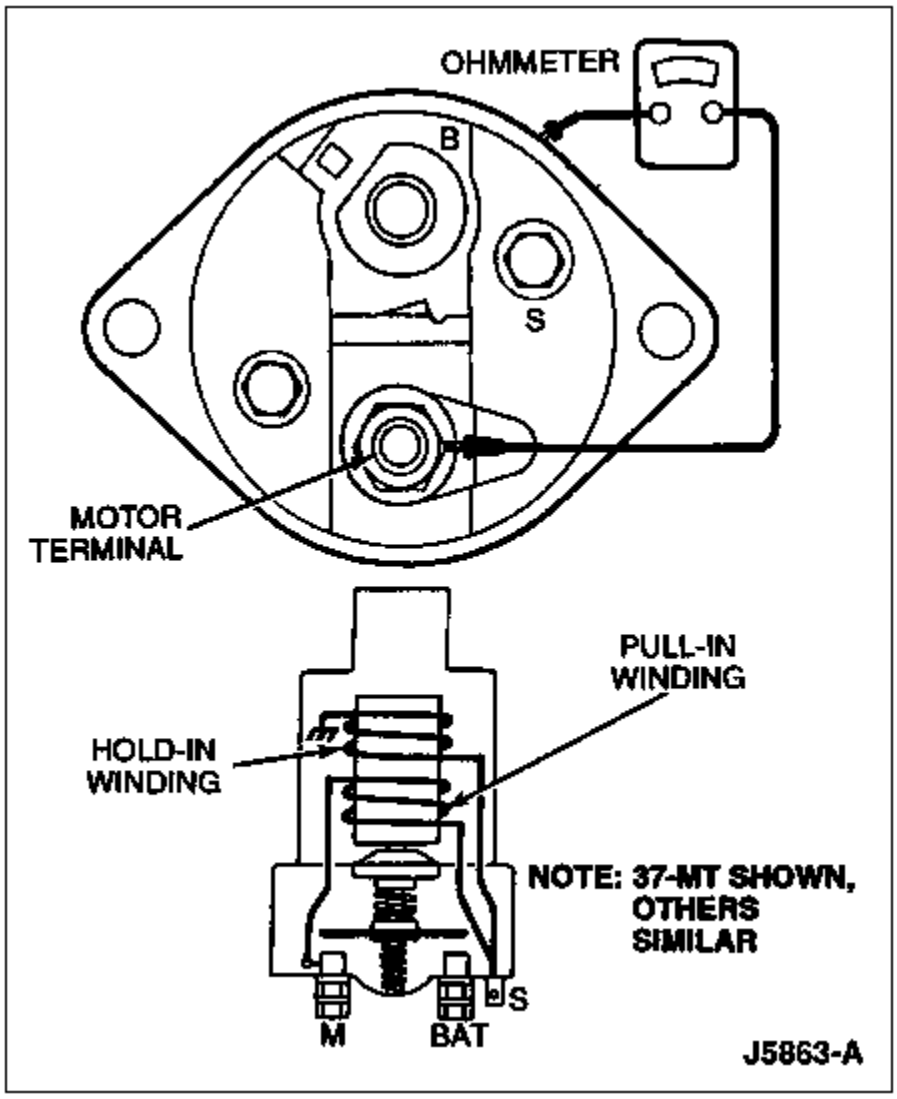
2. Using a Rotunda 73 Digital Multimeter 105-R0051 or equivalent, check windings of starter solenoid assembly for continuity as follows:

    - Check resistance of solenoid pull-in and hold-in windings in series by measuring resistance between motor terminal and solenoid case. Resistance should be approximately 0.95 ohms.

tomsn048@gmail.com

- An extremely high resistance reading indicates a break or fault in winding continuity. A very low resistance reading indicates a short or ground in the winding circuit. Either condition is cause for replacement of the starter solenoid assembly.

Starter Motor Solenoid Windings Test

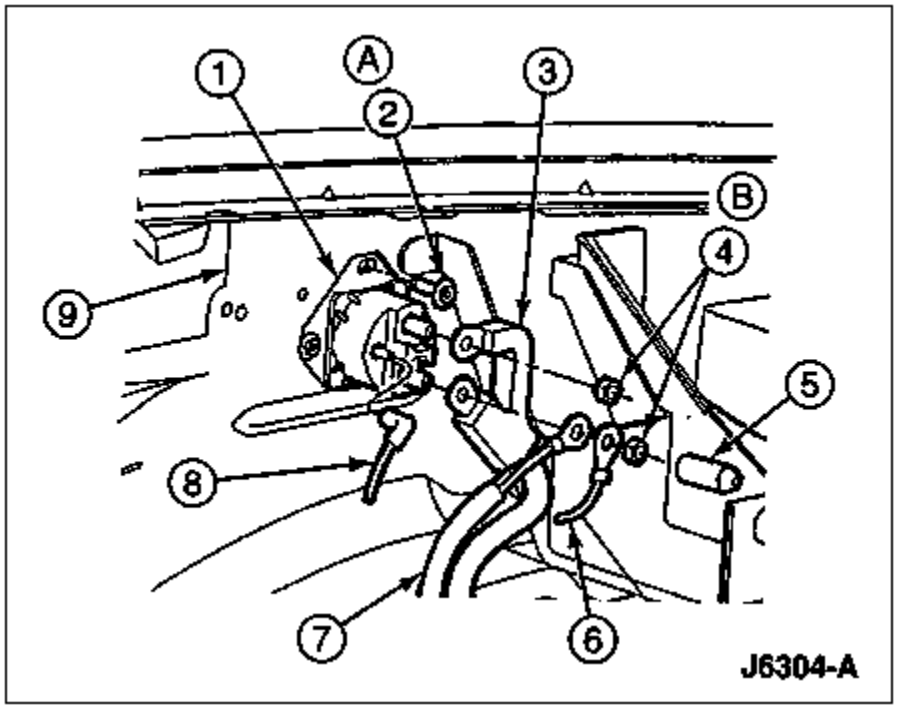


tomsn048@gmail.com

tomsn048@gmail.com

Starter Relay

Removal



Item	Part Number	Description
1	11450	Starter Motor Solenoid Relay Switch
2	N610959-S36	Screw, Starter Motor Solenoid Relay Switch-to-Inner Fender
3	14300	Battery to Starter Relay Cable
4	381561-S36	Nut, Starter Motor Solenoid Relay Switch Terminal
5	14A396	Cover, Starter Relay Terminal
6	14290	Wiring Assembly
7	14305	Wiring Assembly
8	14290	Push-on Connector
9	16015	Inner Fender (LH)
A	—	Tighten to 11-13 Nm

tomsn048@gmail.com

		(98-115 Lb-In)
B	—	Tighten to 7-9 Nm (62-79 Lb-In)

1. Disconnect the battery ground cable (14301).
2. Remove the starter relay terminal cover.
3. Remove the two terminal starter motor solenoid relay switch nuts.
4. Pull off the push-on connector.
5. **NOTE: To aid installation, note wire assembly orientation.**

   Remove the wiring assemblies from the starter motor solenoid relay switch terminals.
6. Remove the two starter motor solenoid relay switch-to-inner fender screws and the starter motor solenoid relay switch (11450).

Installation

To install, reverse the removal procedures.

Tighten the starter motor solenoid relay switch-to-inner fender screws to 11-13 Nm (98-115 lb-in).

Tighten the starter motor solenoid relay switch terminal nuts to 7-9 Nm (62-79 lb-in).

tomsn048@gmail.com

Starter Motor

WARNING: WHEN SERVICING STARTER MOTOR (11001) OR PERFORMING ANY MAINTENANCE IN THE AREA OF THE STARTER MOTOR, NOTE THE HEAVY GAUGE INPUT LEAD CONNECTED TO THE STARTER SOLENOID (11390) IS HOT AT ALL TIMES. MAKE SURE THE PROTECTIVE CAP IS INSTALLED OVER THE TERMINAL AND IS REPLACED AFTER SERVICE.

Removal

1. Disconnect the battery ground cable (14301).
2. Raise and support the vehicle.
3. **CAUTION: When disconnecting hardshell connector at S terminal, grasp the plastic shell and pull off. Do not pull on wire. Be careful to pull straight off to prevent damage to the connector and S terminal. If any part of the connection is damaged, replace the damaged components.**

   Disconnect starter cable and push-on connector from starter solenoid.
4. Remove upper bolt.
5. Remove lower bolt.
6. Remove the starter motor from the vehicle.

Installation

1. Position starter motor to engine and install upper and lower bolt finger-tight.
2. Tighten the upper bolt to 22-28 Nm (16-21 lb-ft).
3. Tighten the lower bolt to 22-28 Nm (16-21 lb-ft).
4. Connect connector on starter solenoid. Be careful to push straight on and make sure connector locks in position with a notable click or detent.
5. Install starter cable nut to terminal. Tighten to 11-13 Nm (91-122 lb-in).
6. Replace red safety cap.
7. Lower vehicle to floor.
8. **NOTE: When the powertrain control module (PCM) (12A650) is disconnected and reconnected, some abnormal drive symptoms may occur while the powertrain control module relearns its adaptive strategy. The vehicle may need to be driven 16 km (10 miles) or more to relearn the strategy.**

tomsn048@gmail.com

Connect battery ground cable.

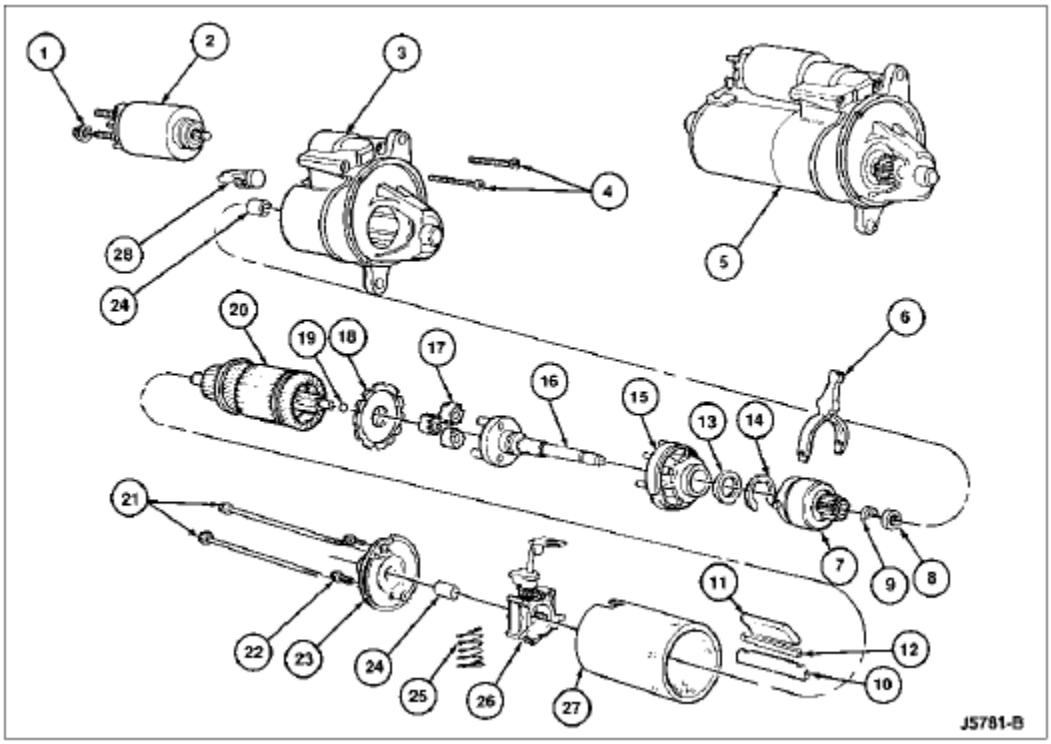
---

tomsn048@gmail.com

Starter Motor

NOTE: Although disassembly and service procedures are shown for the starter motor (11001) in this section, the starter motor should be returned to Ford Return Parts Center for analysis and review.

Starter Motor



Item	Part Number	Description
1	N805403	Terminal Nut
2	11390	Starter Solenoid
3	11130	Drive End Housing
4	N805405 (2 Req'd)	Starter Solenoid Screws
5	11001	Starter Motor
6	11067	Drive Lever and Pin
7	11350	Starter Drive
8	11223	Stop Ring Retainer
9	11222	Starter Drive Stop Ring

tomsn048@gmail.com

10	11A169 (6 Required)	Magnet Retainer
11	11A168 (6 Required)	Magnet Pole Piece
12	11A161 (6 Required)	Pole Shunt
13	11036	Pinion Thrust Washer
14	N805404	E-Ring
15	11A165	Stationary Gear
16	11355	Output Shaft
17	11K190	Planet Gear
18	11A167	Planet Gear Retainer
19	11A172	Armature Thrust Ball
20	11005	Starter Motor Armature
21	N805428 (2 Req'd)	Through-Bolt
22	N805406 (2 Req'd)	Brush End Plate Screw
23	11049	Brush End Plate and Bushing
24	11135	Bushing Bearing
25	11059	Brush Spring
26	11434	Brush Holder
27	11076	Starter Frame
28	11A171	Housing Seal

Disassembly

1. Remove the M-terminal nut, then slide positive brush connector from M-terminal.
2. Remove the two starter solenoid screws and the starter solenoid (11390).
3. Remove the through-bolts and separate drive end housing from starter frame and magnet (11075).
4. Remove seal (11A171) from drive end housing. Remove drive assembly from drive end housing.
5. Remove drive lever and pin (11067) from starter drive (11350).
6. Remove starter drive stop ring (11222), stop ring retainer (11223) and starter drive from output shaft (11355).
7. Pry E-Ring off output shaft, then remove pinion thrust washer (11036) and stationary gear (11A165).
8. **NOTE: Armature thrust ball (11A172) may become dislodged when planet gear retainer (11A167), planet gears (11K190) and bushing are removed from output shaft.**

   Remove output shaft from starter frame and magnet. Remove planet gear retainer, planet gears, bushing and armature thrust ball from output shaft.
9. Remove brush end plate screws. Remove brush end plate and bushing (11049) and brush holder (11061).

tomsn048@gmail.com

10. Push starter motor armature (11005) out of starter frame and magnet.

Assembly

1. **NOTE: Before inserting starter motor armature into starter frame and magnet apply a thin coat of Syncolon SCC-4-030 or equivalent meeting Ford specification WSF-M1C218-B on both ends of starter motor armature shaft and spline.**

   Insert starter motor armature into starter frame and magnet.

2. Install brush holder, making sure brushes fit over commutator. Apply Syncolon SCC-4-030 or equivalent meeting Ford specification WSF-M1C218-B to brush end plate and bushing.

3. Push seal tightly into slot on starter frame and magnet and attach brush end plate and bushing. Insert brush end plate screws and tighten to 2-3 Nm (18-26 lb-in).

4. Apply Syncolon SCC-4-030 or equivalent meeting Ford specification WSF-M1C218-B to output shaft spline. Install stationary gear, pinion thrust washer and attach output shaft E-ring.

5. Install starter drive, starter drive stop ring and stop ring retainer onto output shaft. Attach drive lever and pin to starter drive.

6. Apply Syncolon SCC-4-030 or equivalent meeting Ford specification WSF-M1C218-B to planet gear and install. Install bushing and armature thrust ball onto output shaft.

7. Apply Syncolon SCC-4-030 or equivalent meeting Ford specification WSF-M1C218-B into drive end housing bearing bore until approximately one-quarter full. Install output shaft into drive end housing, making sure to line up output shaft with hole in drive end housing.

8. Install seal into drive end housing and install planet gear retainer.

9. Position starter frame and magnet to drive end housing and install through-bolts. Tighten through-bolts to 5-10 Nm (45-88 lb-in).

10. Position starter solenoid to drive end housing, making sure plunger is attached to drive lever and pin. Insert starter solenoid screws and tighten to 5-10 Nm (45-88 lb-in).

11. Attach positive brush connector to starter solenoid M-terminal. Tighten M-terminal nut to 9-14 Nm (80-123 lb-in).

12. Check that no-load current draw is within specification. Refer to Component Tests in this section.

tomsn048@gmail.com

tomsn048@gmail.com

Starter Drive Replacement

Disassembly

1. Remove positive brush connector from M-terminal. Remove starter solenoid screws and remove starter solenoid (11390).
2. Remove through-bolts and separate drive end housing from the starter frame and magnet (11075).
3. Remove the seal (11A171).
4. Remove the output shaft (11355) and detach drive lever and pin (11067).
5. Remove starter drive stop ring (11222) and stop ring retainer (11223) from output shaft and then remove starter drive (11350).

Assembly

1. Apply a thin coating of Syncolon SCC-4-030 or equivalent meeting Ford specification WSF-M1C218-B on output shaft spline. Install starter drive assembly on output shaft. Install starter drive stop ring and stop ring retainer. Attach drive lever and pin.
2. Partially fill drive end housing bearing bore with Syncolon SCC-4-030 or equivalent meeting Ford specification WSF-M1C218-B (approximately one-quarter full). Install output shaft in drive end housing.
3. Install lever support and seal in drive end housing.
4. Position starter frame and magnet to drive end housing and install through-bolts. Tighten to 5-10 Nm (45-88 lb-in).
5. Install starter solenoid and tighten starter solenoid screws to 5-10 Nm (45-88 lb-in).

tomsn048@gmail.com

tomsn048@gmail.com

Armature Replacement, Starter Motor

Disassembly

1. Remove positive brush connector from M-terminal.
2. Remove through-bolts and separate starter motor (11001) from drive end housing.
3. Remove brush end plate and bushing screws, brush end plate and bushing (11049) and brush holder (11061) from starter frame and magnet (11075). Remove starter motor armature (11005) from frame.

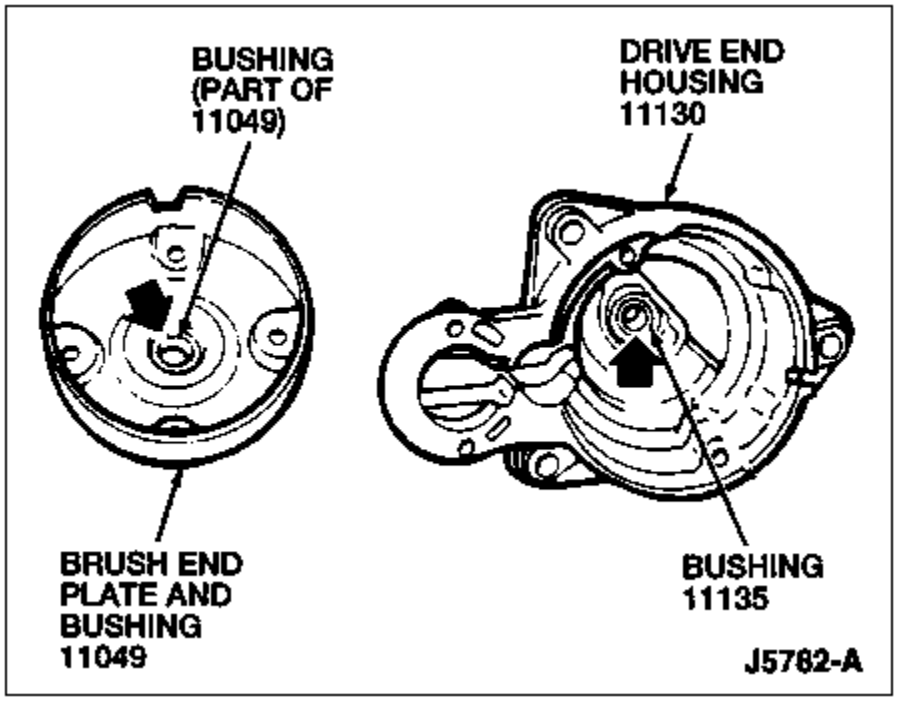
Assembly

1. Install starter motor armature in frame. Apply a thin coating of Syncolon SCC-4-030 or equivalent meeting Ford specification WSF-M1C218-B on both ends of shaft and pinion.
2. Install brush holder. Push seal (11A171) onto frame. Apply Syncolon SCC-4-030 or equivalent meeting Ford specification WSF-M1C218-B to bearing bore in brush end plate and bushing and attach to starter frame and magnet.
3. Position starter frame and magnet to drive end housing and install through-bolts. Tighten to 5-10 Nm (45-88 lb-in).
4. Attach positive brush connector to starter solenoid M-terminal. Tighten M-terminal nut to 9-14 Nm (80-123 lb-in).
5. Check that no-load current draw is within specification. Refer to Component Tests in this section.

tomsn048@gmail.com

tomsn048@gmail.com

Bushings



Disassembly

Use a suitable bushing driver to press or tap the bushings out of the housing. Be sure the housing is well supported.

Assembly

1. Immerse new bushings in engine oil (SAE 20) for at least 20 minutes before installation.
2. **NOTE: Do not ream the bushings after installation since the self-lubricating qualities of the bushing may be damaged.**

   Use a suitable bushing driver to press or tap the new bushing into position.

tomsn048@gmail.com

tomsn048@gmail.com

Drive End Housing

Disassembly

1. Remove positive brush connector from M-terminal.
2. Remove starter solenoid screws and starter solenoid (11390).
3. Remove through-bolts and separate drive end housing from starter frame.

Assembly

1. Apply a thin coating of Syncolon SCC-4-030 or equivalent meeting Ford specification WSF-M1C218-B to end of armature shaft and bushing bore in drive end housing.
2. Position drive end housing on starter frame and install through-bolts. Tighten through-bolts to 5-10 Nm (45-88 lb-in).
3. Position starter solenoid on drive end housing and install starter solenoid screws. Tighten starter solenoid screws to 5-10 Nm (45-88 lb-in).
4. Install positive brush connector on M-terminal.

tomsn048@gmail.com

Brush End Plate

Disassembly

1. Remove through-bolts and brush end plate and bushing screws.
2. Remove brush end plate and bushing (11049).

Assembly

1. Apply a thin coating of Syncolon SCC-4-030 or equivalent meeting Ford specification WSF-M1C218-B to end of armature shaft and bushing bore in brush end plate and bushing.
2. Install brush end plate and bushing.
3. Install through-bolts and brush end plate and bushing screws. Tighten through-bolts to 5-10 Nm (45-88 lb-in). Tighten brush end plate and bushing screws to 2-3 Nm (18-26 lb-in).

tomsn048@gmail.com

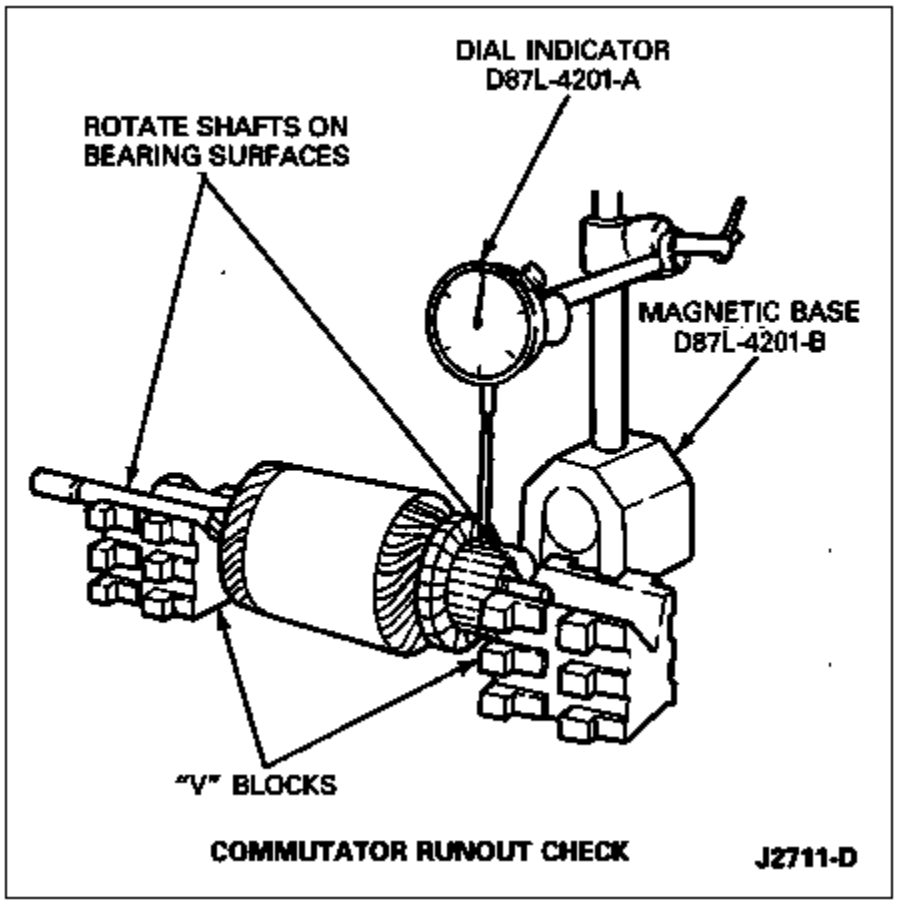
Armature Coil, Starter Motor

CAUTION: Do not wash the starter drive because the solvent will wash out the lubricant causing starter drive to slip. Use a brush or compressed air to clean the starter drive, starter motor armature, brush, and gear assemblies, drive end housing, pole pieces and planet gears. Wash all other parts in solvent and dry.

1. Inspect windings for broken or burned insulation and unwelded or open connections.

2. Check starter motor armature (11005) for open circuits, shorts and grounds. Check for pole rub or rub on magnetic shunts.

3. Check commutator for runout. Inspect starter motor armature shaft and two bearings for scoring and excessive wear with Dial Indicator D87L-4201-A and Magnetic Base D87L-4201-B or equivalents. If commutator is rough, or more than 0.12mm (.005 inch) out of round, it must be replaced.



tomsn048@gmail.com

tomsn048@gmail.com

Bushings

The armature shaft is supported on three sintered bronze bushings installed in the drive end housing, lever housing and brush end plate.

These bushings have a dull finish, as compared to the early-type machined, cast bronze bushings which had a shiny finish.

1. The bushings can be pressed or tapped out of their housing using a suitable puller or driver of the appropriate size. Be sure the housing is well supported.

2. Before pressing the bushing into place, dip it in SAE 20 oil. Also, tangent wicks should be soaked with SAE 20 oil. Insert the wick into place first, and then press in the bushing.

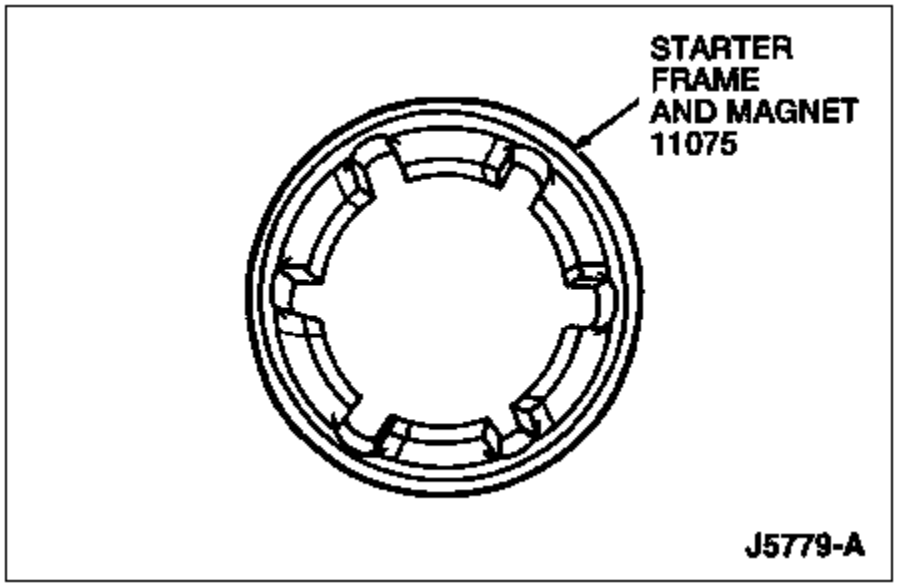
3. DO NOT DRILL, REAM OR MACHINE sintered bushings in any way. These bushings are supplied to size. If drilled or reamed, the ID (inside diameter) will be too large; also, the bushing pores will be sealed over.

It is not necessary to cross-drill a sintered bushing when used with a tangent wick. Because the bushing is so highly porous, oil from the wick touching the outside bushing surface will bleed through and lubricate the shaft.

4. The lever housing bushing prevents starter motor armature deflection during cranking. As compared to end frame bushings, the clearance between the lever housing bushing and shaft is large and the clearance provides a loose fit when assembled.

tomsn048@gmail.com

Starter Frame and Magnet



Check the starter frame and magnet (11075) for visible damage and replace as necessary.

tomsn048@gmail.com

Brush and Brush Holder

1. Check brushes for free movement in brush holders. Inspect brushes for excessive wear. Where brush leads are insulated, make sure insulation is not burned or worn.

2. The brushes should be well seated to commutator; that is, contacting commutator over at least 60 percent of brush contact area. If not, fit brushes to commutator with fine sandpaper until desired seating area is obtained. Do only one brush at a time. Clean brushes and commutator with compressed air. Make sure no abrasive particles from sandpaper are embedded in the contact area of brushes.

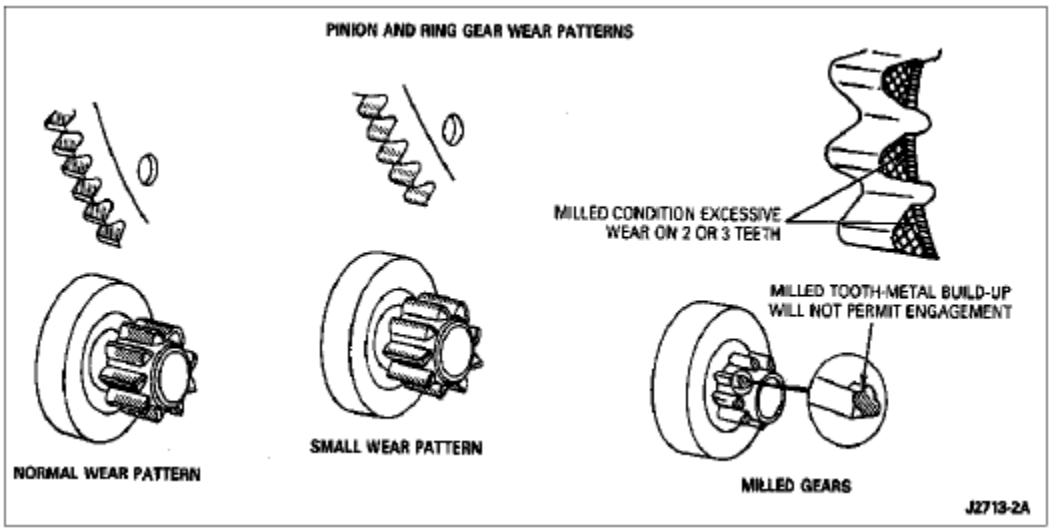
3. New brushes are not ground to fit the commutator; therefore, they must be seated as described.

4. Mark each brush and brush holder with which it was seated to permit assembly in the same position.

tomsn048@gmail.com

Starter Drive/Flywheel Ring Gear Inspection

Inspect the wear pattern on the starter drive (11350) and the flywheel ring gear (6384).



tomsn048@gmail.com

SPECIFICATIONS

STARTER SPECIFICATIONS

Starter Motor				Load		Starter Brushes

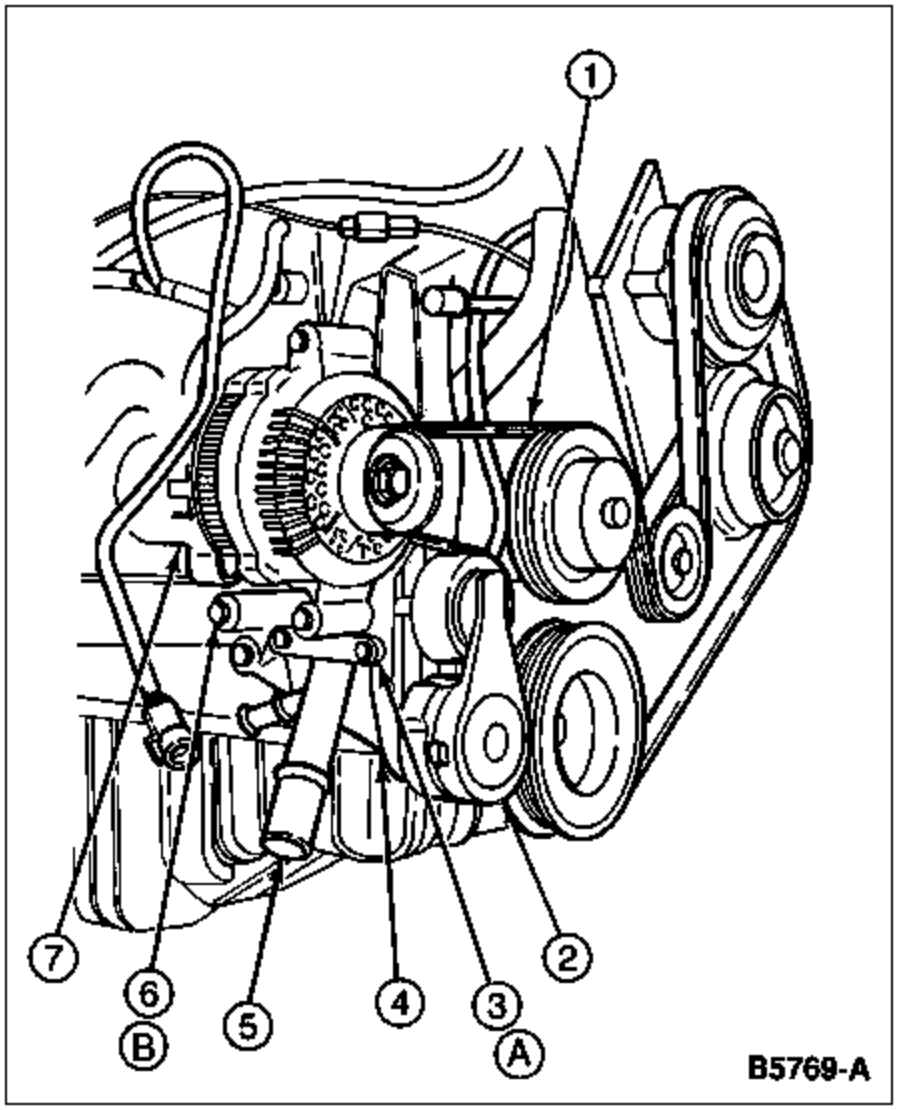
Crankshaft Position Sensor

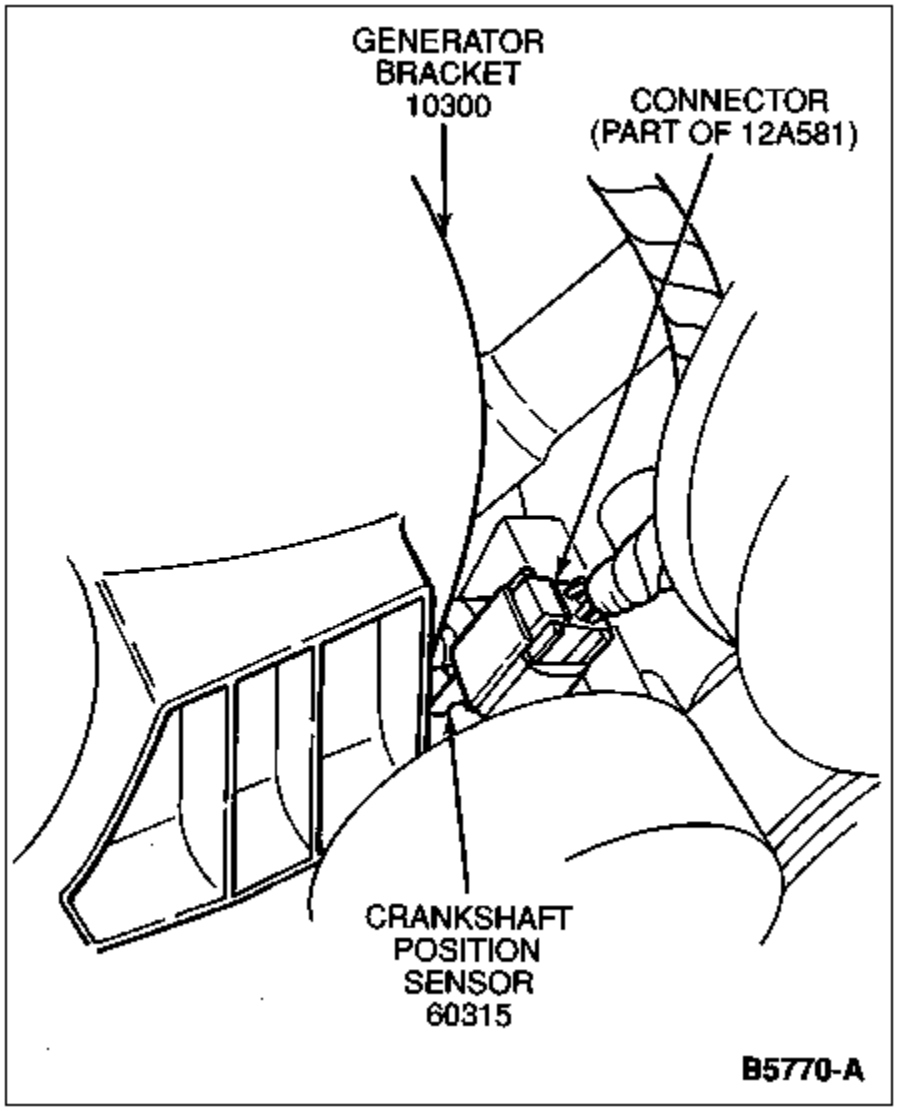
Removal

1. Disconnect battery ground cable (14301).
2. Drain cooling system.
3. Using flex handle, rotate drive belt tensioner (6B209) and remove drive belt (8620).
4. Disconnect generator connectors. Remove three bolts and generator (GEN) (10300).
5. Remove lower radiator hose (8286) and heater water hose (18472) from water pump inlet tube (8290).
6. Remove two bolts and water pump inlet tube. Remove O-ring from water pump inlet tube.

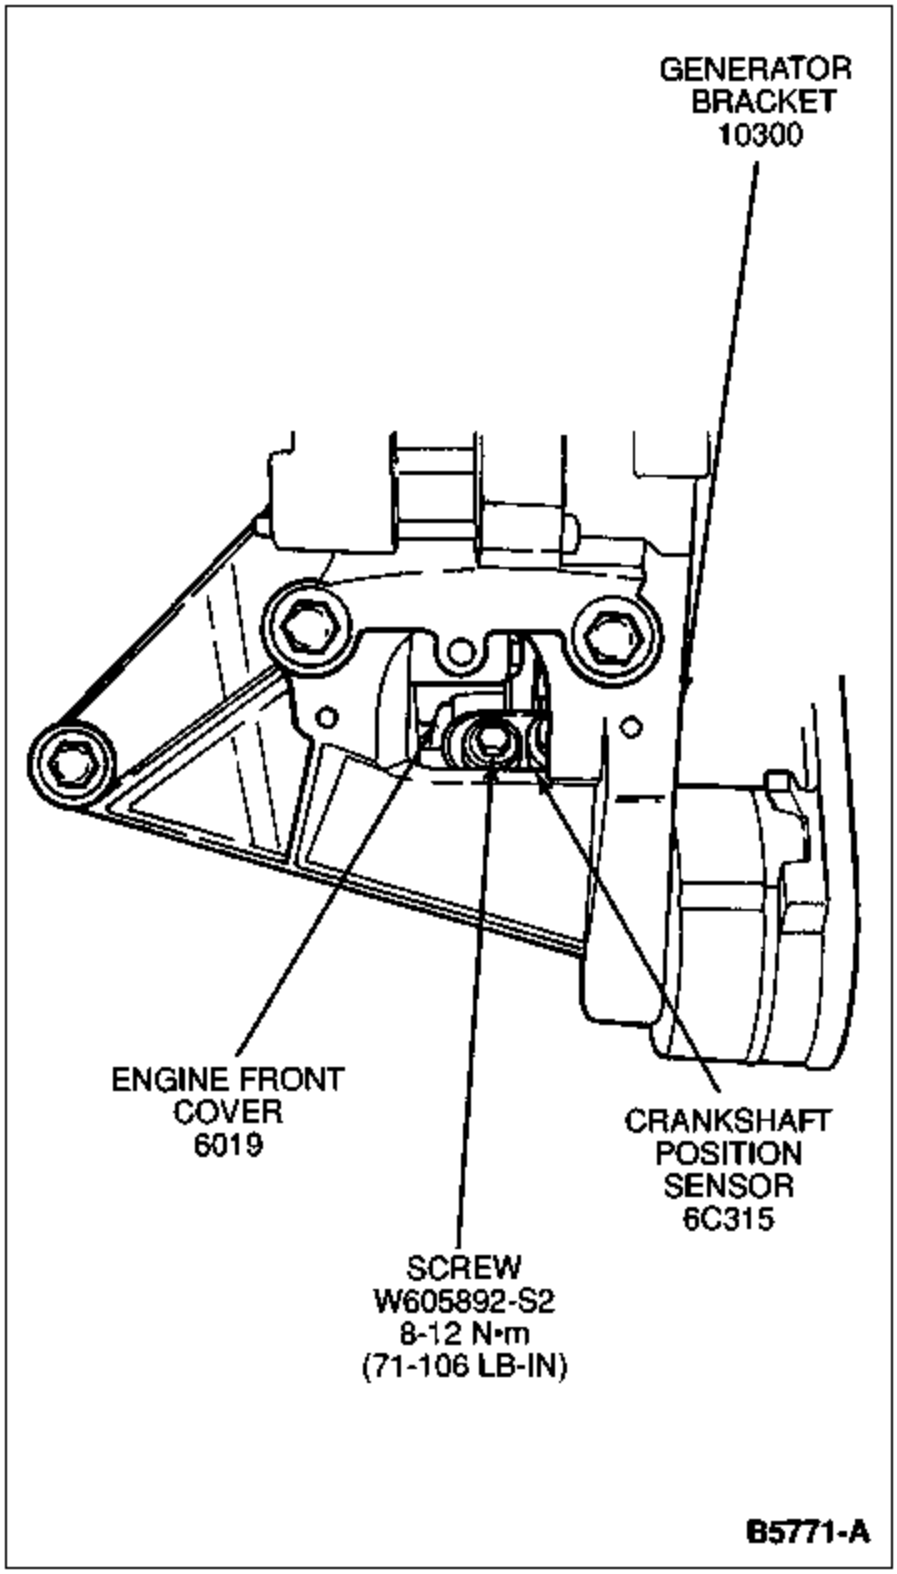


Item	Part Number	Description
1	8620	Drive Belt
2	6B209	Drive Belt Tensioner
3	N60676-S2	Screw, M6-1 x 22.5
4	10153	Generator Mounting Bracket
5	8290	Water Pump Inlet Tube
6	N606068-S	Bolt, M10-1.5 x 80
7	10300	Generator
A	—	Tighten to 9-12 Nm (78-107 Lb-In)
B	—	Tighten to 41-54 Nm (30-40 Lb-Ft)

7. Disconnect crankshaft position sensor connector.



8. Remove crankshaft position sensor retaining screw.
9. Carefully pry crankshaft position sensor (CKP sensor) (6C315) from engine front cover (6019).



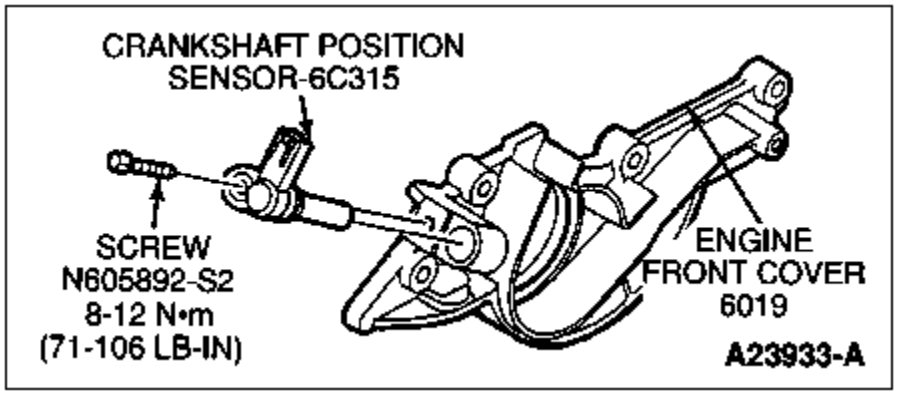
Installation

1. **NOTE: Engine front cover design precisely locates crankshaft position sensor so no**

adjustment is required.

Install crankshaft position sensor.

2. Install screw and tighten to 8-12 Nm (71-106 lb-in).



3. Connect crankshaft position sensor.
4. Install new O-ring on water pump inlet tube.
5. Install water pump inlet tube into water pump (8501).
6. Install water pump inlet tube-to-generator bracket bolts and tighten to 9-12 Nm (79-107 lb-in).
7. Install lower radiator hose and heater water hose on water pump inlet tube.
8. Install generator to generator mounting bracket (10153) and hand-start generator-to-bracket bolts. Alternately tighten bolts to 41-54 Nm (30-40 lb-ft).
9. Connect generator connectors.
10. Position drive belt. Rotate drive belt tensioner, position drive belt and rest tensioner pulley on belt.
11. **NOTE: When the battery (10653) has been disconnected and reconnected, some abnormal drive symptoms may occur while the powertrain control module (PCM) (12A650) relearns its adaptive strategy. The vehicle may need to be driven 16 km (10 miles) or more to relearn the strategy.**

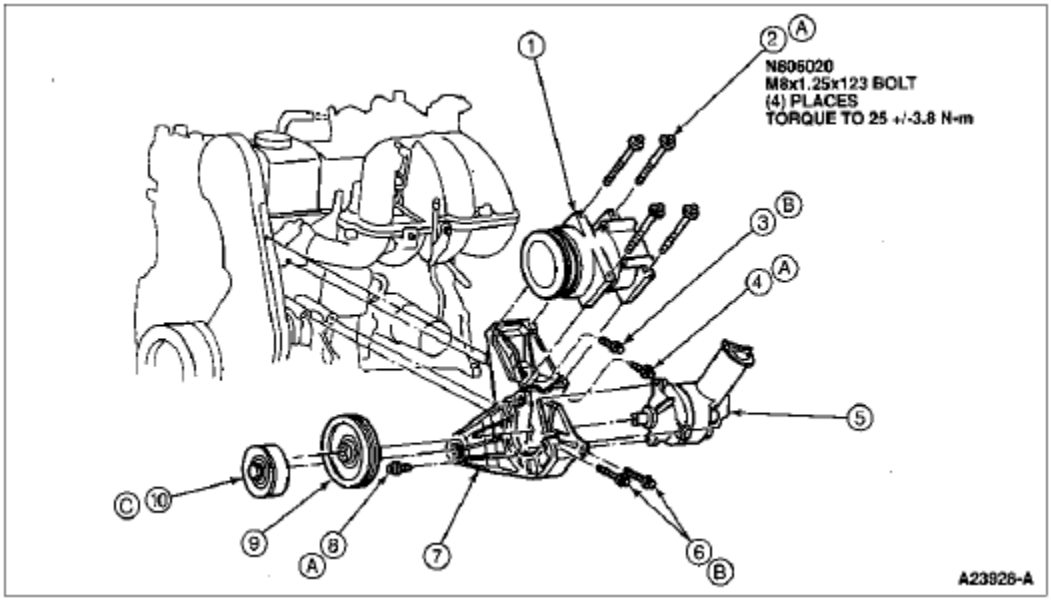
    Connect battery ground cable.
12. Fill cooling system as outlined in Section 03-03 .

Camshaft Position Sensor

Removal

1. Discharge air conditioner and recover refrigerant as outlined in Section 12-00 .
2. Disconnect battery ground cable (14301).
3. Using 3/8-inch drive flex-head handle, rotate drive belt tensioner (6B209) and remove drive belt (8620).
4. Remove four bolts securing A/C compressor (19703) to A/C compressor mounting bracket (2882) and set aside.
5. Remove three bolts and A/C compressor mounting bracket with attached power steering pump (3A674) and set aside.

Power Steering Pump Bracket

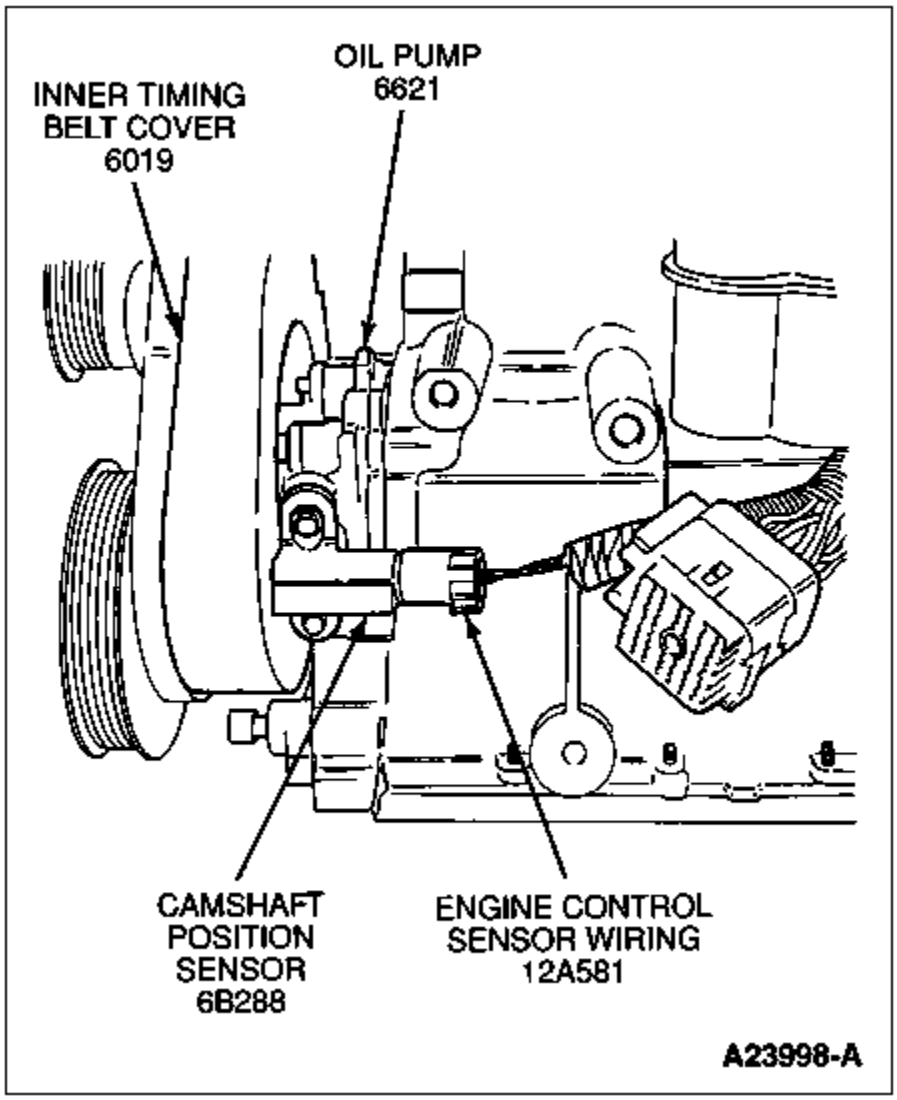


Item	Part Number	Description
1	19703	A/C Compressor
2	N806020	Bolt, M8-1.25 x 123
3	N606572	Bolt, M10-1.5 x 123
4	N606051	Bolt, M8-1.25 x 100
5	3A674	Power Steering Pump

6	N606068-S309	Bolt, M10-1.5 x 80
7	2882	A/C Compressor Mounting Bracket
8	N800199	Bolt, M10-1.5 x 33
9	3A733	Power Steering Pump Pulley
10	3F671	Power Steering Belt Idler Support
A	—	Tighten to 22-28 Nm (15-21 Lb-Ft)
B	—	Tighten to 41-59 Nm (29-40 Lb-Ft)
C	—	Tighten to 53-71 Nm (39-53 Lb-Ft)

6. Disconnect engine control sensor wiring (12A581) from camshaft position sensor (CMP sensor) (6B288).

7. Remove two bolts and camshaft position sensor from oil pump (6600).



Installation

1. Install camshaft position sensor on oil pump. Tighten two screws to 5-7 Nm (45-61 lb-in).
2. Connect engine control sensor wiring to camshaft position sensor.
3. Install A/C compressor mounting bracket with assembled power steering pump and hand start upper front bolt (tight hole) then upper rear bolt (slot hole).
4. Tighten upper front bolt to 40-54 Nm (30-40 lb-ft).
5. Install and tighten lower front bolt to 40-54 Nm (30-40 lb-ft).
6. Tighten upper rear bolt to 22-28 Nm (16-21 lb-ft).
7. Install and tighten lower rear bolt to 40-54 Nm (30-40 lb-ft).
8. Install A/C compressor and hand-start upper front bolt.

9. Install and tighten lower front compressor-to-bracket bolt to 22-28 Nm (16-21 lb-ft).

10. Install and tighten upper rear bolt to 22-28 Nm (16-21 lb-ft).

11. Install and tighten lower rear compressor-to-bracket bolt to 22-28 Nm (16-21 lb-ft).

12. Position drive belt. Using flex-head handle, rotate drive belt tensioner and put drive belt in place. Rest tensioner pulley on drive belt to tension.

13. **NOTE: When the battery (10653) has been disconnected and reconnected, some abnormal drive symptoms may occur while the powertrain control module (PCM) (12A650) relearns its adaptive strategy. The vehicle may need to be driven 16 km (10 miles) or more to relearn the strategy.**

    Connect battery ground cable.

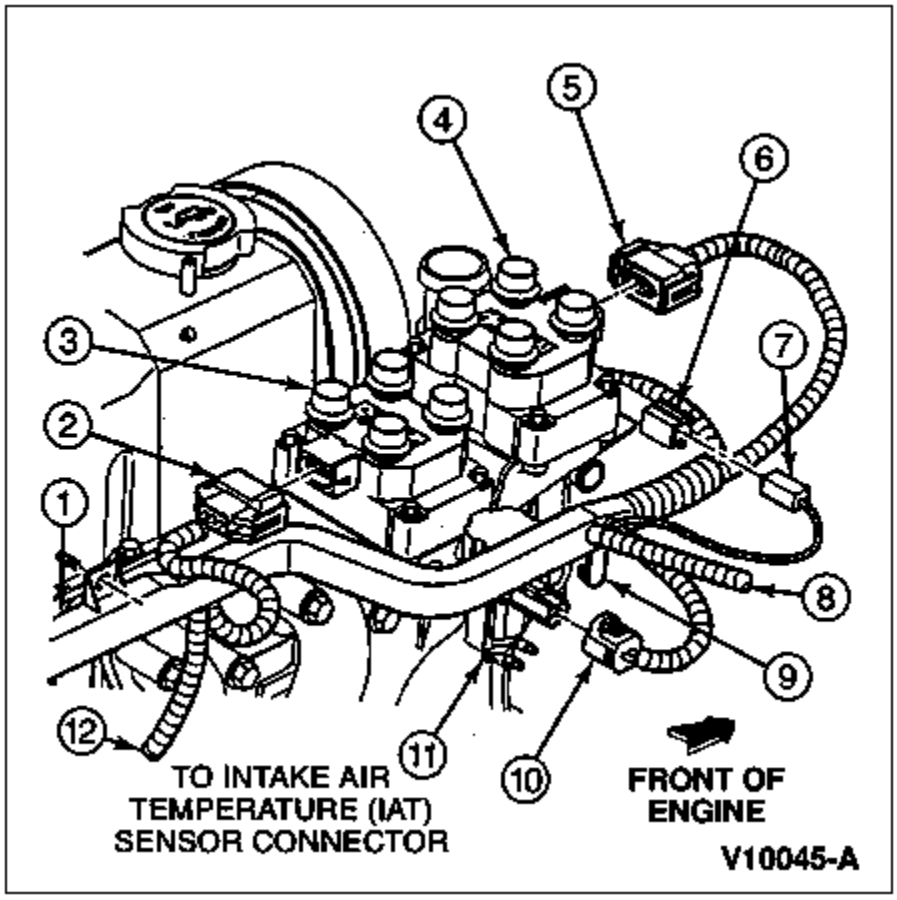
14. Recharge air conditioning system as outlined in Section 12-00 .

Ignition Coil Pack

Removal

1. To disconnect the spark plug wire set (12259) from the ignition coils, squeeze the locking tabs on the coil retainer and pull upward on the boot with a slight side-to-side twist. Do not pull on the spark plug wire set.

2. Disconnect the engine control sensor wiring (12A581) electrical connector from the ignition coil (12029).



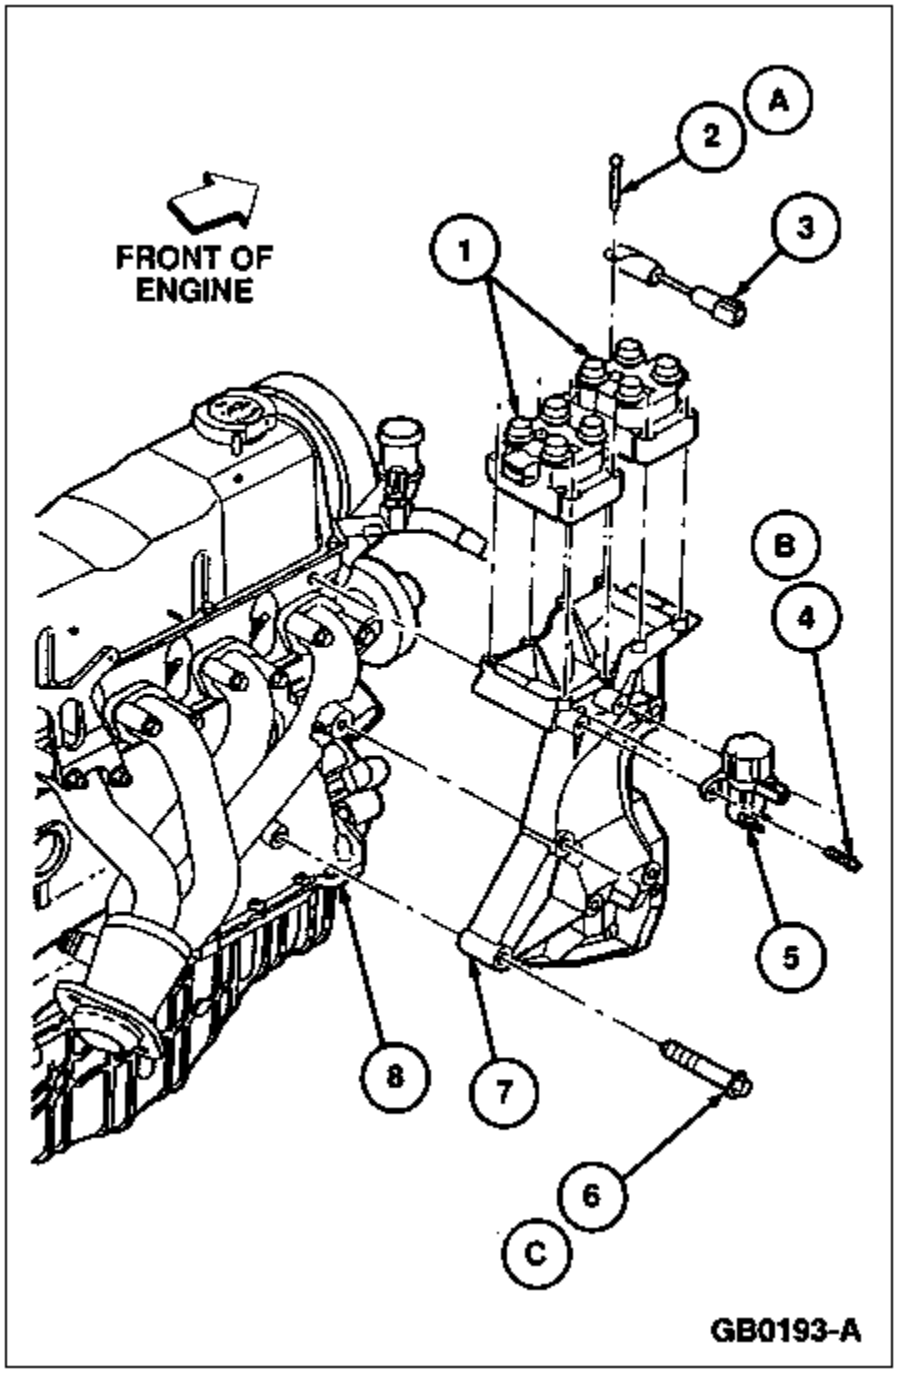
Item	Part Number	Description
1	12A581	Engine Control Sensor Wiring
2	—	Rear Ignition Coil Connector (Part of 12A581)
3	12029	Ignition Coil (Rear)

4	12029	Ignition Coil (Front)
5	—	Front Ignition Coil Connector (Part of 12A581)
6	18801	Radio Ignition Interference Capacitor
7	—	Radio Capacitor Connector (Part of 12A581)
8	—	Branch to Mass Airflow Sensor (Part of 12A581)
9	—	Retainer (Part of 12A581)
10	—	EGR Vacuum Regulator Control Connector (Part of 12A581)
11	9J549	EGR Vacuum Regulator Control
12	—	Branch to Intake Air Temperature Sensor (Part of 12A581)

3. Remove the four ignition coil retaining screws.
4. Remove the ignition coil.

Installation

1. Install the ignition coil and the four ignition coil pack retaining screws on generator mounting bracket (10153).
2. Tighten the four ignition coil retaining screws to 4.5-7.0 Nm (40-62 lb-in).
3. Connect the engine control sensor wiring electrical connector to the ignition coil.
4. To connect the spark plug wire set on the ignition coils in their proper locations, squeeze the locking tabs on the coil retainer and push downward on the boot with a slight side-to-side twist. Each of the terminals is identified on the ignition coil. The firing order of each coil is 1-3-4-2. Check that each of the spark plug wires is fully seated and both locking tabs are engaged.



Item	Part Number	Description
1	12029	Ignition Coils
2	N606502-S36	Bolt, M5-0.8 x 37
3	18801	Radio Ignition Interference Capacitor
4	N606676-S309	Screw, M6-1 x 20
5	9J459	EGR Vacuum Regulator Solenoid
6	N606064-S309	Bolt, M10-1.5 x 60

7	10153	Generator Mounting Bracket
8	6010	Cylinder Blocks
A	—	Tighten to 5-7 Nm (44-62 Lb-In)
B	—	Tighten to 8-12 Nm (71-106 Lb-In)
C	—	Tighten According to Instruction in Text

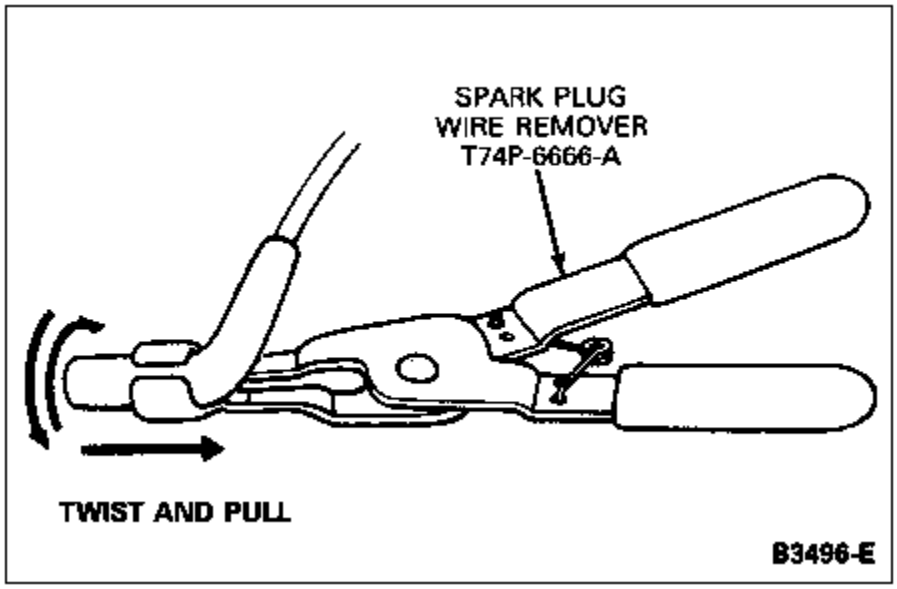
Ignition Wires

SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
Spark Plug Wire Remover	T74P-6666-A

Removal

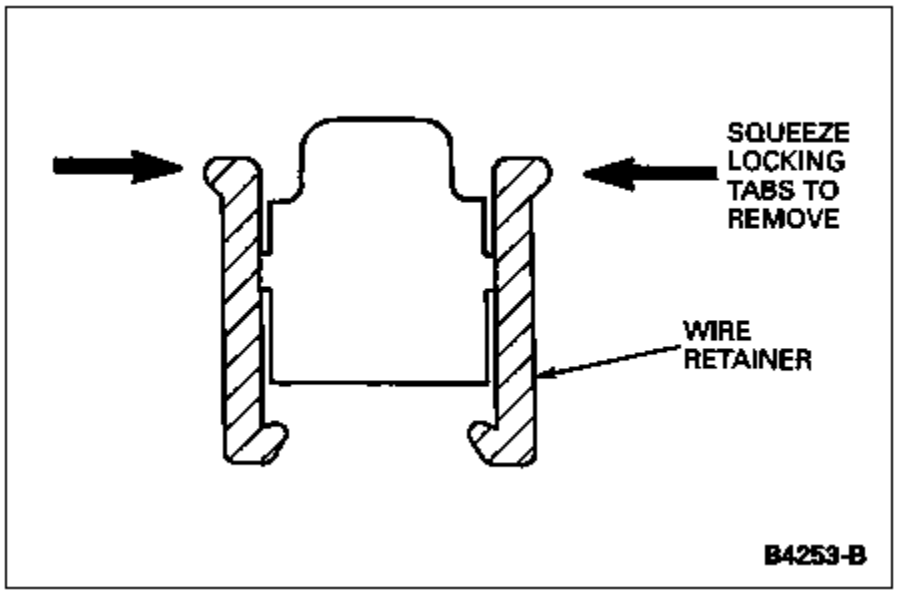
1. Remove spark plug wires from spark plugs with Spark Plug Wire Remover T74P-6666-A, pulling outward on the boot with a slight side-to-side twist. Do not pull on the spark plug wire set (12259).



2. Squeeze the locking tabs on the coil retainer and pull upward on the boot with a slight side-to-side twist to disconnect the spark plug wire set from the ignition coils. Do not pull on the spark plug wire set.

Installation

1. Apply an even coating of Silicone Dielectric Compound WA-10, D7AZ-19A331-A or equivalent meeting Ford specification ESE-M1C171-A to the entire interior surface of the spark plug boot.



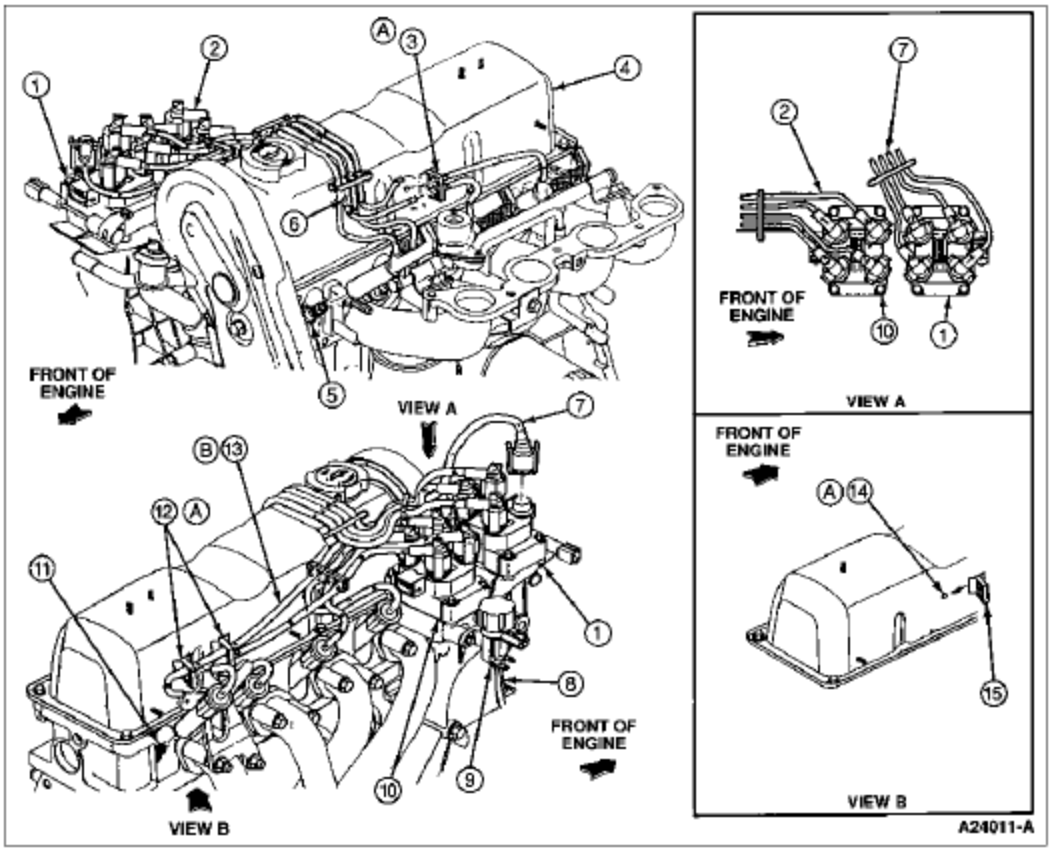
2. Squeeze locking tabs on coil retainer and push down on boot with a slight side-to-side twist to connect spark plug wire set on the ignition coils. Each of the terminals is identified on the ignition coils (12029). The firing order of each coil is 1-3-4-2. Check that each of the spark plug wires is fully seated and both locking tabs are engaged.

3. Remove the ignition wire separator (12297) from the spark plug wire set and reinstall it in the same relative position on the new set.

4. Route the spark plug wire set toward the spark plugs.

5. Connect each spark plug wire set on the proper spark plug.

Spark Plug Wires and Firing Order, 2.3L Engine



Item	Part Number	Description
1	12029	Ignition Coil
2	12280	Ignition Wire and Bracket (Left)
3	—	Retainer (Part of 12281)
4	6582	Valve Cover
5	12405	Spark Plug (LH)
6	—	T-Stud (Part of 6582)
7	12281	Ignition Wire and Bracket (Right)
8	10153	Generator Mounting Bracket
9	9J459	EGR Vacuum Regulator Solenoid
10	12029	Ignition Coil
11	12405	Spark Plug (RH)
12	—	Retainer (Part of 12280)
13	—	"R" (Part of 12280)
14	—	T-Stud (Part of 6582)
15	—	Retainer (Part of 12280)
A	—	Retainer Push onto T-Studs (Part of 6582)
B	—	"R" Indicates Right Side

Radio Ignition Interference Capacitor

Removal

1. Make sure ignition switch (11572) is turned off.
2. Disconnect radio ignition interference capacitor (18801) from engine control sensor wiring (12A581).
3. Remove left front coil screw and radio ignition interference capacitor.

Installation

To install, reverse removal procedures.

Tighten coil to generator bracket screw to 5-7 Nm (44-61 lb-in).

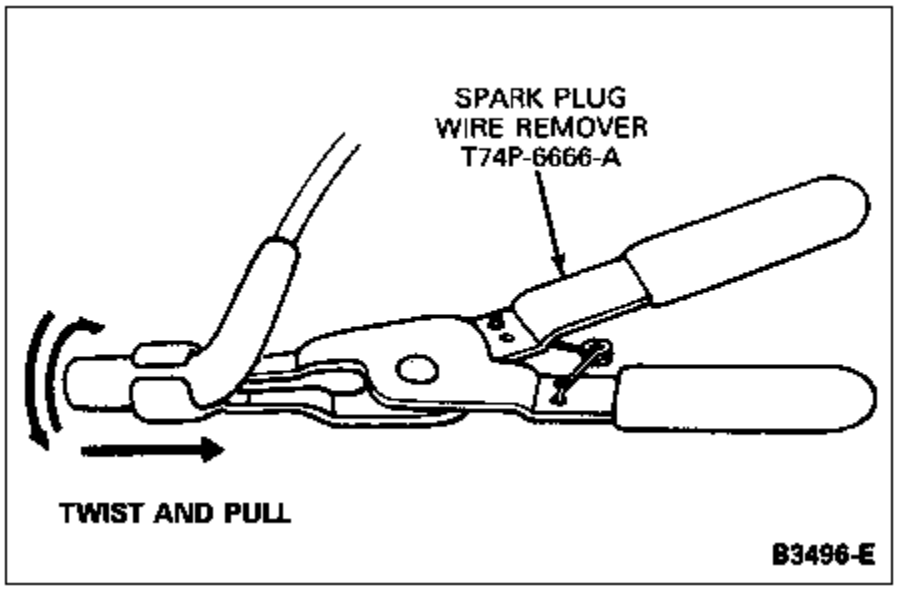
Spark Plugs

NOTE: Refer to the Spark Plug Inspection Chart to determine the condition of the spark plugs.

SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
Spark Plug Wire Remover	T74P-6666-A

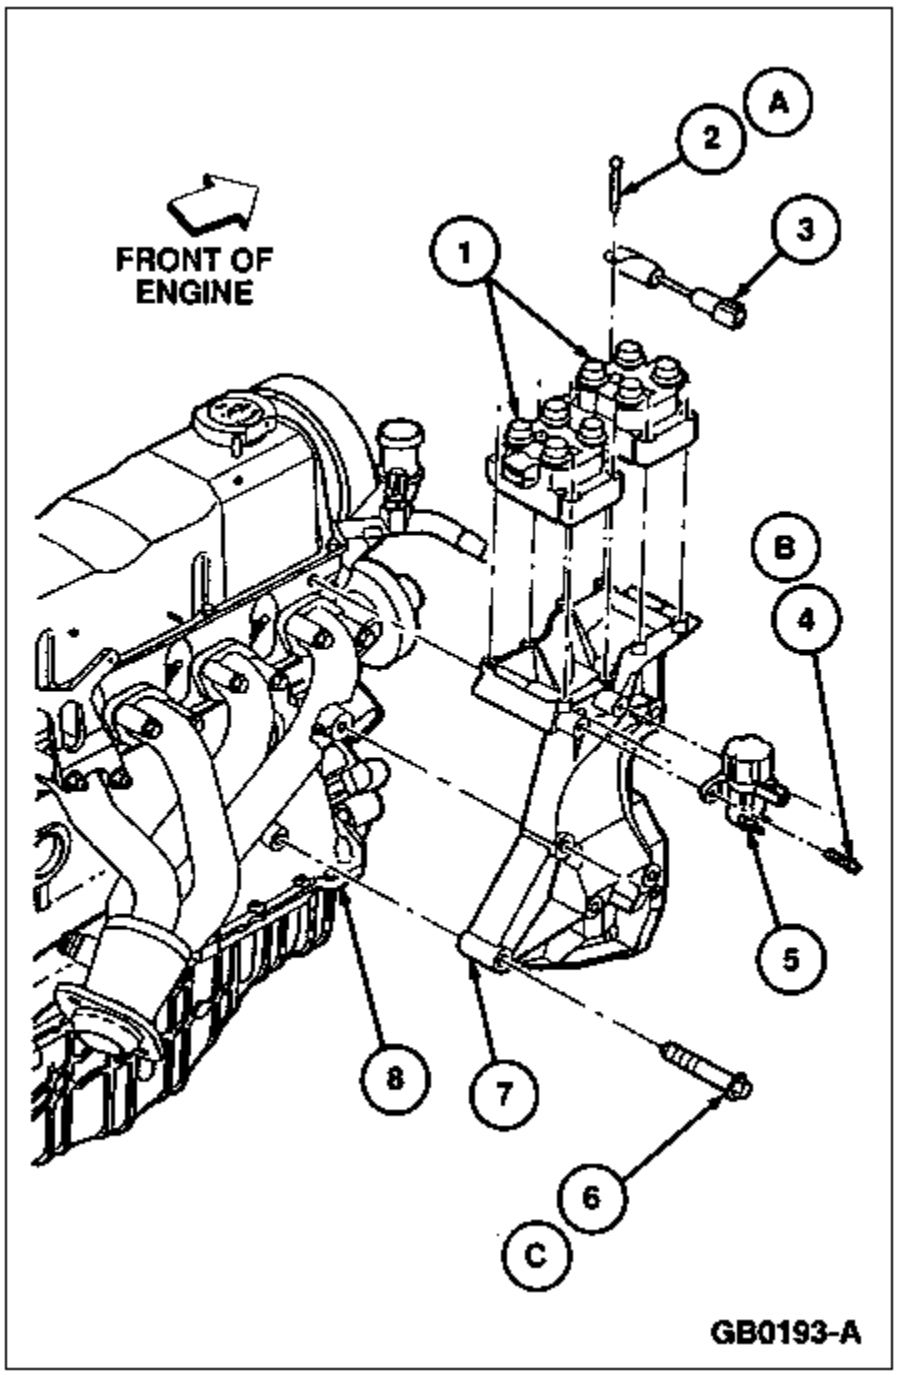
Removal



1. Remove spark plug wires from spark plugs with Spark Plug Wire Remover T74P-6666-A, pulling outward on the boot with a slight side-to-side twist. Do not pull on the spark plug wire set (12259).
2. Loosen spark plugs (12405) and remove any dirt or foreign material from spark plug areas of cylinder head (6049) with compressed air.
3. Remove spark plugs.

Installation

1. Inspect and adjust spark plugs. Refer to Adjustments in this section.
2. Install spark plugs.
3. Tighten spark plugs to 9-20 Nm (7-15 lb-ft).
4. Connect spark plug wires to spark plugs.



Item	Part Number	Description
1	12029	Ignition Coils
2	N606502-S36	Bolt, M5-0.8 x 37
3	18801	Radio Ignition Interference Capacitor
4	N606676-S309	Screw, M6-1 x 20
5	9J459	EGR Vacuum Regulator Solenoid
6	N606064-S309	Bolt, M10-1.5 x 60
7	10153	Generator Mounting Bracket
8	6010	Cylinder Blocks
A	—	Tighten to 5-7 Nm (45-61 Lb-In)
B	—	Tighten to 8-12 Nm (70-106 Lb-In)
C	—	Tighten According to Instruction in Text

Spark Plugs

Using a suitable spark plug gap tool, adjust spark plug gap to 1.07-1.17mm (0.042-0.046 in.).

Ignition Timing

Base ignition timing is preset at 10 degrees ± 2 degrees BTDC, and is **not adjustable** .

SPECIFICATIONS

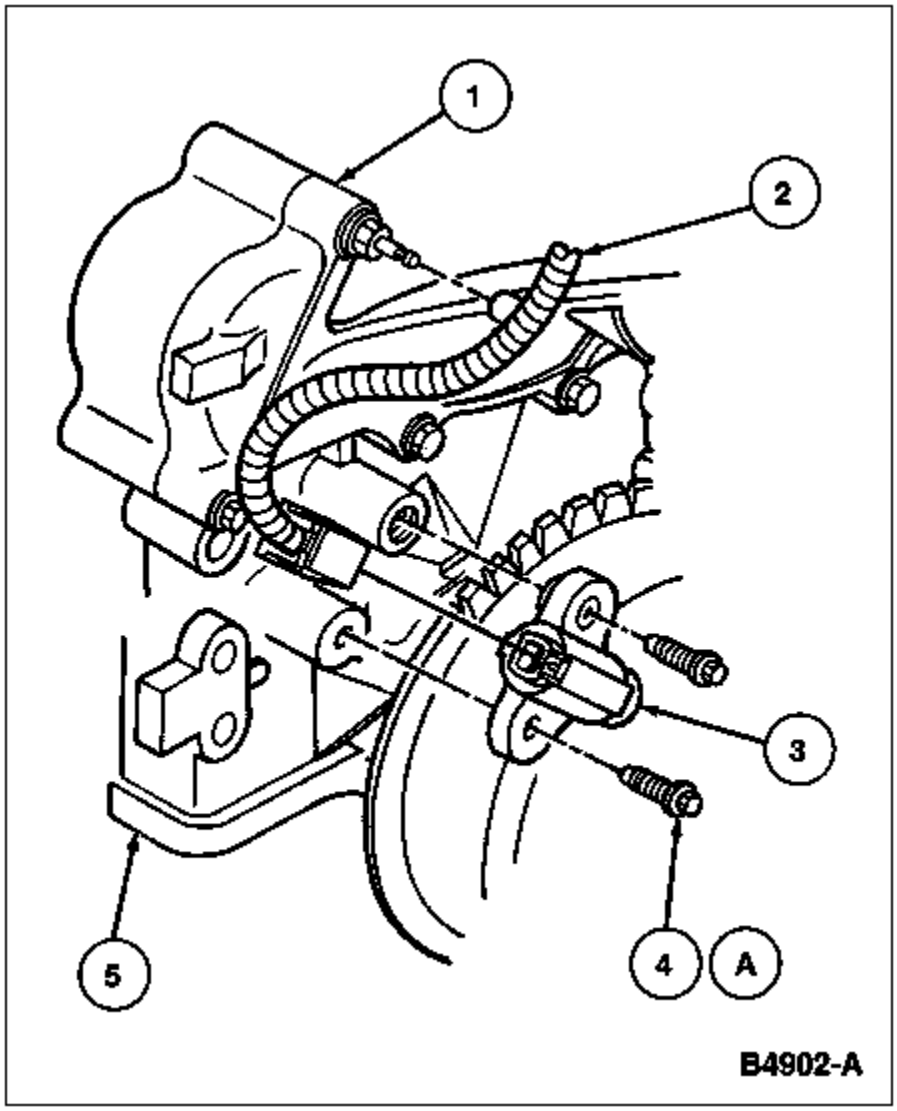
IGNITION SYSTEM SPECIFICATIONS

Firing Order	Ignition Timing	Plug Type	Plug Gap
1-3-4-2	10° ± 2° Non- Adjustable BTDC	AWSF-32F	1.07-1.17mm (.042-.046 In.)

TORQUE SPECIFICATIONS

Description	Nm	Lb-Ft	Lb-In
Spark Plugs	9-20	7-15	—
Coil Mounting Screws	5-7	—	44-62
Crankshaft Hub Bolt	125-165	93-121	—
Crankshaft Position Sensor	8-12	—	71-106

Crankshaft Position Sensor



Item	Part Number	Description
1	8501	Water Pump
2	9D930	Fuel Charging Wiring
3	6C315	Crankshaft Position Sensor
4	N606500-S8 (2 Req'd)	Crankshaft Position Sensor Bolt
5	6019	Engine Front Cover
A	—	Tighten to 5-7 Nm

		(45-61 Lb-In)

Removal

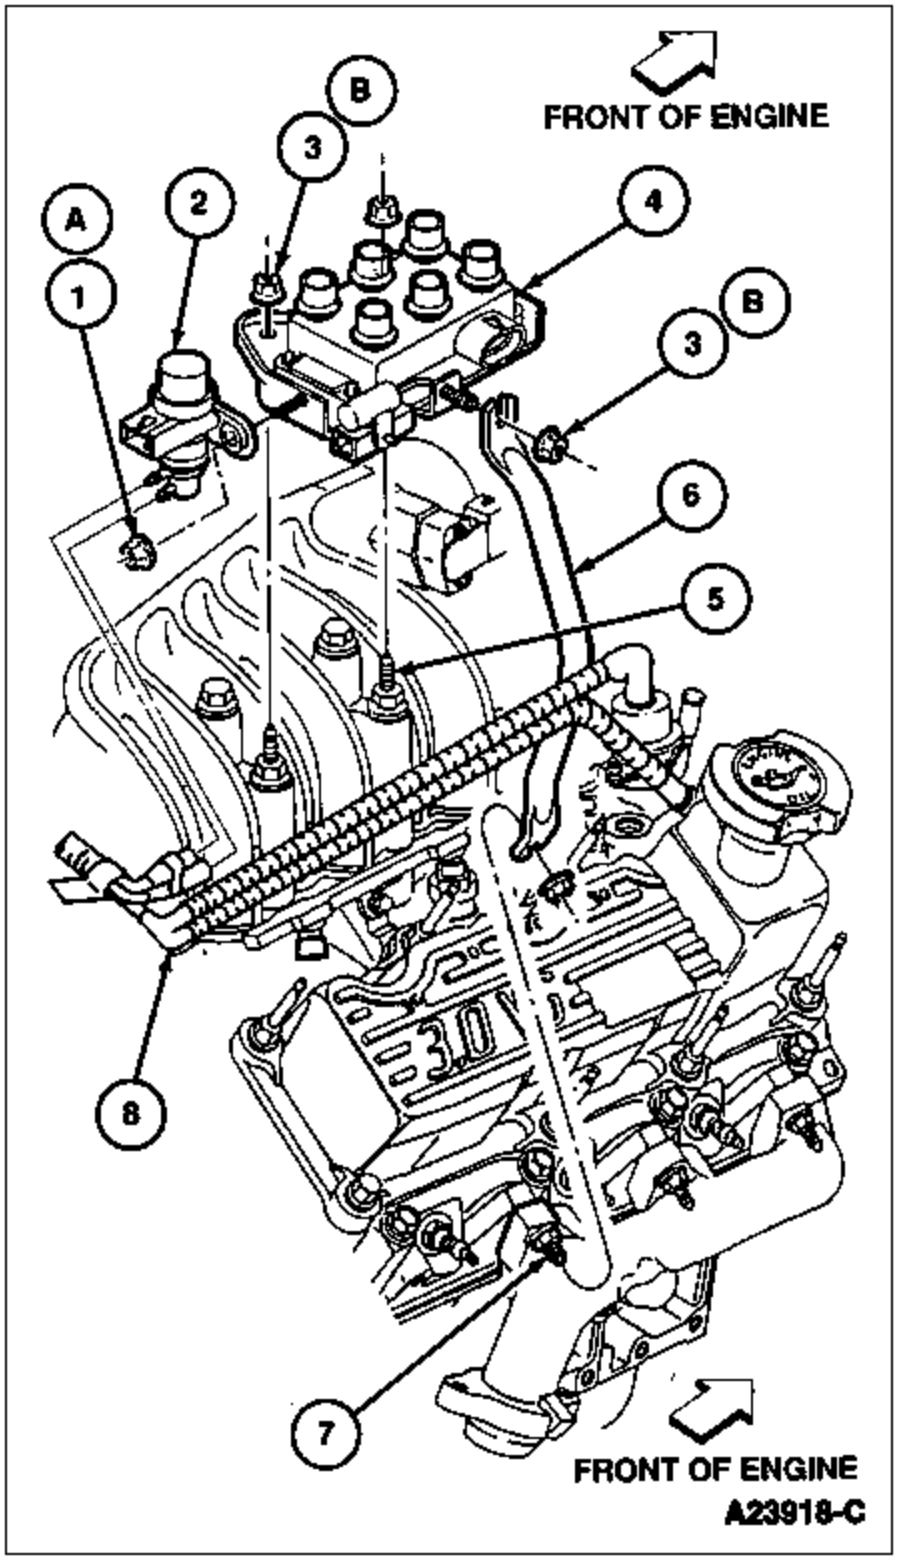
1. Disconnect battery ground cable (14301).
2. Raise and support the vehicle.
3. Disconnect crankshaft position sensor electrical connector from the crankshaft position sensor (CKP sensor) (6C315).
4. Remove CKP sensor bolts and remove crankshaft position sensor.

Installation

1. Position crankshaft position sensor and install CKP sensor bolts. Tighten to 5-7 Nm (45-61 lb-in).
2. Properly route engine fuel charging wiring (9D930) and connect CKP sensor electrical connector to crankshaft position sensor.
3. Lower the vehicle.
4. **NOTE: When battery voltage is removed from the powertrain control module (PCM) (12A650), all learned values will be cleared and reset to predetermined values. When battery voltage is restored to the PCM, the vehicle may exhibit certain driveability concerns. It will be necessary to drive the vehicle to allow the PCM to relearn values for optimum driveability and performance.**

   Connect battery ground cable.

Ignition Coil



Item	Part Number	Description
1	—	EGR Vacuum Regulator Solenoid Nuts
2	9J459	EGR Vacuum Regulator Solenoid

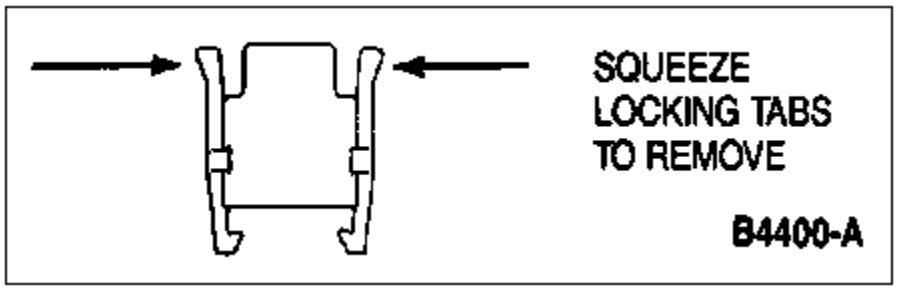
3	—	Ignition Coil and Bracket Assembly Nut
4	12A310	Ignition Coil and Bracket Assembly
5	—	Throttle Body Stud
6	12N004	Ignition Coil Mounting Bracket
7	—	Exhaust Manifold Stud
8	—	Emission Vacuum Control Connector Assembly
A	—	Tighten to 8-12 Nm (71-106 Lb-In)
B	—	Tighten to 16-20 Nm (12-14 Lb-Ft)

Removal

1. Disconnect fuel charging wiring electrical connectors from ignition coil (12029) and radio ignition interference capacitor (18801).

2. **CAUTION: Do not pull on the spark plug wire as it may separate from the spark plug wire connector inside the spark plug wire boot.**

   Disconnect spark plug wires by squeezing locking tabs and twisting while pulling upward.



3. Remove two ignition coil nuts and top ignition coil mounting bracket nut. Remove ignition coil and radio ignition interference capacitor. Save radio ignition interference capacitor for installation with new ignition coil.

4. Remove EGR vacuum regulator solenoid nuts EGR vacuum regulator solenoid (9J459).

Installation

1. Position the EGR vacuum regulator solenoid and install the nuts. Install EGR vacuum regulator bracket (9J472) nut. Tighten EGR vacuum regulator solenoid nuts to 8-12 Nm (6-8 lb-ft).

2. Position ignition coil and radio ignition interference capacitor to ignition coil mounting bracket.

3. Install two ignition coil nuts and top ignition coil mounting bracket nut. Tighten to 16-20 Nm (12-14 lb-ft).

4. Apply Silicone and Dielectric Compound D7AZ-19331-A (Motorcraft WA-10), or equivalent meeting Ford specification ESA-M1C171-A to all spark plug wire boots.

5. Install each spark plug wire connector to the proper terminal on the ignition coil. Make sure spark plug wire boots are fully seated.

6. Connect ignition coil and radio ignition interference capacitor electrical connectors.

Bracket, Ignition Coil

Removal

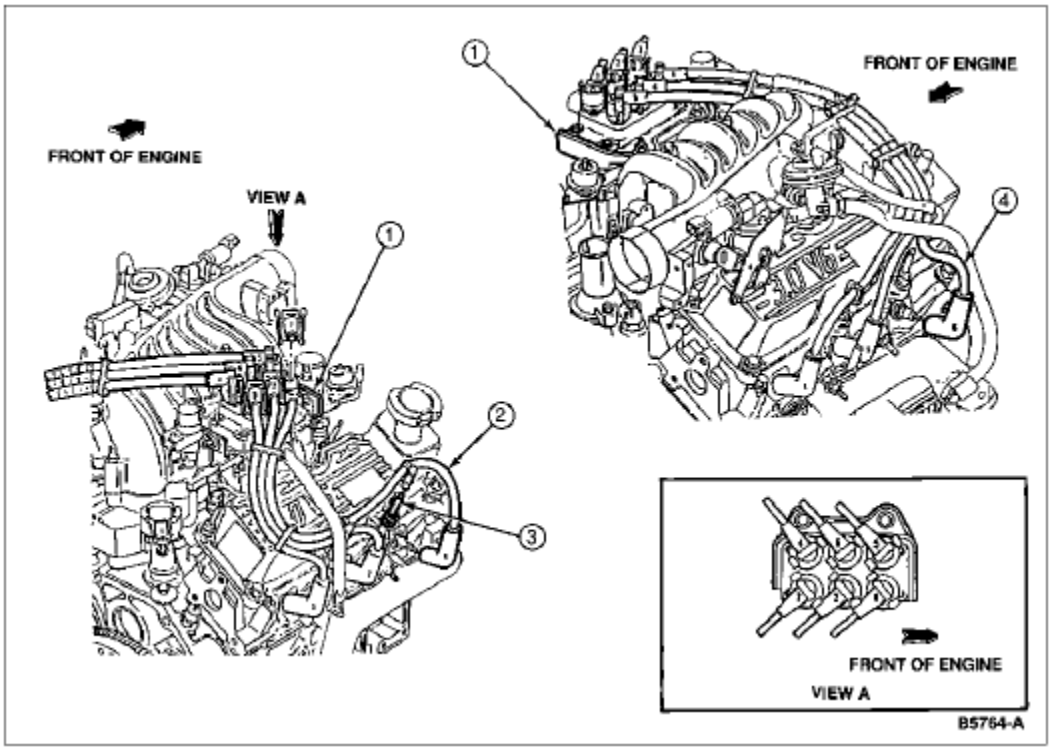
Remove two ignition coil mounting bracket nuts and ignition coil mounting bracket.

Installation

Position the ignition coil mounting bracket on the ignition coil (12029) and the exhaust manifold stud. Install two ignition coil mounting bracket nuts. Tighten to 16-20 Nm (12-14 lb-ft).

Spark Plug Wires

Spark Plug Wires



Item	Part Number	Description
1	12029	Ignition Coil
2	12280	Spark Plug Wire (RH)
3	—	Valve Cover Bolt or Stud
4	12281	Spark Plug Wire (LH)

SPECIAL SERVICE TOOL(S) REQUIRED

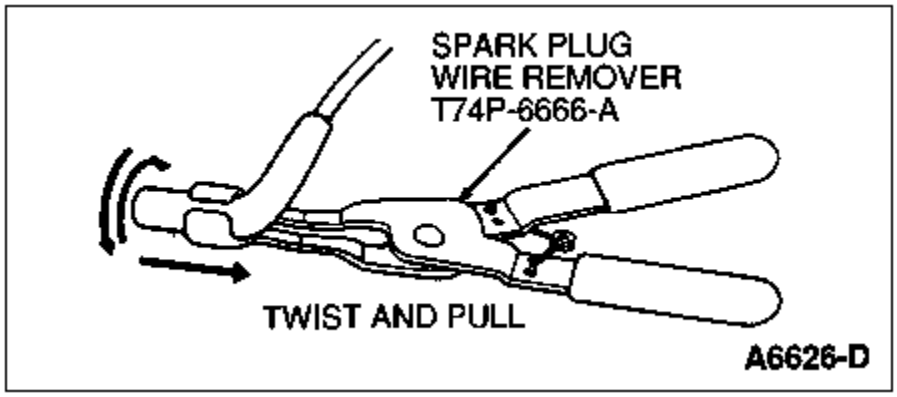
Description	Tool Number
Spark Plug Wire Remover	T74P-6666-A

Removal

1. Remove the inside engine cover.

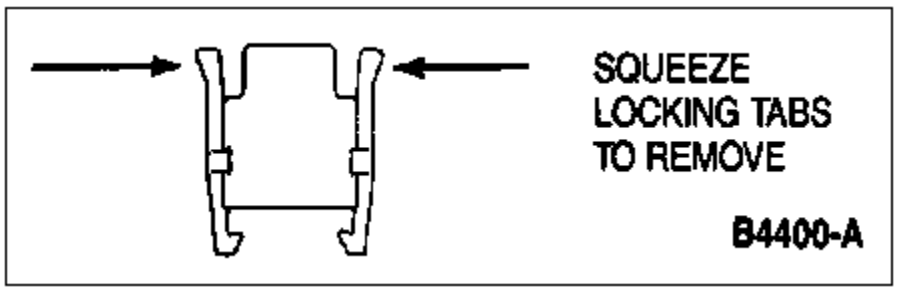
2. **CAUTION: Do not pull on the spark plug wire as it may separate from the spark plug wire connector inside the spark plug wire boot.**

   When removing spark plug wires from spark plugs (12405), use Spark Plug Wire Remover T74P-6666-A. Grasp and twist the spark plug wire boot back and forth on the spark plug insulator to release the connector.



3. **CAUTION: Do not pull on the spark plug wire as it may separate from the spark plug wire connector inside the spark plug wire boot.**

   Disconnect the spark plug wire from the ignition coil (12029) by squeezing the locking tabs and twisting while pulling upward.



4. Open spark plug wire separators and remove spark plug wire.

Installation

CAUTION: Proper installation of spark plug wires is critical to vehicle operation. If one spark plug wire is not properly installed on spark plug or ignition coil, both spark plugs connected to that

segment of the ignition coil may not fire under load.

1. **NOTE: When a spark plug wire is removed for any reason from a spark plug or ignition coil, or a new spark plug wire is installed, Silicone and Dielectric Compound D7AZ-19331-A (Motorcraft WA-10), or equivalent meeting Ford specification ESA-M1C171-A must be applied to the spark plug wire boot prior to installation.**

   Use a small, clean tool to coat the entire interior surface of the boot with Silicone Dielectric Compound D7AZ-19331-A (Motorcraft WA-10), or equivalent meeting Ford specification ESA-M1C171-A.

2. Install each spark plug wire to the proper terminal on the ignition coil. The terminals on the ignition coil and the spark plug wire are numbered. Make sure the spark plug wire boots are fully seated and that both spark plug wire boot locking tabs are engaged.

3. Route the spark plug wires.

4. Connect the spark plug wires to the spark plugs.

5. Install the inside engine cover.

Radio Ignition Interference Capacitor

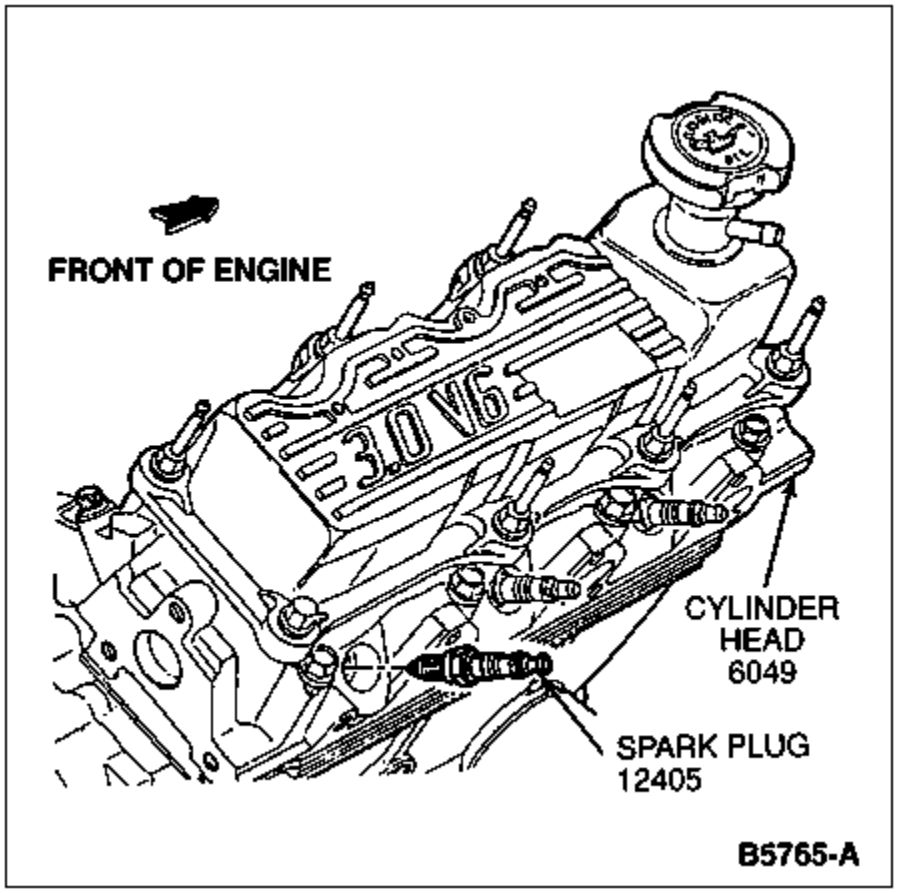
Removal

1. Disconnect engine control sensor wiring connector from radio ignition interference capacitor (18801).
2. Remove radio ignition interference capacitor screw.
3. Remove radio ignition interference capacitor screw.
4. Remove radio ignition interference capacitor.

Installation

To install, reverse the removal procedure. Tighten radio ignition interference capacitor screw to 4.5-7 Nm (40-61 lb-in).

Spark Plugs



Removal

1. Remove the inside engine cover.
2. Disconnect spark plug wires from spark plugs (12405).
3. Loosen spark plugs and, before removing the spark plugs, use compressed air to remove any dirt or foreign material from spark plug areas of cylinder head (6049).
4. **NOTE: If a spark plug is removed for examination, it must be installed in the same cylinder.**

   - **Cylinders No. 1, No. 2, No. 3 have a PG suffix.**
   - **Cylinders No. 4, No. 5, No. 6 have a P suffix.**

   NOTE: If a spark plug needs to be replaced, use only spark plugs with the service number

suffix letters "PP" as shown on the engine decal.

Remove spark plugs.

Installation

1. **NOTE: Refer to the Spark Plug Inspection Chart under Spark Plugs, Cleaning and Inspection, in this section to determine the condition of the spark plugs.**

   Check and adjust spark plugs.

2. Use a suitable spark plug gap tool to adjust spark plug gap to 1.07-1.17mm (0.042-0.046 in).

3. Install spark plugs and tighten to 9-20 Nm (7-15 lb-ft).

4. Connect spark plug wires to spark plugs.

5. Install the inside engine cover.

Spark Plugs

Use a suitable spark plug gap tool to adjust spark plug gap to 1.07-1.17mm (0.042-0.046 inch) following tool manufacturer's instructions.

Ignition Timing

Initial engine ignition timing (base timing) is 10 ± 2 degrees BTDC and is not adjustable.

SPECIFICATIONS

IGNITION SYSTEM SPECIFICATIONS

Description	Specification
Spark Plug Type	AWSF32P and AWSF32PG
Spark Plug Gap	1.07-1.17mm (0.042-0.046 Inch)
Firing Order	1-4-2-5-3-6

TORQUE SPECIFICATIONS

Description	Nm	Lb-Ft	Lb-In
Crankshaft Position Sensor Bolts	5-7	—	45-61
Ignition Coil Screws	4.5-7	—	40-61
Ignition Coil Mounting Bracket Nuts	16-20	12-14	—
Spark Plugs	9-20	7-15	—

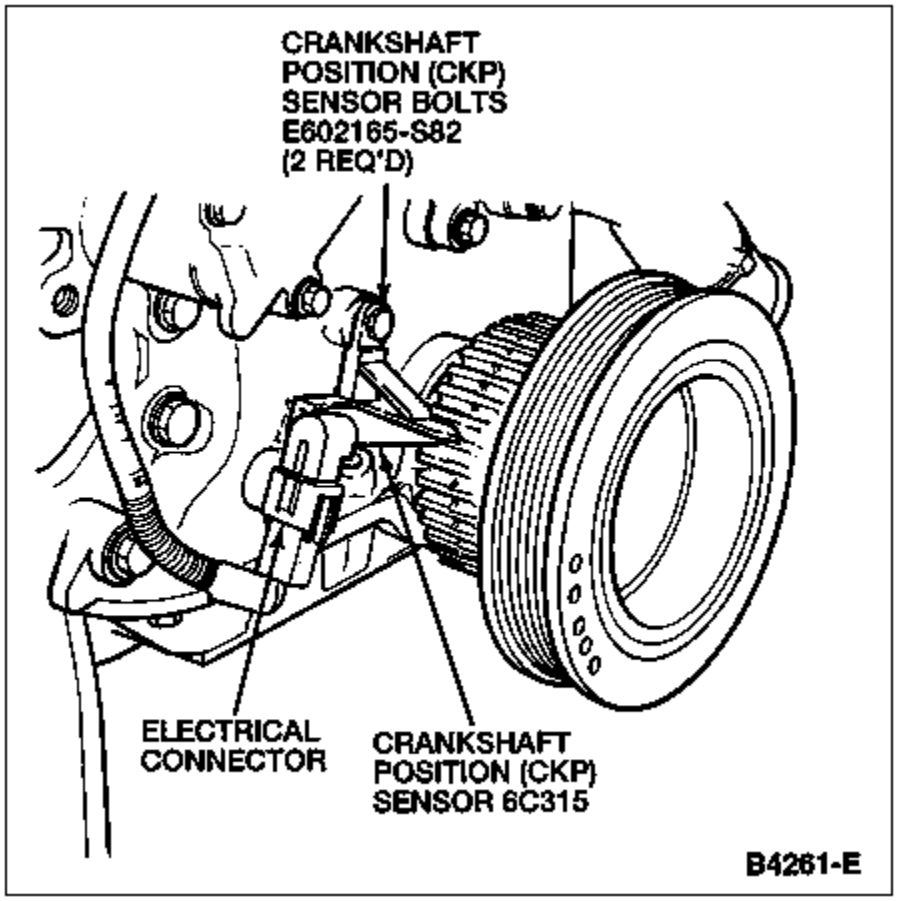
Ignition Coil Nuts	16-20	12-14	—
Radio Ignition Interference Capacitor Screw	4.5-7	—	40-61

Crankshaft Position Sensor

Removal



1. Disconnectbattery ground cable (14301).
2. Disconnect crankshaft position sensor (CKP sensor) electrical connector from wiring harness.
3. Remove CKP sensor bolts and remove crankshaft position sensor (CKP sensor) (6C315).

Installation

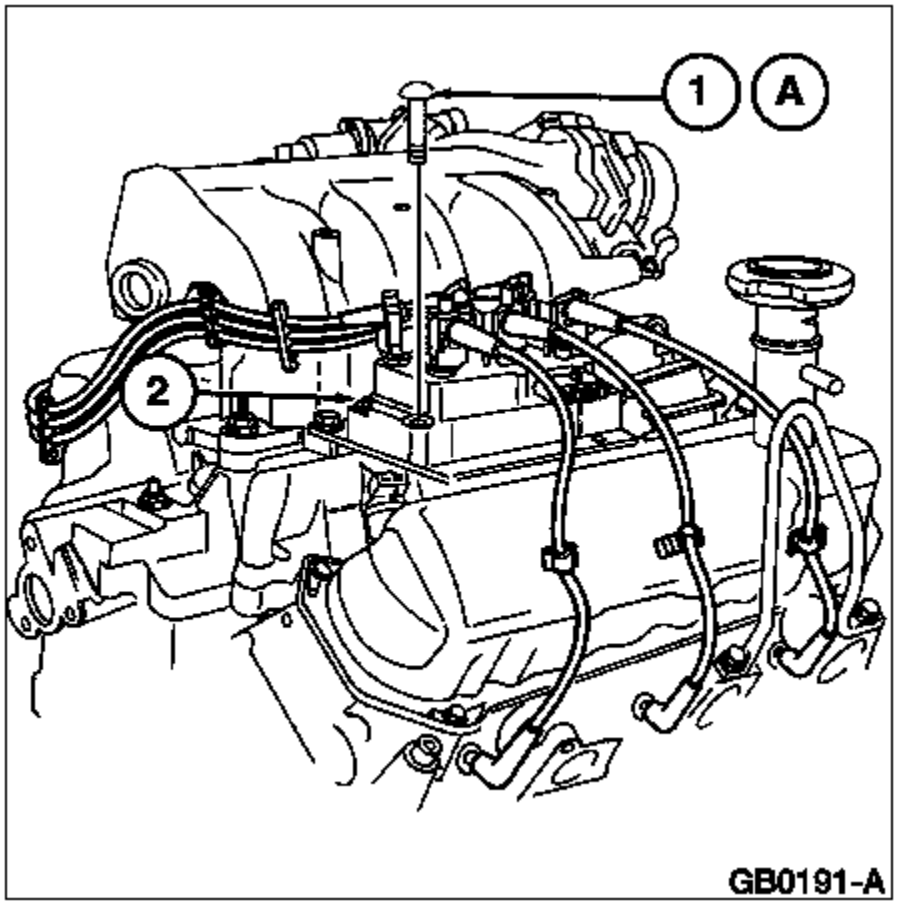
1. Position crankshaft position sensor on engine (6007).
2. Install two CKP sensor bolts and tighten to 9-12 Nm (80-106 lb-in).
3. Route CKP sensor wiring harness and connect electrical connector.
4. **NOTE: When battery voltage is removed from the powertrain control module (PCM) (12A650),**

all learned values will be cleared and reset to predetermined values. When battery voltage is restored to the PCM, the vehicle may exhibit certain driveability concerns. It will be necessary to drive the vehicle to allow the PCM to relearn values for optimum driveability and performance.

Connect battery ground cable.

Ignition Coil

Removal



Item	Part Number	Description
1	E802669	Ignition Coil Bolt (4 Req'd)
2	—	Ignition Coil Pack
A	—	Tighten to 5-7Nm (45-61 Lb-In)

1. Disconnect battery ground cable (14301).
2. Disconnect fuel charging wiring (9D930) from ignition coil (12029).
3. Remove spark plug wires by squeezing locking tabs to release ignition coil boot retainers.
4. On Ranger vehicles equipped with air conditioning, remove air conditioning tube-to-plenum bolt and

move tube enough to gain access to ignition coil bolts.

5. Remove ignition coil bolts and remove ignition coil.

Installation

1. Install ignition coil. Tighten ignition coil bolts to 5-7 Nm (45-61 lb-in).

2. On Ranger vehicles equipped with air conditioning, reposition air conditioning tube and secure. Tighten air conditioning tube-to-plenum bolt to 26-32 Nm (20-23 lb-ft).

3. Connect spark plug wires and connect fuel charging wiring to ignition coil.

4. **NOTE: When the battery voltage is removed from the powertrain control module (PCM) (12A650), all learned values will be cleared and reset to predetermined values. When battery voltage is restored to the PCM, the vehicle may exhibit certain driveability concerns. It will be necessary to drive the vehicle to allow the PCM to relearn values for optimum driveability and performance.**

   Connect battery ground cable.

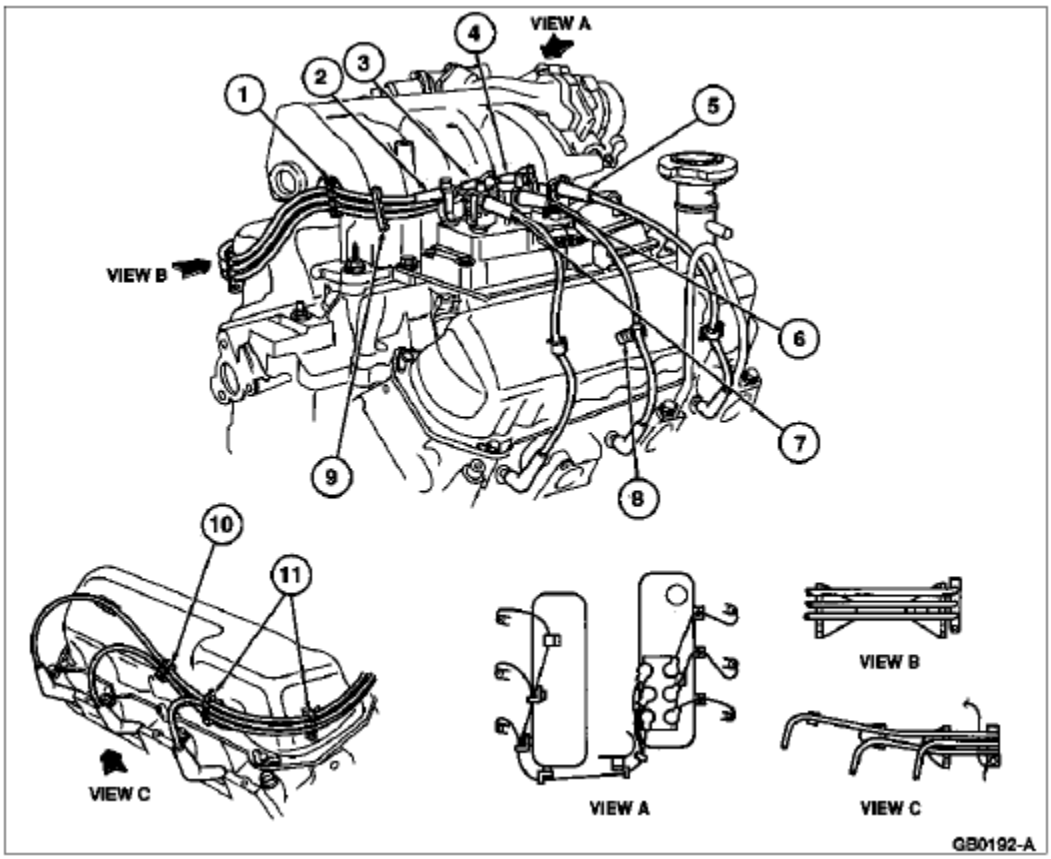
Ignition Wires

SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
Spark Plug Wire Remover	T74P-6666-A

Removal

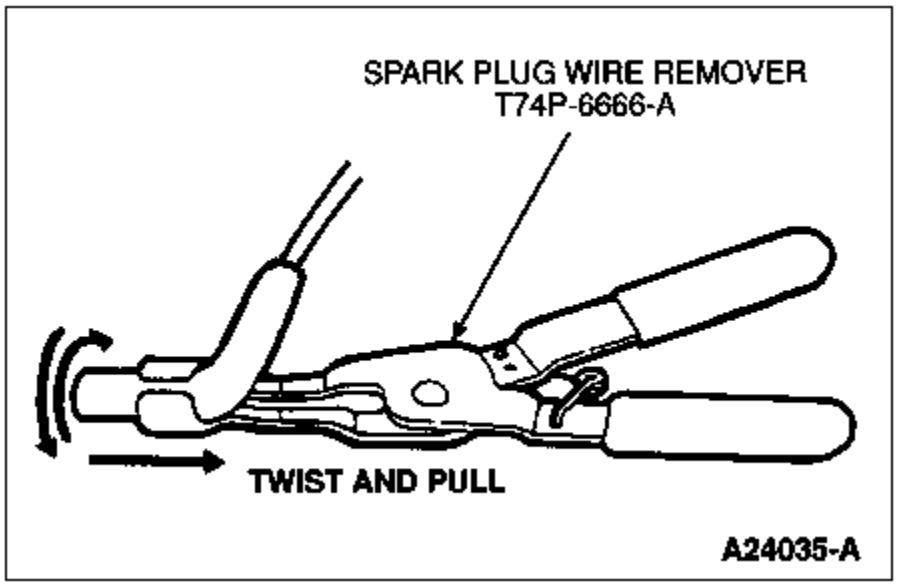
Spark Plug Wire Routing



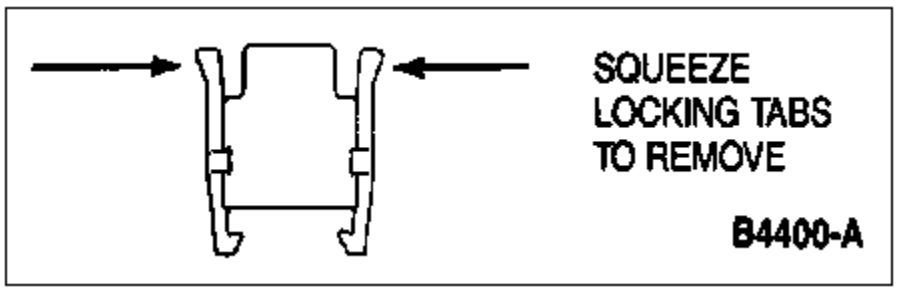
Item	Part Number	Description
1	W703402-S	Clip, Quad

2	12287	Spark Plug Wire No. 4
3	12285	Spark Plug Wire No. 6
4	12282	Spark Plug Wire No. 5
5	12286	Spark Plug Wire No. 1
6	12283	Spark Plug Wire No. 2
7	12284	Spark Plug Wire No. 3
8	W700891-S	Clip (4 Req'd)
9	E4AE-12297-CA	Separator, 4-Way
10	W700891-S	Clip
11	E865603-S	Clip, Quad (2 Req'd)

When removing spark plug wires from spark plugs (12405), use the Spark Plug Wire Remover T74P-6666-A. Grasp and twist the boot back and forth on the spark plug insulator to free the boot. Use the special tool to pull the boot from the spark plug. Do not pull on the spark plug wire directly, as it may separate from the connector inside the boot.



When removing spark plug wires from the ignition coil (12029), squeeze the locking tabs of the coil wire retainer and remove using a twisting and pulling motion. Do not pull on the spark plug wires.



Installation

CAUTION: Proper installation of spark plug wires is critical to vehicle operation. If one spark plug wire is not properly installed on spark plug or ignition coil, both spark plugs connected to that ignition coil may not fire under load.

1. Whenever a high tension wire is removed for any reason from a spark plug or ignition coil, or a new spark plug wire is installed, apply Silicone Brake Caliper Grease and Dielectric Compound D7AZ-19331-AA Motorcraft WAIO, or equivalent meeting Ford specification ESA-M1C171-1C171-A to the boot prior to installation. Using a small, clean tool, coat the entire interior surface of the boot with the compound.

2. Install each spark plug wire on the proper ignition coil. Refer to the previous illustration which shows spark plug wire routing. The terminal cylinder numbers are identified on the ignition coil. Make sure that the coil wire boots are fully seated and that both coil boot retainer locking tabs have engaged. The 4.0L firing order is 1-4-2-5-3-6.

3. Remove the wire retaining brackets from the old spark plug wires and install brackets in same relative position on the new wires. Install spark plug wires and retaining brackets on the engine (6007).

4. Connect spark plug wires to proper spark plugs.

Spark Plugs

Removal

1. Disconnect the intake air temperature (IAT) and mass airflow (MAF) electrical connectors. Remove the crankcase ventilation tube (6C342) from the right valve cover and remove the air cleaner outlet tube assembly (9R504).

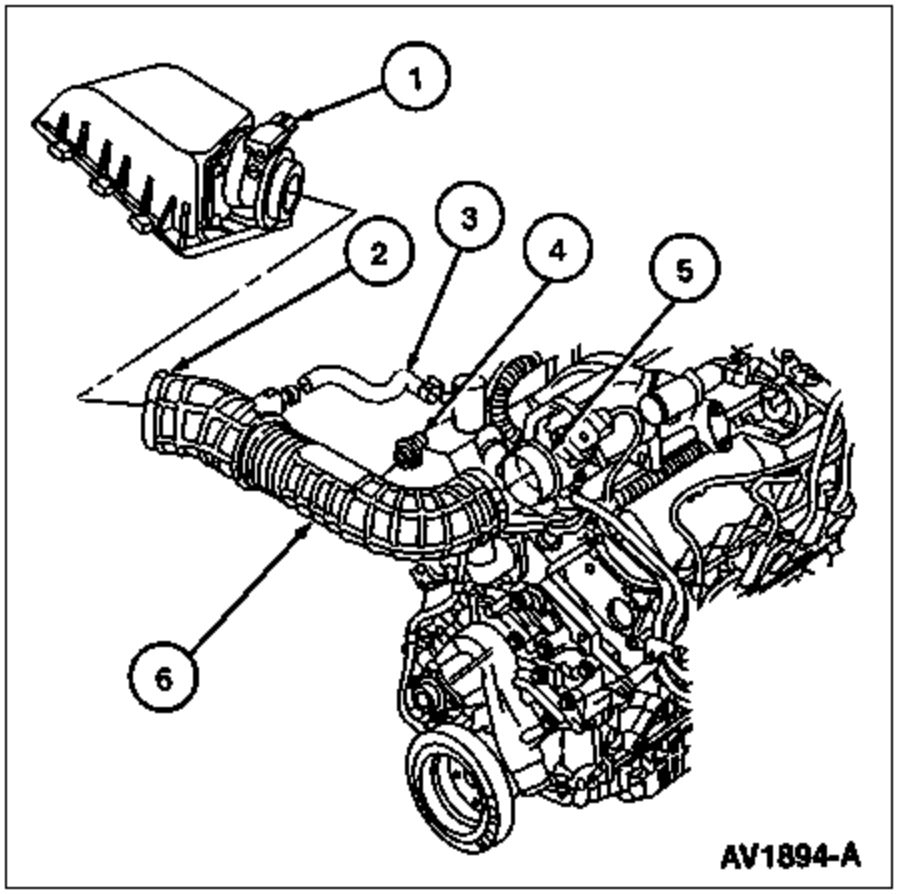
2. Remove the ignition wires from the spark plugs.

3. **NOTE: Use compressed air to remove any foreign material in the spark plug well before removing the spark plugs. If an original spark plug is reused, make sure it is installed in the same cylinder it was taken from. Replacement spark plugs can be used in any cylinder.**

   Remove the spark plugs.

4. Inspect the spark plugs for the following:

   - deposits bridging spark plug gap
   - wet black deposits (oil fouling)
   - dry black deposits (carbon fouling)
   - overheating
   - deposits fused on spark plug
   - pre-ignition damage



Installation

1. Set the spark plugs air gap as necessary. The correct spark plug gap is 1.3-1.4 mm (0.052-0.056 in).
2. Install the spark plugs. Tighten the plugs to 15 Nm (11 lb-ft).
3. Install the spark plug wires to the spark plugs.
4. Install the air cleaner outlet tube assembly. Install the crankscase ventilation tube to the right valve cover. Connect the IAT and MAF sensors.

Spark Plugs

NOTE: Platinum enhanced spark plugs should not require adjustment throughout service life.

Use a suitable spark plug gap tool to check spark plug gap. The correct spark plug gap is 1.3-1.4mm (0.052-0.056 inch).

Ignition Timing

Ignition timing is preset at 10° BTDC and is not ad justable.

SPECIFICATIONS

IGNITION SYSTEM SPECIFICATIONS

Firing Order	Ignition Timing	Plug Type	Plug Gap
1-4-2-5-3-6	10° ± 2° BTDC Non-Adjustable	AWSF-42PG AWSF-42P	1.3-1.4mm (0.052-0.056 In.)

PCV Valve

Removal

1. Disconnect crankcase ventilation hose (6853) from positive crankcase ventilation valve (PCV valve) (6A666).
2. Remove positive crankcase ventilation valve (PCV valve) from crankcase ventilation grommet (6A892).
3. Inspect crankcase ventilation grommet for deterioration and replace if necessary.

Installation

To install, reverse the removal procedure.

PCV Hoses

Crankcase Ventilation Hose

Removal

1. Disconnect crankcase ventilation hose (6853) from positive crankcase ventilation valve (PCV valve) (6A666).

2. Disconnect crankcase ventilation hose from fitting on intake manifold (9424).

Installation

To install, reverse the removal procedure.

EGR Valve — 2.3L, 3.0L, 4.0L

Removal

1. Disconnect the vacuum hose from the EGR valve (EGR valve) (9D475).
2. Disconnect the EGR valve to exhaust manifold tube (9D477) from the EGR valve.
3. Remove the EGR valve bolts and the EGR valve.
4. Remove the EGR valve gasket (9D476) and clean gasket sealing surface. If the old EGR valve is to be installed, clean the gasket sealing surface.

Installation

1. Position EGR valve with a new EGR valve gasket and install EGR valve bolts. Tighten to 20-30 Nm (15-22 lb-ft).
2. Connect the EGR valve to exhaust manifold tube to the EGR valve. Tighten EGR valve to exhaust manifold tube nut to 34-48 Nm (26-35 lb-ft). On 3.0L engines (6007), tighten EGR valve to exhaust manifold tube bolt to 20-30 Nm (15-22 lb-ft).
3. Connect the vacuum hose to the EGR valve.

EGR Valve to Exhaust Manifold Tube — 2.3L, 3.0L, 4.0L

Removal

1. Disconnect the EGR valve to exhaust manifold tube (9D477) at the EGR valve (EGR valve) (9D475) and exhaust manifold.
2. Disconnect hoses and remove EGR valve to exhaust manifold tube.
3. Remove EGR valve tube to manifold connector (9F485) from exhaust manifold, if necessary.

Installation

To install, reverse the removal procedure.

Tighten EGR valve tube to manifold connector and EGR valve to exhaust manifold tube nuts to 34-48 Nm (26-35 lb-ft). On 3.0L engines (6007), tighten EGR valve to exhaust manifold tube bolt to 20-30 Nm (15-22 lb-ft).

EGR (DPFE) Differential Pressure Feedback Transducer — 2.3L, 3.0L, 4.0L

Removal

1. Disconnect battery ground cable (14301).
2. Disconnect electrical connector from EGR backpressure transducer (9J460).
3. Disconnect hoses from EGR valve to exhaust manifold tube (9D477).
4. Remove EGR transducer bolts and EGR transducer (9J433).

Installation

NOTE: When battery voltage is removed from the powertrain control module (PCM) (12A650), all learned values will be cleared and reset to predetermined values. When battery voltage is restored to the PCM, the vehicle may exhibit certain driveability concerns. It will be necessary to drive the vehicle to allow the PCM to relearn values for optimum driveability and performance.

To install, reverse the removal procedure.

Tighten EGR transducer bolts to 3.5-4.5 Nm (31-39 lb-in).

EGR Vacuum Regulator Solenoid

Removal

1. Disconnect battery ground cable (14301).
2. Disconnect electrical connector from EGR vacuum regulator solenoid (9J459).
3. Disconnect vacuum hoses from EGR vacuum regulator solenoid.
4. Remove EGR vacuum regulator solenoid nut(s) and EGR vacuum regulator solenoid.

Installation

NOTE: When battery voltage is removed from the powertrain control module (PCM) (12A650), all learned values will be cleared and reset to predetermined values. When battery voltage is restored to the PCM, the vehicle may exhibit certain driveability concerns. It will be necessary to drive the vehicle to allow the PCM to relearn values for optimum driveability and performance.

To install, reverse the removal procedure.

Tighten the EGR vacuum regulator solenoid nut(s) to 8-12 Nm (71-106 lb-in).

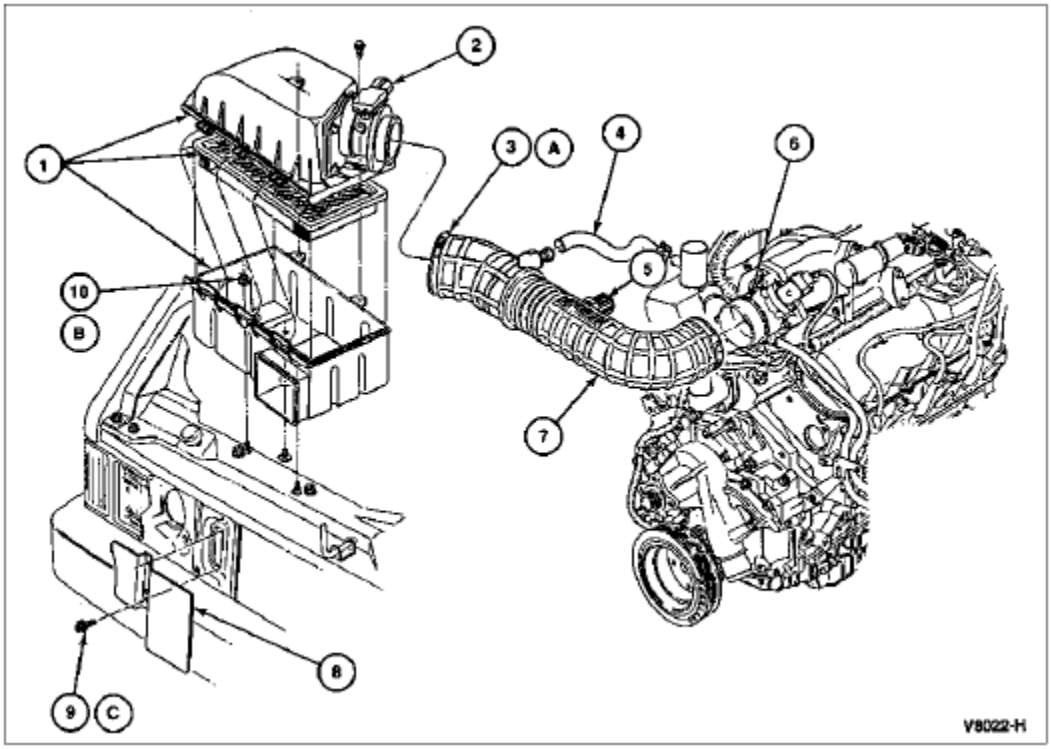
Air Cleaner Element, Aerostar

Refer to Section 00-03 for the Emissions Systems Maintenance Schedule for frequency of air cleaner element (ACL element) inspection/replacement.

Removal

1. Loosen air cleaner outlet tube clamp and remove air cleaner outlet tube (9B659) from mass air flow sensor (MAF sensor) (12B579).

Intake Air System — Aerostar 4.0L Shown, 3.0L Similar



Item	Part Number	Description
1	9600	Engine Air Cleaner
2	12B579	Mass Air Flow Sensor
3	—	Air Cleaner Outlet Tube Clamp
4	6C342	Crankcase Ventilation Hose
5	12A697	Intake Air Temperature Sensor
6	9E926	Throttle Body

7	9B659	Air Cleaner Outlet Tube
8	8N081	Air Intake Baffle
9	56901-S2	Air Intake Baffle Screw (2 Req'd)
10	N621906-S2	Engine Air Cleaner Nut
A	—	Tighten to 4-6 Nm (36-54 Lb-In)
B	—	Tighten to 8-12 Nm (71-106 Lb-In)
C	—	Tighten to 3-7 Nm (27-61 Lb-In)

2. Disconnect engine control sensor wiring (12A581) from mass air flow sensor. Disconnect intake air temperature sensor electrical connector.

3. **NOTE: Do not remove air cleaner cover screws.**

   Loosen air cleaner cover screws until air cleaner cover is free from engine air cleaner (ACL) (9600). Release air cleaner cover clips if equipped.

4. Position air cleaner cover aside.

5. **CAUTION: Do not tamper with sensing elements located in the airflow bypass of the MAF sensor.**

   Remove air cleaner element (ACL element) (9601).

Installation

1. Clean all inside surfaces of the engine air cleaner. Refer to Cleaning and Inspection in this section.

2. Install the air cleaner element.

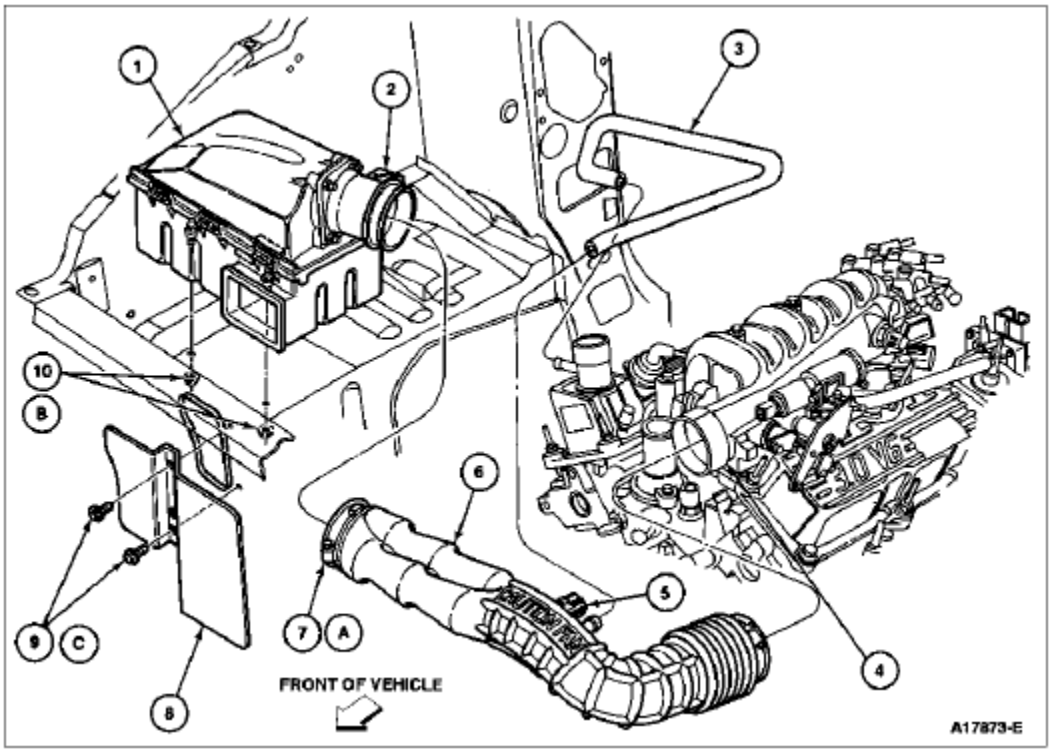
3. Position air cleaner cover. Fasten air cleaner cover clips if equipped. Tighten air cleaner cover screws to 3-4 Nm (27-35 lb-in).

4. Connect engine control sensor wiring to mass air flow sensor. Connect intake air temperature sensor electrical connector.

5. Install the air cleaner outlet tube. Tighten the air cleaner outlet tube clamp to 4-6 Nm (36-54 lb-in).

Engine Air Cleaner — Aerostar

Intake Air System — Aerostar



Item	Part Number	Description

B	—	Tighten to 8-12 Nm (71-106 Lb-In)
C	—	Tighten to 3-7 Nm (27-61 Lb-In)

Removal

1. **CAUTION: Do not tamper with sensing elements located in the airflow bypass of the mass air flow sensor (MAF sensor) (12B579).**

   Loosen air cleaner outlet tube clamp and remove air cleaner outlet tube (9B659) from mass air flow sensor.

2. Disconnect the mass air flow sensor.

3. Remove two engine air cleaner nuts and engine air cleaner (ACL) (9600).

Installation

1. Clean all inside surfaces of the engine air cleaner. Refer to Cleaning and Inspection in this section.

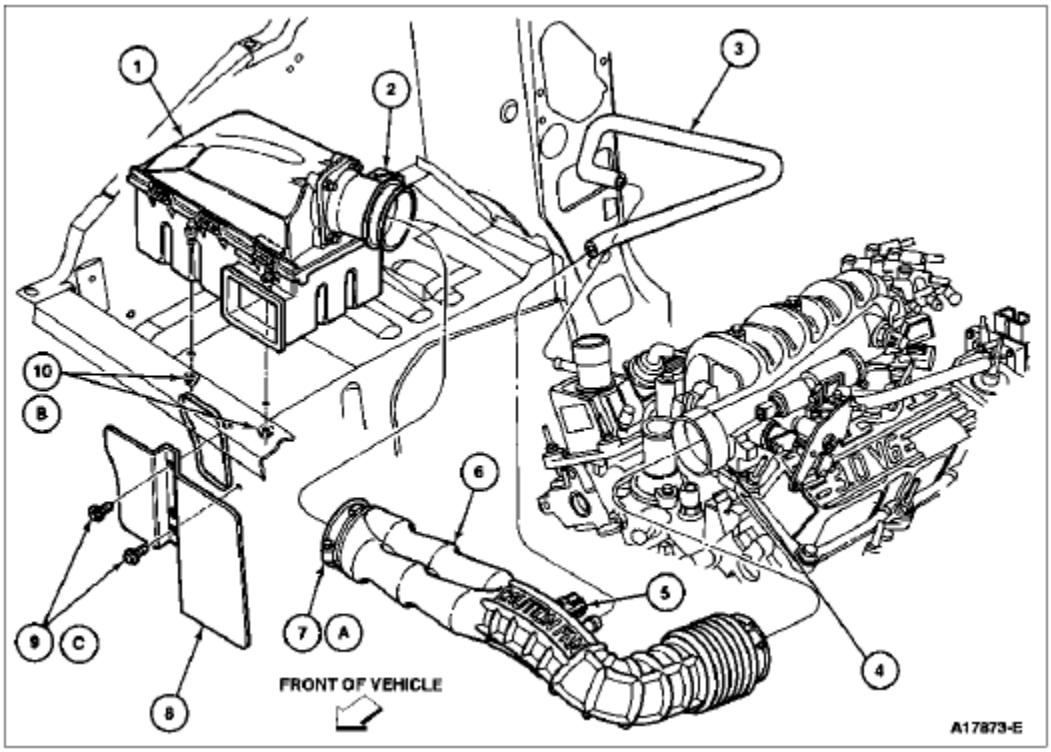
2. Install engine air cleaner and tighten two engine air cleaner nuts to 8-12 Nm (71-106 lb-in).

3. Connect engine control sensor wiring (12A581) to mass air flow sensor.

4. Install air cleaner outlet tube. Tighten air cleaner outlet tube clamp to 4-6 Nm (36-54 lb-in).

Air Cleaner Outlet Tube

Intake Air System — Aerostar



Item	Part Number	Description
1	9600	Engine Air Cleaner
2	12B579	Mass Air Flow Sensor (MAF)
3	6C342	Crankcase Ventilation Hose
4	9E926	Throttle Body
5	12A697	Intake Air Temperature Sensor
6	9B659	Air Cleaner Outlet Tube
7	—	Air Cleaner Outlet Tube Clamp
8	8N081	Air Intake Baffle
9	56902-S2	Air Intake Baffle Screws (2 Req'd)
10	N621906-S2	Engine Air Cleaner Nut
A	—	Tighten to 4-6 Nm (36-54 Lb-In)

B	—	Tighten to 8-12 Nm (71-106 Lb-In)
C	—	Tighten to 3-7 Nm (27-61 Lb-In)

Removal

1. Disconnect crankcase ventilation hose (6853) from air cleaner outlet tube (9B659) on 3.0L and 4.0L .0L equipped vehicles.
2. Disconnect intake air temperature (IAT) sensor electrical connector.
3. Loosen air cleaner outlet tube-to-throttle body clamp and the air cleaner outlet tube-to-air cleaner clamp (Ranger) or the air cleaner outlet tube clamp at the mass air flow sensor (MAF sensor) (12B579) (Aerostar).
4. Remove the air cleaner outlet tube from the vehicle.

Installation

To install, reverse the removal procedure.

Tighten the air cleaner outlet tube-to-air cleaner clamp to 1-2 Nm (9-18 lb-in).

Tighten the air cleaner outlet tube-to-throttle body clamp to 2-3 Nm (18-27 lb-in).

Air Cleaner Element, Ranger

NOTE: Refer to Section 00-03 for the Emissions Systems Maintenance Schedule for air cleaner element inspection or replacement.

Removal

1. Remove engine air cleaner (ACL) (9600). Refer to Engine Air Cleaner removal in this section.
2. Pull snap ring on engine air cleaner to separate air cleaner body.
3. **CAUTION: Do not tamper with the sensing elements located in the mass air bypass of the mass airflow sensor.**

   Remove air cleaner element (ACL element) (9601).

Installation

1. Clean all inside surfaces of engine air cleaner. Refer to Engine Air Cleaner cleaning in this section.
2. Install air cleaner element.
3. Position engine air cleaner body parts and close snap ring.
4. Install engine air cleaner. Refer to Engine Air Cleaner installation in this section.

Engine Air Cleaner, Ranger

Removal

1. **NOTE: Removal and installation steps are the same for all Ranger vehicles even though parts may differ in appearance.**

   On 3.0L and 4.0L engines (6007), disconnect crankcase ventilation hose (6853) from air cleaner outlet tube (9B659).

2. Disconnect mass airflow (MAF) sensor connector.

3. Disconnect intake air temperature (IAT) sensor electrical connector.

4. Loosen engine air cleaner (ACL) (9600) clamp.

5. Carefully separate engine air cleaner and remove air cleaner element.

Installation

For installation, follow removal procedures in reverse order.

A mild detergent solution may be used to facilitate assembly of engine air cleaner to engine air cleaner mounting bracket (9626) and inner front fender.

Air Cleaner Outlet Tube, Ranger

Removal

1. Disconnect crankcase ventilation hose (6853) from air cleaner outlet tube (9B659) on 3.0L and 4.0L engines (6007).
2. Disconnect mass airflow (MAF) sensor connector.
3. Disconnect intake air temperature (IAT) sensor electrical connector.
4. Loosen air cleaner outlet tube clamps at engine air cleaner (ACL) (9600) and throttle body (9E926) and remove tube.

Installation

For installation, follow removal procedures in reverse order.

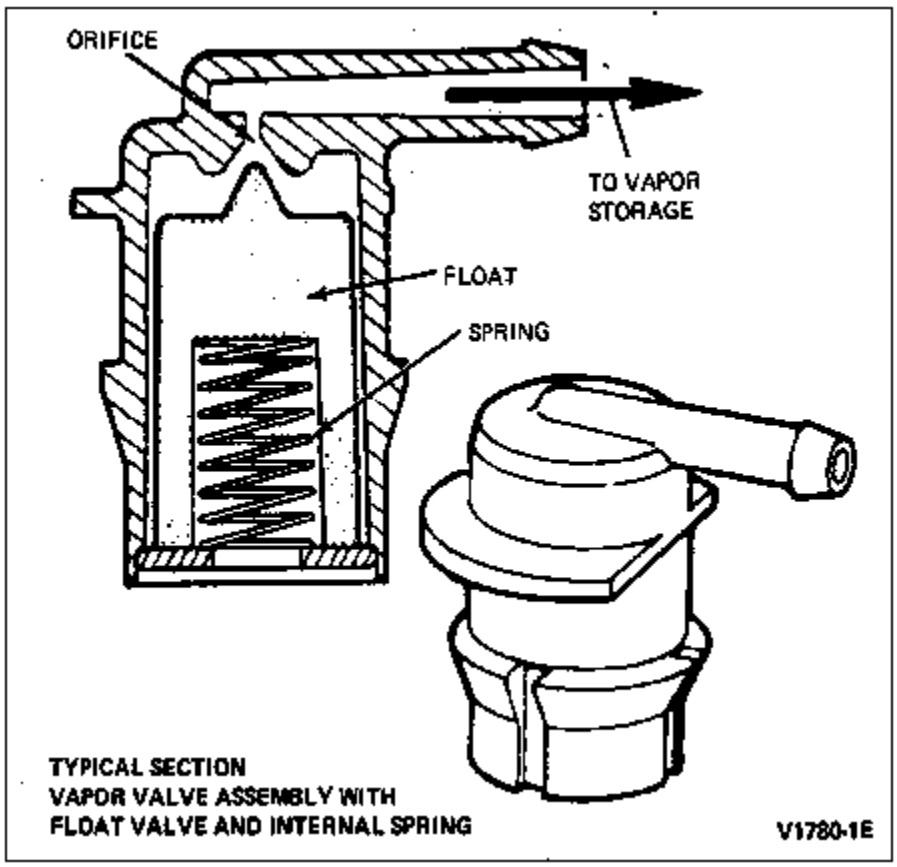
Fuel Vapor Valve (Aerostar 3.0L Engine)

Fuel tank vapor valve assemblies make use of a small orifice, 1.27mm (0.050 inch), that allows only vapor and not fuel to pass into the line running forward to the evaporative emissions canister (EVAP canister) (9D653). This assembly mounts directly to the fuel tank (9002) using a fuel vapor separator seal.

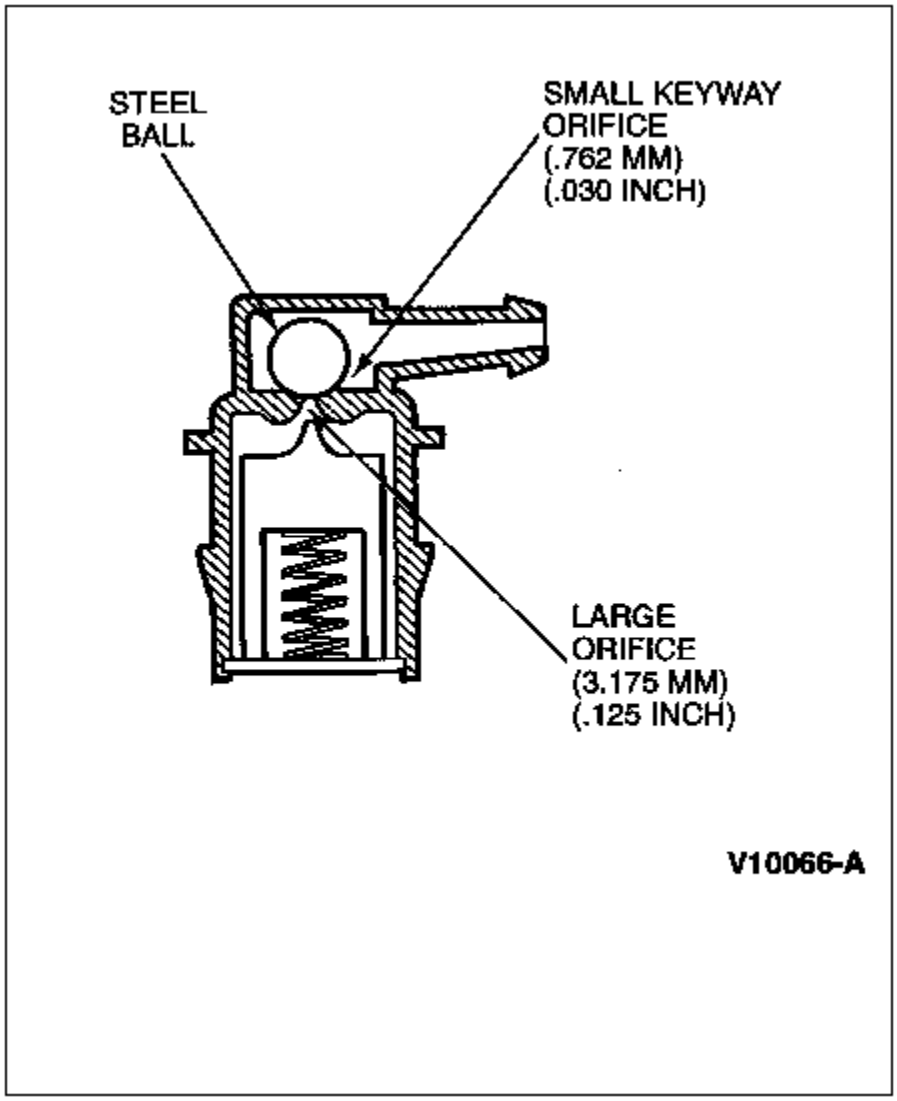
Fuel vapors trapped in the sealed fuel tank are vented through the orificed evaporative emission valve (9B593) in the top of the fuel tank. The vapors leave the evaporative emission valve through a single vapor line and continue to the evaporative emissions canister in the engine compartment for storage, until such time as they are purged to the engine (6007).



Fuel Vapor Valve (Ranger)

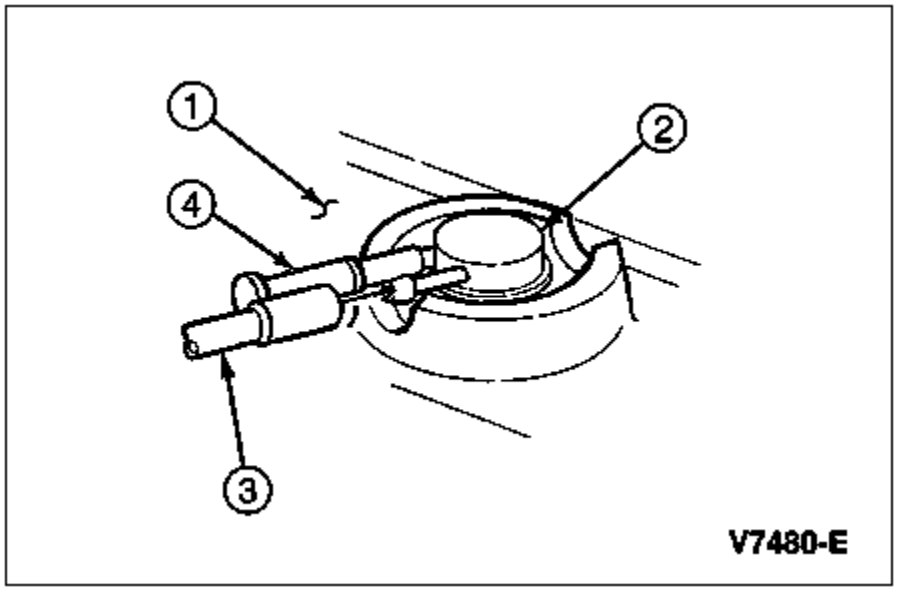
The Ranger 2.3L, 3.0L and 4.0L engines use a new valve design with a "head valve" which does not allow vapor flow until a predetermined pressure is reached (8 inches H_2O).

The new head valve allows flow through the .762mm (.030-inch) keyway orifice until there is sufficient pressure to lift the ball (head valve) about 8 inches H_2O or 2.0685 kPa (0.3 psi). When the head valve is open, vapor can flow through the larger 3.175mm (.125-inch) orifice.



Fuel Vapor Valve, Aerostar (4.0L Engine)

The evaporative emission valve (9B593) uses a small orifice, 1.83mm (0.072 inch), that allows vapors to pass into the vapor line running forward to the evaporative emissions canister (EVAP canister) (9D653). This evaporative emission valve mounts directly into the fuel tank (9002) using a fuel vapor separator seal. Fuel vapors trapped in the sealed fuel tank are vented through the orificed evaporative emission valve. The vapors from the fuel tank leave the evaporative emission valve through a single vapor line and continue to the evaporative emissions canister in the engine compartment for storage.



Item	Part Number	Description
1	9002	Fuel Tank
2	9B227	Valve and Hose Assembly
3	9G271	Evaporative Emission Return Tube
4	—	Purge Port (Part of 9B227)

Inspection and Verification

1. Verify the vehicle owner's original concern by removing fuel tank filler cap (9030) to duplicate the condition.

2. Inspect to determine if any of the following mechanical concerns apply:

Mechanical
• Hissing sound or release of pressure as the fuel tank filler cap is removed from the fuel tank filler pipe.

3. If the concern(s) remain after the inspection, determine the symptoms and proceed to the following Symptom Chart.

Symptom Chart — Evaporative Emissions

EVAPORATIVE EMISSIONS

Condition	Possible Source	Action
• Fuel Tank Pressure Abnormal	• Evaporative emission hoses or inlets blocked. • Tubes or hoses kinked or pinched.	• GO to Pinpoint Test A .

Pinpoint Tests

PINPOINT TEST A: FUEL TANK PRESSURE ABNORMAL

A1 CANISTER HOSE AND INLET TUBE BLOCKAGE TEST

- Test canister fuel vapor hose and inlet nipple for blockage.

Are fuel vapor hoses or inlets blocked?

Yes	No
GO to **A2**.	GO to **A6**.

A2 FUEL EVAPORATIVE EMISSION SYSTEM BLOCKAGE TEST

- Test fuel tank evaporative emission system for blockage.

Are all system passages open?

Yes	No
GO to **A7**.	REMOVE blockage or REPLACE component.

A3 VAPOR TUBE INSPECTION

- Inspect vapor tube and fuel vapor hoses for kinks or pinched areas.

Are tube or fuel vapor hoses kinked or pinched?

Yes	No
SERVICE or REPLACE tube or fuel vapor hoses. VERIFY service.	GO to **A4**.

A4 VAPOR HOSE INSPECTION

- Inspect vapor hose routing between fuel tank and body for pinches.

Is vapor hose pinched?

Yes	No
LOOSEN fuel tank and reroute hose. VERIFY service.	GO to **A5** .

A5 FUEL VAPOR VALVE INSPECTION

- Remove fuel tank.
- Remove evaporative emission valve.
- Inspect evaporative emission valve for open air passage through orifice.

Is air passage open?

Yes	No
INSTALL evaporative emission valve in fuel tank. INSTALL fuel tank. System test complete. RESTORE vehicle.	REPLACE evaporative emission valve. VERIFY service.

A6 FLOW TEST (FUEL TANK FILLER CAP INSTALLED)

CAUTION: Do not use other high pressure air supplies. Damage to evaporative emissions canister will result.

- Install hand pump and pressure gauge Rotunda Vacuum Tester 014-R1054 or equivalent in fuel vapor hose at test point B1 (refer to the following illustration).
- Hand pump to a maximum of 17.2 kPa (2.5 psi).

Does pressure drop to zero immediately?

Yes	No
System flow OK. No service required.	GO to **A3** .

A7 FLOW TEST (FUEL TANK FILLER CAP REMOVED)

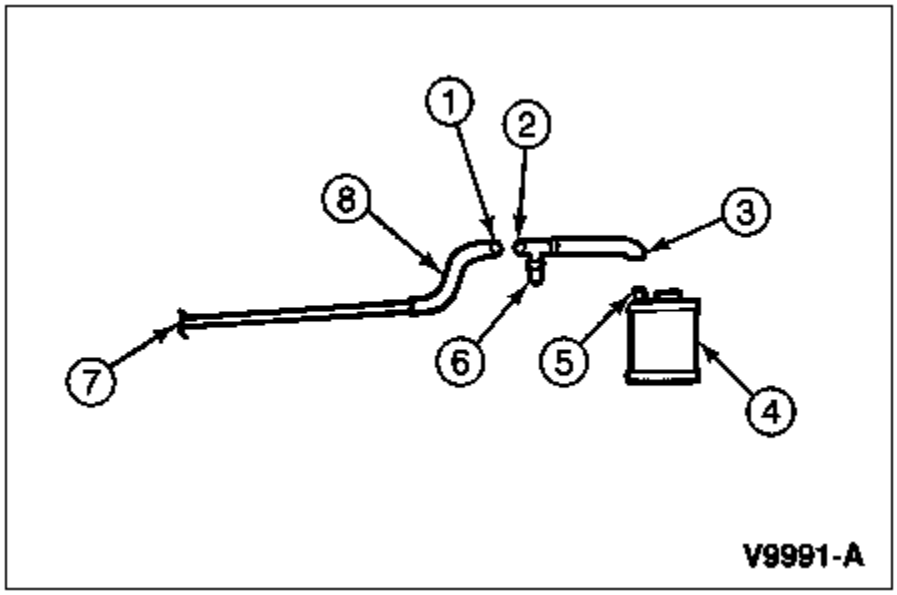
CAUTION: Failure to remove fuel tank filler cap may result in damage to fuel tank.

- Remove fuel tank filler cap from fuel tank filler pipe.

CAUTION: Do not use other high-pressure air supplies. Damage to fuel tank may result.

- Install hand pump and pressure gauge onto tee or evaporative emission canister nipple at test point B2.
- Hand pump to a maximum of 17.2 kPa (2.5 psi).

Does pressure drop to zero immediately?



Item	Part Number	Description
1	—	Test Point B2 with Tee
2	—	Test Point B1 with Tee
3	—	Test Point B2 without Tee
4	—	Evaporative Emissions Canister (EVAP canister)
5	—	Test Point B1 without Tee
6	—	Close Off Line
7	—	To Fuel Tank
8	—	Evaporative Emission Return Tube

Yes	No
System OK. No service required.	GO to **A4** .

Evaporative Emissions

WARNING: THE EVAPORATIVE EMISSION SYSTEM CONTAINS FUEL VAPOR AND CONDENSED FUEL VAPOR. ALTHOUGH NOT PRESENT IN LARGE QUANTITIES, IT STILL PRESENTS THE DANGER OF EXPLOSION OR FIRE. DISCONNECT THE BATTERY GROUND CABLE FROM THE BATTERY TO MINIMIZE THE POSSIBILITY OF AN ELECTRICAL SPARK OCCURRING, POSSIBLY CAUSING A FIRE OR EXPLOSION IF FUEL VAPOR OR LIQUID FUEL ARE PRESENT IN THE AREA.

CAUTION: Fuel supply lines on vehicles with fuel injected engines (6007) will remain pressurized for long periods of time after engine shutdown. The pressure must be relieved before servicing the fuel system. Refer to fuel system pressure relief. Refer to Section 10-01 . For servicing information on fuel lines refer to Section 10-01 .

Evaporative emission components have been designed and tested to exceed 193,116 km (120,000 miles) or 11 years of vehicle use. No maintenance or servicing should be required. However, if components have been damaged and are to be replaced, or if disconnection or removal is required for diagnosis, the following techniques should be used to aid in servicing the system.

Evaporative emission systems are shown in the illustrations that follow. Refer to these illustrations for component location and installation instructions.

Use Ford-approved parts for replacement of fuel and vapor hoses and tubes. Original equipment components are designed to resist most environmental conditions encountered in the evaporative emission system.

Fuel Vapor Canister, Aerostar, Ranger

Removal and Installation

Refer to the appropriate illustration for component location.

1. Disconnect vapor hoses from evaporative emissions canister (EVAP canister) (9D653) to be removed.

2. Remove screw retaining evaporative emissions canister.

3. Lift evaporative emissions canister to disengage tab on back side of evaporative emissions canister, and remove evaporative emissions canister.

For installation, follow removal steps in reverse order. Refer to Specifications for retaining screw torque specifications.

Evaporative Emission Valve

Removal

1. Lower fuel tank (9002).
2. Remove evaporative emission hose from evaporative emission valve.
3. Turn evaporative emission valve counterclockwise and remove from fuel tank.

Installation

To install, reverse the removal procedure.

Fuel Vapor Canister Purge Regulator Valve, Aerostar, Ranger

Removal and Installation

1. Disconnect wire harness from evaporative emission canister purge valve (EVAP canister purge valve) (9C915).
2. Disconnect wire harness from thermistor.
3. Disconnect evaporative emission canister purge valve assembly from fuel vapor canister and throttle body.
4. To install, reverse removal procedure.

Fuel Vapor Valve

Refer to Section 10-01 .

Safeguards

1. Always disconnect the battery ground cable (14301) prior to service.
2. Follow diagnostic procedures outlined in the Powertrain Control/Emissions Diagnosis Manual.
3. Disconnect the powertrain control module (PCM) (12A650) from the wire harness before measuring for continuity, resistance or energizing with any voltage source.
4. Never measure voltage or resistance directly at the powertrain control module.

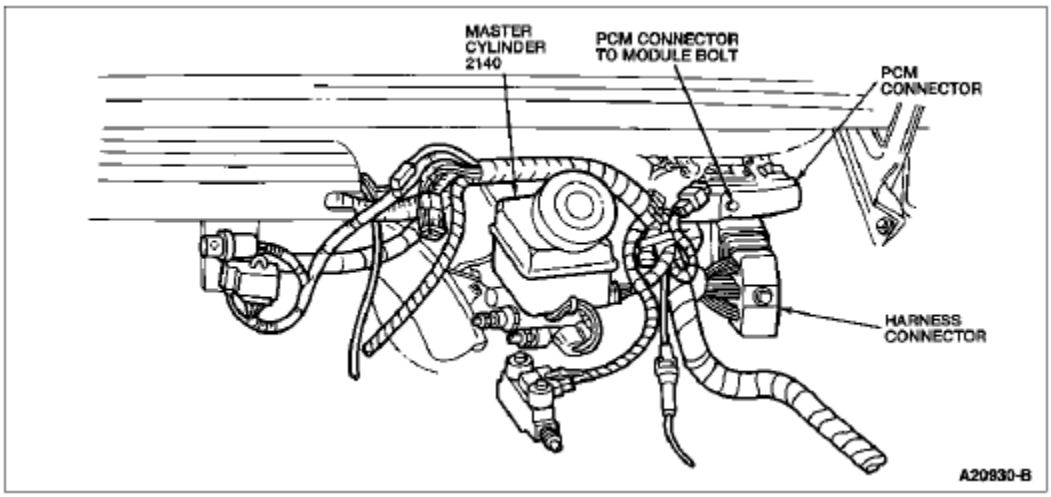
tomsn048@gmail.com

Powertrain Control Module (PCM) — Aerostar

Removal

1. Disconnect the battery ground cable (14301).
2. Loosen PCM connector to module bolt and unplug PCM connector.

Powertrain Control Module — Aerostar



3. Remove two PCM cover bolts and PCM cover. Remove powertrain control module (PCM) (12A650) from PCM bracket.

Installation

NOTE: When battery voltage is removed from the powertrain control module, all learned values will be cleared and reset to predetermined values. When battery voltage is restored to the PCM, the vehicle may exhibit certain driveability concerns. It will be necessary to drive the vehicle to allow the PCM to relearn values for optimum driveability and performance.

To install powertrain control module, reverse the removal procedure.

Tighten PCM connector to module bolt to 5 to 7 Nm (45 to 61 lb-in). Tighten PCM cover bolts to 8-10 Nm (71-88 lb-in).

C	—	Tighten to 5-7 Nm (45-61 Lb-In)
D	—	Tighten to 4-5.6 Nm (36-49 Lb-In)

Removal

1. Disconnect battery ground cable (14301).
2. Loosen PCM connector to module bolt and unplug PCM connector.
3. Remove two PCM cover nuts and PCM cover.
4. Remove powertrain control module (PCM) (12A650).

Installation

NOTE: When battery voltage is removed from the powertrain control module, all learned values will be cleared and reset to predetermined values. When battery voltage is restored to the PCM, the vehicle may exhibit certain driveability concerns. It will be necessary to drive the vehicle to allow the PCM to relearn values for optimum driveability and performance.

To install, reverse the removal procedure.

Tighten PCM connector to module bolt to 5-7 Nm (45-61 lb-in). Tighten PCM cover nuts to 4-5.6 Nm (36-49 lb-in).

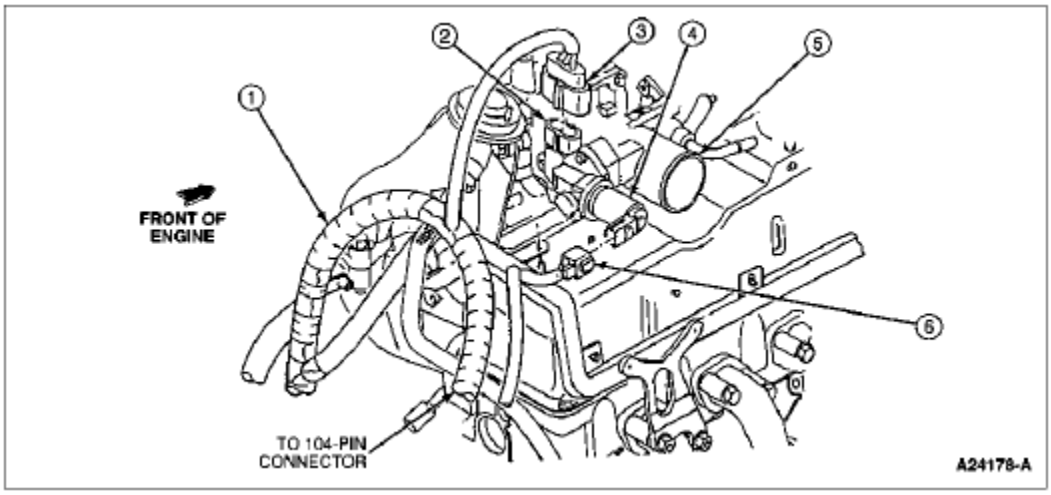
tomsn048@gmail.com

Throttle Position (TP) Sensor, 2.3L Engine

Removal

1. Disconnect battery ground cable (14301).
2. Disconnect throttle position sensor (TP sensor) (9B989) electrical connector engine control sensor wiring (12A581).
3. Remove the two throttle position sensor retaining screws.
4. Remove the throttle position sensor and throttle position sensor gasket (9F782).

Throttle Position Sensor, 2.3L



Item	Part Number	Description
1	12A581	Engine Control Sensor Wiring
2	9B989	Throttle Position Sensor
3	—	Throttle Position Sensor Connector (Part of 12A581)
4	9F715	Idle Air Control Valve
5	9E926	Throttle Body
6	—	Idle Air Control Valve Connector (Part of 12A581)

Installation

tomsn048@gmail.com

1. **CAUTION: Slide rotary tangs into position over throttle shaft blade, then rotate throttle position sensor CLOCKWISE ONLY to installed position. Failure to install the throttle position sensor in this manner may result in excessive idle speeds.**

   Position the throttle position sensor on the throttle body. Make sure that rotary tangs on sensor are in proper alignment with the throttle shaft blade.

2. **NOTE: This throttle position sensor is non-adjustable.**

   Secure throttle position sensor to throttle body (9E926) with two retaining screws. Tighten to 3-4 Nm (28-35 lb-in).

3. Make sure that both the idle air control valve gasket and surfaces are clean.

4. Install idle air control gasket (IAC gasket) (9F670) on throttle body surface and mount idle air control valve (IAC valve) (9F715), securing it with two retaining screws. Tighten to 8-11 Nm (71-97 lb-in).

5. Connect electrical connectors to both the throttle position sensor and the idle air control valve.

6. **NOTE: When battery voltage is removed from the powertrain control module (PCM) (12A650), all learned values will be cleared and reset to predetermined values. When battery voltage is restored to the PCM, the vehicle may exhibit certain driveability concerns. It will be necessary to drive the vehicle to allow the PCM to relearn values for optimum driveability and performance.**

   Connect battery ground cable.

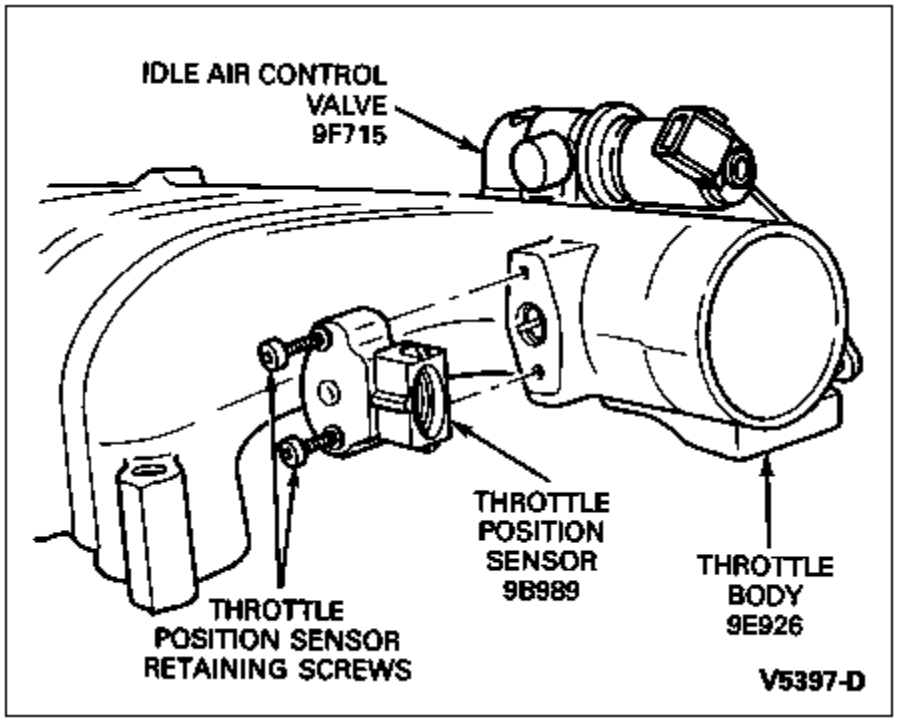
---

tomsn048@gmail.com

Throttle Position (TP) Sensor, 3.0L Engine

Removal

1. Disconnect battery ground cable (14301).
2. Disconnect the fuel charge wiring connector at the throttle position sensor (TP sensor) (9B989).
3. Remove two throttle position sensor retaining screws.
4. Remove throttle position sensor.



Installation

1. **CAUTION: Slide rotary tangs into position over throttle shaft blade, then rotate throttle position sensor clockwise to installed position only. Failure to install the throttle position sensor in this manner may result in excessive idle speeds.**

   Install throttle position sensor. Make sure that rotary tangs on sensor are in proper alignment and that the red seal is inside the connector housing.

2. **NOTE: This throttle position sensor is non-adjustable.**

   Secure sensor to throttle body (9E926) with two retaining screws. Tighten to 3-4 Nm (27-35 lb-in).

tomsn048@gmail.com

3. Install electrical connector to sensor.

4. **NOTE: When battery voltage is removed from the powertrain control module (PCM) (12A650), all learned values will be cleared and reset to predetermined values. When battery voltage is restored to the PCM, the vehicle may exhibit certain driveability concerns. It will be necessary to drive the vehicle to allow the PCM to relearn values for optimum driveability and performance.**

   Connect battery ground cable.

---

tomsn048@gmail.com

Throttle Position (TP) Sensor, 4.0L Engine

Removal

1. Disconnect battery ground cable (14301).
2. Disconnect throttle position sensor (TP sensor) (9B989) from fuel charging wiring (9D930).
3. Remove two throttle position sensor retaining screws.
4. Remove throttle position sensor and discard throttle position sensor gasket (9F782).

Installation

1. Position new throttle position sensor gasket and throttle position sensor with connector facing rearward.
2. Secure throttle position sensor to throttle body (9E926) with two retaining screws. Tighten to 3-4 Nm (27-35 lb-in).
3. Connect electrical connector to throttle position sensor.
4. **NOTE: When battery voltage is removed from the powertrain control module (PCM) (12A650), all learned values will be cleared and reset to predetermined values. When battery voltage is restored to the PCM, the vehicle may exhibit certain driveability concerns. It will be necessary to drive the vehicle to allow the PCM to relearn values for optimum driveability and performance.**

   Connect battery ground cable (14301).

tomsn048@gmail.com

tomsn048@gmail.com

Mass Airflow (MAF) Sensor, Ranger

Removal

CAUTION: Sensing elements located in the airflow bypass are not to be tampered with.

1. Disconnect battery ground cable (14301).
2. Disconnect mass airflow extension wiring.
3. Release air cleaner band clamp.
4. Separate the inlet and outlet sides of the engine air cleaner.
5. Peel back the convolute from the MAF extension wiring. Cut tape if necessary.
6. Pull grommet out of outlet side of engine air cleaner and slide it down the extension wiring.
7. Remove the MAF sensor plate and the MAF sensor from the outlet side of the engine air cleaner.
8. Disconnect MAF sensor connector.
9. Remove MAF from sensor plate. The MAF sensor electronics module and body are calibrated as a unit and must be serviced as a complete unit.

Installation

1. Install mass air flow sensor (MAF sensor) (12B579) to sensor plate. Torque MAF sensor to 8-11 Nm.
2. Connect MAF sensor connector.
3. Clean the screeen on the 4.0L Ranger and ensure it is properly aligned.
4. Install the MAF sensor plate and MAF sensor into outlet side of engine air cleaner.
5. **CAUTION: The grommet used to seal the opening for the MAF extension wiring must be fully seated, otherwise, unmetered air will enter the engine.**

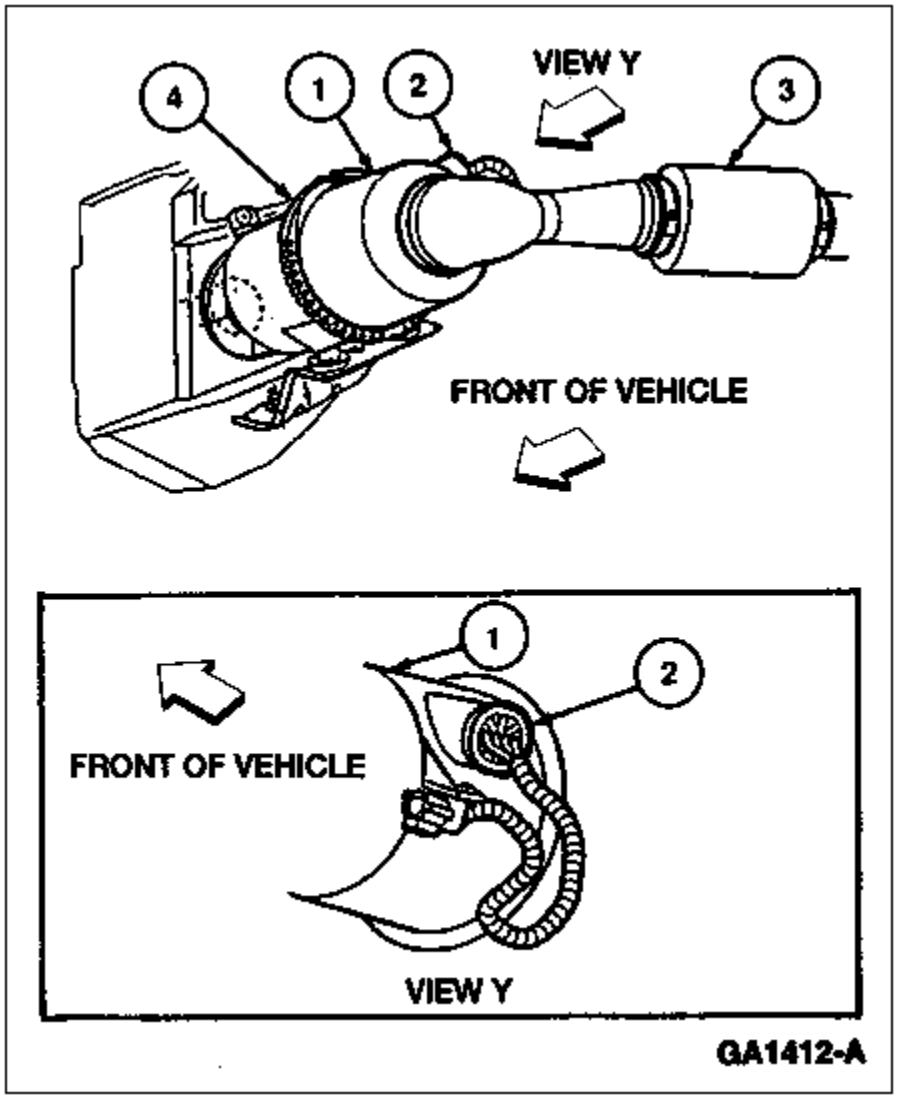
   Slide grommet up the extension wiring and install into outlet side of engine air cleaner.
6. Replace the convolute around the extension wiring and tape if necessary.
7. Align the notch and position the inlet and outlet sides of the engine air cleaner.
8. Secure the engine air cleaner band clamp.
9. Connect the MAF extension wiring.

tomsn048@gmail.com

10. **NOTE: When battery voltage is removed from the powertrain control module (PCM) (12A650), all learned values will be cleared and reset to predetermined values. When battery voltage is restored to the PCM, the vehicle may exhibit certain driveability concerns. It will be necessary to drive the vehicle to allow the PCM to relearn values for optimum driveability and performance.**

    To install, reverse the removal procedure.

11. Connect ground cable at battery.



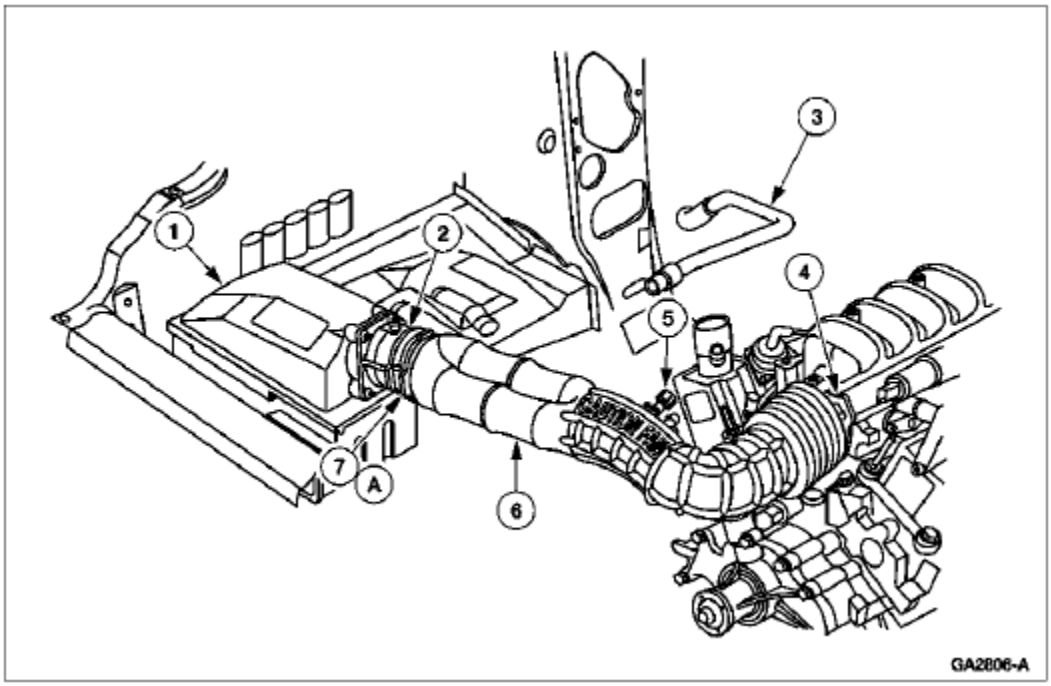
Item	Part Number	Description
1	9600	Engine Air Cleaner
2	—	Grommet and MAF Sensor Extension Wiring.
3	9B659	Air Cleaner Outlet Tube

tomsn048@gmail.com

4	—	Air Cleaner Band Clamp

tomsn048@gmail.com

Mass Airflow (MAF) Sensor — Aerostar



Item	Part Number	Description
1	9600	Engine Air Cleaner
2	12B579	Mass Air Flow Sensor (MAF Sensor)
3	6C342	Crankcase Ventilation Hose
4	9E926	Throttle Body
5	12A697	Intake Air Temperature Sensor (IAT Sensor)
6	9B659	Air Cleaner Outlet Tube
7	—	Air Cleaner Outlet Tube Clamps (2 Req'd)

Removal

1. Disconnect battery ground cable (14301).
2. Loosen the air cleaner outlet tube clamp at the mass air flow sensor (MAF sensor) (12B579) and remove the air cleaner outlet tube (9B659)air cleaner outlet tube from the MAF sensor.
3. Disconnect MAF sensor electrical connector.

tomsn048@gmail.com

4. Remove four MAF sensor nuts.
5. Remove the MAF sensor and discard the gasket.

Installation

1. Clean the sealing surfaces of the engine air cleaner and MAF sensor.
2. Position MAF sensor and new gasket to the engine air cleaner (ACL) (9600) engine air cleaner.
3. Install four MAF sensor nuts and tighten to 10 Nm 88 lb-in).
4. Connect MAF sensor electrical connector.
5. Install the air cleaner outlet tube and tighten the air cleaner outlet tube clamps to 2-3 Nm (18-27 lb-in).
6. **NOTE: When battery voltage is removed from the powertrain control module (PCM) (12A650), all learned values will be cleared and reset to predetermined values. When battery voltage is restored to the PCM, the vehicle may exhibit certain driveability concerns. it will be necessary to drive the vehicle to allow the PCM to relearn values for optimum driveability and performance.**

   Connect negative battery cable.
7. Start the engine and check for air leaks and proper MAF sensor operation.

---

tomsn048@gmail.com

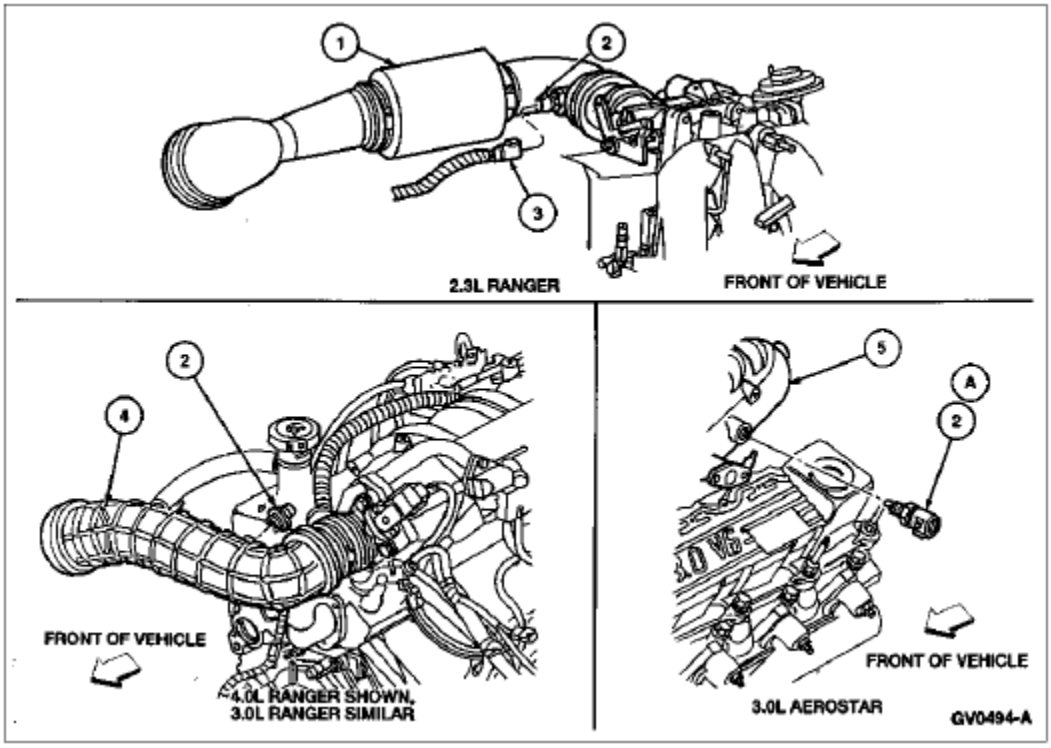
Intake Air Temperature (IAT) Sensor

Removal and Installation

1. Disconnect negative battery cable.
2. Disconnect electrical connector from intake air temperature sensor (IAT sensor) (12A697).
3. Remove intake air temperature sensor.
4. To install, reverse removal procedure. Aerostar only, tighten intake air temperature sensor to 12-17 Nm (9-13 lb-ft).
5. **NOTE: When battery voltage is removed from the powertrain control module (PCM) (12A650), all learned values will be cleared and reset to predetermined values. When battery voltage is restored to the PCM, the vehicle may exhibit certain driveability concerns. It will be necessary to drive the vehicle to allow the PCM to relearn values for optimum driveability and performance.**

   Connect negative battery cable.

Intake Air Temperature (IAT) Sensor Location, 2.3L, 3.0L and 4.0L Engines

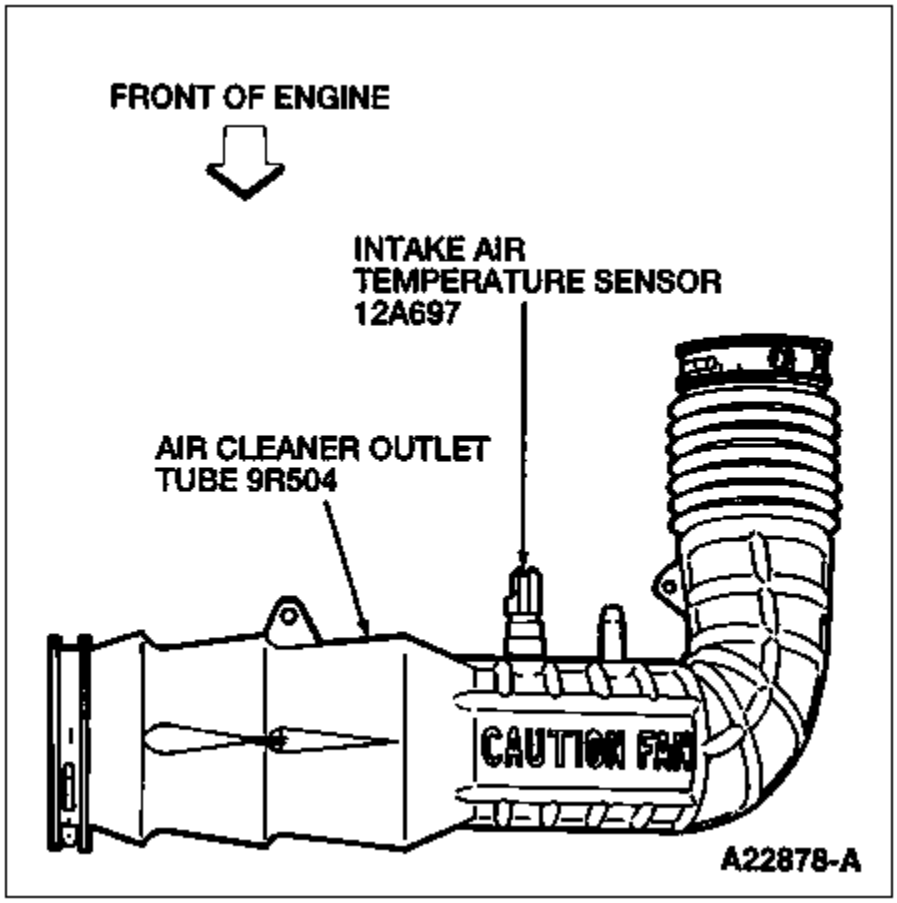


tomsn048@gmail.com

Item	Part Number	Description
1	9B659	Air Cleaner Outlet Tube
2	12A697	Intake Air Temperature Sensor
3	12A581	Engine Wiring Harness
4	9B659	Air Cleaner Outlet Tube
5	9E926	Throttle Body
A	—	Tighten to 12-17 Nm (9-13 Lb-Ft)

tomsn048@gmail.com

Intake Air Temperature (IAT) Sensor Location 4.0 Aerostar



Removal

1. Disconnect battery ground cable (14301).
2. Disconnect electrical connector from intake air temperature sensor (IAT sensor) (12A697).
3. Loosen screw clamp securing IAT tube to engine air cleaner outlet tube and remove intake air temperature sensor.

Installation

1. Install IAT and torque to 3-5 Nm (27-44 lb-in).
2. Position engine air cleaner outlet tube and tighten screw clamp.

tomsn048@gmail.com

3. **NOTE: When battery voltage is removed from the powertrain control module (PCM) (12A650), all learned values will be cleared and reset to predetermined values. When battery voltage is restored to the PCM, the vehicle may exhibit certain driveability concerns. It will be necessary to drive the vehicle to allow the PCM to relearn values for optimum driveability and performance.**

   Connect battery ground cable.

---

tomsn048@gmail.com

Idle Air Control Valve (IAC), 2.3L Engine

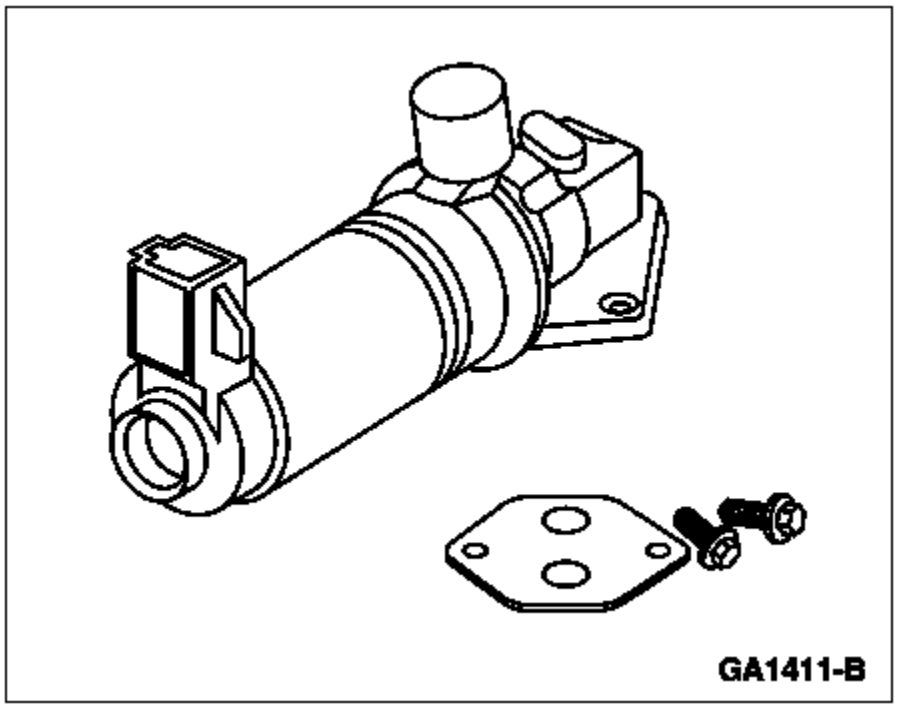
Removal

1. Disconnect battery ground cable (14301).
2. Disconnect idle air control valve electrical connector.
3. Remove two idle air control valve retaining screws.
4. Remove idle air control valve (IAC valve) (9F715) and idle air control gasket (IAC gasket) (9F670).
5. **NOTE: If scraping is necessary, be careful not to damage idle air control valve or throttle body gasket surfaces, or drop material into throttle body.**

   Clean gasket surfaces.

Installation

1. Make sure that both throttle body (9E926) and idle air control valve gasket surfaces are clean.



2. Install idle air control gasket on throttle body surface and mount idle air control valve, securing it with two retaining screws. Tighten to 8-11 Nm (71-97 lb-in).
3. Connect electrical connector to idle air control valve.

tomsn048@gmail.com

4. **NOTE: When battery voltage is removed from the powertrain control module (PCM) (12A650), all learned values wil be cleared and reset to predetermined values. When battery voltage is restored to the PCM, the vehicle may exhibit certain driveability concerns. It will be necessary to drive the vehicle to allow the PCM to relearn values for optimum driveability and performance.**

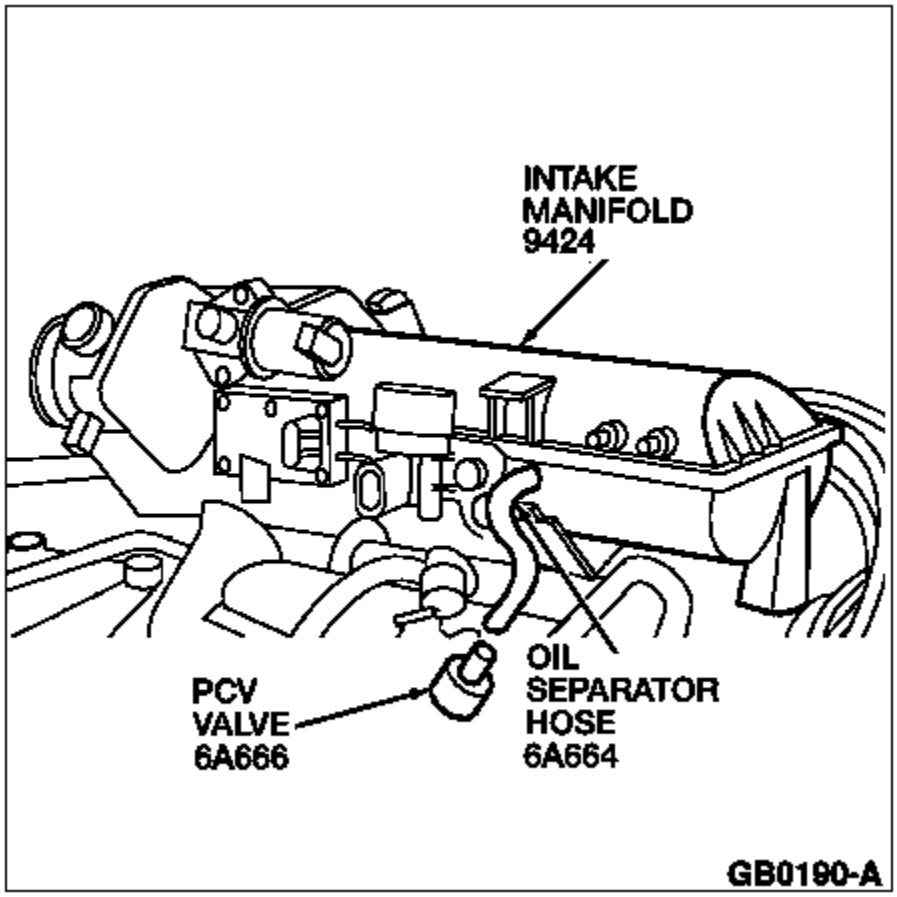
   Connect battery ground cable.

---

tomsn048@gmail.com

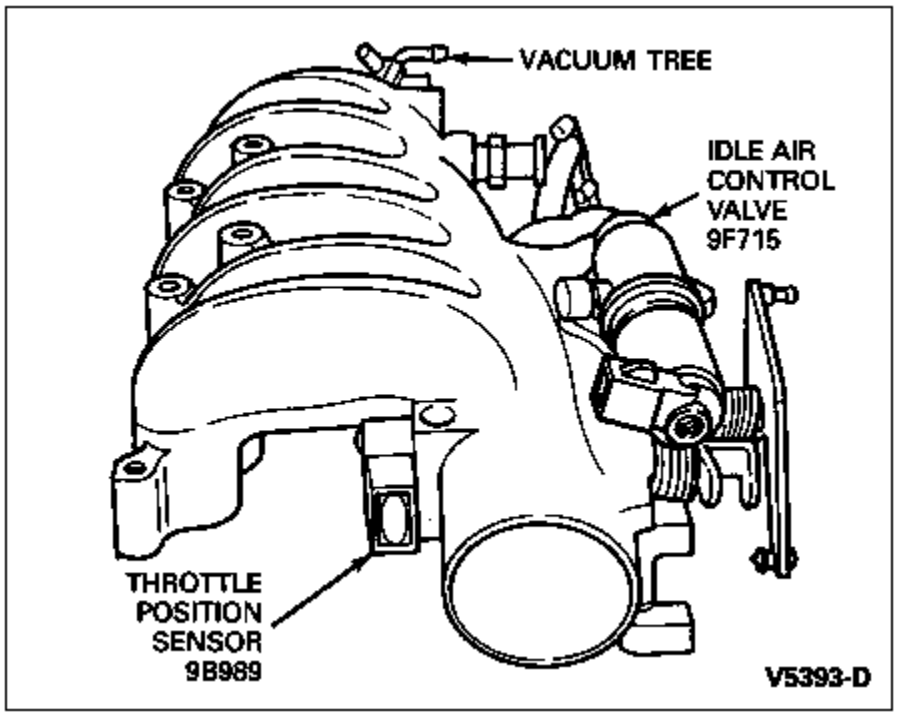
Idle Air Control (IAC) Valve — 3.0L, 4.0L

Idle Air Control Valve — 4.0L



Idle Air Control Valve — 3.0L

tomsn048@gmail.com



Removal

1. Disconnect the battery ground cable (14301).
2. Remove the screws and the accelerator cable splash shield.
3. Disconnect the fuel charging wiring (9D930) connector at the idle air control valve.
4. Remove the two idle air control valve bolts.
5. Remove the idle air control valve (IAC valve) (9F715) and the idle air control gasket (IAC gasket) (9F670).

Installation

1. Position the IAC gasket and the IAC.
2. Install the two IAC bolts and torque to 9-11 Nm (80-97 lb-in).
3. Connect the fuel charging wiring connector to the idle air control valve.
4. Position the accelerator cable splash shield and install the screw.
5. **NOTE: When the battery voltage is removed from the powertrain control module (PCM) (12A650), all learned values will be cleared and reset to predetermined values. When battery voltage is restored to the PCM, the vehicle may exhibit certain driveability concerns. It will be necessary to drive the vehicle to allow the PCM to relearn values for optimum driveability and performance.**

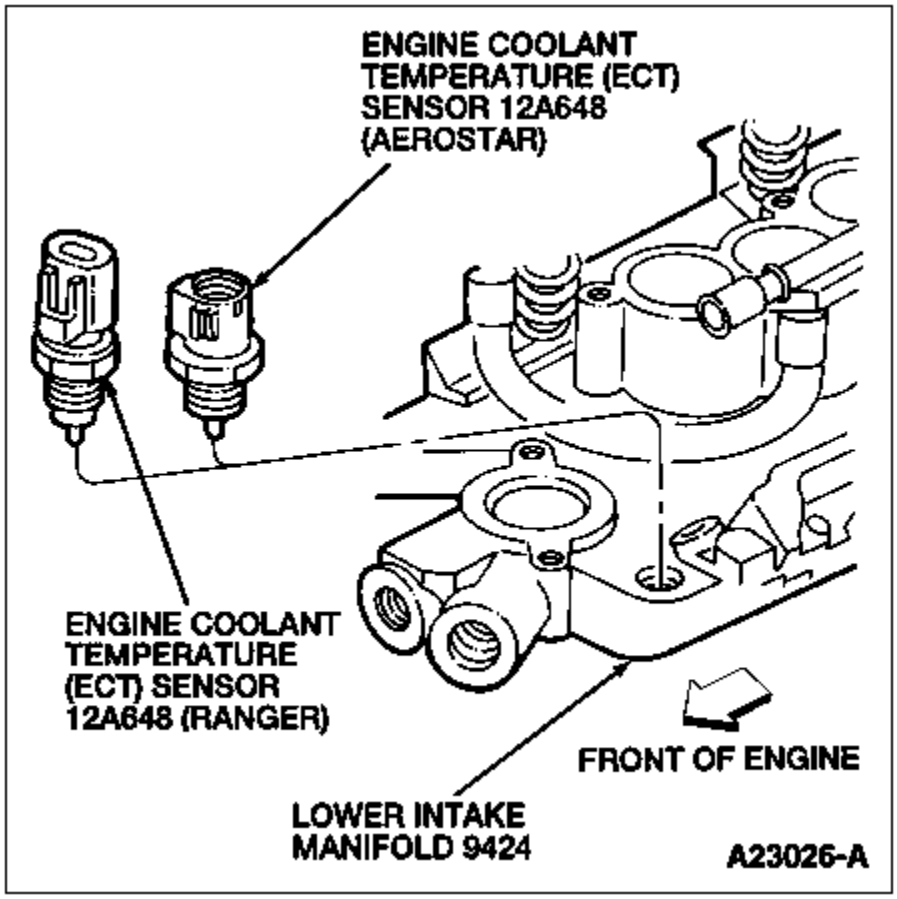
tomsn048@gmail.com

Connect the battery ground cable.

tomsn048@gmail.com

Engine Coolant Temperature (ECT) Sensor

Engine Coolant Temperature (ECT) Sensor — 3.0L

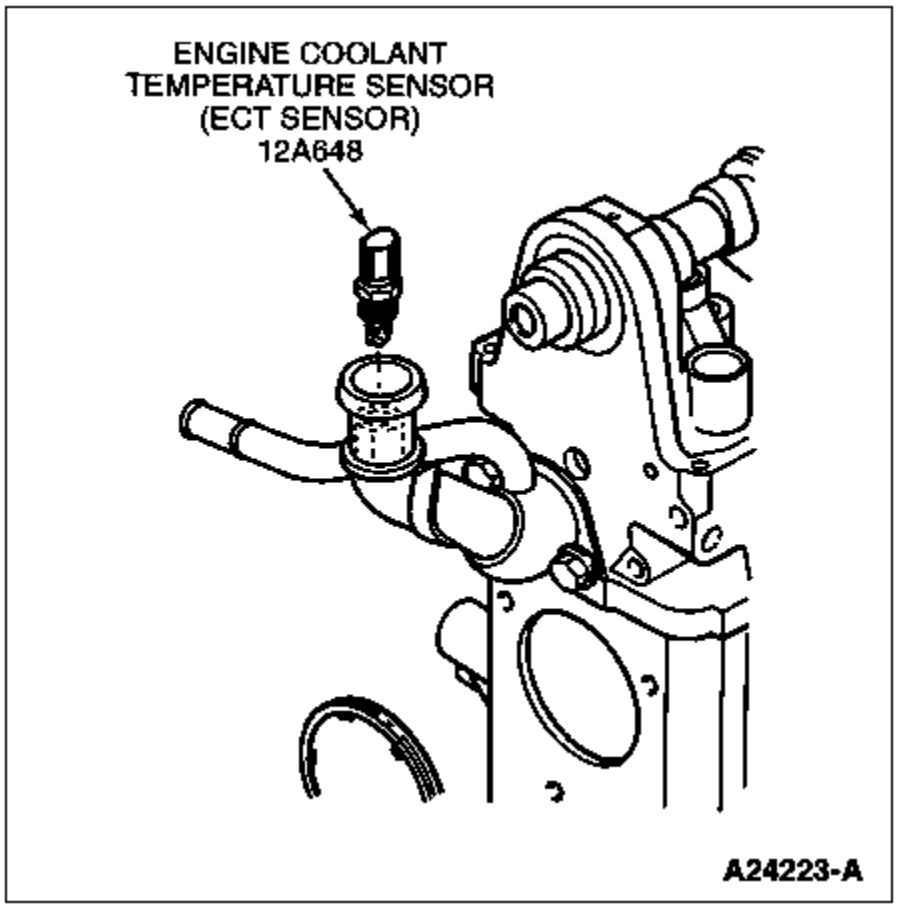


Removal

1. Disconnect battery ground cable (14301).

Engine Coolant Temperature (ECT) Sensor — 2.3L

tomsn048@gmail.com



2. Partially drain cooling system. Refer to Section 03-03 for cooling system service procedures.
3. Disconnect engine coolant temperature sensor (ECT sensor) (12A648) electrical connector.
4. On 3.0L and 4.0L engines, remove engine coolant temperature sensor from lower intake manifold.
5. On 2.3L engines, remove engine coolant temperature sensor from heater hot water supply tube.

Installation

1. Install ECT and torque to 16-24 Nm (12-17 lb-ft).
2. Connect ECT electrical connection.
3. Refill cooling system; refer to Section 03-03 for cooling system service procedure.
4. **NOTE: When battery voltage is removed from the powertrain control module (PCM) (12A650), all learned values will be cleared and reset to predetermined values. When battery voltage is restored to the PCM, the vehicle may exhibit certain driveability concerns. It will be necessary to drive the vehicle to allow the PCM to relearn values for optimum driveability and performance.**

   Connect battery ground cable.

tomsn048@gmail.com

tomsn048@gmail.com

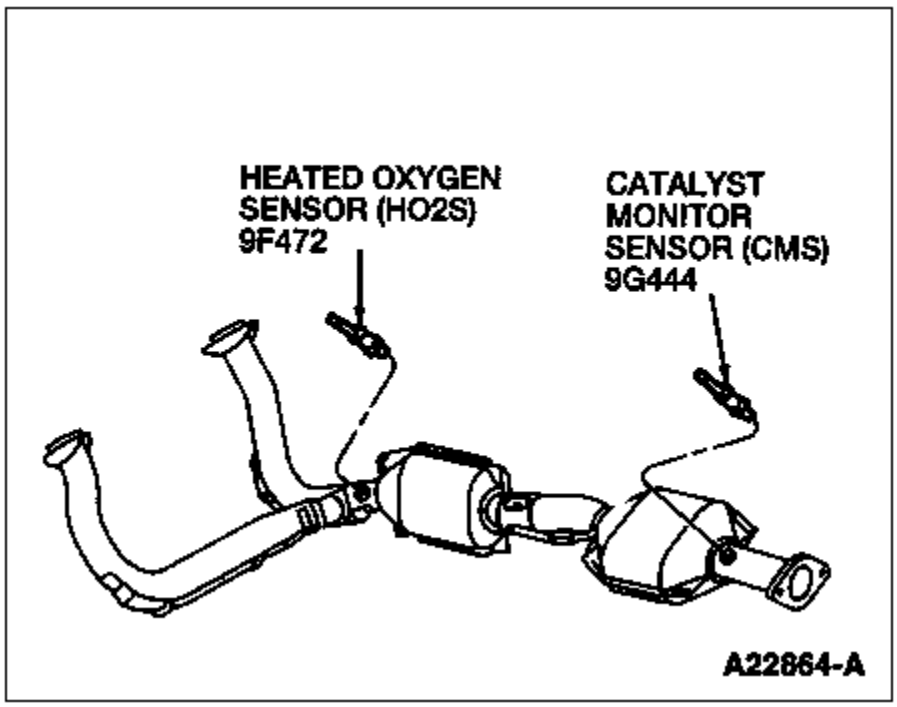
Heated Oxygen Sensor (HO2S)

SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
Oxygen Sensor Wrench	T94P-9472-A

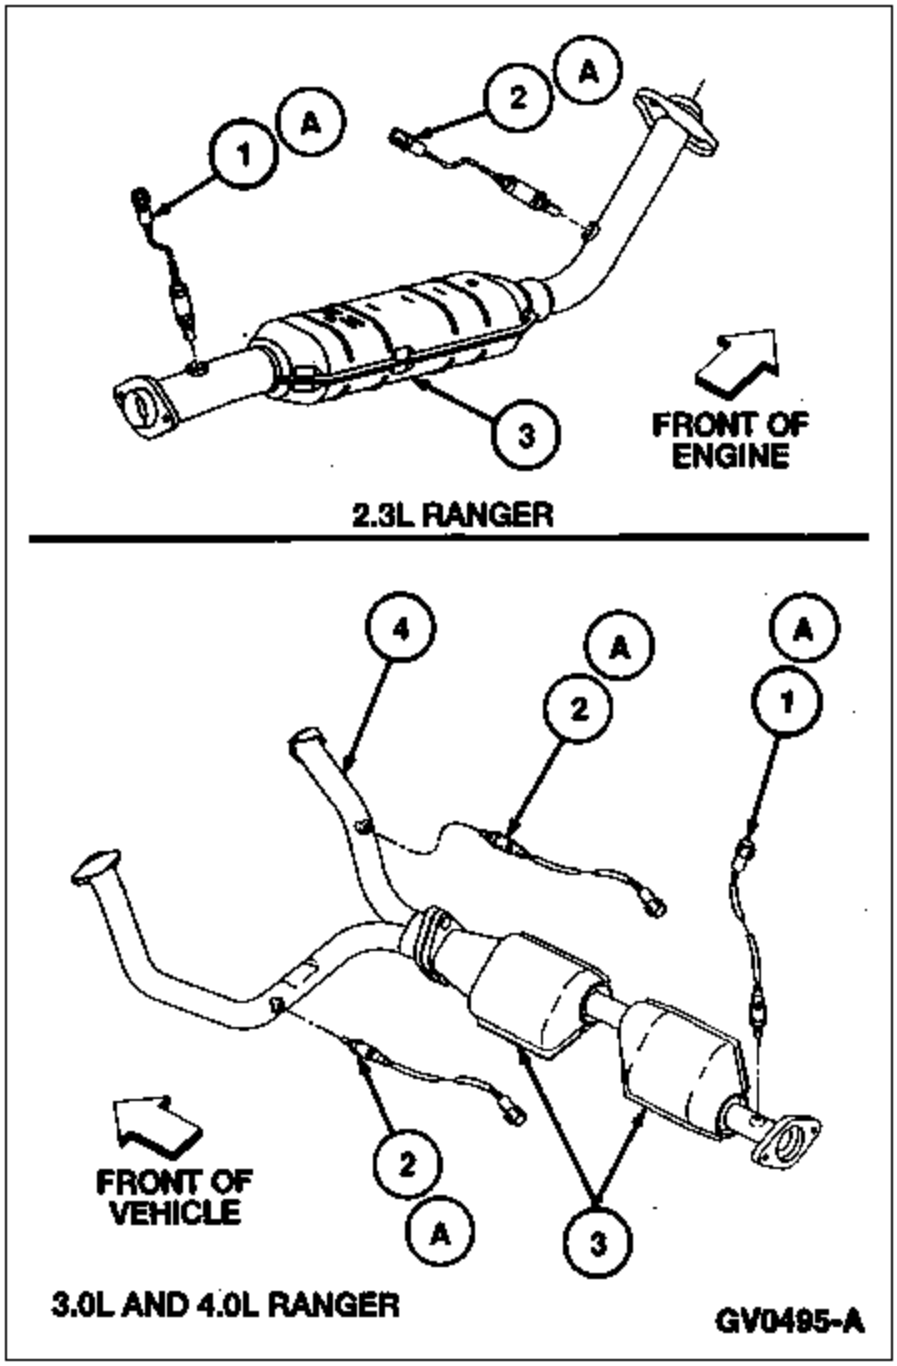
Removal

Heated Oxygen Sensor (HO2S) Location — Aerostar 3.0L, 4.0L



Heated Oxygen Sensor (HO2S) Location, 2.3L, 3.0L, and 4.0L Engines

tomsn048@gmail.com



Item	Part Number	Description
1	9G444	HO2S (Catalyst Monitor)
2	9F472	HO2S (Engine Control)
3	5E212	Catalytic Converter
4	5246	Exhaust Inlet
A	—	Tighten to 34-46 Nm (25-34 Lb-Ft)

tomsn048@gmail.com

1. **NOTE: If excessive force is needed to remove heated oxygen sensor (HO2S) (9F472), lubricate heated oxygen sensor with Ford Penetrating Lubricant E8AZ-19A501-B or equivalent prior to removal.**

   Disconnect battery ground cable (14301).

2. Disconnect heated oxygen sensor from engine control sensor extension wiring (12A690).

3. On 3.0L and 4.0L raise and support vehicle.

4. Remove heated oxygen sensors from exhaust manifold, inlet pipe, or dual converter Y pipe (5F250), using Oxygen Sensor Wrench T94P-9472-A.

Installation

1. Apply a light coat of anti-seize compound F6AZ-9L494-AA install and tighten heated oxygen sensors to 36-46 Nm (27-33 lb-ft).

2. **NOTE: When battery voltage is removed from the powertrain control module (PCM) (12A650), all learned values will be cleared and reset to predetermined values. When battery voltage is restored to the PCM, the vehicle may exhibit certain driveability concerns. It will be necessary to drive the vehicle to allow the PCM to relearn values for optimum driveability and performance.**

   Connect battery ground cable.

---

tomsn048@gmail.com

Camshaft Position (CMP) Sensor — 3.0L and 4.0L

SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
Syncro Positioning Tool — 3.0L, 4.0L	T95T-12200-A

CAUTION: Syncro Positioning Tool T95T-12200-A (3.0L, 4.0L) must be obtained prior to installation of the replacement synchronizer assembly. Failure to follow this procedure will result in the fuel system being out of time with the engine (6007), possibly causing engine damage.

CAUTION: Prior to the removal of the camshaft position sensor (CMP sensor) (12A112), set No. 1 cylinder to 0 degrees top dead center (TDC) of compression stroke. Then note the position of the camshaft position sensor electrical connector. The installation procedure requires that the electrical connector be located in the same position.

Removal

1. Disconnect battery ground cable (14301).
2. Disconnect fuel charging wiring electrical connector from camshaft position sensor.
3. Remove the CMP sensor screws and camshaft position sensor from camshaft synchronizer.

CAUTION: Do not move crankshaft (6303) until entire installation procedure is complete. Doing so will result in the fuel system being out of time with the engine resulting in possible emissions fault.

NOTE: If camshaft synchronizer is to be removed from the cylinder blocks (6010), proceed with Step 4. If the camshaft synchronizer is not being removed, proceed to installation Step 8.

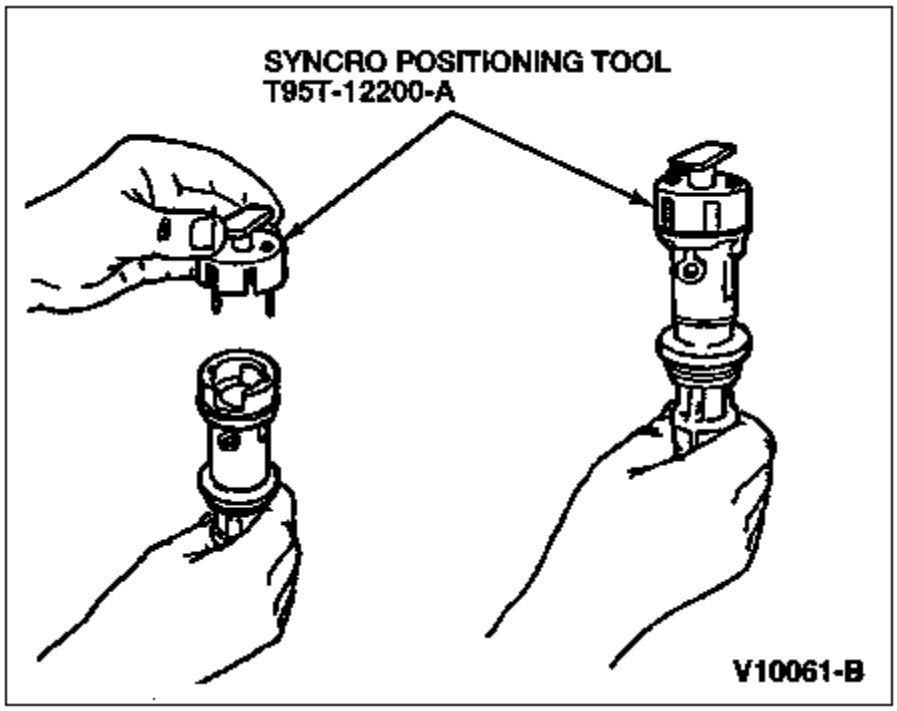
4. Remove hold-down clamp (12270).
5. Remove camshaft synchronizer from cylinder blocks.

Installation

1. Attach Syncro Positioning Tool T95T-12200-A (3.0L, 4.0L).

Camshaft Synchronizer — 3.0L, 4.0L

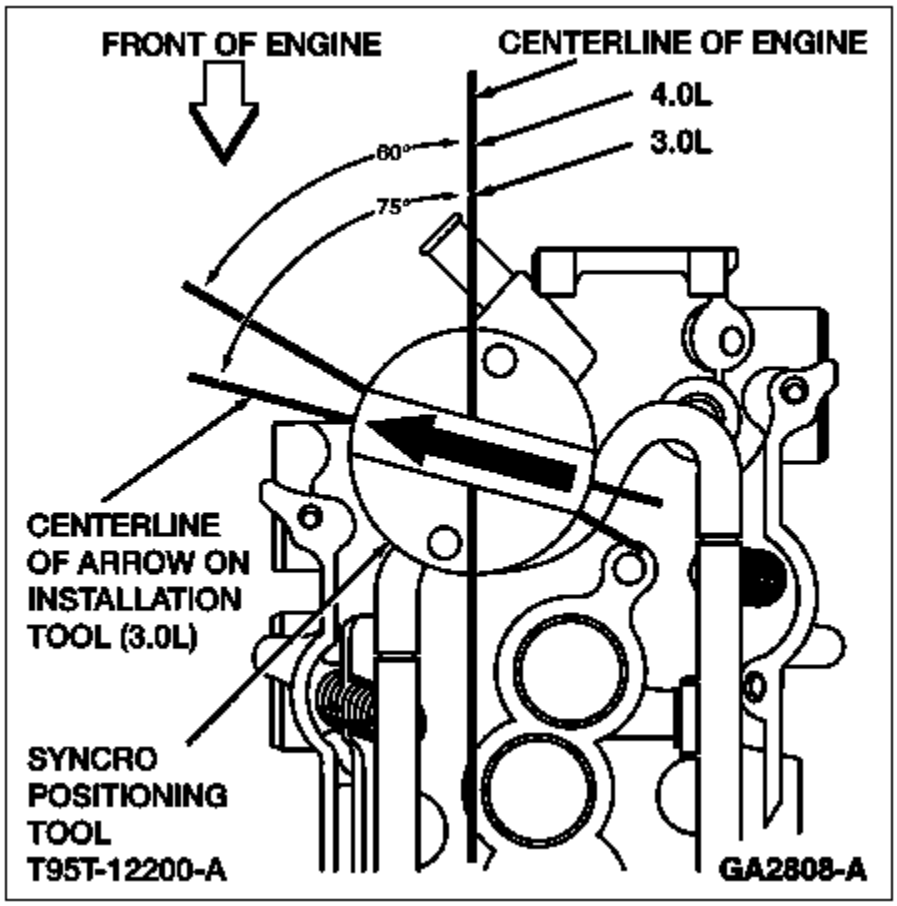
tomsn048@gmail.com



2. Align the synchronizer vane with the radial slot of the Syncro Positioning Tool T95T-12200-A (3.0L).
3. Rotate the tool on the synchronizer base until the tool's boss engages the base notch.
4. Dip gear end into ESE-M2C123-A oil or equivalent to coat gear, thrust washer and lower bearing.

Syncro Positioning Tool — 3.0L, 4.0L

tomsn048@gmail.com



5. **CAUTION: Do not rotate crankshaft when syncro positioning tool is on the camshaft synchronizer. Armature tab will be damaged and synchronizer timing may be shifted.**

   Install camshaft synchronizer so that drive gear engagement occurs when arrow on Syncro Positioning Tool T95T-12200-A is pointed approximately 75 degrees (3.0L), 60 degrees (4.0L) counterclockwise off the centerline of the engine. This step will locate camshaft position sensor electrical connector to the original position.

6. **CAUTION: If camshaft position sensor electrical connector is not positioned properly, DO NOT reposition the connector by rotating the synchronizer assembly. This will result in the fuel system being out of time with the engine, possibly causing engine damage. Remove the synchronizer assembly and repeat Step 5.**

   Install hold-down clamp and tighten to 19-30 Nm (14-22 lb-ft) on 3.0L and 4.0L.

7. Remove Syncro Positioning Tool.

8. Install CMP sensor and CMP sensor screws. Tighten to 2.5-3.5 Nm (23-30 lb-in).

9. Connect fuel charging wiring electrical connector to camshaft position sensor (CMP sensor).

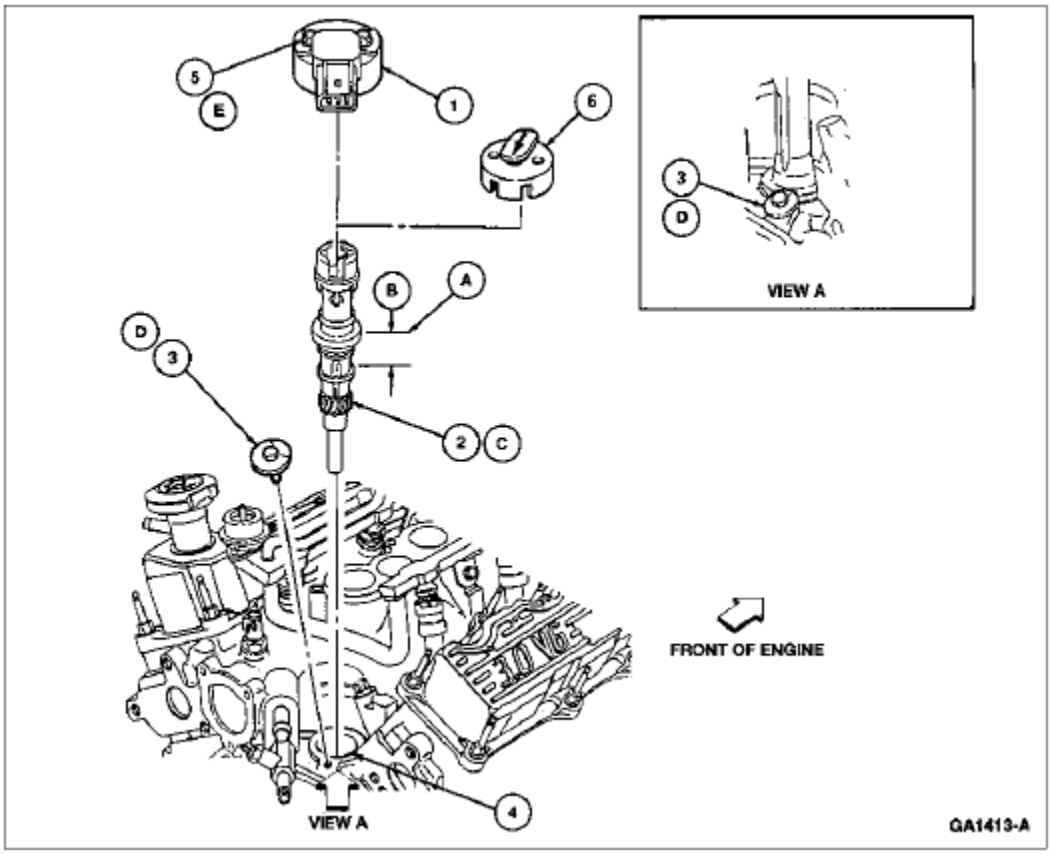
10. **NOTE: When battery voltage is removed from the powertrain control module (PCM) (12A650), all learned values will be cleared and reset to predetermined values. When battery voltage is restored to the PCM, the vehicle may exhibit certain driveability concerns. It will be necessary**

tomsn048@gmail.com

to drive the vehicle to allow the PCM to relearn values for optimum driveability and performance.

Connect battery ground cable.

Camshaft Position (CMP) Sensor — 3.0L Shown, 4.0L



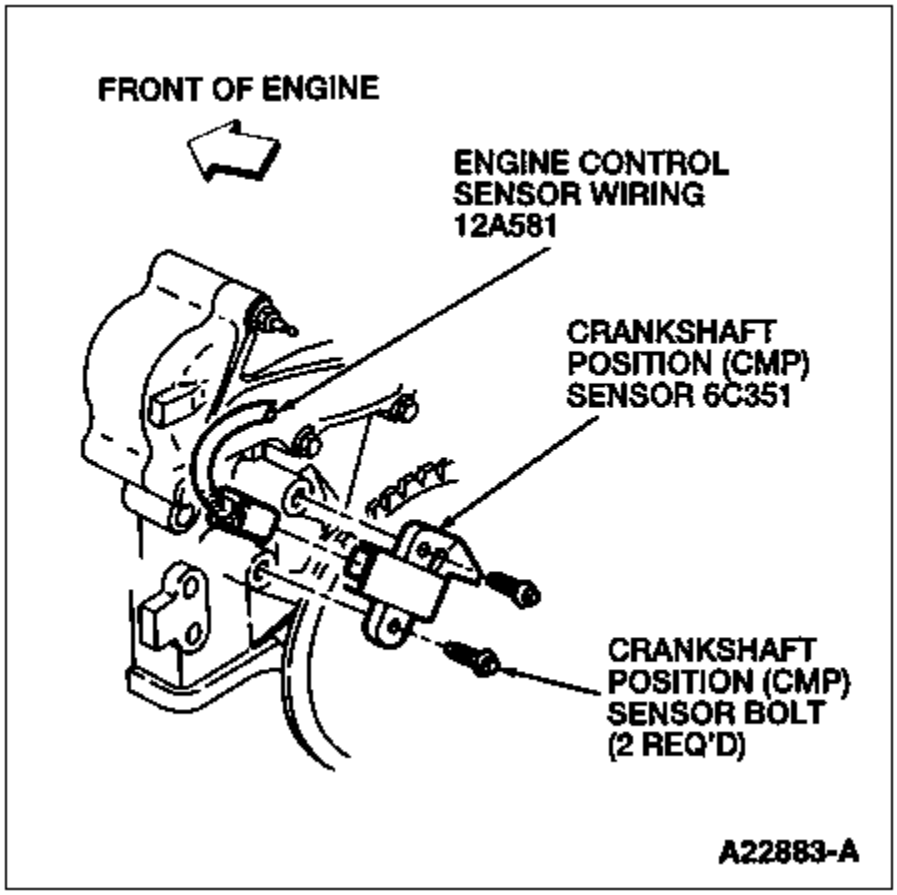
Item	Part Number	Description
1	12A112	Camshaft Position Sensor
2	12A362	Camshaft Synchronizer
3	12270	Hold-Down Clamp
4	6010	Cylinder Blocks
5	N602704-S	CMP Sensor Screws (2 Req'd)
6	T95T-12200-A	Syncro Positioning Tool (3.0L) (4.0L)
A	—	Bottom of Flange
B	—	22mm (.88 In.) Maximum
C	—	Pre-Lube Synchronizer Gear with ESE-M2C123-A Oil
D	—	Tighten to 19-30 Nm (14-22 Lb-Ft) (3.0L and 4.0L)

tomsn048@gmail.com

E	—	Tighten to 2.5-3.5 Nm (23-30 Lb-In)

tomsn048@gmail.com

Crankshaft Position (CKP) Sensor — 3.0L, 4.0L



Removal

1. Disconnect battery ground cable (14301).
2. Disconnect CKP sensor electrical connector.
3. Remove two CKP sensor screws and remove crankshaft position sensor (CKP sensor) (6C351).

Installation

1. Position crankshaft position sensor on engine (6007).
2. Install two CKP sensor screws and tighten to 9-12 Nm (80-106 lb-in) 4.0L, or to 4-7 Nm (35-62 Lb-In) for 3.0L.
3. Route CKP sensor wiring harness and connect electrical connector.

tomsn048@gmail.com

4. **NOTE: When the battery has been disconnected and reconnected, some abnormal drive symptoms may occur while the powertrain control module (PCM) (12A650) relearns its adaptive strategy. The vehicle may need to be driven 16 km (10 miles) or more to relearn the adaptive strategy.**

   Connect battery ground cable.

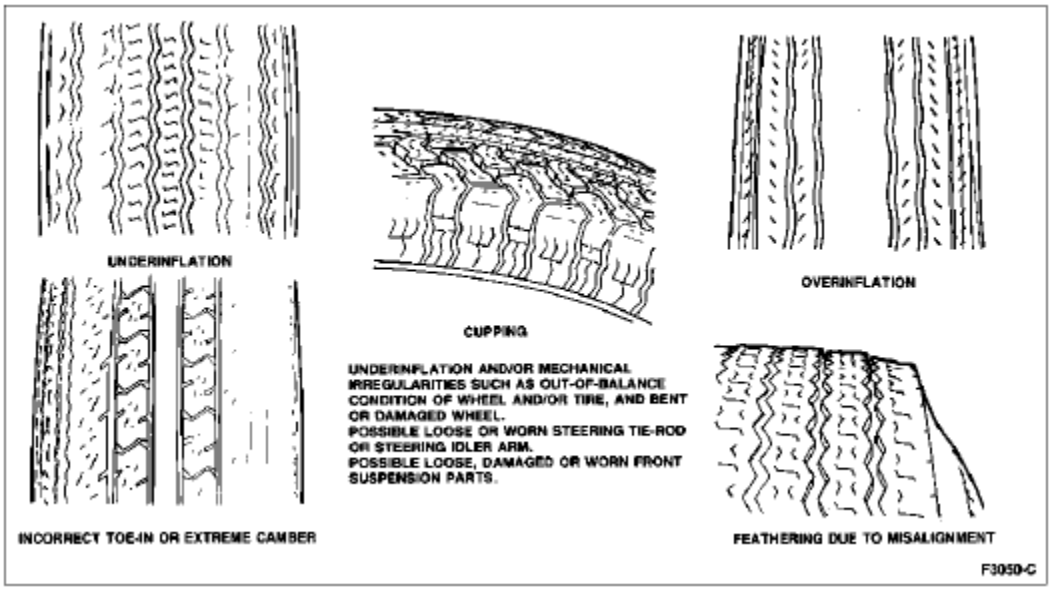
Inspection and Verification

Tire Wear

Inspect tires for wear. The original equipment tires have built-in tread wear indicators to show when tires need replacement. Abnormal or excessive wear may be caused by incorrect wheel alignment, wheel/tire imbalance or improper tire pressure.

Tire Wear Indications



Vibration and Roughness

Vibration, roughness, tramp, shimmy and thump may be caused by excessive tire or wheel runout, worn or cupped tires, or wheel and tire unbalance.

These conditions may also be caused by rough or undulating road surfaces. Driving the vehicle on different types of road surfaces will indicate if the road surfaces are actually causing the condition.

Do not immediately suspect the tires when attempting to diagnose a vibration concern. Other sources of vibration include the following:

- loose or worn wheel bearings
- loose or worn suspension or steering components
- brake hub and rotor runout
- loose engine or transmission supports
- engine-driven accessories

This section covers those vibrations related to the tires and wheels.

For diagnostic procedures and service for non-tire related vibrations, refer to Section 00-04 .

Road Test

A tire vibration diagnostic procedure always begins with a road test. The road test and customer interview (if available) will provide much of the information needed to find the source of a vibration.

During the road test, drive the vehicle on a road that is smooth and free of undulations. If vibration is apparent, note and record the following:

- The speed at which the vibration occurs.
- What type of vibration occurs in each speed range — mechanical or audible.
- How the vibration is affected by changes in vehicle speed, engine speed, and engine torque.
- Type of vibration sensitivity — torque sensitive, vehicle speed sensitive, or engine speed sensitive.

Use the following explanation of terms to help isolate the source of the vibration.

Torque Sensitive

This means that the condition can be improved or worsened by accelerating, decelerating, coasting, maintaining a steady vehicle speed and application of engine torque.

Vehicle Speed Sensitive

This means that the vibration always occurs at the same vehicle speed and is not affected by engine torque, engine speed, or transmission gear selection.

Engine Speed Sensitive

This means that the vibration occurs at varying vehicle speeds when a different transmission gear is selected. It can sometimes be isolated by increasing or decreasing engine speed with the transmission in NEUTRAL, or by stall testing with the transmission in gear. If the condition is engine-speed sensitive, the condition is not related to tires.

If the road test indicates the vibration is related to the tires or wheels, refer to Diagnosis and Testing, Tire Wear in this section. Refer to the Symptom Chart to help pinpoint the cause of the concern. For more wheel and tire diagnosis, refer to Section 04-04 . If the road test indicates that there is tire whine, but no shake or vibration, the noise originates with the contact between the tire and the road surface.

- A thumping noise usually means that the tire has flat or soft spots making a noise as they slap the roadway. Tire whine can be distinguished from axle noise because axle noise diminishes or changes according to load or speed. Tire noise remains the same over a range of speeds.
- To verify that tire noise is not associated with shake or vibration, inflate the tires one at a time and check for a change in the sound. The pitch or whine will change as the increased pressure changes the tire frequency.
- Be sure to deflate tires to their proper pressures after this check is completed.
- A complete road test procedure is provided in Section 00-04 .

Front End

CAUTION: Do not attempt to adjust front wheel alignment without first making a preliminary inspection of the front end parts and correcting where necessary.

Prior to inspection:

- Fill all fluids to specification.
- Make sure spare tire or wheel and related equipment are properly stored.
- Remove all payloads and any excessive accumulation of mud, dirt or road deposits from the chassis and underbody.
- Inflate all tires to the pressure specified on the Safety Compliance Certification Label (usually located on the inside driver's door pillar).
- Check both front tires for the same size, ply rating, and load range.

Inspection

1. Check for excessive wheel bearing end play. Refer to the procedure in Diagnosis and Testing, Wheel Bearing End Play, Front in this section. Adjust and/or replace the wheel bearings as described in Section 04-01A (4x2) or Section 05-03A (4x4 Ranger). For Aerostar E-4WD, replace the wheel hub and bearing as an assembly. Refer to Section 05-03C (Aerostar E-4WD).

2. Check for worn or damaged spindle ball joints (Ranger) or upper and lower suspension arm ball joints (Aerostar). Replace the ball joints as described in Section 04-01A (4x2), Section 04-01C (Aerostar E-4WD), or Section 05-03B (4x4 Ranger).

3. Check for bent steering linkage or excessively worn joints. Inspect inner and outer tie rods. Refer to Section 11-03 (Ranger), or Section 11-02C (Aerostar).

4. For Ranger, check the steering gear mounting bolts and tighten to the specified torque.

5. For Ranger only, inspect the radius arm if bent or damaged. Inspect the bushings at the radius arm-to-frame attachment for wear or looseness. Repair or replace parts as required.

6. For Aerostar, inspect the upper and lower suspension arm-to-frame bushings and attachments for wear and looseness. Repair or replace parts as necessary.

7. Check other suspension components for damage.

8. **NOTE: Specifications in this manual do not apply to vehicles with aftermarket changes.**

   Check for aftermarket changes to steering, suspension, wheel and tire components (i.e., competition, heavy duty, etc.).

Ball Joint, Upper — Inspection

Refer to Component Tests in this section. To service ball joints, refer to Section 04-01A for Aerostar (4x2) and Ranger (4x2). Refer to Section 04-01C for Aerostar (E-4WD). Refer to Section 05-03B for Ranger (4x4).

Ball Joint, Lower — Inspection

Refer to Component Tests in this section. To service ball joints, refer to Section 04-01A for Aerostar (4x2) and Ranger (4x2). Refer to Section 04-01C for Aerostar (E-4WD). Refer to Section 05-03B for Ranger (4x4).

Shock Absorber Checks

CAUTION: The low-pressure gas shock absorbers are charged with nitrogen gas to 931 kPa (135 psi) for 1 inch and 1-3/16 inch bore, and 1034 kPa (150 psi) for 1-3/8 inch bore. Do not attempt to open puncture or apply heat to the shock absorbers.

All vehicles are equipped with low-pressure gas-filled hydraulic shock absorbers of the direct acting type. They are nonadjustable and nonrefillable. They cannot be serviced as cartridges and must be serviced as shock assemblies.

Before replacing a shock absorber, check the action of the shock absorbers as follows.

Vehicle Inspection

1. Check all tires for proper inflation pressure.
2. Check tire condition to confirm proper front end alignment, tire balance and overall tire condition such as separation or bulges.
3. Check the vehicle for optional suspension equipment such as heavy duty handling or trailer tow suspensions. These suspensions will have a firmer ride feeling than standard suspensions.
4. Check the vehicle attitude for evidence of possible overload or sagging.

   Many times front spring or torsion bar and front shock absorbers are replaced in an effort to solve a vehicle sag concern. Shock absorbers by design are hydraulic damping units only, and unlike suspension springs, do not support any suspension loads. Therefore, replacing a shock absorber will not correct a vehicle sag concern.
5. Road test vehicle to confirm customer concern.
6. Make sure the shock absorber is securely and properly installed.
7. Check the shock absorber insulators for damage and wear.
8. Replace any worn or damaged insulators and tighten attachments to the specified torque (on a shock absorber which incorporates internal insulators, replace the shock absorbers).
9. Tighten shock absorber attachments to specified torque. Refer to Section 04-01A (4x2), Section 04-01B (4x4), or Section 04-01C (Aerostar E-4WD).
10. Inspect the shock absorber for evidence of fluid leakage.

    A light film of oil (weepage) on the upper portion of the shock absorber is permissible and is a result of proper shock lubrication. Weepage is a condition in which a thin film of oil may be deposited on the shock outer tube (body) and is normally noticed due to the collection of dust in this area. Shock absorbers which exhibit this weepage condition are functional units and should not be replaced. Leakage is a condition in which the entire shock body is covered with oil and the oil will drip from the shock onto the pavement.

If this condition exists, perform the following steps:

- Make sure that fluid observed is not from sources other than the front shock absorber.
- Replace the worn or damaged front shock absorber.

11. Disconnect the lower end of the front shock absorber.

12. With shock absorber in normal upright position, extend and compress the shock absorber as fast as possible, using as much travel as possible. Action should become smooth and uniform throughout each stroke.

    - Higher resistance on extension than on compression is a normal condition.
    - Faint swish noises are also normal.

Hoist Check

1. **Noise:** Noise can be caused by loose suspension or shock attachments. Verify that all shock attachments and the suspension components are tight. Replace any worn or damaged upper stud insulators. Check front spring and front shock absorbers for external damage.

2. **Bottoming Out/Hopping:** Check condition of the rubber suspension travel stops (front suspension bumpers (3020)). Replace if worn or missing. Examine for evidence of previous overload or damaged components.

3. **Force-Check:** Support front suspension lower arm (3078) or axle, and remove lower front shock attachment. Stroke front shock body using as much travel as possible. The action should be smooth and uniform throughout each stroke. Damping forces should be equivalent on both sides of the vehicle.

4. Replace only the worn or damaged front shock absorber.

   In the past it was recommended that front shock absorbers be replaced in pairs if one unit became unrepairable. Improved sealing, new materials, design, and improved rod machining and hardening techniques have added to the reliability of shock absorbers. **Therefore, front shock absorbers no longer need to be replaced in pairs when only one unit is not repairable.**

Bench Test

The front shock absorbers are gas-pressurized, which results in their being fully extended when not restrained. If a front shock absorber does not fully extend, it is damaged and should be replaced. Check length overall. If the front shock absorber does not meet the length overall requirement, it is a good indication something internal is not to specification and the front shock absorber should be replaced.

With the front shock absorber in the normal upright position, compress it and allow it to extend three times to purge the pressure chamber of any gas that may have been introduced during handling.

Place the front shock absorber right side up in a vise. Hand-stroke the front shock absorber as fast as possible using as much travel as possible. Action should be smooth and uniform throughout each stroke. Higher resistance on extension than on compression is normal.

The following conditions are abnormal:

- A lag or skip at reversal of travel near mid-stroke when front shock absorber is properly primed and in the installed position
- Seizing
- Noise, other than a faint swish, such as a clicking upon fast stroke reversal
- Excessive fluid leakage
- With rod fully extended, any lateral motion of rod in relation to outer cylinder

If front shock absorber action remains erratic after purging air, install a front shock absorber, replacing only the damaged front shock absorber. Front shock absorbers do not need to be replaced as sets.

Suspension, Rear

1. Check for leaks on rear shock absorbers (18125).

2. Check shock absorber operation (whether operation is stiff, rough or spongy).

3. Check condition of rear suspension bushings and rear suspension springs.

If the above check reveals evidence of excessive wear, deterioration, or improper operation, replace damaged components.

Vehicle Lean

Side-to-side vehicle lean should be verified by measuring the fender lip-to-ground dimension before beginning diagnosis and service actions. Normal acceptable limits are:

- Maximum of 16mm (5/8 inch) variance between left and right front wheel lips to ground.
- Maximum of 20mm (3/4 inch) variance between left and right rear wheel lips to ground.

NOTE: Codes identifying the front and rear springs are printed on the Safety Standard Certification Label. If a spring should require replacement because it is damaged, worn or due to a leaning condition, replace only with the same part as specified on the label. In rare instances, the spring codes will not reflect the springs as installed due to a district special order (DSO) option or assembly plant substitution. If a DSO option number is shown on the certification label, the District Office can establish whether springs are affected. If the factory-installed springs do not agree with the code printed on the Safety Standard Certification Label (right and left spring part number should match), replace the damaged or worn spring with a new spring of the same part number as the damaged or worn spring. It will not be necessary to replace the matching, non-worn or undamaged spring.

Once a lean condition has been verified, the following procedure should be followed to resolve the condition:

1. Place the vehicle on a flat, smooth surface.

2. Inspect vehicle for any heavy add-ons that may cause excessive weight on any corner of the vehicle.

    - In cases where the excess weight is a snow plow, a rear tailgate lift, etc., the vehicle must be diagnosed with the equipment in place.
    - Measure corner weights if necessary.
    - Vehicle should be empty, fuel tanks full, no cargo such as tools, equipment or debris in the pickup box or rear body section.
    - Vehicle must be sitting on the wheels and tires and not a hoist, jack or jackstands.

3. Check all wheels (1007) and tires:

    - Wheels must be same size and design, right and left side on each axle.
    - Wheels size and design, tire size and tire design should be as indicated on the Vehicle Certification Label.
    - Check air pressure of all tires; inflate to specifications indicated on the Vehicle Certification Label.

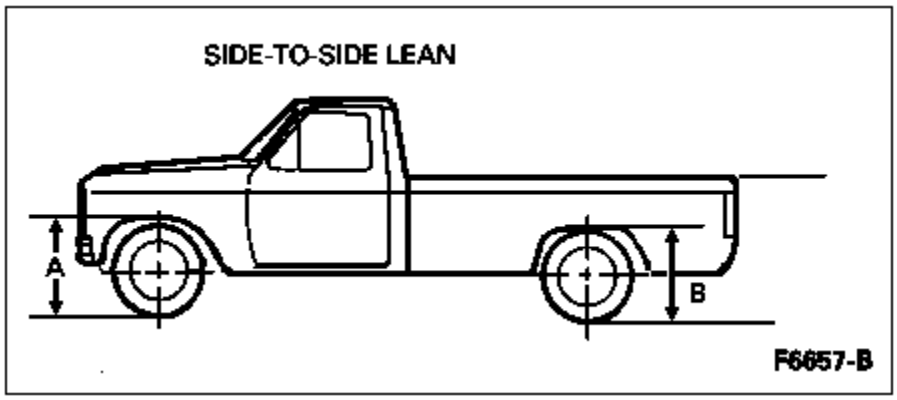
4. Check front and rear suspension. Make sure the same spring is on the left/right front and left/right rear. The front coil springs (5310) have I.D. tags indicating the part number. The rear springs (5560) have the part number stamped on the bottom just behind the U-bolt attachment.

5. Jounce the vehicle's front and rear suspension to normalize the vehicle static ride height.

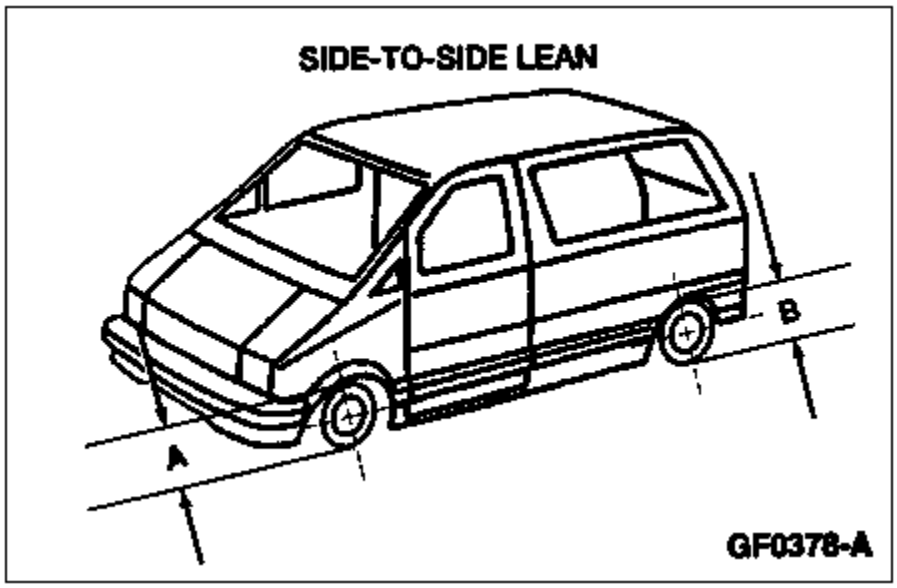
6. Measure the height of the right and left fender lip openings for both front (dimension A) and rear (dimension B).

7. Calculate the side-to-side differences for each dimension. If these differences are greater than 16mm (5/8 inch) between left or right front and/or 20mm (3/4 inch) between left and right rear, adjustment can be performed following the procedure under Adjustments, Vehicle Lean in this section.

Ranger



Aerostar



SIDE-TO-SIDE LEAN

B
GF0378-A

Symptom Chart — Suspension, Service

Refer to the following chart for front suspension problems. For driveline noise, refer to Section 00-04 . For additional diagnostics related to alignments, refer to Section 05-00 .

SUSPENSION, SERVICE

Condition	Possible Source	Action
• Vehicle Leans to One Side	• Incorrect tire pressure.	• ENSURE specified tire pressure for all four tires.
	• Improper tire/wheel usage.	• INSTALL correct tire/wheel combination.
	• Vehicle overloaded or unevenly loaded.	• CORRECT as required.
	• Loose, worn or damaged front or rear suspension components.	• Visually INSPECT suspension systems. REPAIR or REPLACE as required.
	• Improper spring usage or improperly installed and seated springs.	• Correct as required.
	• Incorrect front axle ride height.	• ADJUST or REPLACE as required.
	• Twin I-Beam to frame dimension out of specifications (over 16mm [5/8 inch] difference side to side) for Ranger.	• For Ranger, REFER to Adjustments, Front Lean for instructions on shimming to ADJUST ride height.
	• Incorrect rear axle ride height.	• ADJUST or REPLACE as required.
	• Rear axle to frame dimension out of specification (Ranger).	• For Ranger , LOOSEN spring shackle and hanger bolts, both sides. JOUNCE vehicle. TIGHTEN U-bolts to specification. RECHECK height.
		• If side-to-side ride height is less than 20mm (3/4 inch), REFER to Adjustments, Rear Lean in this section.
		• If ride height is greater than 20mm (3/4 inch), SWITCH rear springs from side to side.
		• If rear spring switch is not effective, REPLACE both rear springs.
		• TIGHTEN all bolts to specification.
• Front Bottoming or Riding Low	• Incorrect tire pressure.	• CORRECT as required.

	• Improper tire/wheel usage.	• INSTALL correct tire/wheel combination.
	• Vehicle overloaded or unevenly loaded.	• REMOVE or REDISTRIBUTE load as required.
	• Broken or incorrectly installed front coil springs.	• REPAIR or REPLACE as necessary.
	• Loose or broken front shock absorbers.	• TIGHTEN or REPLACE as necessary.
	• Distorted or split front suspension bumper.	• CORRECT as required.
	• Improper ride height.	• For Ranger and Aerostar, MEASURE vertical distance between axle and spring tower flange/frame rail. If height is below ride heights, INSTALL shims (part number 389117 shims — 2 max.) under lower spring seats.
	• Incorrect front coil springs.	• REPLACE front coil springs.
• Dogtracking of Rear Wheels	• Loose or damaged front or rear suspension components.	• INSPECT, REPAIR or REPLACE as required.
	• Loose rear spring U-bolts.	• CHECK for damaged components. REPAIR as required.
	• Rear springs improperly installed on axle.	• REPAIR as required.
	• Rear spring center bolt bent.	• REPLACE center bolt.
	• Non-OEM size/style tires and/or wheels.	• INSTALL OEM equipment.
• Shimmy or Wheel Tramp	• Loose front axle pivot bracket attaching parts (Ranger).	• TIGHTEN to specification.
	• Loose upper or lower control arm attaching parts (Aerostar).	• INSPECT and TIGHTEN to specification.
	• Tire pressure.	• ADJUST air pressure in tires.
	• Excessive tire sidewall deflection.	• INSPECT, ADJUST air pressure and REPLACE as necessary.
	• Irregular tire wear or tire sizes not uniform.	• CHECK front wheel alignment, ADJUST and REPLACE with same size tires.
	• Loose wheel lugnuts.	• REPLACE damaged parts. TIGHTEN to specifications.
	• Front wheel bearing adjustment.	• ADJUST to specifications.
	• Radial runout of wheels.	• FOLLOW tire and wheel runout

		check in this section.
	• Radial runout of tires.	• FOLLOW tire and wheel runout check in Section 04-04 .
	• Wheel and tire lateral runout not to specifications.	• FOLLOW tire and wheel runout check in Section 04-04 .
	• Wheel and tire balance.	• BALANCE wheels and tires.
	• Front wheel alignment (toe-in, camber and caster).	• SET toe to specifications. SET caster to specifications.
	• Deteriorated radius arm bushing (Ranger).	• REPLACE.
	• Loose or damaged front shock absorbers.	• TIGHTEN and REPLACE as necessary.
	• Loose, worn or damaged steering linkage and idler arm connections (Ranger).	• TIGHTEN or REPLACE as necessary.
	• Loose, worn or damaged steering tie rods (Aerostar).	• TIGHTEN or REPLACE as necessary.
	• Broken or sagging springs.	• REPLACE as required.
	• Loose steering gear mounting.	• INSPECT and REPAIR as required. TIGHTEN to specifications.
	• Incorrect steering gear adjustment (Ranger).	• ADJUST to specifications.
	• Worn ball joints.	• REPLACE ball joints.
• Sway or Roll	• Tire pressure.	• ADJUST air pressure in tires.
	• Worn or loose stabilizer assembly.	• TIGHTEN or REPLACE as required.
	• Loose or defective front shock absorbers.	• TIGHTEN or REPLACE as required.
	• Excessive load or body height.	• CORRECT as necessary.
	• Unequal load distribution (side to side or excessively rearward).	• CORRECT as necessary.
	• Loose wheel lugnuts.	• TIGHTEN to specifications.
	• Broken or sagging spring (Ranger, Aerostar).	• REPLACE as required.
	• Steering gear adjustment (Ranger).	• ADJUST to specifications.
	• Loose steering gear mounting.	• CHECK for damaged components. REPAIR as required.
	• Excessive front or rear	• CORRECT as necessary.

	overhang.	
	• Broken tie bolts on rear spring.	• REPLACE as required.
	• Non-OEM size/style tires and/or wheels.	• INSTALL OEM equipment.
• Wander	• Improper loading.	• WEIGH vehicle/balance load.
	• Improper tire/wheel size.	• REPLACE as necessary.
	• Improper tire pressure.	• INFLATE to specification.
	• Steering gear not centered (Ranger).	• CENTER steering wheel by ADJUSTING tie rod.
	• Steering gear preload/meshload adjustment off (Ranger).	• MEASURE/ADJUST preload/meshload.
	• Incorrect wheel alignment.	• ALIGN front end.
	• Excessive spindle rotating torques.	• INSPECT ball joints. REPLACE as necessary.
	• Steering linkage ball studs sloppy (Ranger).	• INSPECT and REPLACE as necessary.
	• Steering inner or outer tie rods sloppy (Aerostar).	• INSPECT and REPLACE as necessary.
• Sticky, Steering, Pointing or Poor Small Angle Returnability	• High spindle rotating torque.	• INSPECT and REPAIR.
	• Fluid level low.	• CHECK fluid level.
	• Incorrect front wheel toe set (poor groove feel mainly).	• MEASURE and RESET toe-in
	• Excessive steering gear preload/meshload (Ranger).	• MEASURE and ADJUST meshload/preload.
• Drift/Pull	• Improper loading creating caster split.	• MEASURE alignment and service as required. WEIGH vehicle.
	• Mismatched tires/wheels.	• REPAIR as required.
	• Tire pressure.	• INFLATE to specification.
	• Uneven tire wear (conicity).	• REPAIR through tire rotation.
	• Unequal tire circumferences.	• MEASURE and REPAIR.
	• Excessive caster split.	• CHECK caster split — SET to optimum caster split per alignment chart in this section.
	• Improper toe set.	• MEASURE and RESET toe-in.
	• Front/rear wheel brake	• CHECK during alignment inspection.

	drag. • Power steering rotary control valve centering (Ranger).	• CHECK steering gear centering. REFER to Section 11-02B .
• Drift Left or Right	• Tires. • Steering linkage. • Alignment.	• PERFORM Pinpoint Test A .
• Steering Wheel Off-Center	• Clear vision. • Steering linkage.	• PERFORM Pinpoint Test B .
• Tracks Improperly	• Caster. • Rear suspension.	• PERFORM Pinpoint Test C .
• Rough Ride	• Front shock absorbers. • Rear shock absorbers.	• PERFORM Pinpoint Test D .
• Excessive Noise	• Shock absorbers • Springs. • Suspension components.	• PERFORM Pinpoint Test E .
• Improper Tire Wear	• Tires (alignment). • Tires (balance).	• PERFORM Pinpoint Test F .
• Vibration	• Tires and wheels. • Wheel bearings. • Wheel hubs. • Rotors. • Drums.	• PERFORM Pinpoint Test G .

Pinpoint Tests

PINPOINT TEST A: DRIFT LEFT OR RIGHT

A1 CHECK TIRES

- Inspect tires for excessive wear or damage.

Are tires excessively worn or damaged?

Yes	No
REPLACE tires.	GO to **A2** .

A2 CHECK STEERING LINKAGE

- Raise vehicle on hoist.
- Check steering linkage for indications of excessive wear or damage.

Is there indication of excessive wear or damage?

Yes	No
REPAIR or REPLACE worn or damaged components as necessary.	GO to **A3** .

A3 CHECK VEHICLE ALIGNMENT

- Place vehicle on an alignment rack.
- Check vehicle alignment.

Is alignment within specification?

Yes	No
GO to **B1** .	ADJUST alignment as necessary.

PINPOINT TEST B: STEERING WHEEL OFF-CENTER

B1 CHECK CLEAR VISION

- Place vehicle on alignment rack.

Is clear vision within specifications?

Yes	No
GO to **B2** .	ADJUST clear vision to specification. REFER to Adjustments, Alignment For Clear Vision .

B2 INSPECT STEERING COMPONENTS

- Raise vehicle on hoist.
- Inspect steering and suspension components for excessive wear or damage.

Are steering and suspension components excessively worn or damaged?

Yes	No
REPLACE or REPAIR worn components. REFER to Section 04-01A , Section 04-01B , Section 04-01C or Section 11-00 .	GO to **C1** .

PINPOINT TEST C: TRACKS IMPROPERLY

C1 CHECK CASTER

- Place vehicle on alignment rack.

Is caster within specification?

Yes	No
GO to **C2** .	ALIGN vehicle.

C2 CHECK REAR SUSPENSION

- Measure vehicle wheel base for LH and RH.
- Compare measurements.

Are measurements the same?

Yes	No
	INSPECT rear suspension components for wear or damage. REPAIR or REPLACE worn or

GO to **D1** .	damaged components as required. REFER to Section 04-02 .

PINPOINT TEST D: ROUGH RIDE

D1 CHECK FRONT SHOCK ABSORBERS

- Raise vehicle on hoist.
- Inspect front shock absorbers for oil leaks or damage.

Are front shock absorbers leaking?

Yes	No
REPLACE front shock absorbers. REFER to Section 04-01A , Section 04-01B or Section 04-01C .	GO to **D2** .

D2 CHECK REAR SHOCK ABSORBERS

- With vehicle on hoist, inspect rear shock absorbers for oil leak or damage.

Are rear shock absorbers leaking?

Yes	No
REPLACE rear shock absorbers. REFER to Section 04-02 .	Vehicle OK.

PINPOINT TEST E: EXCESSIVE NOISE

E1 INSPECT SUSPENSION

- Raise vehicle on hoist.
- Inspect shock absorber mount bolts.

Are mounting bolts loose or broken?

Yes	No
TIGHTEN/REPLACE shock absorber mount bolts. REFER to Section 04-01A , Section 04-01B or Section 04-02 .	GO to **E2** .

E2 INSPECT SPRINGS

- With vehicle on hoist, inspect springs for damage.

Are springs damaged?

Yes	No
REPLACE springs. REFER to Section 04-01A , Section 04-01B , Section 04-01C or Section 04-02 .	GO to **E3** .

E3 INSPECT FRONT SUSPENSION

- Inspect front suspension components for excessive wear or damage.

Are front suspension components worn or damaged?

Yes	No
REPLACE worn or damaged front suspension components. REFER to Section 04-01A , Section 04-01B or Section 04-01C .	Vehicle OK.

PINPOINT TEST F: IMPROPER TIRE WEAR

F1 INSPECT TIRES

- Raise vehicle on hoist.
- Inspect tires for uneven wear on inner or outer shoulder.

Is there uneven tire wear?

Yes	No
ALIGN vehicle. REPLACE tires if badly worn.	GO to **F2** .

F2 UNEVEN TIRE WEAR

- With vehicle on hoist, inspect tires for sawtooth pattern.

Do tires have sawtooth pattern?

Yes	No
ALIGN vehicle. REPLACE tires if badly worn.	GO to **F3** .

F3 CHECK FOR CUPPED TIRE

- With vehicle on hoist, inspect tires for cupping or dishing.

Are tires cupped or dished?

Yes	No
BALANCE and ROTATE tires.	Vehicle OK.

PINPOINT TEST G: VIBRATION

G1 ROAD TEST

- Accelerate vehicle to the speed which the customer indicated the vibration occurred.

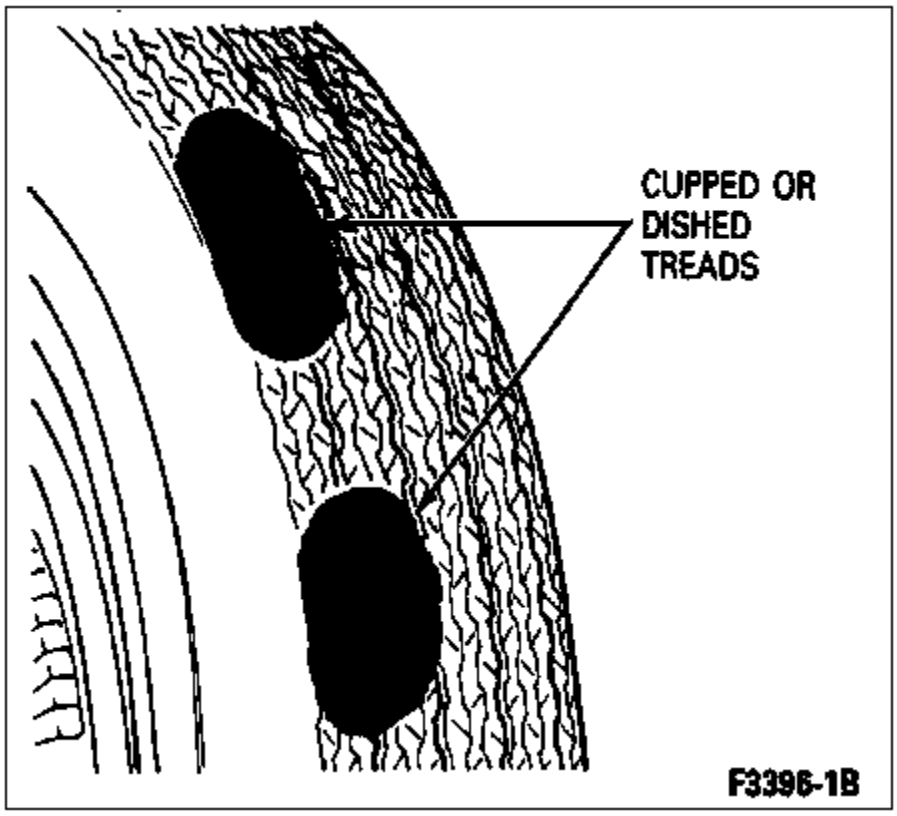
Is a vibration present?

Yes	No
GO to **G2** .	Vehicle OK.

G2 INSPECT TIRES

- Raise vehicle on a frame contact hoist. Inspect tires for extreme wear or damage, cupping or flat spots. Refer to Diagnosis and Testing, Tire Wear in this section.

Are tires OK?



Yes	No
GO to G3.	CHECK suspension components for misalignment, abnormal wear, or damage that may have contributed to the tire wear. CORRECT suspension concerns and REPLACE damaged tires. PERFORM Road Test.

G3 INSPECT WHEEL BEARINGS

- Spin tires by hand to check for wheel bearing roughness. Check wheel bearing end play.

Is wheel bearing end play OK?

Yes	No
GO to G4.	REPLACE wheel bearings as necessary. PERFORM Road Test.

G4 TIRE/WHEEL BALANCE

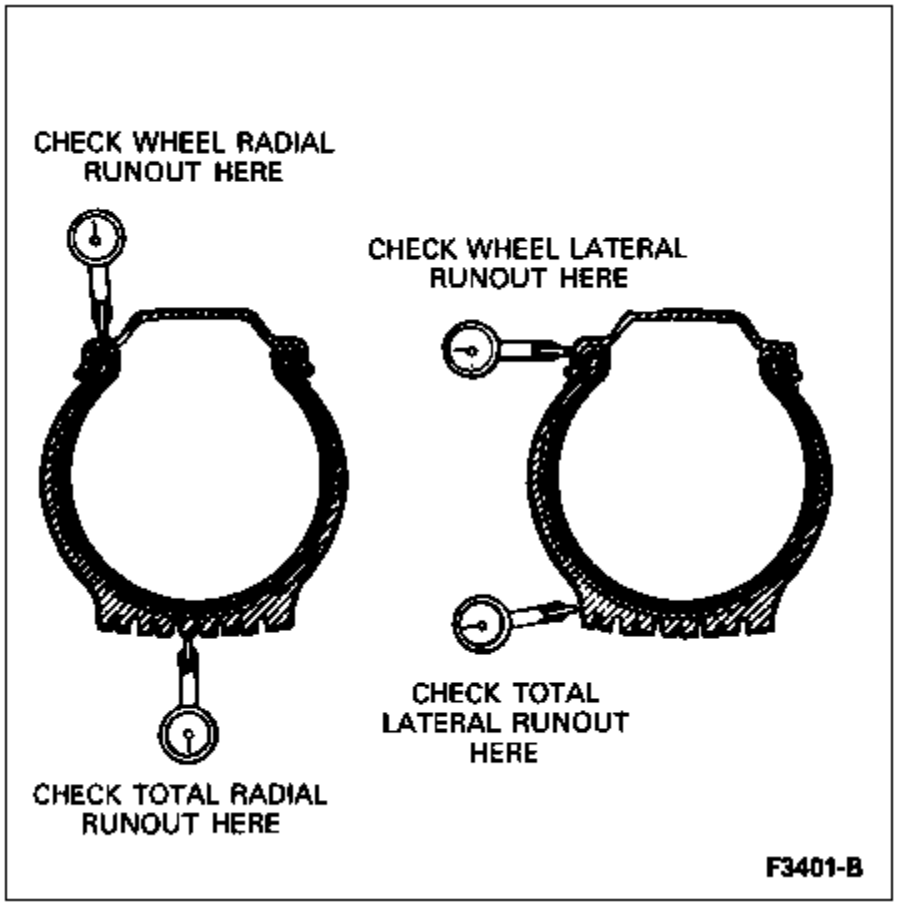
- Check tire/wheel balance, correct as needed.
- Road test.

Are tires and wheels balanced?

Yes	No
GO to **G5** .	BALANCE tires and wheels as necessary. PERFORM Road Test.

G5 MEASURE RUNOUTS

- For each wheel position measure, locate and mark:
  - High point of tire/wheel assembly total radial runout.
  - High point of wheel radial runout.
  - High point of wheel lateral runout.



- Record all measurements in chart below.

Have all tire/wheel assemblies been measured?

Assembly Position	Tire/Wheel Assembly Total Radial Runout	Wheel Radial Runout	Wheel Lateral Runout
Left Front			

Right Front			
Left Rear			
Right Rear			
Example	1.52mm (0.060 Inch)	0.50mm (0.020 Inch)	0.63mm (0.025 Inch)

Yes	No
GO to **G6** .	COMPLETE measurements and REPEAT Step **G5** .

G6 ANALYSIS OF RUNOUT MEASUREMENT

- Measurements obtained in G5 will fall within guidelines below.

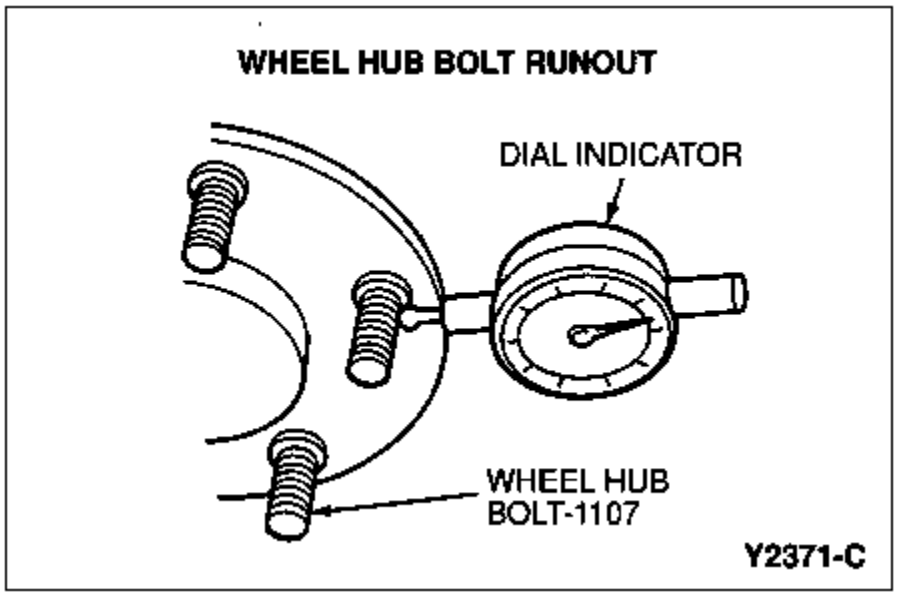
Do any of these conditions exists?

Condition	Assembly Total Radial Runout	Wheel Radial Runout	Wheel Lateral Runout
1	Less Than 1.02mm (0.040 Inch)	Less Than 1.14mm (0.045 Inch)	Less Than 1.14mm (0.045 Inch)
2	Less Than 1.02mm (0.040 Inch)	More Than 1.14mm (0.045 Inch)	Less Than 1.14mm (0.045 Inch)
3	Less Than 1.02mm (0.040 Inch)	Less Than 1.14mm (0.045 Inch)	More Than 1.14mm (0.045 Inch)
4	More Than 1.02mm (0.040 Inch)	Less Than 1.14mm (0.045 Inch)	Less Than 1.14mm (0.045 Inch)
Example	More	Less	Less

Yes	No
Condition 1; Good Assembly. GO to **G12** . Condition 2; REPLACE wheel. GO to **G7** . Condition 3; REPLACE wheel. GO to **G7** . Condition 4; INDEX tire/wheel. GO to **G9** .	RECHECK measurements.

G7 WHEEL HUB BOLT RUNOUT

- Wheel hub bolt runout can affect wheel runout. Remove wheels and inspect lug bolts.
- Measure wheel hub bolt runout. Refer to Section 04-04 .



- Wheel hub bolt circle runout should not exceed .41mm (0.016 inch). TIR (Total Indicated Runout).

Is wheel hub bolt runout within the limit?

Yes	No
GO to **G8** .	CHECK for bent or damaged lug bolts. REPLACE as necessary. CHECK wheel hub bolt runout again. If OK, GO to **G8** .

G8 REPLACING A WHEEL

- Align the runout index mark of the new wheel 180 degrees away from the previously measured total assembly radial runout high point.
- Measure the runouts on the new assembly.

Is assembly within specification from G6?

Yes	No
GO to **G11** .	FOLLOW direction from **G6** .

G9 INDEX TIRE/WHEEL ASSEMBLY

- Align high point of total assembly radial runout 180 degrees away from high point of wheel radial runout.
- Measure total assembly radial runout.

Is total radial runout less than 0.76mm (0.030 inch)?

Yes	No
GO to **G11** .	GO to **G10** .

G10 REPLACE A TIRE

- Align high point of wheel radial runout to runout index mark on new tire.
- Measure total assembly radial runout.

Is total radial runout less than 1.02mm (0.040 inch)?

Yes	No
GO to **G11** .	REPEAT procedure **G10** with another new tire.

G11 BALANCE NEW TIRE/WHEEL

- Balance new tire/wheel assembly.
- After all assemblies have been checked and corrected, road test vehicle.

Is vehicle operating correctly?

Yes	No
Vehicle OK.	GO to **G12** .

G12 SUBSTITUTE WHEELS AND TIRES

- Substitute a known good set of wheels and tires.
- Road test.
- If the vehicle still exhibits a shake or vibration, note the vehicle speed and/or engine rpm at which it occurs.

Is vibration felt?

Yes	No
GO to **G13** .	INSTALL original tire/wheel assemblies one by one, ROAD TESTING at each step until the damaged tire(s) is identified. REPLACE tire(s) as necessary and RETEST.

G13 VIBRATION DIAGNOSIS OF ENGINE/TRANSMISSION VS. DRIVESHAFT/SUSPENSION COMPONENTS

- Spin all four wheels independently to identify position generating problem vibration.
  - For rear wheels, use on car balance machine.
  - For front wheels, accelerate to half critical speed observed in road test.

Was any vibration observed at the wheels?

Yes	No
CHECK front disc brake hub and rotors or brake drums. REFER to Pinpoint Tests in Section 00-04 .	Engine/transmission imbalance. REFER to Group 02, Group 03 and Group 07.

Component Tests

Ball Joints, Front Suspension Upper and Lower, Aerostar

1. Position a floor jack under the front suspension lower arm (3078) and jack up the vehicle far enough for the tire to clear the ground.

2. Grasp the lower edge of the tire and move the wheel in and out. While the wheel is being moved, observe the lower spindle jaw and the front suspension lower arm.

A movement of 0.8mm (1/32-inch) or greater between the front suspension lower arm and the lower spindle jaw indicates the front suspension lower arm ball joint (3050) must be replaced.

3. Inspect the rubber bushings at the lower control arm attachments for wear or looseness. Repair or replace parts as necessary.

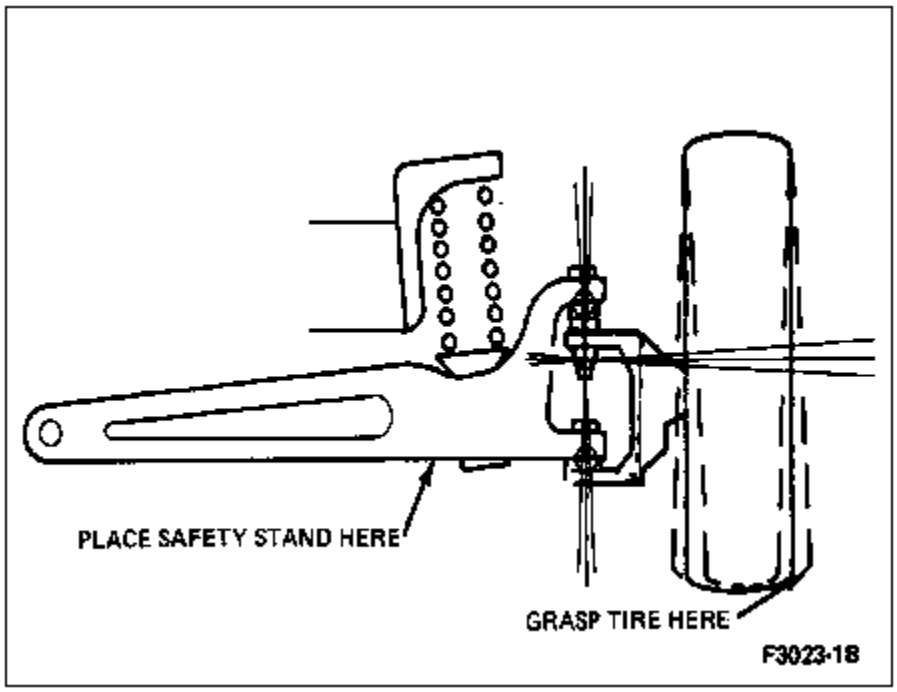
4. Grasp the upper edge of the tire and move the wheel in and out. A 0.8mm (1/32-inch) or greater movement between the upper spindle arm and the front suspension upper arm (3083) indicates that the front suspension upper ball joint (3049) must be replaced.

5. Inspect the rubber bushings at the front suspension upper arm attachments for wear or looseness. Repair or replace as necessary.

Ball Joints, Front Suspension Upper and Lower, Ranger

Prior to performing any ball joint inspection, check and adjust the front wheel bearings as described in Section 04-01A (4x2) or Section 05-03A (4x4).

1. Raise the vehicle and place safety stands under the I-beam axle beneath the front coil spring (5310) as shown.



2. Have an assistant grasp the lower edge of the tire and move the wheel in and out.

3. While the wheel is being moved, observe the lower spindle arm and the lower part of the axle jaw.

    - A 0.8mm (1/32-inch) or greater movement between the lower part of the axle jaw and lower spindle arm indicates that the front suspension lower arm ball joint must be replaced.

4. Check the front suspension upper ball joints. Grasp the upper edge of the tire and move the wheel in and out.

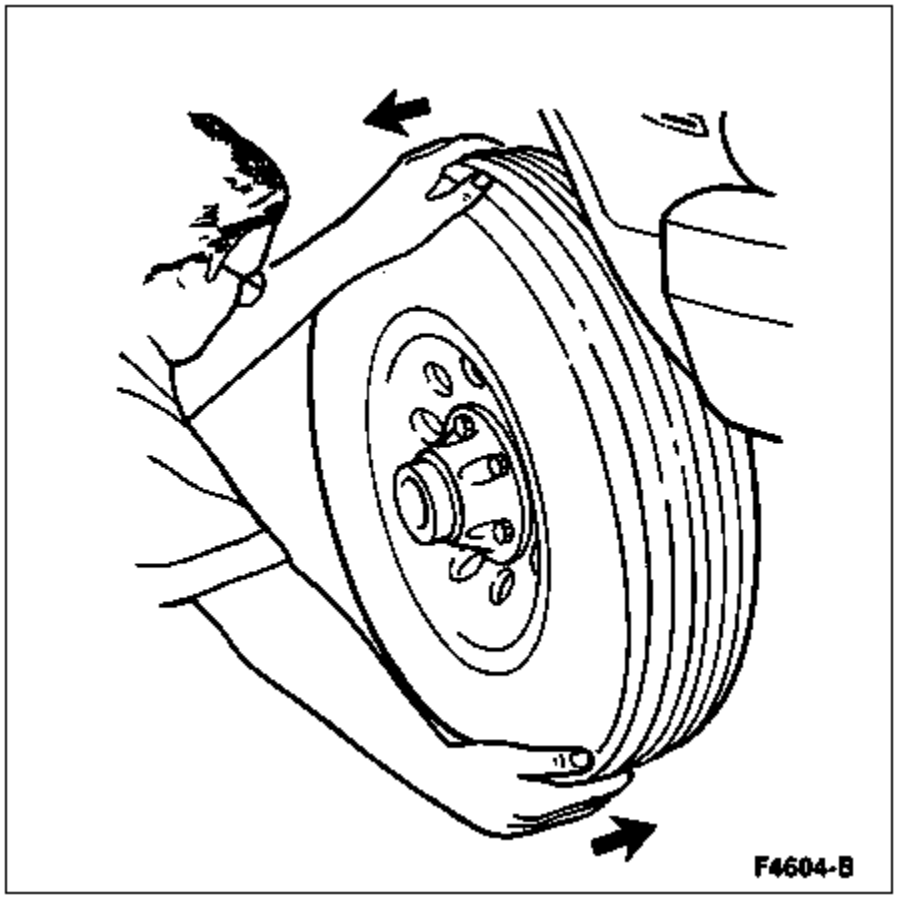
    - A 0.8mm (1/32-inch) or greater movement between the upper spindle arm and the upper part of the axle jaw indicates that the front suspension upper ball joint must be replaced.

Wheel Bearing End Play, Front

1. **NOTE: For 4x4 Aerostar vehicles, the wheel bearings are part of the spindle hub assembly and are not repairable. If end play is found to be excessive, replace the spindle hub and bearing assembly. Refer to Section 05-03C.**

   Raise the vehicle until the tire clears the floor.

2. Grasp each front tire at the top and bottom and push the wheel inward and outward while lifting the weight of the tire off the bearings.



3. Make sure the wheel (1007) rotates freely and the brake pads are retracted sufficiently to allow movement of the wheel assembly.

4. End play is adjustable to correct bearing and shoulder wear on the front wheel spindle (3105).

   - Check end play at regular intervals to ensure proper operation and long life of bearings.
   - If end play is adjusted too tightly, the bearings will overheat and wear rapidly. End play that is excessively loose can cause pounding and contribute to uneven tire wear, steering difficulties and inefficient brakes.

5. Clean, inspect and lubricate front hub assemblies and bearings whenever the hub assemblies are removed or at the mileage/time periods indicated in the maintenance schedule.

6. **NOTE: A damaged or worn seal may permit bearing lubricant to reach the brake linings, resulting in ineffective brake operation and necessitating premature replacement of linings.**

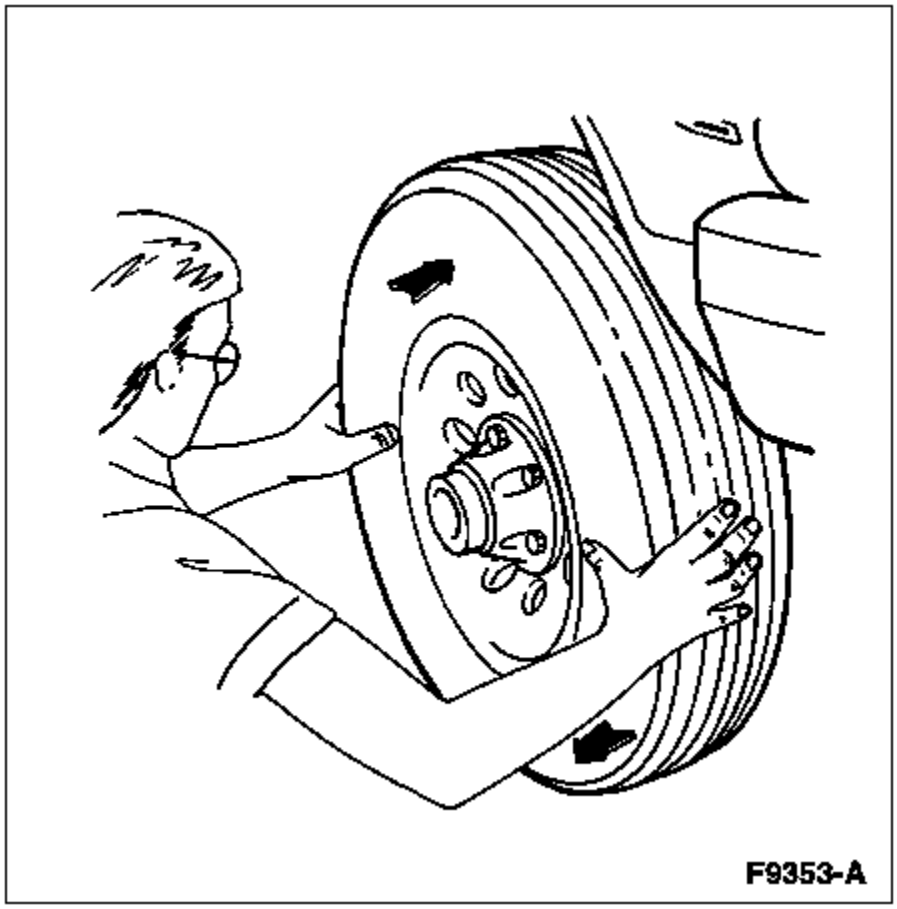
   Install new hub assembly grease seals when the hub is removed.

7. If the wheel/hub-rotor is loose on the front wheel spindle or does not rotate freely, adjust the wheel bearings as described in Section 04-01A (4x2) or Section 05-03A (Ranger 4x4).

Steering Linkage

1. With the vehicle resting on the ground and the parking brake fully applied, perform the following.

   a. Have someone turn the steering wheel back and forth 360 degrees and watch for relative motion of the studs in the steering linkage ball sockets.
      - Excessive **vertical** motion of the studs relative to the sockets may indicate excessive wear.
   b. Watch for a loose steering gear attachment to the frame. Another method is to raise the front tires off the ground.
      - Grasp the tire at the front and rear and watch for excessive play in the joints while trying to steer the wheels.



- Steel, greaseable joints (Ranger) or tie rod joints (Aerostar) can be checked for excessive wear by measuring the torque it takes to turn the stud.
- Remove the tapered stud from its seat and thread the attaching nut back onto the stud. Turn the stud with a pound-inch torque wrench and note the torque to turn the stud.

Joints	Nm	Lb-In
New Steel Joints	1.1-7.9	10-70
Good, Used Joints	0.5-4.5	5-40
Joint with Excessive Play	0.5	5

- Some joint turning torques will be as little as 0.5 Nm (5 lb-in) within the first 1000 miles and remain there for the life of the joint.
- Only replace a ball joint that requires less than 0.5 Nm (5 lb-in).
- Tighten or replace loose, worn or damaged steering parts as described in the appropriate section in Group 11.

Dogtracking

To diagnose a dogtrack situation, find a stretch of empty road or an empty parking lot and perform the following steps.

1. Drive the vehicle while sighting down the hood. Use a hood ornament or a body style line to be able to see if the vehicle is going in a straight line or dogtracking.

2. Stop the vehicle when you notice the vehicle dogtracking. Have an assistant mark the position of the center tread of both front tires with chalk on the ground.

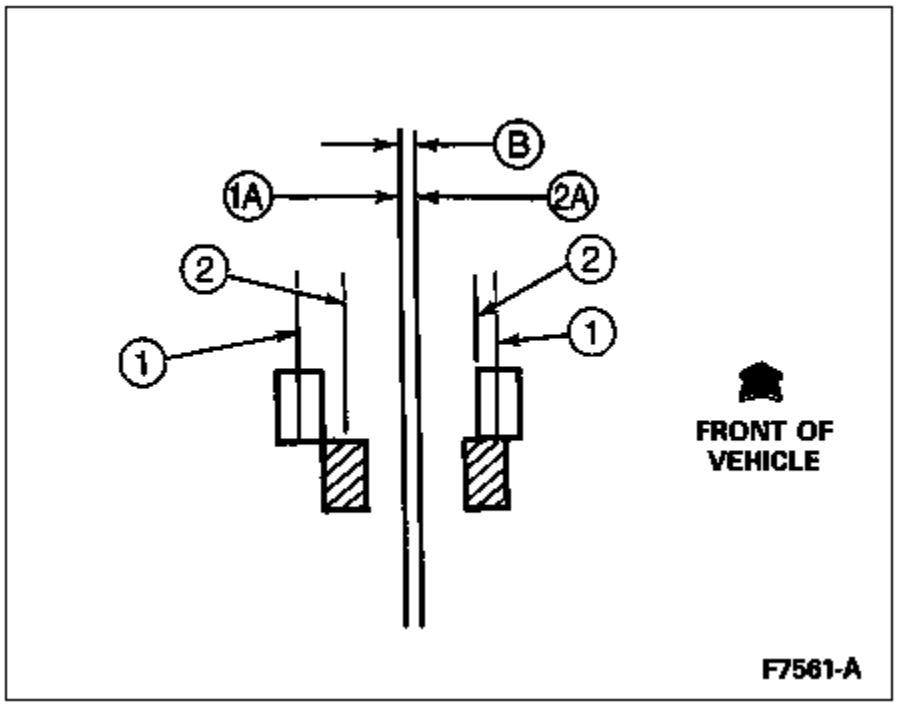
3. Slowly pull the vehicle forward until the rear tires are at the same position as the marks made for the front tires.

4. Have your assistant mark the ground as he did for the front tires, identifying which marks are for the front tires and which ones are for the rear tires.

5. Move the vehicle out of the way so all marks can be seen.

6. Proceed to measure the total amount of dogtracking as follows:

    - Measure the distance between the front tire marks.
    - Mark the ground exactly halfway between these marks.
    - Do the same for the rear tire marks.
    - The difference between the two center marks is the amount of dogtracking present in the vehicle.



Item	Part Number	Description
1	—	Centerline of Front Tire Tread
1A	—	Centerline Between Front Tires
2	—	Centerline of Rear Tire Tread
2A	—	Centerline Between Rear Tires
B	—	Dimension "B" Equals Total Amount of Dogtracking

Wheel Bearings, Front

NOTE: For Aerostar 4x4 vehicles, the wheel bearings are part of the spindle hub assembly and are not repairable. If the hub bearing is worn or damaged, replace the spindle hub and bearing as an assembly. Refer to Section or 05-03C (Aerostar).

Wheel bearings are adjustable to correct for bearing and shoulder wear on the spindle.

1. **CAUTION: If bearings are adjusted too tightly, they will overheat and wear rapidly. An adjustment that is excessively loose can cause pounding and contribute to uneven tire wear, steering difficulties and inefficient brakes.**

   NOTE: Bearing adjustment should be checked at regular inspection intervals.

   Front hub assemblies and bearings should be cleaned, inspected and lubricated whenever the hub assemblies are removed or at the mileage/time periods indicated in the maintenance schedule.

2. **CAUTION: A damaged or worn seal may permit bearing lubricant to reach the brake linings, resulting in ineffective brake operation and necessitating premature replacement of the linings.**

   New hub assembly grease seals should be installed when the hub is removed.

3. Bearing adjustment is described for Ranger 4x2, and Aerostar 4x2 in Section 04-01A . For Ranger 4x4, refer to Section 05-03A . For Aerostar E-4WD the bearings are not adjustable.

Wheel Alignment, Front

Caster and Camber, Aerostar

Caster and camber adjustment is provided by shims on the front suspension upper arm (3083). The two different shims initially provided from the assembly plant include one 2mm (.078-inch) thick shim and one 6mm (.236-inch) thick shim for a total shim stack thickness of 8mm (0.315 inch) at each leg of the front suspension upper arm. The shims are to be added, deleted or switched from the front and rear legs of the front suspension upper arms as required to adjust the alignment. Use of only these hardened shims is suggested to provide adequate reliability and durability.

- Camber adjustment is obtained by removing or adding an equal number of shims to the front and rear leg of the adjusting arm.
- Caster adjustment is obtained by removing shims from the front leg and installing them on the rear leg, or vice-versa. If the same amount is switched from one leg to the other, the caster will be revised but the camber will not be affected.
- If unequal amounts are removed and added to the front and rear legs, both the caster and camber will be revised. Refer to caster and camber charts in this section.

To ease the access from the fender opening over the tire to the front suspension upper arm assembly, the following tools are recommended.

- Wrench D87T-3068-A or equivalent.
- Pivoting ratchet.
- A 24-inch extension for the ratchet.
- Crow's foot wrenches and adapters.

1. Position unit on front end alignment equipment and check status of caster, camber and toe-in.

2. **NOTE: Do not loosen front suspension upper arm-to-frame and crossmember bolts for caster/camber adjustment unless shims do not provide adequate adjustment.**

   Adjust caster and camber by loosening the two front suspension upper arm retaining nuts, adding or removing the necessary amount of shims.

3. When using shims, refer to the following charts.

CASTER CHANGES — AEROSTAR

Caster Change	Camber Change	Shim Changes	
		Front Leg	Rear Leg
Increase Caster by 2 Degrees	None	Add One 6mm (.236 Inches) Shim	Remove One 6mm (.236 Inches) Shim
Increase Caster by 1.67 Degrees	+.1°-.2°	Add One 6mm (.236 Inches) Shim	Remove Two 2mm (.078 Inches) Shims

Increase Caster by 1.33 Degrees	None	Add Two 2mm (.078 Inches) Shims	Remove Two 2mm (.078 Inches) Shims
Increase Caster by 1 Degree	+.1°-.2°	Add Two 2mm (.078 Inches) Shims	Remove One 2mm (.078 Inches) Shim
Increase Caster by .67 Degrees	None	Add One 2mm (.078 Inches) Shim	Remove One 2mm (.078 Inches) Shim
Increase Caster by .33 Degrees	+.1°-.2°	Add One 2mm (.078 Inches) Shim	No Change
0 or Starting Position		No Change	No Change
Decrease Caster by .33 Degrees	-.1°-.2°	Remove One 2mm (.078 Inches) Shim	No Change
Decrease Caster by .67 Degrees	None	Remove One 2mm (.078 Inches) Shim	Add One 2mm (.078 Inches) Shim
Decrease Caster by 1 Degree	-.1°-.2°	Remove Two 2mm (.078 Inches) Shims	Add One 2mm (.078 Inches) Shim
Decrease Caster by 1.33 Degrees	None	Remove Two 2mm (.078 Inches) Shims	Add Two 2mm (.078 Inches) Shims
Decrease Caster by 1.67 Degrees	-.1°-.2°	Remove One 6mm (.236 Inches) Shim	Add Two 2mm (.078 Inches) Shims
Decrease Caster by 2 Degrees	None	Remove One 6mm (.236 Inches) Shim	Add One 6mm (.236 Inches) Shim

CAMBER CHANGES — AEROSTAR

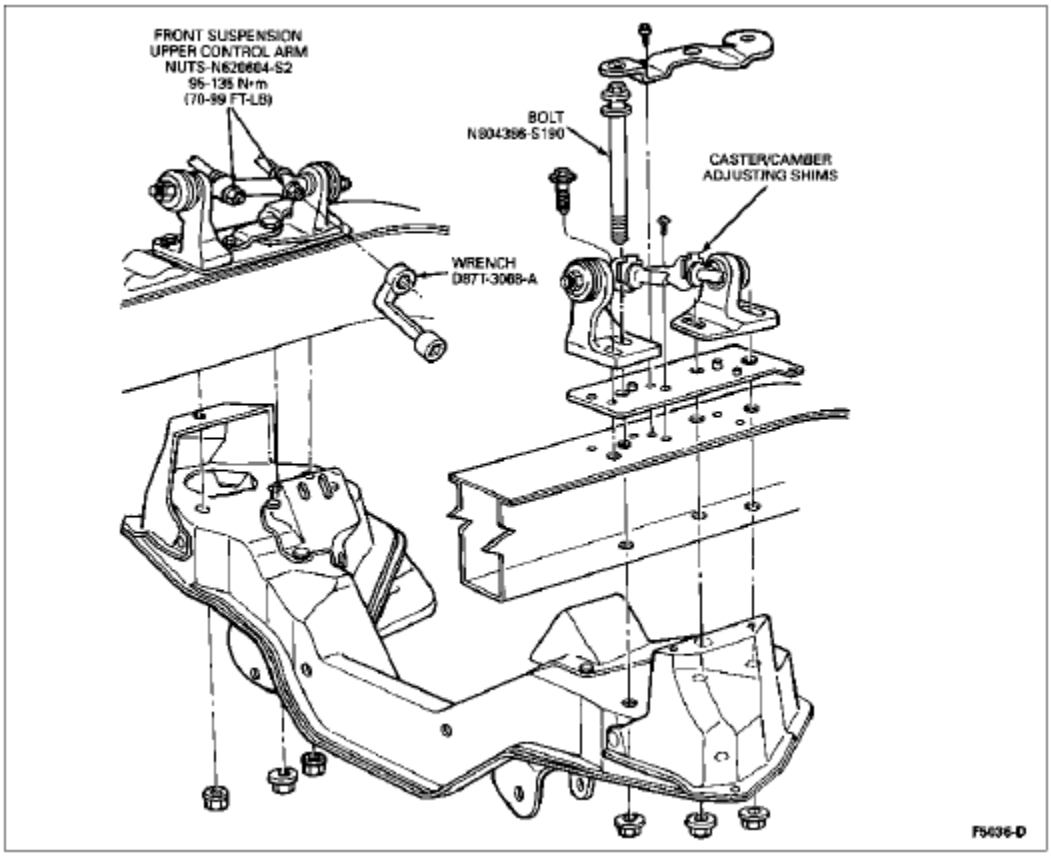
Camber Change	Shim Changes	
	Front Leg	**Rear Leg**
Increase Camber by 1.67 Degrees	Add One 6mm (.236 Inches) and Two 2mm (.078 Inches) Shims	Add One 6mm (.236 Inches) and Two 2mm (.078 Inches) Shims
Increase Camber by 1.33 Degrees	Add One 6mm (.236 Inches) and Two 2mm (.078 Inches) Shims	Add One 6mm (.236 Inches) and Two 2mm (.078 Inches) Shims
Increase Camber by 1 Degree	Add One 6mm (.236 Inches) Shim	Add One 6mm (.236 Inches) Shim
Increase Camber by .66 Degrees	Add Two 2mm (.078 Inches) Shims	Add Two 2mm (.078 Inches) Shims
Increase Camber by .33 Degrees	Add One 2mm (.078 Inches) Shim	Add One 2mm (.078 Inches) Shim
0 or Starting Position	No Change	No Change
Decrease Camber by .33 Degrees	Remove One 2mm (.078 Inches) Shim	Remove One 2mm (.078 Inches) Shim
Decrease Camber by .67 Degrees	Remove Two 2mm (.078 Inches) Shims	Remove Two 2mm (.078 Inches) Shims
Decrease Camber by 1 Degree	Remove One 6mm (.236 Inches) Shim	Remove One 6mm (.236 Inches) Shim
Decrease Camber by 1.33 Degrees	Remove One 6mm (.236 Inches) and One 2mm (.089 Inches) Shims	Remove One 6mm (.236 Inches) and One 2mm (.078 Inches) Shims

Decrease Camber by 1.67 Degrees	Remove One 6mm (.236 Inches) and One 2mm (.078 Inches) Shims	Remove One 6mm (.236 Inches) and One 2mm (.078 Inches) Shims

4. Retighten front suspension upper arm nuts to 95-135 Nm (70-100 lb-ft) to prevent the loss of shims or the movement of the front suspension upper ball joint (3049).

5. Adjust toe-in as described in Adjustments, Toe in this section.

Caster/Camber Adjustment, Aerostar



Caster and Camber, Ranger 4x2 and 4x4

SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
Pitman Arm Puller	T64-3590-F

Caster and camber adjustment is possible with service adjusters available in 1/2-degree, 1-degree and 1-1/2-degree increments. One adjuster is used to adjust both caster and camber depending on its orientation.

1. Measure vehicle caster and camber.

- Refer to the alignment charts in this section to determine if the vehicle is within specifications.
- Note difference between the actual measurements and the specification. This information will be used to select the correct service adjuster.

2. If adjustment is necessary, determine the amount of caster/camber in the adjuster installed in the vehicle.

   - Production adjusters have the amounts of caster and camber stamped in the top of the adjuster.
   - The first number is the amount of caster, the second number is the amount of camber in degrees if the adjuster is installed in the right axle position.
   - If the adjuster is in the left axle, the caster number is the opposite sign of the number shown.
   - For example, a positive amount in the right axle is a negative amount in the left axle, and a negative amount in the right axle is a positive in the left position.

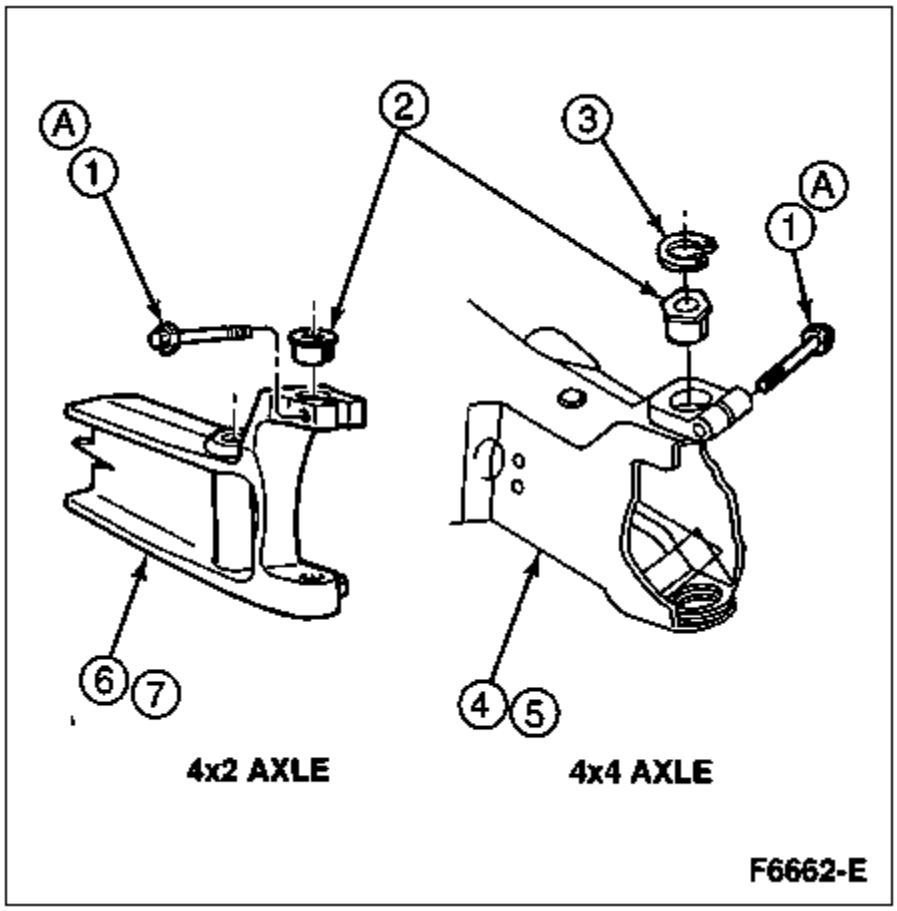
3. Refer to the following chart. Select a new service adjuster and its orientation in the axle to obtain the optimum caster/camber. Note that the caster change or camber change required to obtain the optimum settings must be added to amounts of caster/camber in the old or production adjuster.

   For example, if caster and camber must be reduced 1.0 degree, and camber increased +0.75 degree at the left wheel, and the existing adjuster has +0.25 degree caster as installed, select the 1.0 degree service adjuster and orient the slot 225 degrees from the straight-ahead position.

4. Raise the vehicle and support with jackstands.

5. Remove the front wheel.

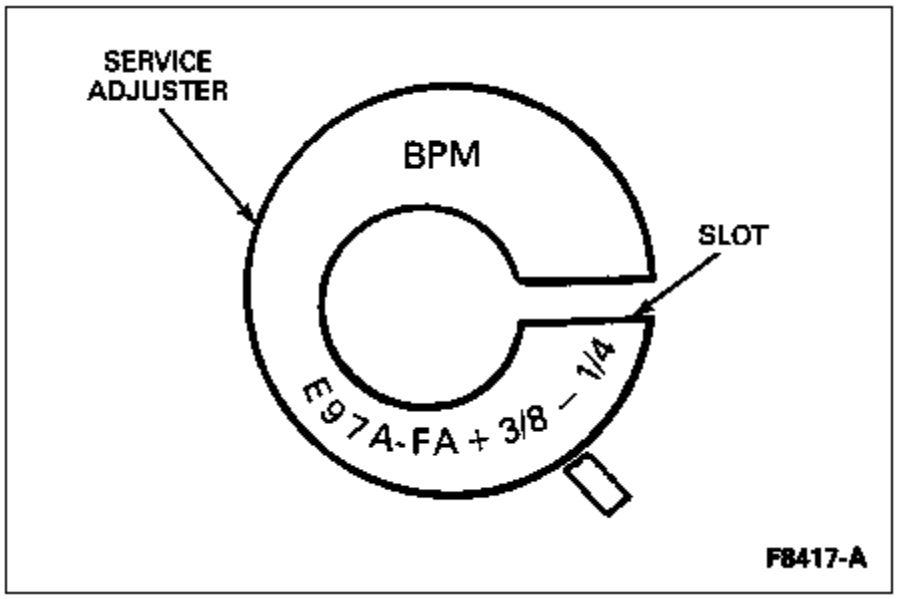
6. Loosen the pinch bolt at the upper ball joint and pry the adjuster out of the axle with the blade of a screwdriver. If required, use Pitman Arm Puller T64P-3590-F to remove the adjuster.



Item	Part Number	Description
1	60682	Pinch Bolt
2	38404	Caster and Camber Adjuster
3	—	Snap Ring (Part of 38404)
4	3B403	Left Axle Arm (Shown) (4x4)
5	3B402	Right Axle Arm (4x4)
6	3007	Left Axle (Shown) (4x2)
7	3006	Right Axle (4x2)
A	—	Tighten to 68-92 Nm (50-68 Lb-Ft)

7. **NOTE: The assembly plant sometimes builds vehicles with adjusters that are not zero-degree type to control alignment. The table shows the alignment changes that will occur if the vehicle was originally built with zero-degree adjusters. Always check to see which adjuster has been installed (and its orientation) before making changes.**

   Install the new service adjuster. Orient the slot as specified in the chart.



RANGER ADJUSTABLE CAMBER/CASTER SERVICE ADJUSTER SELECTION TABLE

Service Adjuster Type (Degrees)	Position Slot in Axle (Degrees)	LH Axle		RH Axle	
		Camber Change (Degrees)	Caster Change (Degrees)	Camber Change (Degrees)	Caster Change (Degrees)
1/2	0	-0.5	0	+0.5	0
1	0	-1.0	0	+1.0	0
1-1/2	0	-1.5	0	+1.5	0
1/2	45	-0.25	+0.25	+0.25	+0.25
1	45	-0.75	+0.75	+0.75	+0.75
1-1/2	45	-1.00	+1.00	+1.00	+1.00
1/2	90	0	+0.5	0	+0.5
1	90	0	+1.0	0	+1.0
1-1/2	90	0	+1.5	0	+1.5
1/2	135	+0.25	+0.25	-0.25	+0.25
1	135	+0.75	+0.75	-0.75	+0.75
1-1/2	135	+1.00	+1.00	-1.00	+1.00
1/2	180	+0.5	0	-0.5	0
1	180	+1.0	0	-1.0	0
1-1/2	180	+1.5	0	-1.5	0
1/2	225	+0.25	-0.25	-0.25	-0.25
1	225	+0.75	-0.75	-0.75	-0.75
1-1/2	225	+1.00	-1.00	-1.00	-1.00
1/2	270	0	-0.5	0	-0.5

1	270	0	-1.0	0	-1.0
1-1/2	270	0	-1.5	0	-1.5
1/2	315	-0.25	0.25	+0.25	-0.25
1	315	-0.75	-0.75	+0.75	-0.75
1-1/2	315	-1.00	-1.00	+1.00	-1.00

8. Tighten the pinch bolt to 68-92 Nm (50-68 lb-ft) and install a new caster/camber adjuster snap ring (4x4).

9. Install front wheel and lower vehicle.

10. Check alignment. If not optimal caster/camber setting, additional adjustment of the rotation of the adjuster may be required to obtain optimal alignment settings.

11. Once optimal caster/camber is achieved, reset front toe to specifications and check alignment.

    - In all cases, select the adjuster and orientation that will bring the alignment closest to the optimal settings.

12. Check alignment and reset toe to specification.

Toe, Aerostar

1. Start the engine. Move steering wheel into straight-ahead or centered position.

2. Turn the engine off, and lock the steering wheel in place using a steering wheel holder.

3. Check the toe reading.

4. If toe is not within specifications, remove bellows seal clamp if used.

5. **NOTE: Whenever the jam nuts are loosened for toe adjustment, the nut and tie threads must be cleaned and lubricated and the jam nut retightened to 80 Nm (59 lb-ft).**

   NOTE: Free the boot from the rod before attempting to adjust toe. Do not allow boot to twist when rod is turned for toe adjustment.

   Loosen the jam nuts and adjust toe to 0.80mm (1/32 inch) IN for the preferred setting (0.80mm [1/32 inch] OUT for Aerostar E-4WD vehicles).

6. Hold tie rod end with wrench while tightening in jam nut.

7. Replace bellows seal clamp, if used after tightening jam nut.

Toe, Ranger

1. Loosen the clamp bolts at each end of the tie rod end (3A131).

2. Rotate the sleeve until the correct toe alignment is obtained.

3. With the clamps centered between the protrusions on the adjustment sleeve lock ring, position the bolts horizontally with the clamp nuts facing in the direction shown. Tighten the clamp nuts to 40-57 Nm (30-42 lb-ft).

4. Recheck the toe alignment after tightening clamps.

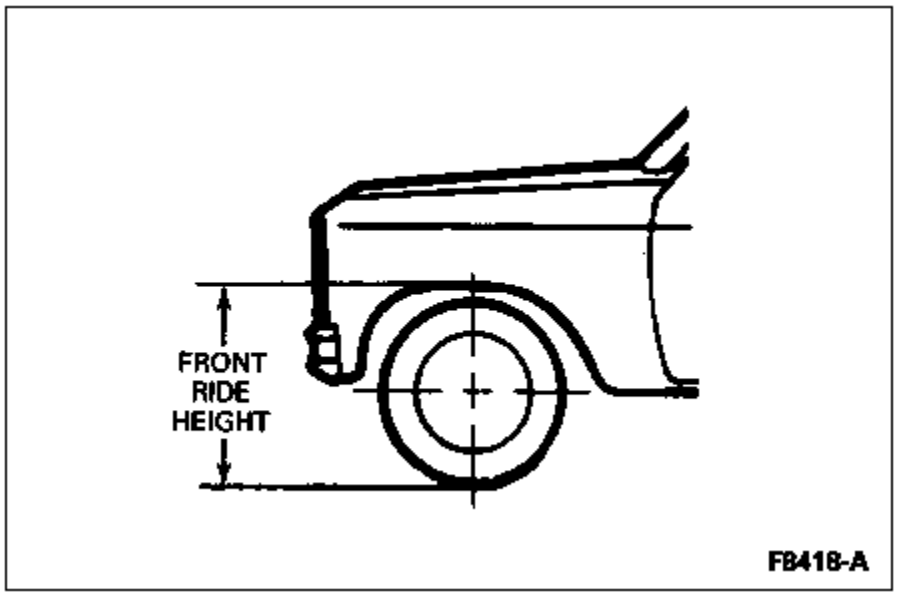
5. Check the steering wheel for clear vision.

Vehicle Lean Correction

NOTE: Codes identifying the front and rear spring options are printed on the Safety Standard Certification Label. If a spring or torsion bar requires replacement because of damage or sagging, replace only with the same part as specified on the label. In rare instances, the spring codes will not reflect the springs or torsion bars as installed due to a district special order (DSO) option or Assembly Plant substitution. If a DSO option number is shown on the certification label, the district office can establish whether springs are affected. If the factory-installed springs or torsion bars do not agree with the code printed on the Safety Standard Certification Label (right and left spring part number should match), it is advisable to replace springs or torsion bars in pairs.

Front Lean

1. Measure the left and right front ride heights by measuring the height of the right and left front fender lip openings.



2. Compute the difference between left and right ride heights as figured above.

    - For Ranger, if the difference exceeds 16mm (5/8 inch) and is less than 20mm (3/4 inch) measured at the wheelhouse opening to ground, add **one** shim to the side of the vehicle that is low.
    - The shim is to be placed under the lower spring seat; service shim (part number 389117-S2) can be used on 4x2 and 4x4 models without a front stabilizer bar.
    - If there is a computed side-to-side difference of 20mm (3/4 inch) or more in the left/right wheelhouse openings, swap front coil springs (5310) from side to side. If the lean condition

follows the spring (lean now on other side of the vehicle), replace **both** springs with new ones.
- Changing front ride height by adding the service shim also affects caster angles. Adding the 4.5mm thick shim (part number 389117-S2 or equivalent) may reduce caster by up to 0.40 degrees on the side to which the shim is added.

EXAMPLES

Ranger 4x2 Vehicles	Ranger 4x4 Vehicles
Measured LH Ride Height 25-5/16 Inch	Measured LH Ride Height 29-1/4 Inch
Measured RH Ride Height 25-1/2 Inch	Measured RH Ride Height 29-7/8 Inch
Calculated RH Ride Height 25-13/16 Inch	Calculated LH Right Height 29-3/4 Inch
Side-to-Side Difference 1/2 Inch	Side-to-Side Difference 1/8 Inch
Since the difference is larger than 1/8 Inch, one shim should be added to the side of the suspension.	Since the difference does not exceed 1/8 Inch, no shim is to be installed on the front suspension. The lean condition may be caused by a rear lean condition.

Rear Lean, Ranger

1. Measure the rear ride height by measuring the height of the right and left rear fender lip openings.

2. Compute the difference.

   - A side-to-side lean at the rear of the vehicle can be adjusted approximately 6mm (1/4 inch) by installing a shim between the rear spring (5560) and axle on the low side of the vehicle.
   - A "low at the rear" vehicle can be raised approximately 6mm (1/4 inch) by installation of one shim on each side.

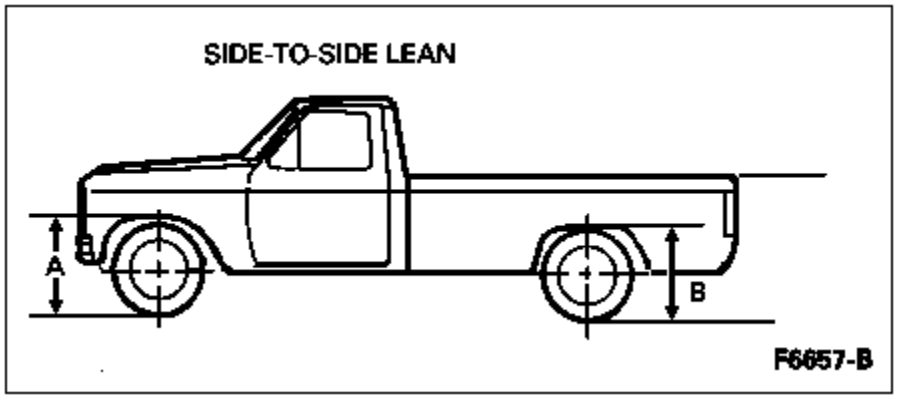
3. Use the following procedure to install the shim(s) (E37A-5742-AA).

   - Raise the vehicle until the weight is off the rear springs but with the tires still touching the floor.
   - Loosen the spring U-bolts to allow the axle to separate from the spring approximately 13mm (1/2 inch).
   - Position the shim (E37A-5742-AA) between the spring and the spring seat with the tie bolt head through the hole in the shim.
   - On 4x4 vehicles, position the shim between the rear spring and axle spacer. Tape may be used to hold the shim in position.
   - Make sure the spring leaves are properly aligned and the spring U-bolts contact the edges of the spring assembly or axle seat.
   - Tighten the spring U-bolt sufficiently and make sure the spring bolt head extends through shim into axle seat hole.
   - Tighten the U-bolt nuts to 88-102 Nm (65-75 lb-ft).

Side-to-Side Lean, Ranger

1. Side-to-side vehicle lean should be verified by measuring the fender lip-to-ground dimensions A and B.

Ranger



Normal acceptable limits are as follows:

- Maximum of 16mm (5/8 inch) variance between left and right front wheel lips to ground.
- Maximum of 20mm (3/4 inch) variance between left and right rear wheel lips to ground.

2. Once a lean condition has been verified, perform the following steps.

   a. Place the vehicle on a flat, smooth surface. Vehicles must be sitting on the wheels and tires, not on a hoist, jack or jackstands.
   b. Inspect vehicle for any heavy add-ons that may cause excessive weight on any corner of the vehicle. Vehicle should be empty, fuel tanks full, no cargo in the pickup box or rear body section.
   c. Check all wheels and tires:
      - Wheel size and design, tire size and tread should be indicated on the Vehicle Safety Standard Certification Label.
      - Wheels must be same size and design, right and left side, on each axle.
      - Tires must be same brand, tire size, tread design and equal tread wear side to side on each axle.
      - Check air pressure of all tires; inflate to specifications indicated on the Vehicle Safety Standard Certification Label.
   d. Check front and rear suspension. Verify the same spring or torsion bar is on left/right front and same spring is on left/right rear.
      - Front coil springs have I.D. tags indicating the part number.
      - Rear springs have the part number stamped on the bottom left just behind the U-bolt attachment.
      - If I.D. tags are missing from front springs, refer to the Safety Standard Certification Label on the driver's door. If the label is missing, there is no sure way of identifying which springs or torsion bars are installed on the vehicle. It is advisable to order springs or torsion bars in pairs only.
   e. Bounce the vehicle's front and rear suspension to normalize the vehicle static ride height.
   f. Measure the height of the right and left fender lip openings again. If the differences are still greater than 16mm (5/8 inch) between left or right front and/or 20mm (3/4 inch) between left and right rear, factors other than suspension are the cause.

Drive Axle Adjustments (Ranger)

1. **NOTE: A warped or bent rear axle assembly (4006) or bent frame can cause a vehicle to "dogtrack" and should be considered during diagnosis.**

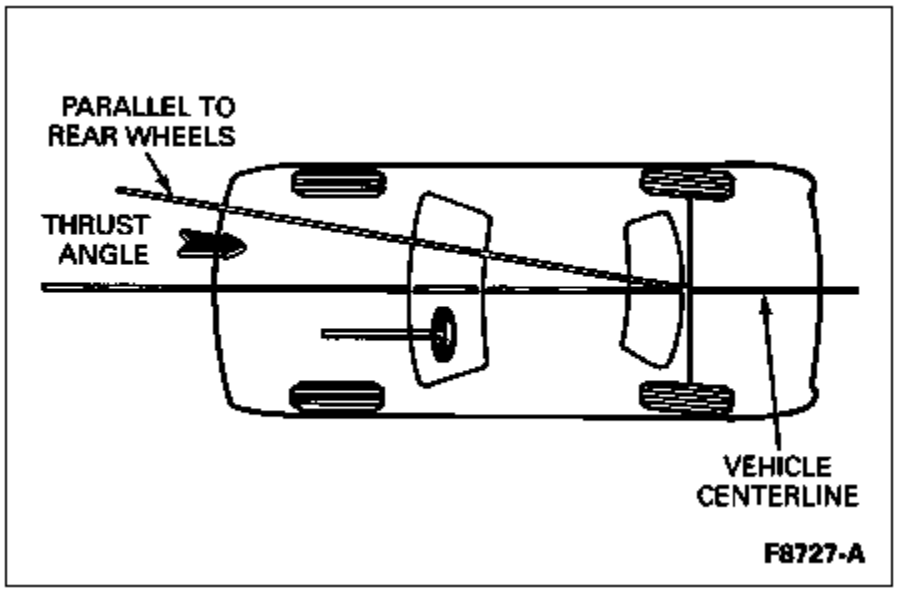
   Verify that the vehicle dogtracks by performing the diagnostic procedure as outlined in this section.

2. Raise the vehicle off the ground using a frame-mounted hoist or equivalent. Do not hoist the vehicle using the rear axle assembly as a lift point.

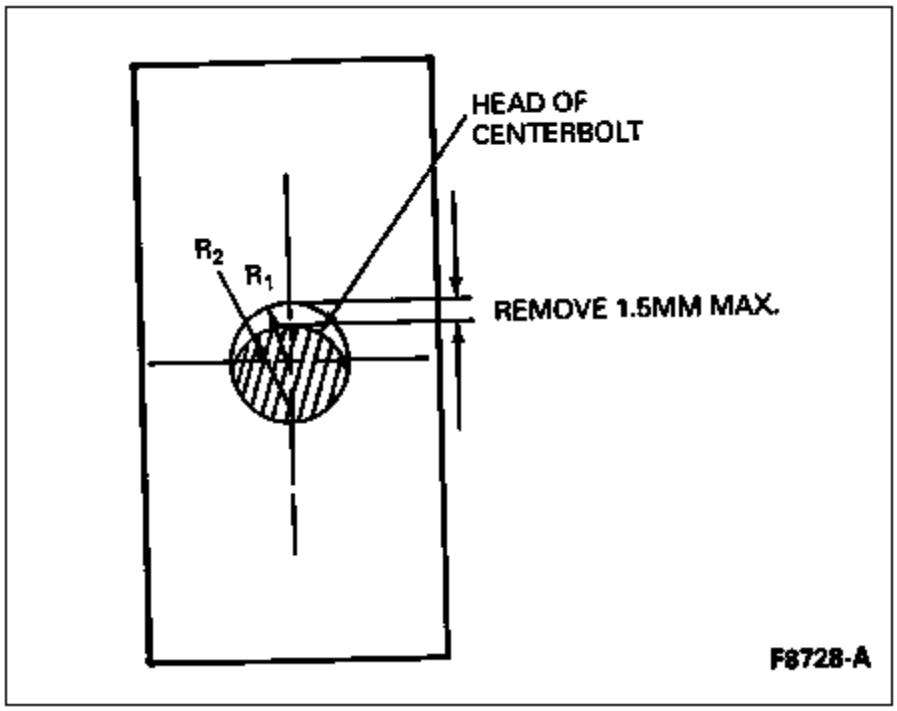
3. Remove the U-bolts which attach the rear axle assembly to the rear leaf springs on the side of the rear axle assembly which will be moved. Allow the axle to drop down. The shock absorber will support the axle assembly.

4. Using C-clamps, clamp the leafs of the leaf spring together on both sides of the center bolt and remove the bolt.

5. If thrust angle is 0 to 0.3 degrees modify the spring center bolt on the side of the axle which must be moved.



6. Grind and radius the head of the center bolt to match the radius of the hole in the spring seat.



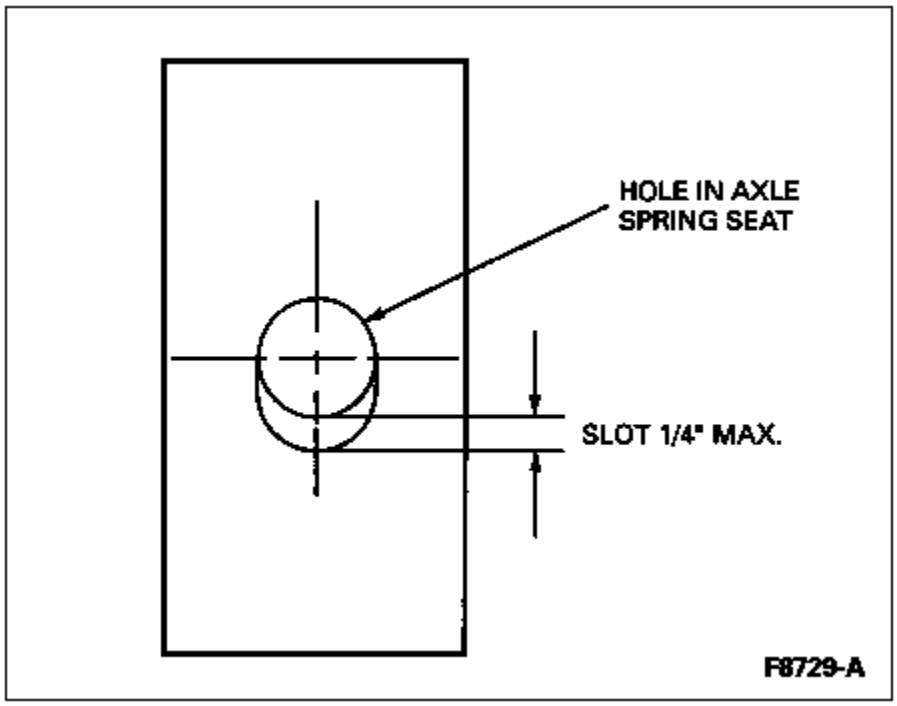
7. If thrust angle is 0.3 to 0.5 degrees, modify the spring center bolt on the sides of the axle. Adjust as required.

8. Reinstall the center bolt and tighten the nut to 60-80 Nm (44-59 lb-ft). Push the rear axle assembly the maximum distance in the direction required to reduce the thrust angle and finish tightening the M-12 U-bolt nuts to 88-102 Nm (65-75 lb-ft).

9. Verify that the vehicle no longer dogtracks using the chalk line procedure or by visual inspection while driving on a flat road.

10. **CAUTION: Do not use a cutting torch to elongate the hole in the spring seat.**

    If the vehicle still dogtracks, the hole in the axle spring seat will require slotting. Use a die grinder or equivalent to elongate the hole perpendicular to the vehicle centerline. The hole in the spring seat should be elongated no more than 6.25mm (1/4 inch).



11. Finally, check the vehicle front wheel toe and clear vision. Correct if necessary.

SPECIFICATIONS

Front Wheel Alignment Specifications

The following charts reflect vehicle alignments after shipment from the assembly plant and prior to any aftermarket and/or body-builder modifications. Alignment can be checked at any time to help diagnose a problem. Always perform an inspection of the front end components and repair where necessary prior to attempting to adjust the alignment to specification. Refer to Front End in the Diagnosis and Testing portion of this section.

Vehicle Conditions for Checking Alignment

- No driver and/or passenger
- Full fluids
- All tires set to specified pressure
- All tire sizes comparable to original equipment
- Vehicle configured to normal operated conditions (not to exceed maximum front GAWR, maximum rear GAWR, and/or maximum GVWR)

Optimum Caster, Camber, And Total Toe Settings

Torque Specifications

Description	Nm	Lb-Ft
Centerbolt Nut	60-80	44-59
Clamp Nut	40-57	30-42
Front Suspension Upper Arm Nuts — Aerostar	95-135	70-100
Jam Nut — Aerostar	80	59
Lugnut 1/2-20 (to Frame)	135	100
Pinch Bolt — Upper Ball Joint — Ranger	68-92	50-68
U-Bolts to Rear Axle — Ranger	88-102	65-75

NOTE: Torque specifications are for clean, dry bolt and nut threads. Never use oil or grease on studs or nuts.

Suspension — Aerostar

NOTE: The critical joint in the front chassis area includes the front crossmember (5019), longitudinal side member, and front suspension upper arms (3083). Whenever this joint is loosened or removed (including engine service), it is imperative that new fasteners or cleaned/lubricated present fasteners be installed with the proper installation torque at this critical joint.

The front suspension is a short/long arm suspension system with helical front coil springs (5310). It consists of front wheel spindles (3105), front suspension upper arms and front suspension lower arm (3078) with integral ball joints and bushings, adjustment shims, front coil springs, front shock absorbers and a front stabilizer bar (5482). The front coil springs are computer-selected based on vehicle options.

Suspension, Front, Aerostar

Wheel Spindle — Aerostar

SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
Pitman Arm Puller	T64P-3590-F

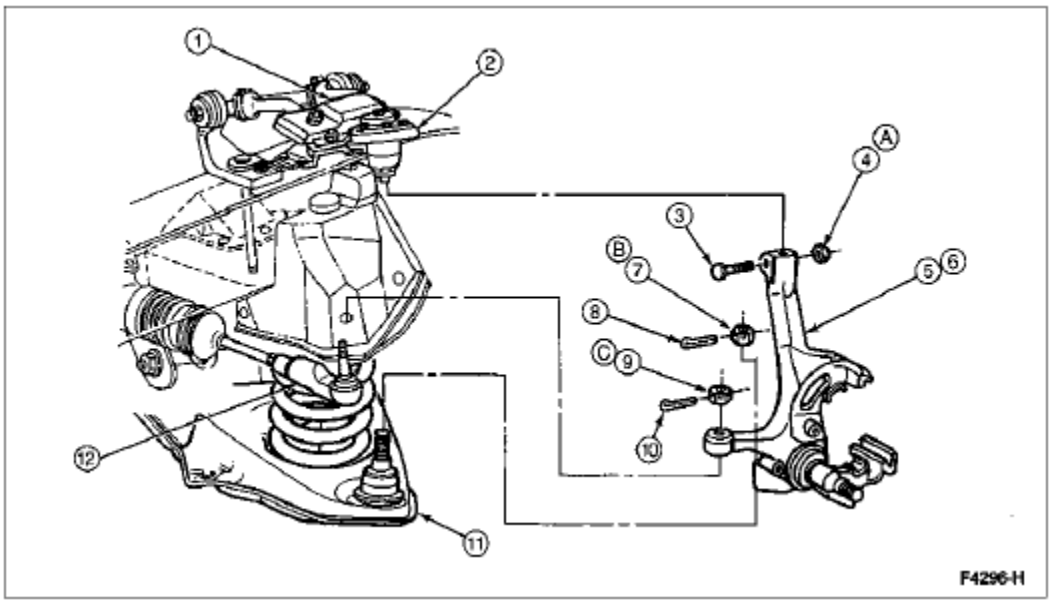
Removal

1. **NOTE: Any time the steering linkage is disconnected from the front wheel spindle (3105), the steering system must be placed in the on-center position.**

   Place the steering wheel and steering system in the on-center position.

2. Raise the vehicle on a frame hoist. Position a tall jack under the front suspension lower arm (3078) and raise the jack.

Spindle, Aerostar



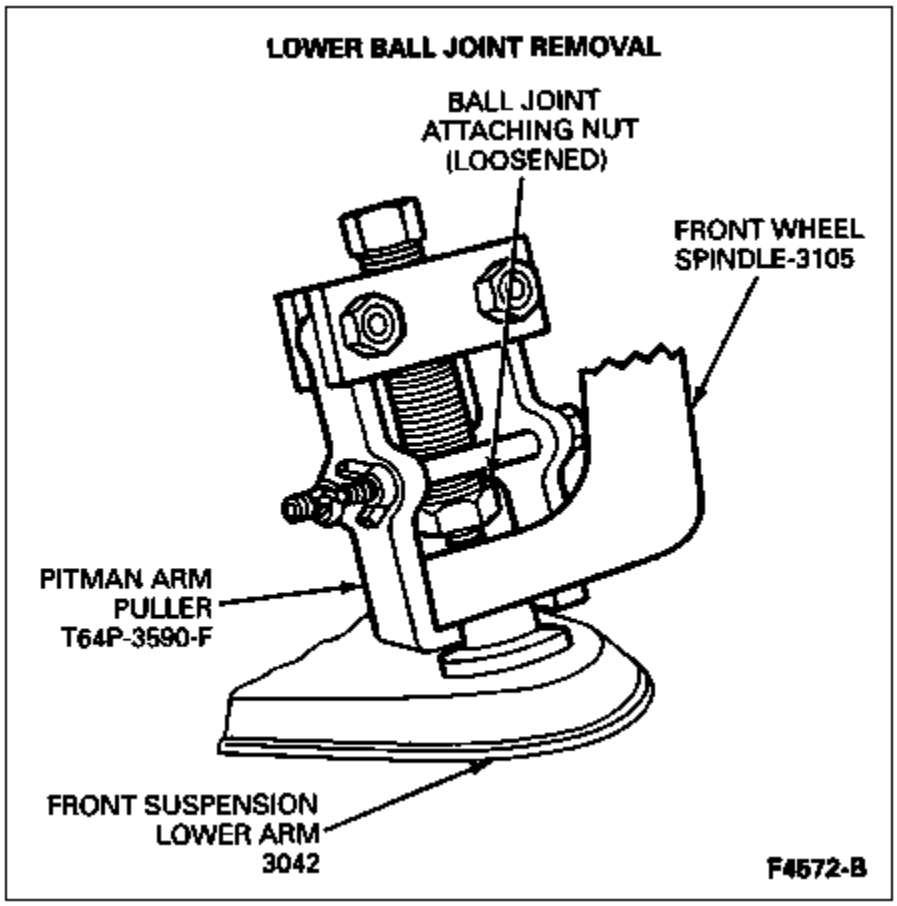
Item	Part Number	Description
1	3C156	Damper
2	3083	Front Suspension Upper Arm

tomsn048@gmail.com

3	N804806-5160	Bolt
4	N801206-S2	Nut
5	3105	Front Wheel Spindle (RH)
6	3106	Front Wheel Spindle (LH)
7	381612	Nut
8	642588	Cotter Pin
9	N800895-556	Nut
10	642589	Cotter Pin
11	3078	Front Suspension Lower Arm
12	3A131	Tie Rod End
A	—	Tighten to 36-50 Nm (27-37 Lb-Ft)
B	—	Tighten to 108-153 Nm (80-113 Lb-Ft)
C	—	Tighten to 70-100 Nm (52-74 Lb-Ft)

3. Remove the lugnuts and the wheel and tire assembly.
4. Remove the front disc brake caliper (2B121), rotor and dust shield from the spindle. Refer to procedure in this section.
5. Remove the cotter pin and nut retaining the tie rod end to the front wheel spindle front suspension lower arm.
6. Disconnect the tie rod end (3A130) from the front wheel spindle using Pitman Arm Puller T64P-3590-F.
7. Support the front suspension lower arm with a jackstand. Remove the cotter pin and loosen the nut retaining the front wheel spindle to the front suspension lower arm ball joint (3050).
8. Disconnect the front suspension lower arm ball joint using pitman arm puller and loosen the front suspension lower arm ball joint.
9. Remove the tool and front suspension lower arm ball joint retaining nut.

tomsn048@gmail.com



10. **WARNING: USE EXTREME CAUTION WHEN LOWERING THE JACK. THE COIL SPRING MAY QUICKLY EXPAND WITH DANGEROUS FORCE.**

    Slowly lower the jack until the front suspension lower arm ball joint is disengaged from the front wheel spindle.

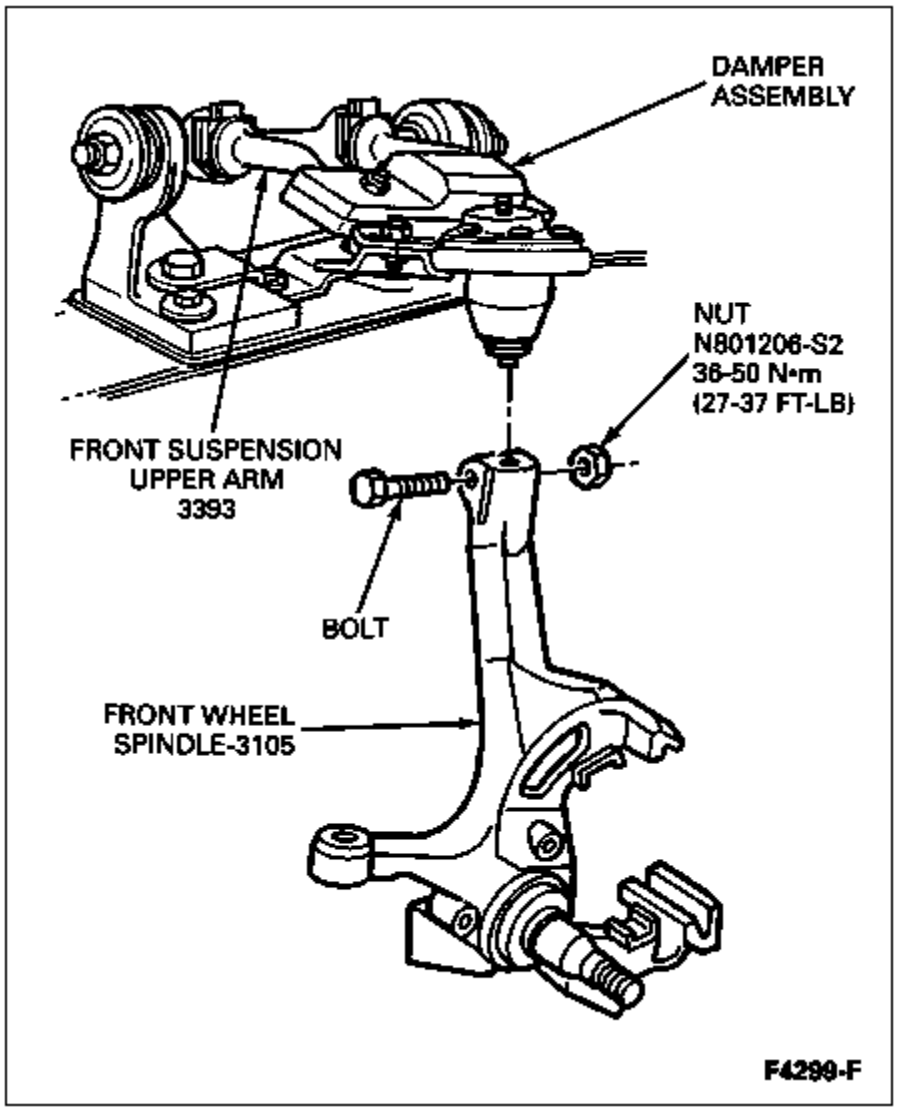
11. Remove the bolt and nut retaining the front wheel spindle to the front suspension upper ball joint (3049). Remove the front wheel spindle.

Installation

1. Inspect upper and lower ball joints and seals for damage. Ball joints and seals are not serviceable. Replace control arm if required.

2. Position the front wheel spindle on the front suspension upper ball joint. Install the nut and bolt and tighten to 36-50 Nm (27-37 lb-ft).

tomsn048@gmail.com



3. Position the front wheel spindle over the lower ball joint stud. With the hoist, slowly lower the vehicle until the ball joint stud extends through the front wheel spindle arm and is seated in the front wheel spindle.

4. Install nut and tighten to 108-153 Nm (80-113 lb-ft). If required, advance the nut to the next castellation and install the cotter pin.

5. Connect the tie rod end to the front wheel spindle arm. Firmly seat the tie rod end stud into the tapered hole to prevent rotation while tightening.

6. Install the nut and tighten to 70-100 Nm (52-74 lb-ft). If required, advance the nut to the next castellation and install the cotter pin.

7. Install the front disc brake rotor shield (2K004), front disc brake hub and rotor (1102) and front disc brake caliper. Refer to procedure in this section.

8. **WARNING: RETIGHTEN WHEEL LUGNUTS TO SPECIFICATION AT 800 KM (500 MILES). FAILURE TO RETIGHTEN LUGNUTS AT MILEAGES SPECIFIED COULD ALLOW THE WHEEL TO COME OFF WHILE THE VEHICLE IS IN MOTION, POSSIBLY CAUSING LOSS OF VEHICLE**

tomsn048@gmail.com

CONTROL OR COLLISION.

Install the wheel and tire assembly. Refer to Section 04-04 . Install the lug nuts (1012) and tighten to 135 Nm (100 lb-ft).

9. Remove the safety stands and lower the vehicle.

---

tomsn048@gmail.com

Wheel Spindle — Ranger

SPECIAL SERVICE TOOL(S) REQUIRED

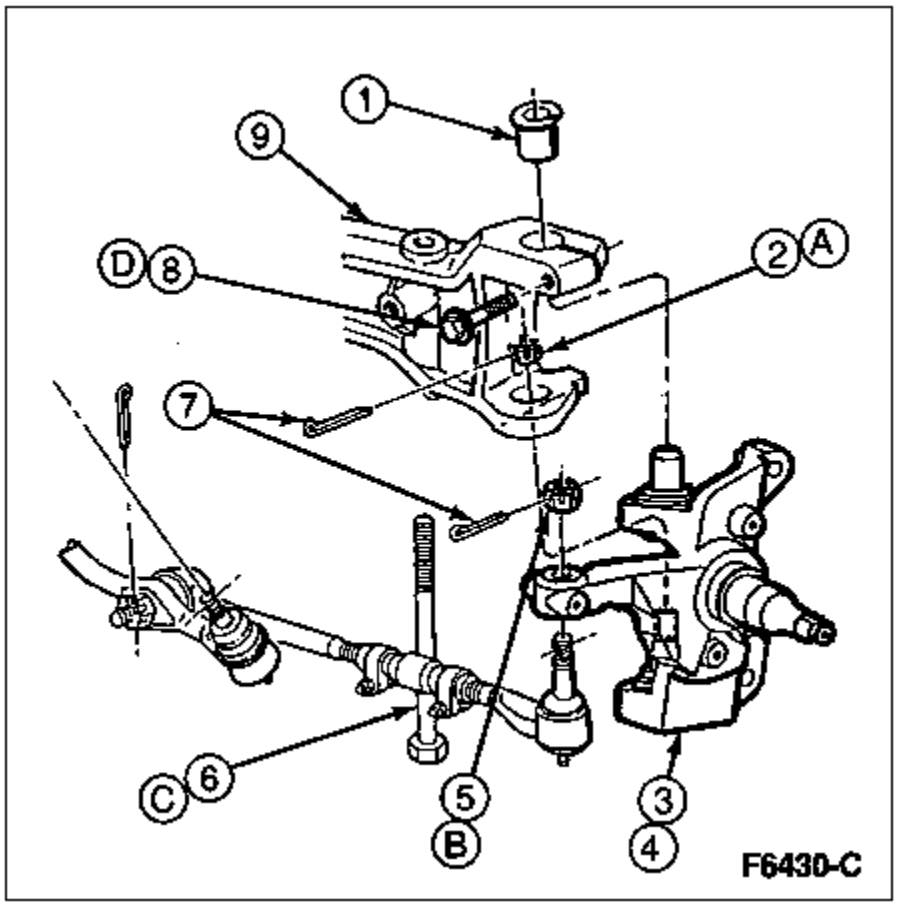
Description	Tool Number
Pitman Arm Puller	T64P-3590-F

Removal

1. Raise the front of the vehicle and install safety stands.
2. Remove the wheel and tire assembly.
3. Remove the front disc brake caliper (2B121), front disc brake hub and rotor (1102) and front disc brake rotor shield (2K004) from the front wheel spindle (3105). Refer to Front Disc Brake Hub and Rotor, Wheel Grease Seal, Bearing Cones and Cups procedure in this section.
4. Disconnect the steering linkage from the front wheel spindle by removing the cotter pin and nut.

Ranger (4x2)

tomsn048@gmail.com



Item	Part Number	Description
1	3B404	Camber Adjuster
2	383436	Nut
3	3105	Front Wheel Spindle (RH)
4	3106	Front Wheel Spindle (LH)
5	N800895	Nut
6	390386	Bolt
7	N642569	Pin
8	N606082	Bolt
9	3007	Front Axle (LH)
A	—	Tighten to 120-180 Nm (89-133 Lb-Ft)
B	—	Tighten to 70-100 Nm (52-74 Lb-Ft)
C	—	Tighten to 255-345 Nm (188-254 Lb-Ft)
D	—	Tighten to 68-92 Nm (50-68 Lb-Ft)

tomsn048@gmail.com

5. Remove the tie rod end (3A130) from the front wheel spindle with Tie Rod End Remover TOOL-3290-D.

6. Remove front wheel ABS sensor (if equipped).

7. Remove the cotter pin and castellated nut from the lower ball joint stud.

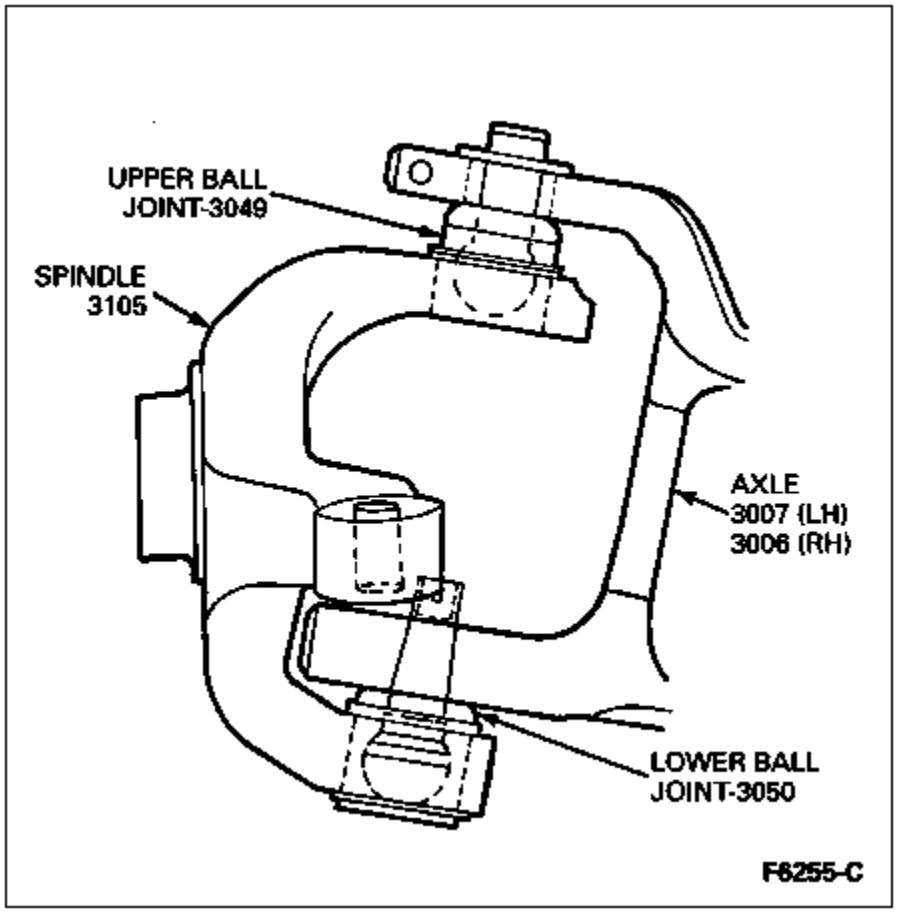
8. Mark orientation and remove the axle clamp bolt from the axle.

9. Remove the camber adjuster from the upper ball joint stud and axle beam using Ball Joint Remover Tool D81T-3010-B or equivalent.

10. **CAUTION: Do not use a pickle fork to separate the front suspension lower arm ball joint (3050) from the axle.**

    Strike the inside area of the axle to pop the front suspension lower arm ball joints loose from the axle beam. If required, use Pitman Arm Puller T64P-3590-F.

11. Remove the front wheel spindle and ball joint assembly from the axle.



Installation

tomsn048@gmail.com

1. Prior to assembly, make sure the upper and lower ball joint seals are in place in front wheel spindle.
2. Place front wheel spindle and ball joints into axle.
3. **NOTE: Make sure adjuster is aligned properly. If camber adjustment is necessary, special adjusters must be installed. Refer to Section 04-00 .**

   Install the camber adjuster into front wheel spindle over upper ball joint stud.
4. Tighten the lower ball joint stud nut to 120-180 Nm (89-133 lb-ft).
5. Continue tightening the castellated nut until it lines up with the hole in the stud. Install the cotter pin.
6. Install the clamp bolt into the axle boss and tighten to 68-92 Nm (50-68 lb-ft).
7. Install front ABS sensor and bolt (if equipped). Tighten to 7.5-10.5 Nm (67-93 lb-in).
8. Install the front disc brake rotor shield.
9. **NOTE: If a bearing packer is unavailable, pack the bearing cone by hand, working the grease through the cage behind the rollers.**

   Pack the inner and outer bearing cones with Premium Long-Life Grease XG-1-C or -K meeting Ford specification ESA-M1C75-B or equivalent bearing grease. Use bearing packer Rotunda Bearing Packer 108-00074 or equivalent.
10. Install the front disc brake hub and rotor on the front wheel spindle.
11. Install the outer bearing cone, washer, and nut. Adjust bearing preload and install the nut retainer, cotter pin and dust cap. Refer to Adjustments in this section.
12. Install the front disc brake caliper as described in Section 06-03 .
13. Connect the steering linkage to the front wheel spindle. Tighten the nut to 70-100 Nm (52-74 lb-ft). Install cotter pin.
14. Install the wheel and tire assembly. Refer to Section 04-04 .
15. Lower the vehicle.
16. If necessary, adjust the toe setting. Refer to Section 04-00 .
17. Check brake operation before driving the vehicle.

tomsn048@gmail.com

tomsn048@gmail.com

Hub and Rotor, Wheel Grease Seal, Bearing Cones and Cups

SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
Hub Seal Replacer	T83T-1175-B
Front Hub Remover/Replacer	T81P-1104-C
Bearing Cup Puller	T77F-1102-A
Driver Handle	T80T-4000-W
Bearing Cup Replacer	T73T-1202-A

Removal

Wheel bearing lubricant is a lithium-base grease, Premium Long-Life Grease XG-1-C or -K or equivalent meeting Ford specification ESA-M1C75-B.

CAUTION: Sodium-base grease is not compatible with lithium-base grease. Do not intermix. Do not lubricate front wheel bearings without first thoroughly cleaning all old grease from the bearing. Use of incompatible bearing lubricants could result in premature lubricant breakdown.

1. **NOTE: If bearing adjustment will not eliminate looseness or rough and noisy operation, the hub and bearings should be cleaned, inspected, and repacked with specified wheel bearing grease. If the bearing cups or the cone and roller assemblies are worn or damaged, they should be replaced.**

   Raise the vehicle until the tire clears the floor. Remove wheel and tire from front disc brake hub and rotor (1102).

2. Remove the front disc brake caliper (2B121) from the front wheel spindle (3105), and wire to the underbody to prevent damage to the brake hose. Refer to Section 06-03 for the front disc brake caliper removal procedure.

3. Remove the grease cap from the front disc brake hub and rotor.

4. Remove the cotter pin, retainer, adjusting nut, and flatwasher from the front wheel spindle. Discard the cotter pin.

5. Remove the front wheel bearing (1216).

6. Pull the front disc brake hub and rotor assembly off the front wheel spindle.

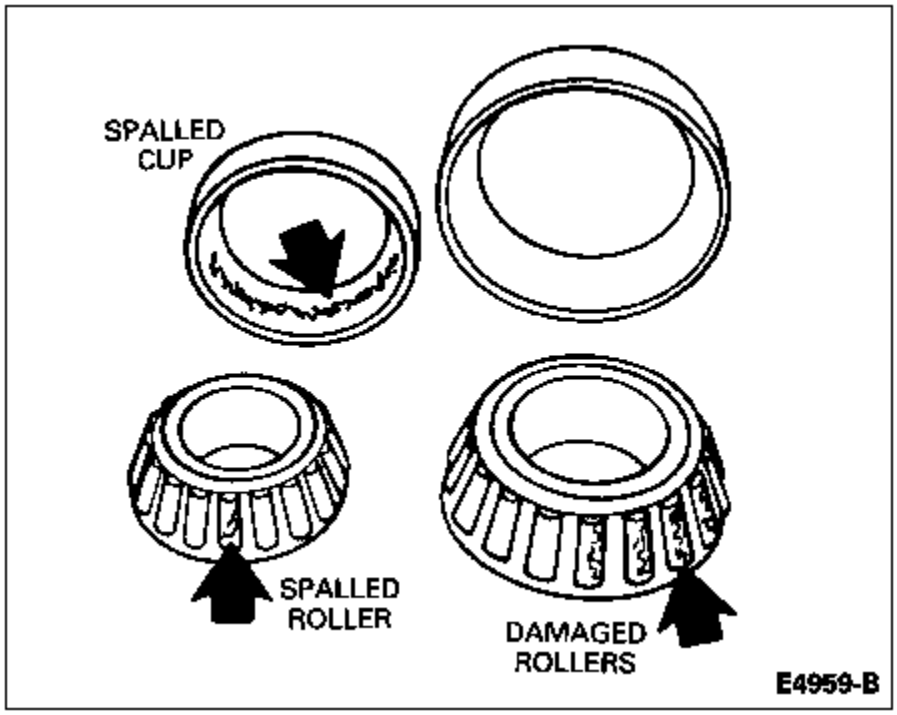
7. **NOTE: Perform the following steps if the original front disc brake hub and rotor assembly are to be reinstalled.**

   Using Grease Seal Remover TOOL-1175-AC or equivalent to remove and discard the grease seal.

tomsn048@gmail.com

8. Remove the bearing cone and roller (1201) from the front disc brake hub and rotor.

9. Clean the inner and outer bearing cups with solvent. Inspect the cups for scratches, pits, excessive wear, and other damage. If the cups are worn or damaged, remove with Front Hub Remover/Replacer T81P-1104-C and Bearing Cup Puller T77F-1102-A.

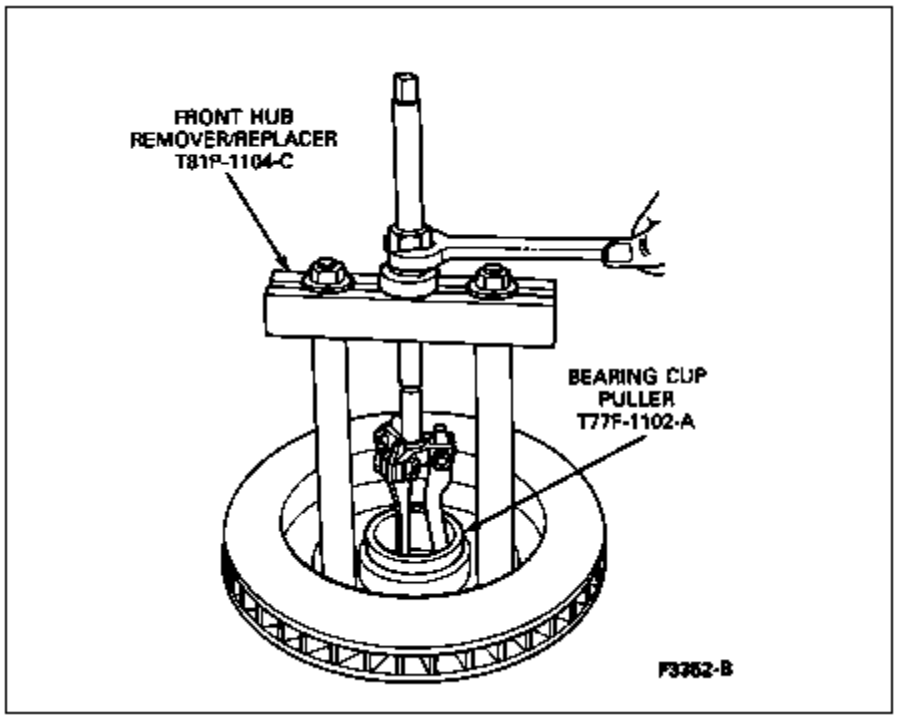


10. Using Rotunda Asbestos Brake Drum System with Vacuum 091-00025 or equivalent remove all loose dirt and dust from the front disc brake hub and rotor. Wipe all old lubricant from the front wheel spindle and the inside of the front disc brake hub and rotor.

11. Cover the front wheel spindle with a clean cloth, and brush all loose dust and dirt from the front disc brake rotor shield (2K004).

12. Carefully remove the cloth from the front wheel spindle to prevent dirt from falling onto front wheel spindle.

tomsn048@gmail.com

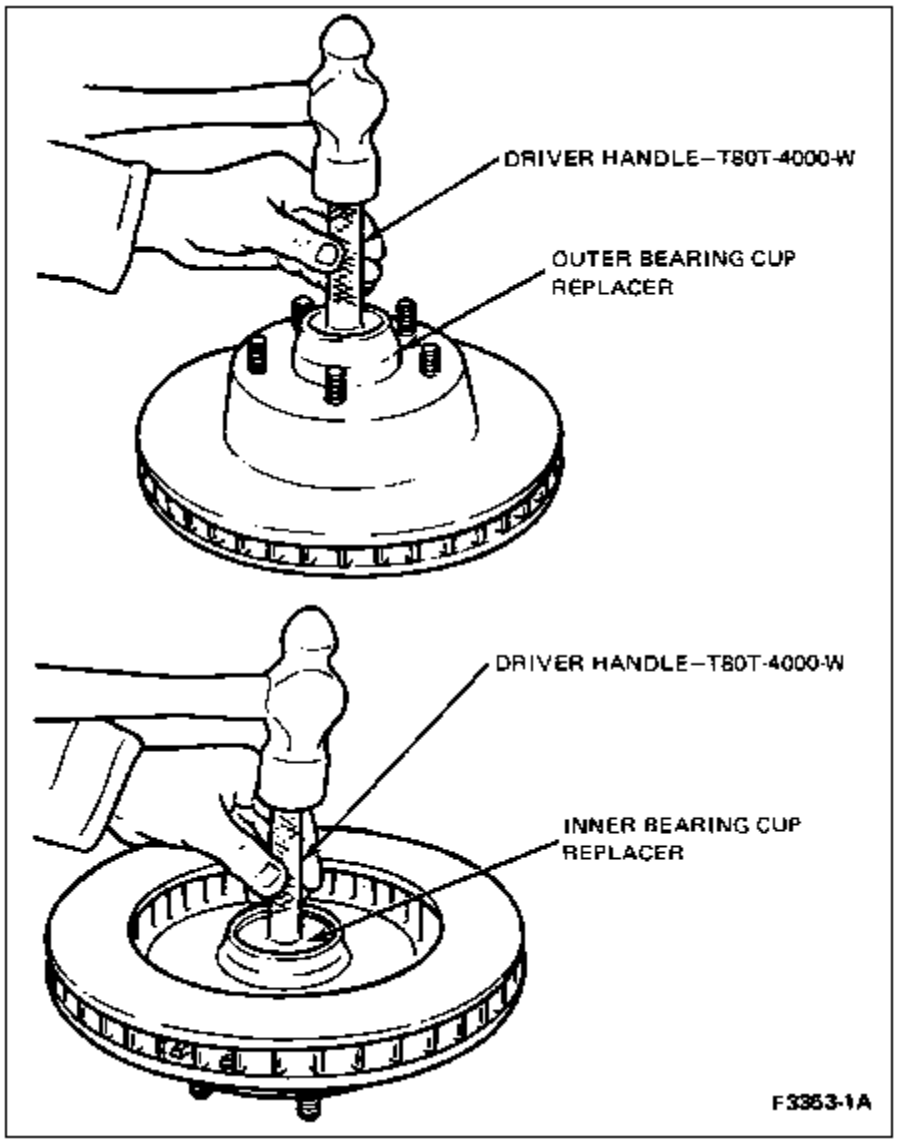


Installation

1. Thoroughly clean old grease from the surrounding surfaces. If a new front disc brake hub and rotor assembly is being installed, remove the protective coating using carburetor degreaser.

2. If the inner or outer bearing cups were removed, install replacement cups using Driver Handle T80T-4000-W and Bearing Cup Replacer T73T-1202-A. Seat cups fully against step in the hub.

tomsn048@gmail.com



3. **NOTE: If a packer is not available, work as much grease as possible between the rollers and cages. Grease the cone surfaces.**

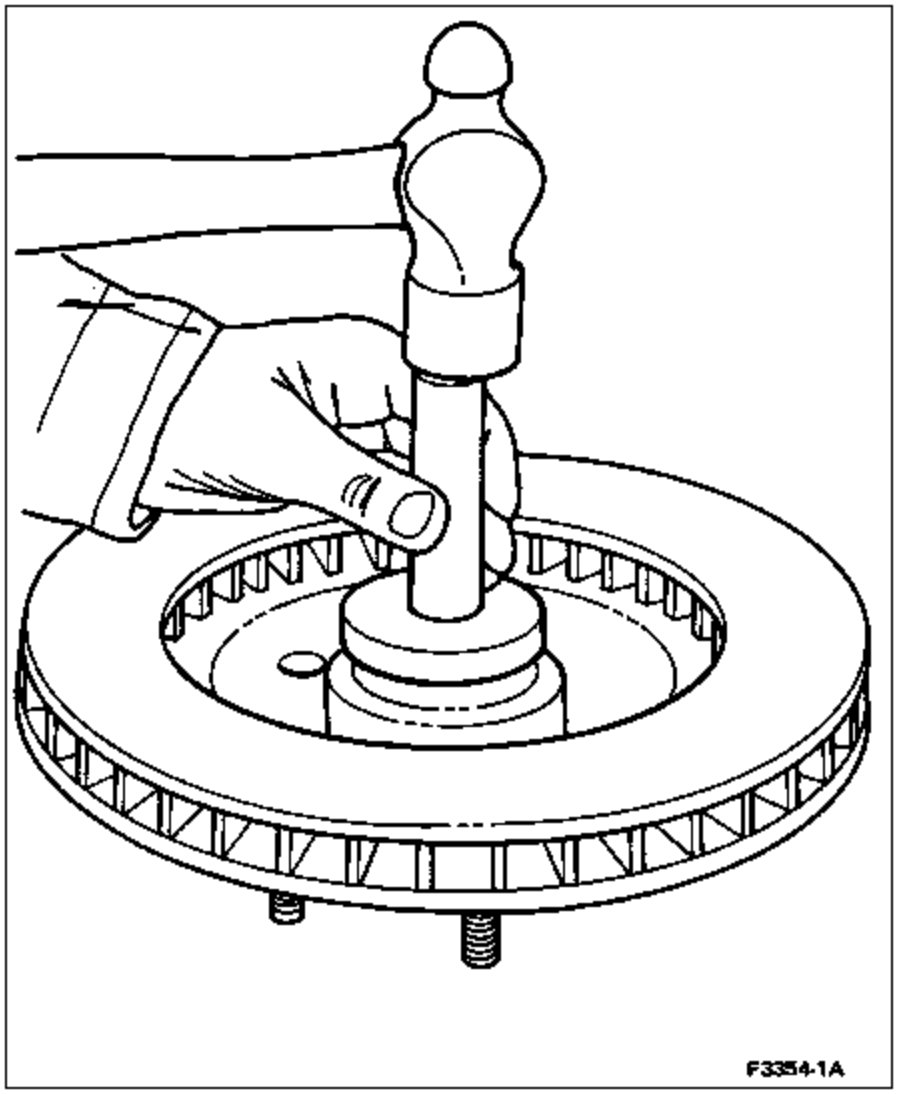
   Using Rotunda Bearing Packer 108-00074 or equivalent pack the bearing cone and roller assemblies with Premium Long-Life Grease XG-1-C or -K or equivalent meeting Ford specification ESA-M1C75-B.

4. Place the bearing cone and roller assembly in the inner cup. A light film of grease should be included between the lips of the new grease seal. Additional Premium Long-Life Grease XG-1-C or -K or equivalent meeting Ford specification ESA-M1C75-B may be added to the new grease seal if required.

5. **CAUTION: When installing seal, be sure it is properly seated.**

   Install the seal with Hub Seal Replacer T83T-1175-B and Driver Handle T80T-4000-W.

tomsn048@gmail.com



6. **NOTE: While installing front disc brake hub and rotor keep the hub centered on the front wheel spindle to prevent damage to the retainer and the front wheel spindle threads.**

   Install the front disc brake hub and rotor on the front wheel spindle.

7. Install the front wheel bearing assembly and flatwasher on the front wheel spindle.

8. Install the adjusting nut. Adjust wheel bearing as described in this section under Adjustments .

9. Install retainer, new cotter pin, and grease cap.

10. Install the front disc brake caliper to the front wheel spindle as outlined in Section 06-03 .

11. Install the wheel and tire. Refer to Section 04-04 .

12. **WARNING: RETIGHTEN WHEEL LUGNUTS TO SPECIFICATION AT 800 KM (500 MILES). FAILURE TO RETIGHTEN LUGNUTS AT MILEAGES SPECIFIED COULD ALLOW THE WHEEL TO COME OFF WHILE THE VEHICLE IS IN MOTION, POSSIBLY CAUSING LOSS OF VEHICLE CONTROL OR COLLISION.**

tomsn048@gmail.com

Lower the vehicle and tighten the lugnuts to 135 Nm (100 lb-ft). Install the wheelcover.

13. Before driving the vehicle, pump the brake pedal several times to restore normal brake pedal travel.

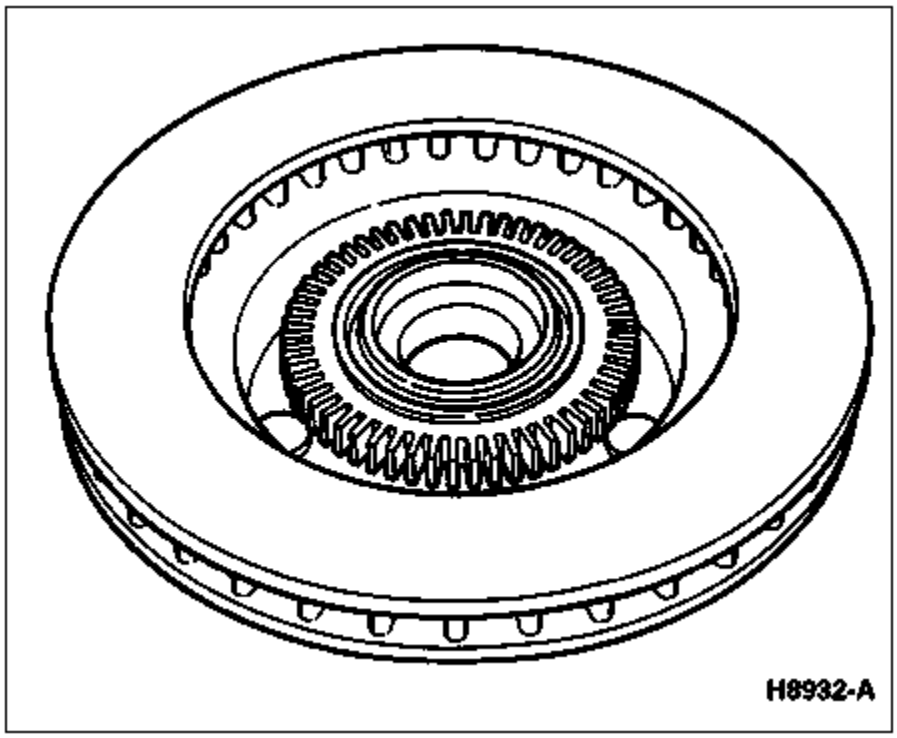
Sensor Indicator, Anti-Lock Brake

Removal

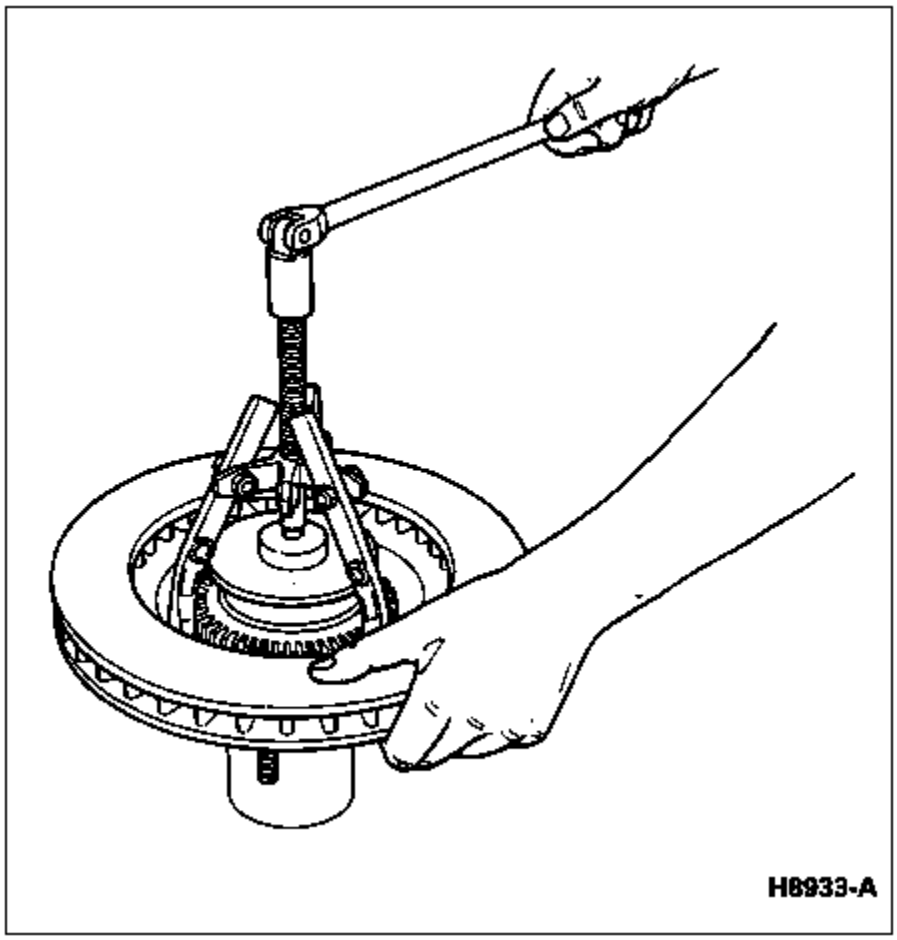
1. Raise vehicle on hoist. Refer to Section 00-02 .
2. Remove wheel and tire assembly.
3. Remove front disc brake caliper (2B121), rotor and hub assemblies. Refer to this section and Section 06-03 .



4. **CAUTION: Discard front brake anti-lock sensor indicator (2C182) after removal. Do not reuse old ring.**

   Using a 3-jaw puller and a step plate, remove front brake anti-lock sensor indicator from hub.

tomsn048@gmail.com



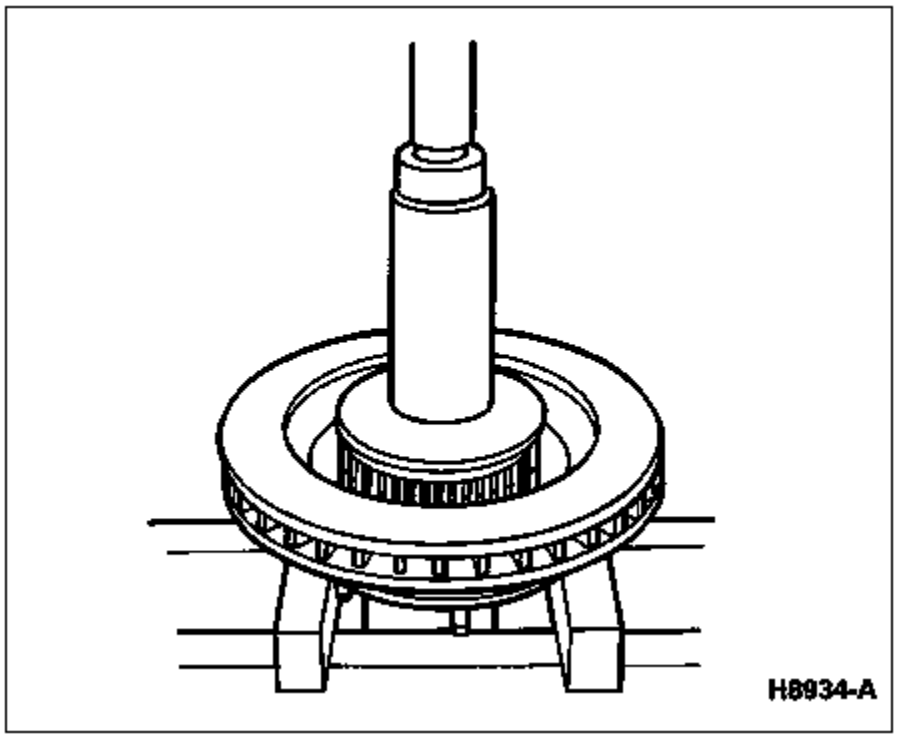
Installation

1. Support center of hub so that wheel studs do not rest on work surface.

2. **CAUTION: When performing the following step, make sure indicator ring is pressed on straight.**

   Position new front brake anti-lock sensor indicator on front disc brake hub and rotor (1102). Using a cylinder with 79mm (3.1 in.) ID and 96mm (3.8 in.) OD, press the front brake anti-lock sensor indicator onto the hub. The front brake anti-lock sensor indicator must be fully seated against the shoulder in the front disc brake hub and rotor.

tomsn048@gmail.com



3. Install hub, rotor and caliper assemblies. Refer to Front Brake Hub and Rotor in this section and Section 06-03 .

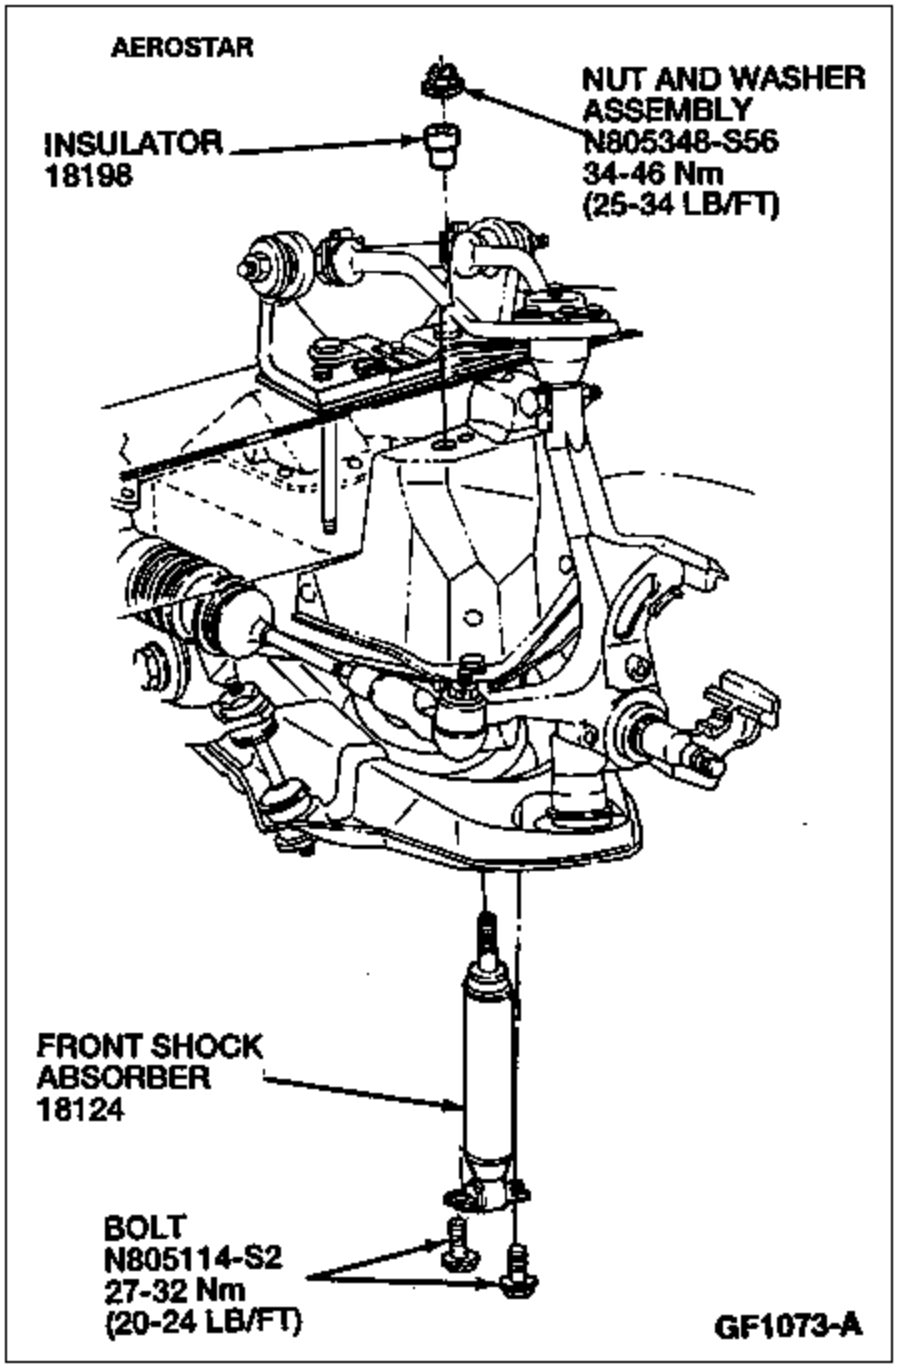
4. Install wheel and tire assembly. Tighten wheel lugnuts to 135Nm (100 lb-ft).

tomsn048@gmail.com

Shock Absorber — Aerostar

WARNING: THE LOW PRESSURE GAS SHOCK ABSORBERS ARE CHARGED WITH NITROGEN GAS TO 930 KPA (135 PSI). DO NOT ATTEMPT TO OPEN, PUNCTURE OR APPLY HEAT TO THE SHOCK ABSORBERS.

tomsn048@gmail.com



Removal

1. Raise vehicle on hoist with control arms in rebound position and position suitable safety stands under vehicle.

2. **NOTE: Inspect coil spring upper bracket insulator. If required, remove and replace.**

   Remove the nut and washer assembly retaining the front shock absorber to the coil spring upper bracket.

3. Remove two bolts retaining the front shock absorber to the bottom of the front suspension lower arm

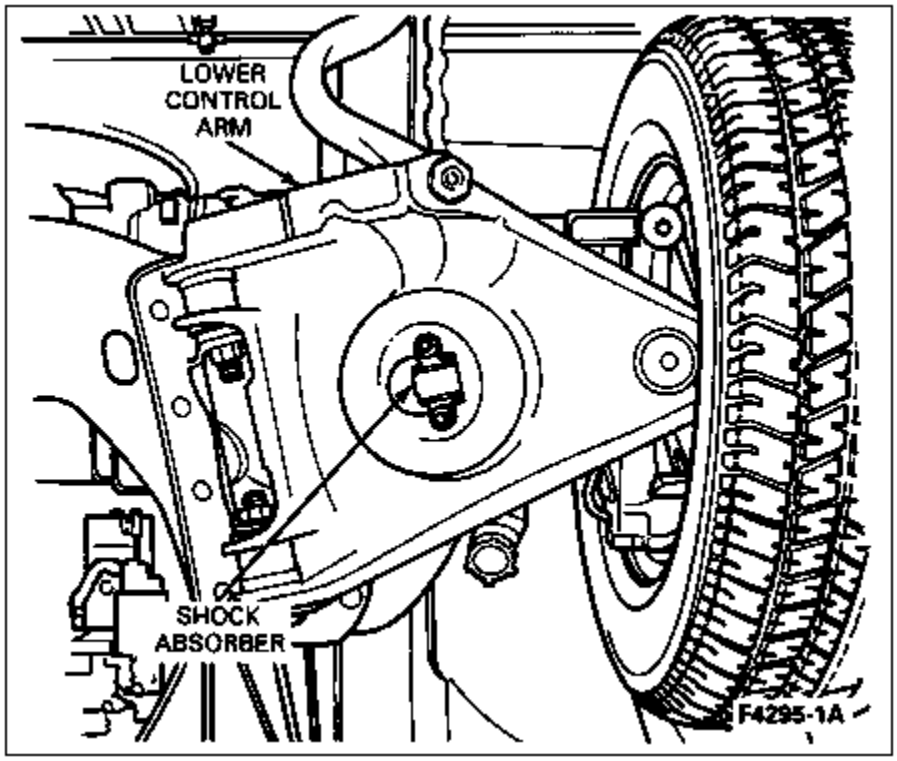
tomsn048@gmail.com

(3078).

4. Remove the front shock absorber through the front suspension lower arm.

Installation

For installation, follow removal procedures in reverse order. Tighten front shock absorber to lower control arm bolts to 27-32 Nm (20-24 lb-ft) and shock absorber to coil spring upper bracket nut 34-46 Nm (25-35 lb-ft).



tomsn048@gmail.com

tomsn048@gmail.com

Shock Absorber — Ranger

WARNING: THE LOW PRESSURE GAS SHOCK ABSORBERS ARE CHARGED WITH NITROGEN GAS TO 930 KPA (135 PSI). DO NOT ATTEMPT TO OPEN, PUNCTURE OR APPLY HEAT TO THE SHOCK ABSORBERS.

Removal

1. Raise vehicle on hoist with axle in the rebound position and position suitable safety stands under axle to prevent it from dropping down when shock is removed.
2. Remove the shock absorber upper nut and washer from the spring seat.
3. Remove stud nut and washer that holds the front shock absorber to the radius arm.
4. Slide the front shock absorber off of the radius arm stud. Slightly compress the front shock absorber by hand and remove from the vehicle.

Installation

For installation, follow removal procedures in reverse order. Inspect the insulator in the spring seat. If the insulator requires replacement, install a new one. Tighten the lower nut to 53-72 Nm (39-53 lb-ft). Tighten the upper insulator, nut and washer to 34-46 Nm (25-34 lb-ft).

Ball Joints, Upper and Lower — Ranger

SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
U-Joint Tool	T74P-4635-C
Receiver Cup	T78P-5638-A3

Removal

1. **NOTE: The front suspension lower arm ball joint (3050) must be removed before removing front suspension upper ball joint (3049).**

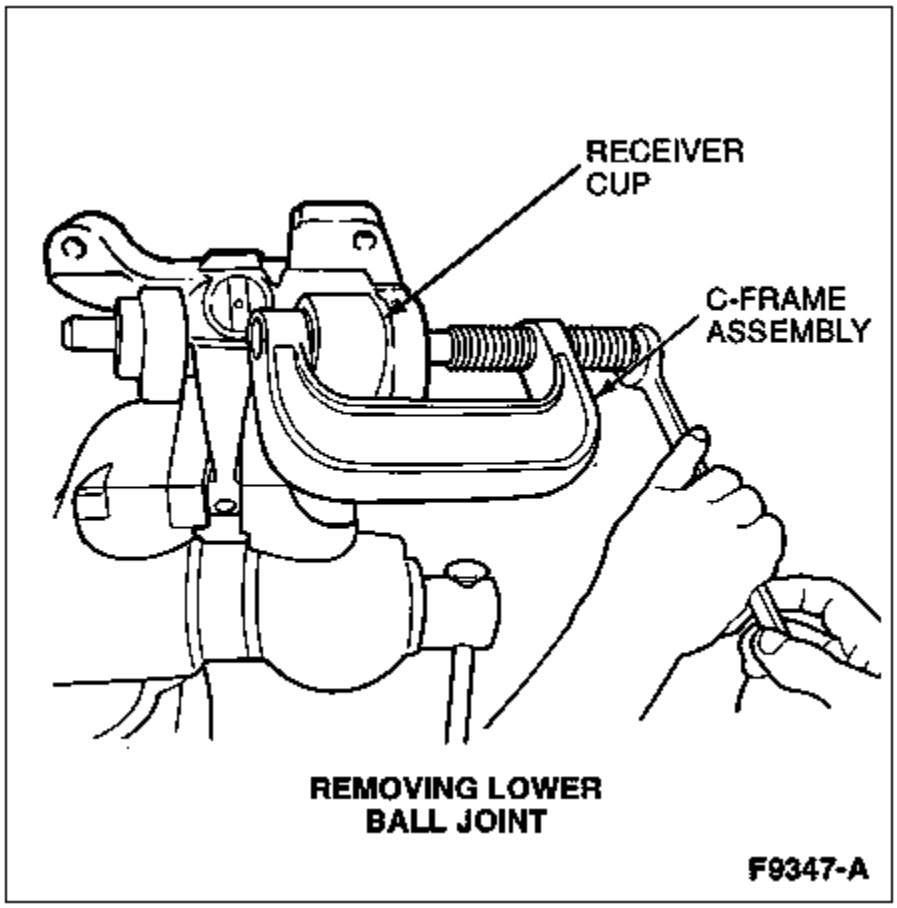
   Remove the front wheel spindle (3105) and ball joint assembly from the axle as described in this section.

2. Install the front wheel spindle assembly in a vise, remove the snap ring from the front suspension lower arm ball joint. Remove the front suspension lower arm ball joint from the front wheel spindle using U-Joint Tool T74P-4635-C C-frame and Receiver Cup T78P-5638-A3.

3. **CAUTION: Do not heat the ball joint or the front wheel spindle to aid in removal.**

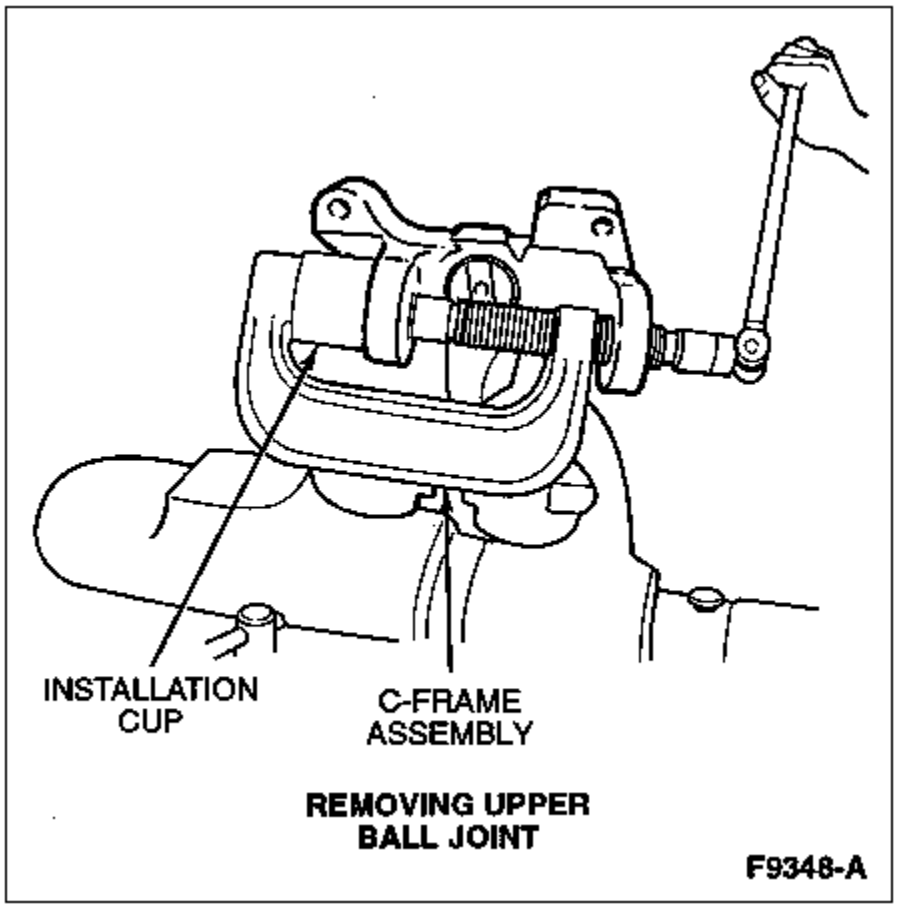
   Turn the forcing screw clockwise until the front suspension lower arm ball joint is removed from the front wheel spindle.

tomsn048@gmail.com



4. Assemble C-frame assembly and receiver cup on the front suspension upper ball joint and turn forcing screw clockwise until front suspension upper ball joint is removed from the front wheel spindle.

tomsn048@gmail.com



Installation

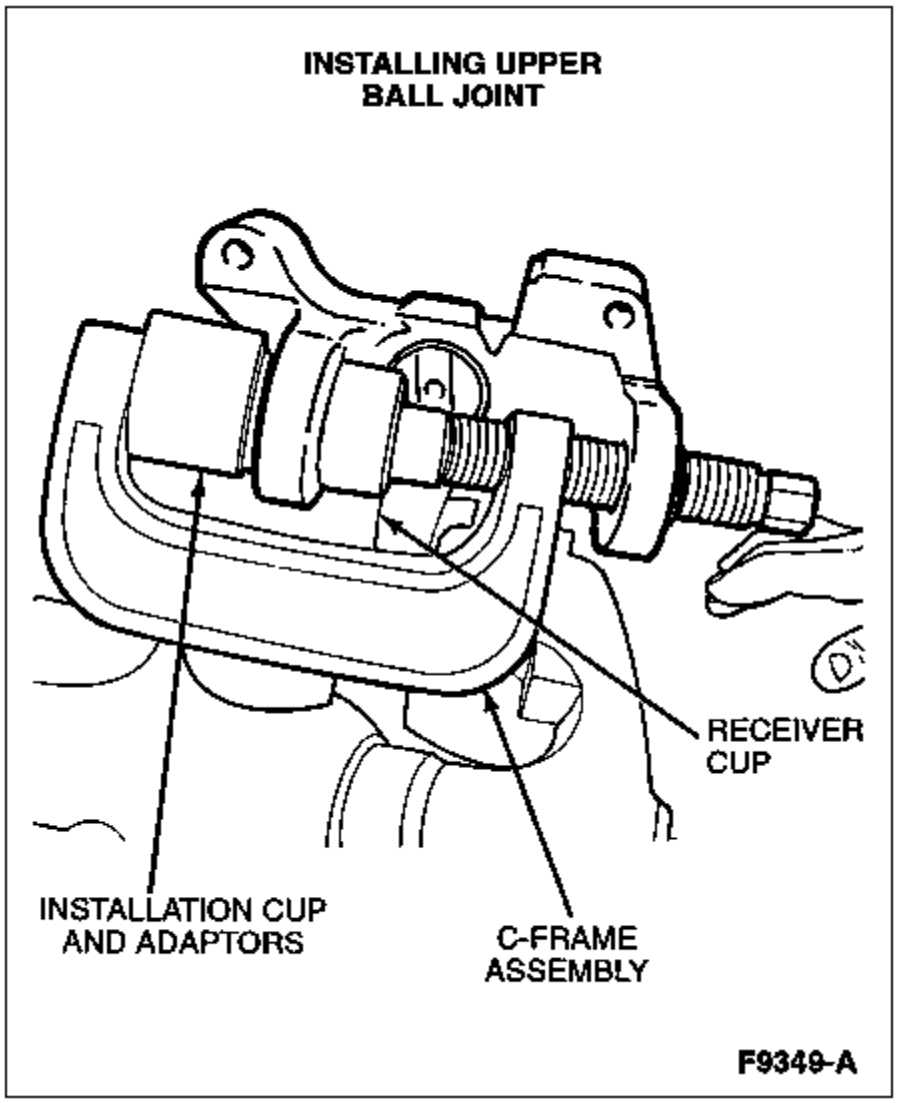
1. **NOTE: Front suspension upper ball joint must be installed into the front wheel spindle first.**

   Assemble U-Joint Tool T74P-4635-C C-frame assembly, Receiver Cup T78P-5638-A3 and suitable size ball joint installation cup from Ball Joint Adaptor Set D81T-3010-A inside cup in position on the front wheel spindle.

2. **CAUTION: Do not heat the ball joint or axle to aid in installation.**

   Turn forcing screw clockwise until front suspension upper ball joint is seated.

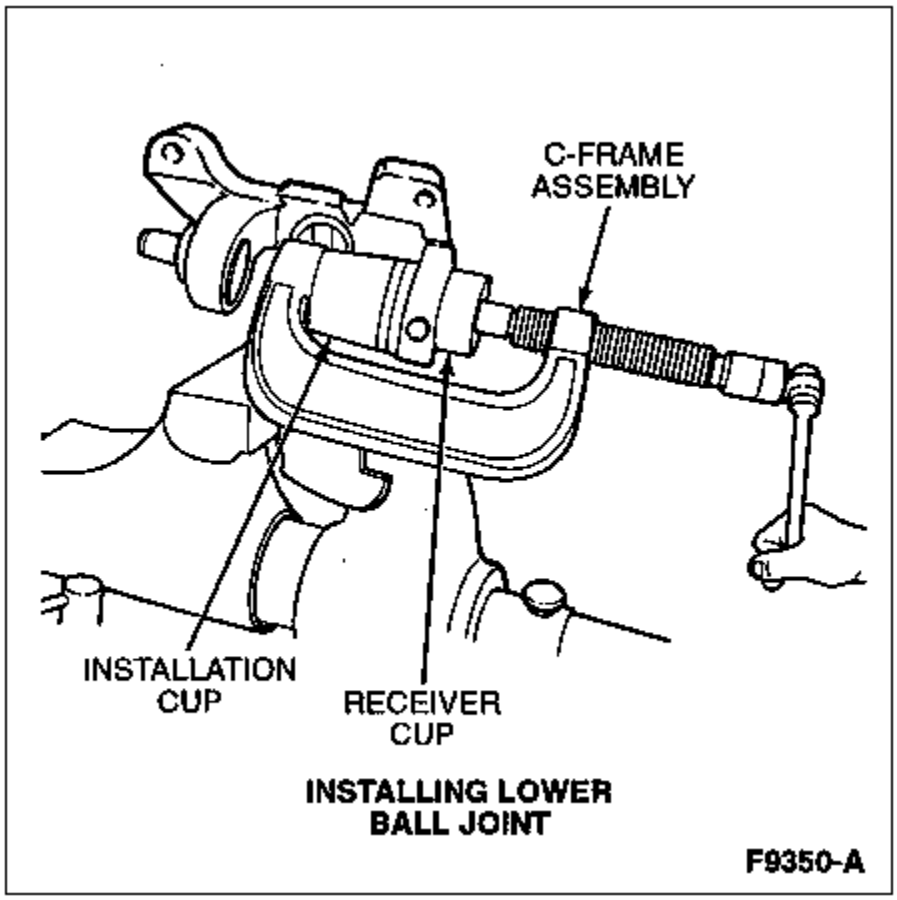
tomsn048@gmail.com



3. To install the front suspension lower arm ball joint, assemble the C-frame in position on the front wheel spindle and repeat Step 1.

4. Install the snap ring onto the front suspension lower arm ball joint.

tomsn048@gmail.com



5. Install the front wheel spindle and ball joint assembly as described in this section.

tomsn048@gmail.com

Radius Arm — Ranger

Removal and Installation

1. **CAUTION: The axle must be supported on the jack throughout front coil spring (5310) removal and installation, and must not be permitted to hang by the brake hose. If the length of the brake hose is not sufficient to provide adequate clearance for removal and installation of the front coil spring, the front disc brake caliper (2B121) must be removed from the front wheel spindle (3105) according to the procedures specified in Section 06-03 . After removal, the front disc brake caliper must be placed on the frame or otherwise supported to prevent suspending the front disc brake caliper from the brake hose. These precautions are absolutely necessary to prevent serious damage to the tube portion of the brake hose assembly.**

   Raise the front of the vehicle, place safety stands under the frame. Place a jack under the axle.

Item	Part Number	Description
1	3B244	Spacer
2	3A184	Outer Insulator
3	3B463	Shield (RH Only)
4	379572	Washer
5	34992	Nut
6	3B203	Inner Insulator
7	3B186	Retainer
8	3405	Radius Arm
9	18045	Front Shock Absorber
10	N806372	Nut Flange
A	—	Tighten to 113-153 Nm (82-113 Lb-Ft)
B	—	Tighten to 53-72 Nm

tomsn048@gmail.com

		(39-53 Lb-Ft)

2. Remove the nut and disconnect the lower end of the front shock absorber from the shock lower stud.
3. Remove the front coil spring as described in this section.
4. Remove the spring lower seat from the radius arm.
5. Remove the bolt and nut attaching radius arm to axle and front bracket.
6. Remove the nut, rear washer shield (right side, V-6 engine only), spacer and insulator from the rear side of the radius arm rear bracket.
7. Remove the radius arm from the vehicle.
8. Remove the inner insulator and retainer from the radius arm stud.

For installation, follow removal procedures in reverse order. Tighten shock absorber-to-radius arm stud nut to 53-72 Nm (39-53 lb-ft). Tighten radius arm-to-axle bolt to 255-345 Nm (190-255 lb-ft). Tighten radius arm-to-bracket nut to 113-153 Nm (83-113 lb-ft).

tomsn048@gmail.com

Insulators, Radius Arm — Ranger

Removal and Installation

1. Loosen the upper shock absorber pivot bolt and compress the front shock absorber.
2. Remove the nut and washer attaching the radius arm to the radius arm bracket. Remove the outer insulator and spacer and shield (on right radius arm V-6 engines only).
3. Move the radius arm and axle assembly forward out of the radius arm bracket.
4. Remove the inner insulator and retainer.

For installation follow removal procedures in reverse order. Tighten radius arm to radius arm bracket nut to 113-153 Nm (83-113 lb-ft). Tighten upper shock bolt to 34-46 Nm (25-34 lb-ft).

tomsn048@gmail.com

Coil Spring and Arm, Lower — Aerostar

SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
Pitman Arm Puller	T64P-3590-F

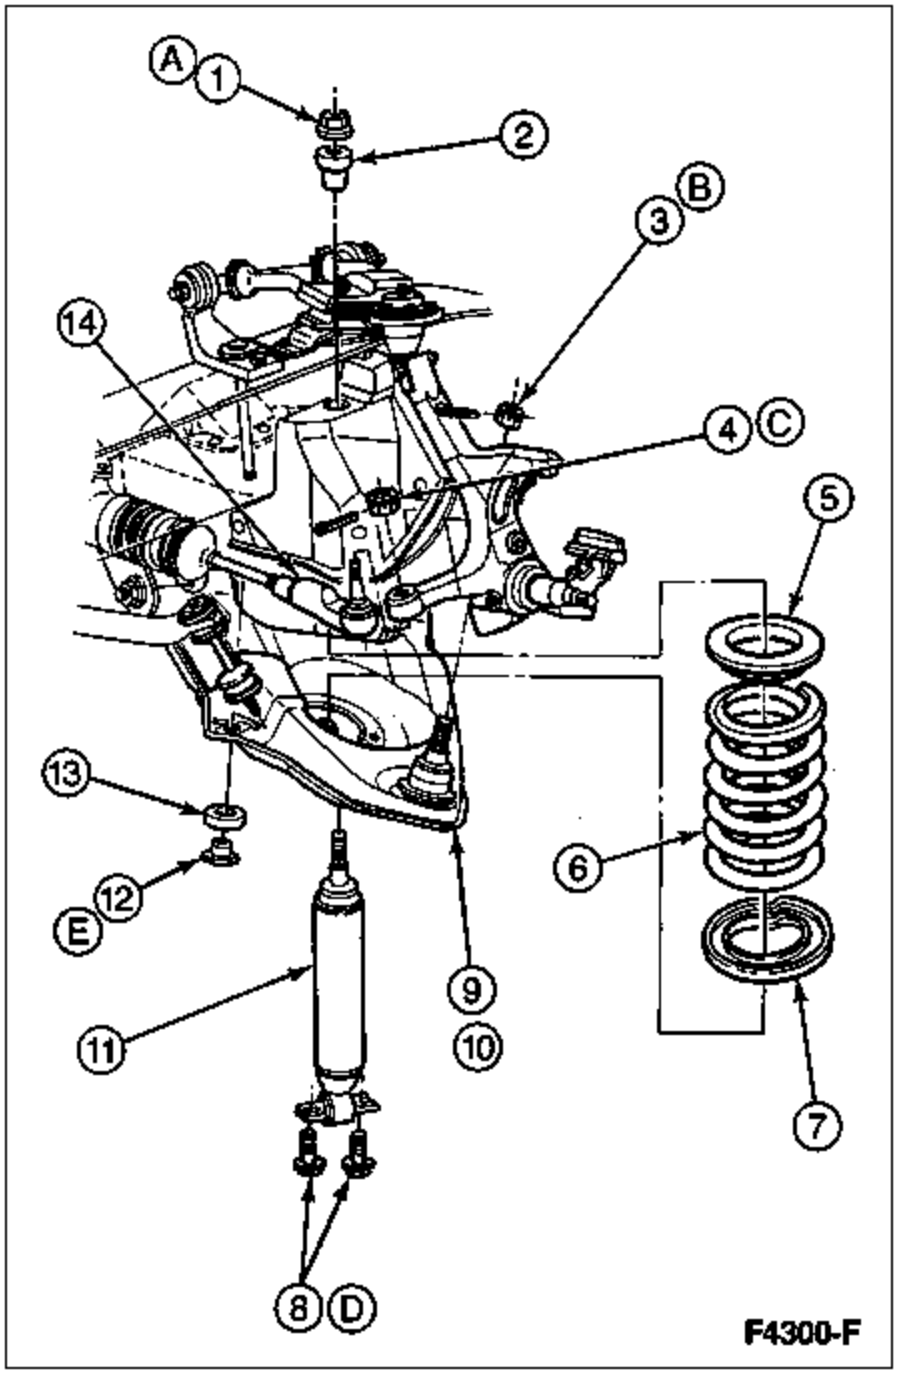
Removal

1. **NOTE: Any time the steering linkage is disconnected from the front wheel spindle (3105), place steering system in the on-center position.**

   Place the steering wheel and steering system in the on-center position.

   Front Coil Spring and Front Suspension Lower Arm, Aerostar

tomsn048@gmail.com



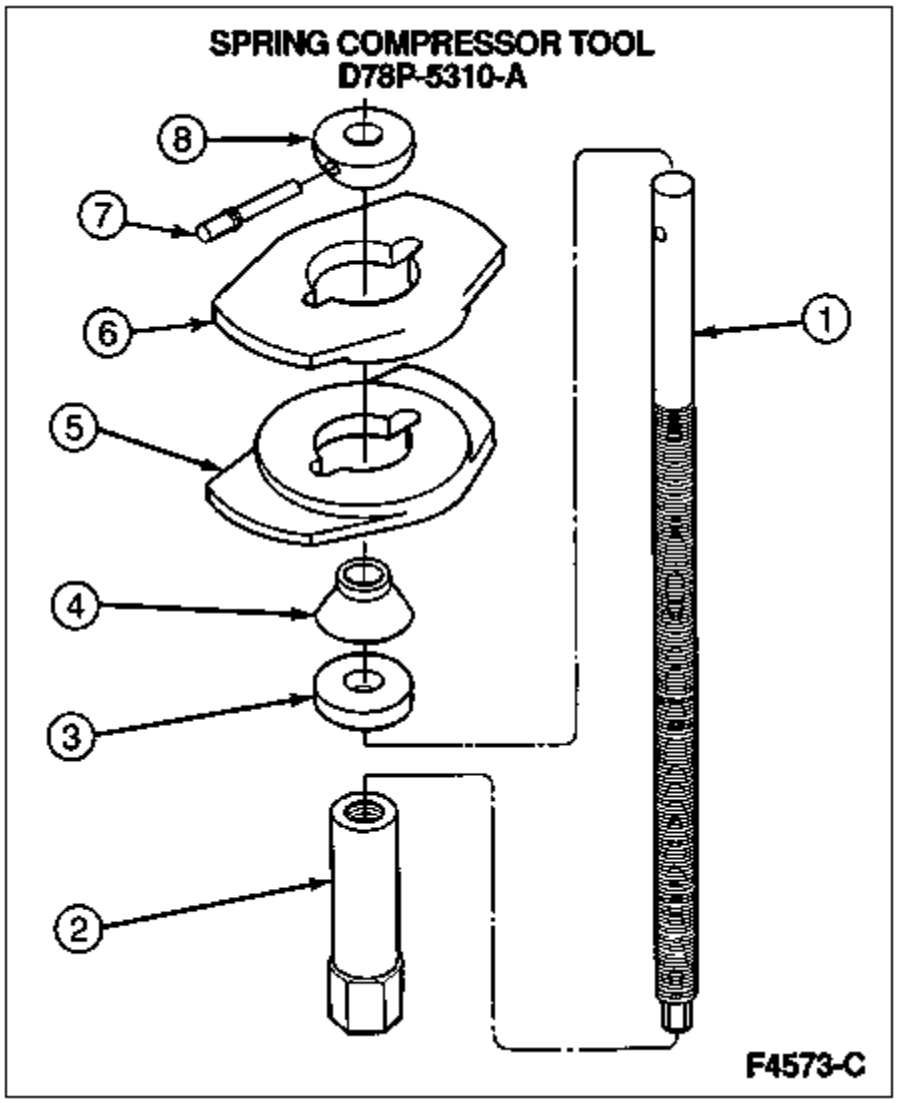
Item	Part Number	Description
1	805348	Nut
2	18198	Insulator
3	381612	Spindle Lower Nut
4	800895	Tie Rod Nut
5	5415	Front Spring Insulator
6	5310	Front Coil Spring

tomsn048@gmail.com

7	5414	Front Spring Insulator
8	N805114-S2	Bolts (2 Req'd)
9	3078	Front Suspension Lower Arm (RH)
10	3079	Front Suspension Lower Arm (LH)
11	18045	Front Shock Absorber
12	5C491	Nut
13	803702	Insulator
14	3A130	Tie Rod End
A	—	Tighten to 34-46 Nm (25-34 Lb-Ft)
B	—	Tighten to 108-153 Nm (80-113 Lb-Ft)
C	—	Tighten to 70-100 Nm (52-74 Lb-Ft)
D	—	Tighten to 27-32 Nm (20-24 Lb-Ft)
E	—	Tighten to 8-12 Nm (71-106 Lb-In)

2. Raise vehicle on a hoist. Remove wheel and tire assembly. Refer to Section 04-04 .
3. Disconnect stabilizer bar link bolt from front suspension lower arm (3079).
4. Remove the two nuts attaching the front shock absorber to the front suspension lower arm (3078) assembly.
5. Remove the upper nut and washer retaining the front shock absorber. Remove the front shock absorber.
6. Support the vehicle with safety stands under the jacking pads, and lower the hoist but maintain working room.
7. Using Coil Spring Compressor D78P-5310-A or equivalent, install one plate with the pivot ball seat facing downward into the coils of the spring. Rotate the plate, until flush with the upper surface of the front suspension lower arm.

tomsn048@gmail.com



Item	Part Number	Description
1	—	Compression Rod (Part of D78P-5310-A)
2	—	Forcing Nut (Part of D78P-5310-A)
3	—	Thrust Washer (Part of D78P-5310-A)
4	—	Lower Ball Nut (Part of D78P-5310-A)
5	—	Lower Plate (Part of D78P-5310-A)
6	—	Upper Plate (Part of D78P-5310-A)
7	—	Pin (Part of D78P-5310-A)
8	—	Upper Ball Nut (Part of D78P-5310-A)

tomsn048@gmail.com

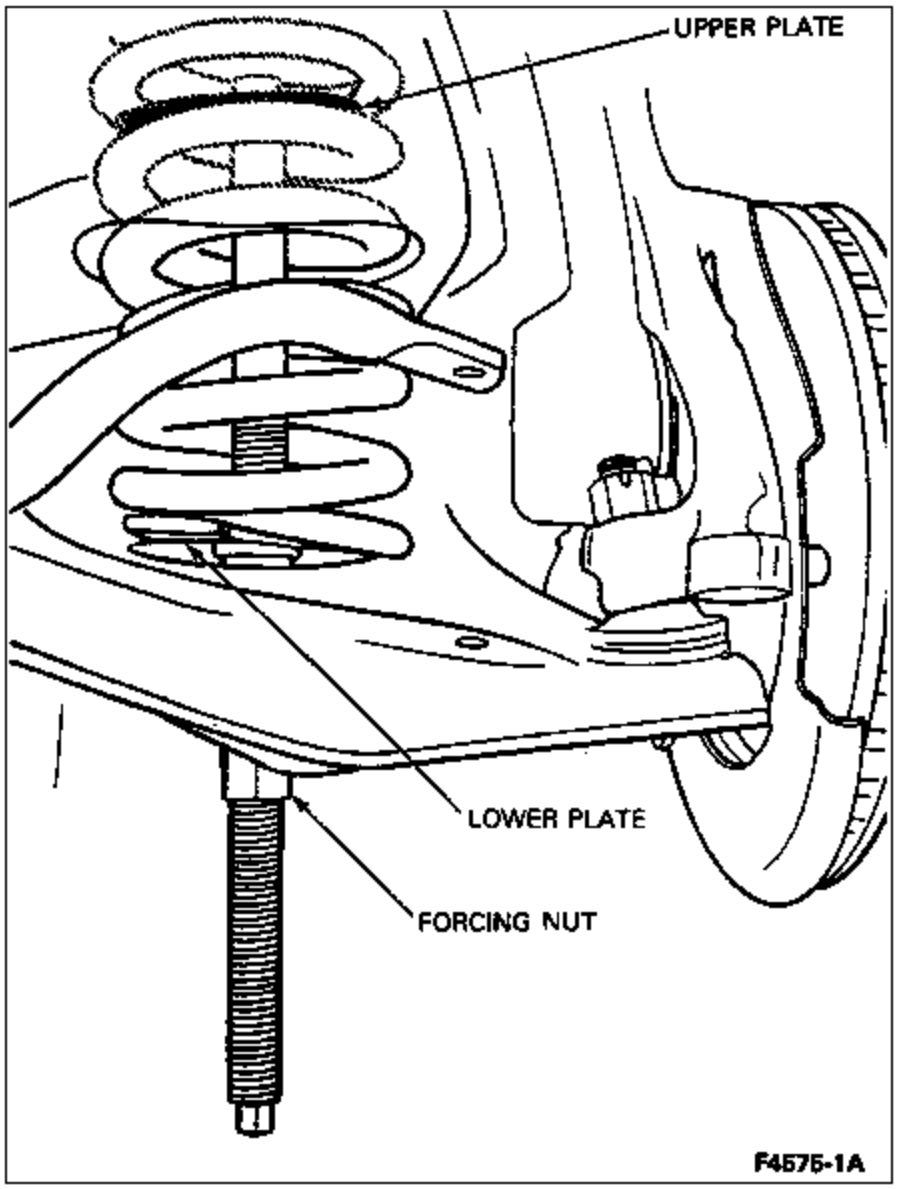
8. Install the other plate with the pivot ball seat facing upward into the spring coils. Insert the upper ball nut through the spring coils so nut rests in the upper plate.

9. Insert the compression rod into the opening in the lower arm, through the upper and lower plate and upper ball nut.

10. **NOTE: Securing pin can only be inserted one way into the upper ball nut because of a stepped hole design.**

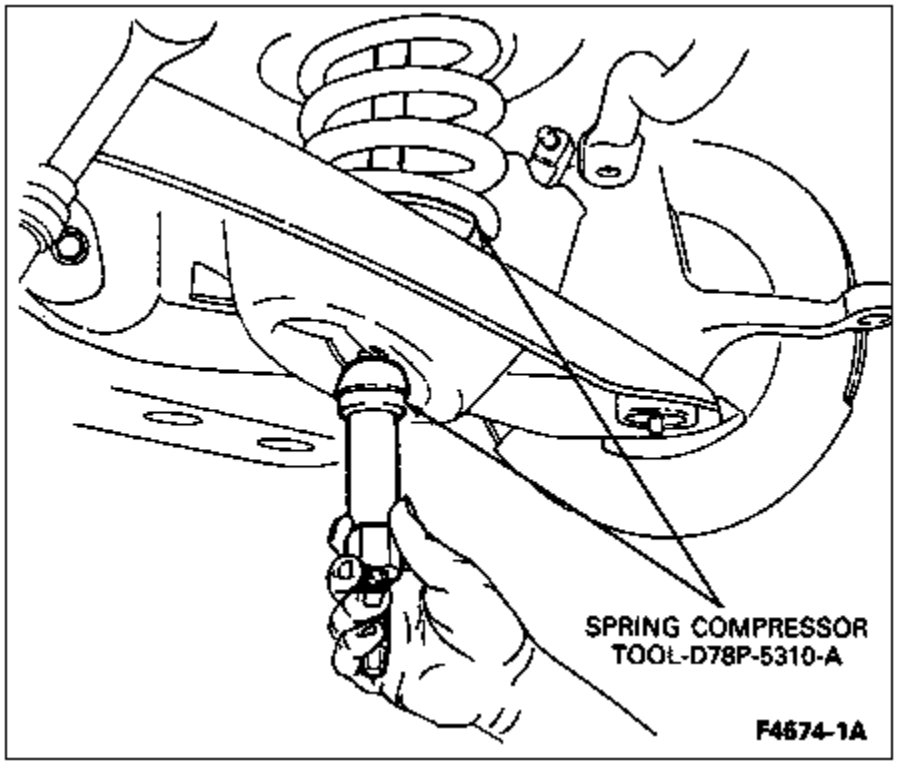
    Insert the securing pin through the upper ball nut and compression rod.

11. With the upper ball nut secured, turn the upper plate so that it walks up the coil and contacts upper spring seat; then back off one-half turn.

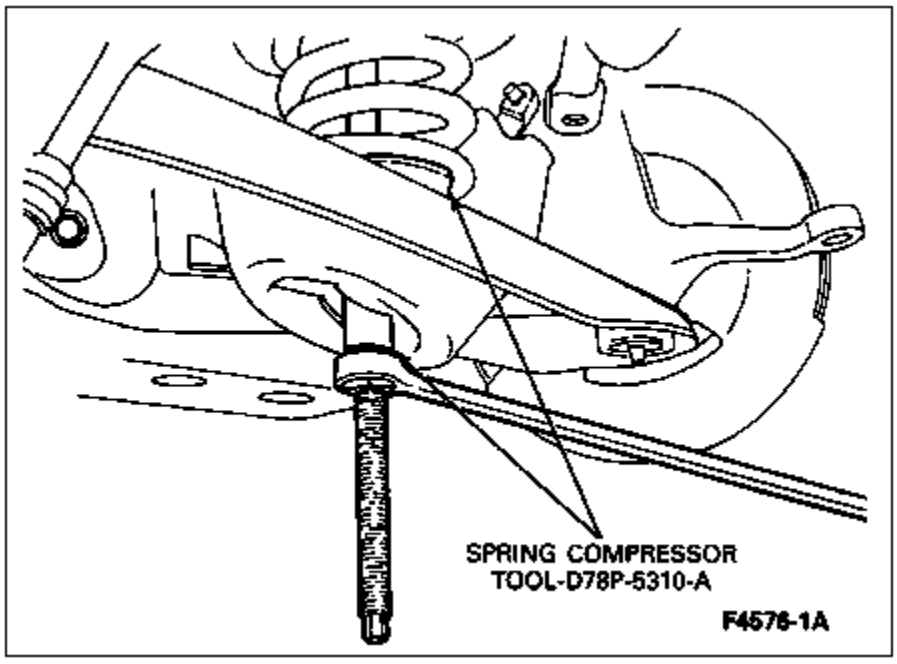


12. Install lower ball nut and thrust washer onto compression rod, and screw on the forcing nut.

tomsn048@gmail.com



13. Tighten the forcing nut until the front coil spring (5310) is compressed.



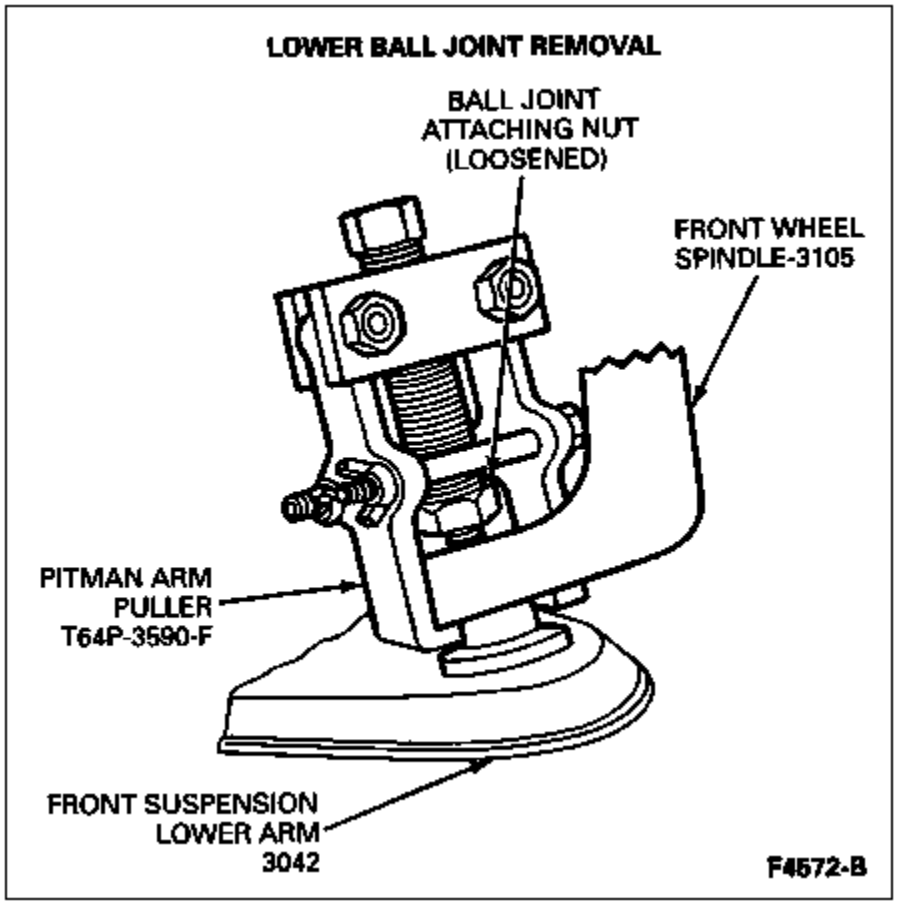
14. Loosen the two lower arm pivot bolts.

15. Remove the cotter pin and loosen, do not remove nut attaching the front suspension lower arm ball

tomsn048@gmail.com

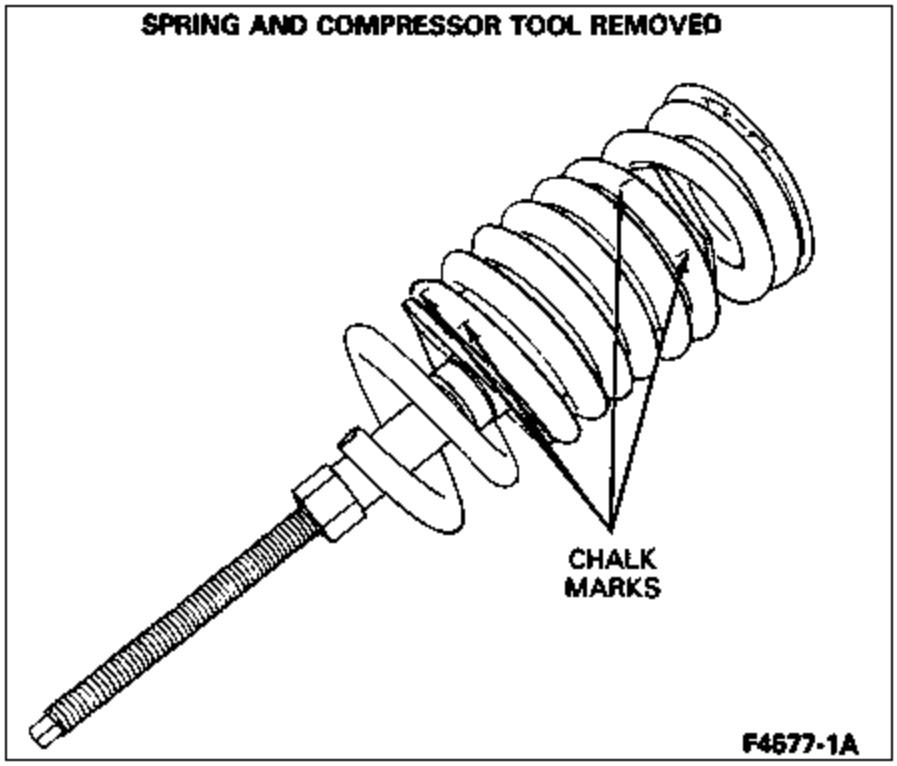
joint (3050) to the spindle.

16. Using Pitman Arm Puller T64P-3590-F loosen the lower ball joint. Remove the puller tool.
17. Supporting front suspension lower arm with a jack, and remove the ball joint nut.
18. Lower the front suspension lower arm and remove the front coil spring.



19. If a new front coil spring is to be installed, mark the position of the upper and lower plates on the front coil spring with chalk and measure the compressed length of the old front coil spring.
20. Loosen the forcing nut to relieve spring tension, and remove the tools from the front coil spring.

tomsn048@gmail.com



21. Remove the bolts and nuts retaining the lower control arm to the front crossmember (5019). Remove the front suspension lower arm.

22. Replace entire front suspension lower arm assembly-to-service bushings.

Installation

1. **NOTE: Do not tighten the front suspension lower arm bolts and nuts to the specified torque until the front coil spring is installed and uncaged. Install nuts and tighten until snug.**

   Inspect lower ball joint boot seal for damage and replace if required.

2. Position the front suspension lower arm in the front crossmember. Install the bolts. Install the nuts and tighten until snug.

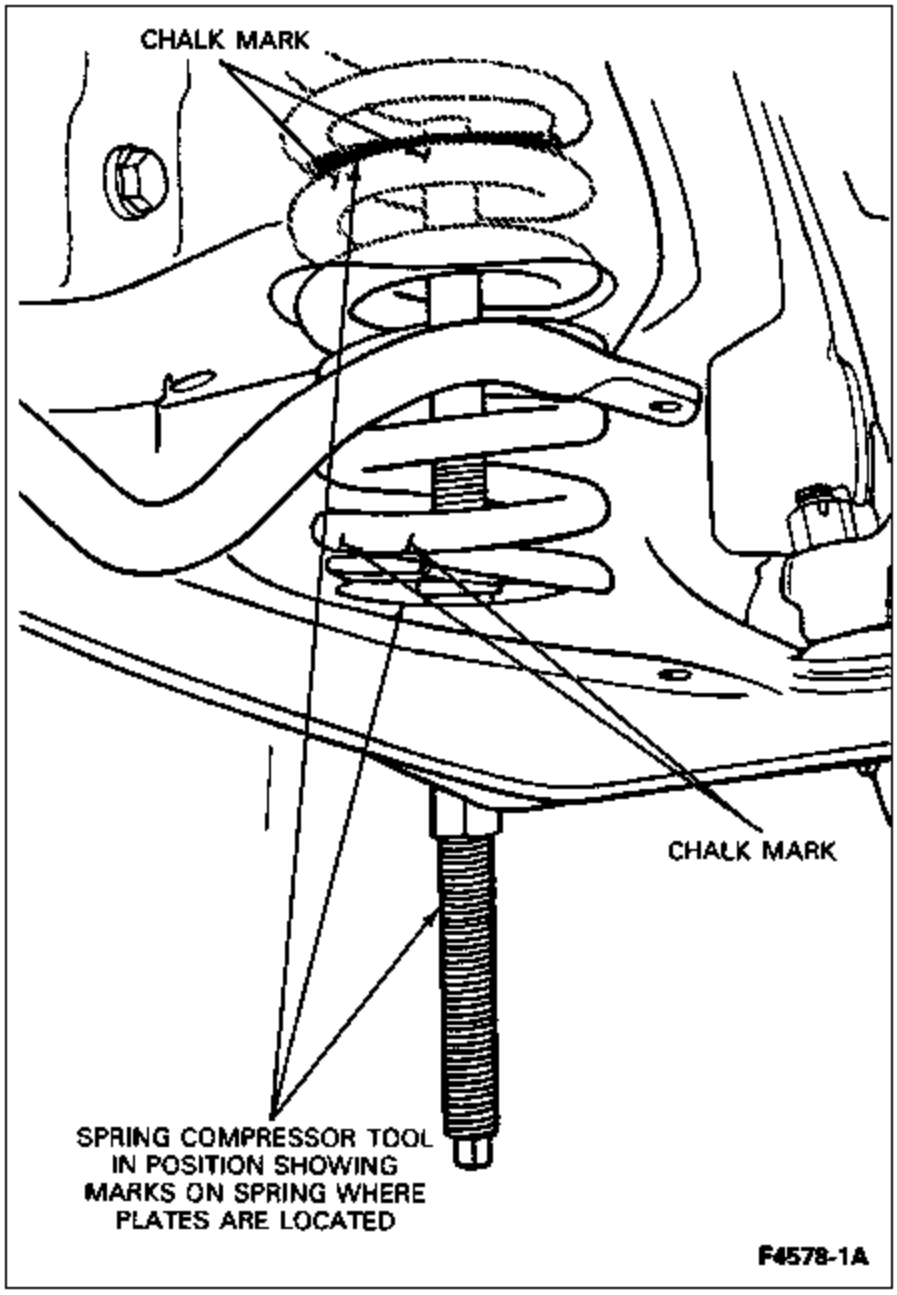
3. Assemble the spring compressor, locate in the same positions indicated in Removal.

4. Before compressing the front coil spring, make sure upper ball nut securing pin is inserted properly.

5. Compress front coil spring until spring height reaches the dimension obtained in Removal, Step 19.

6. Position the front coil spring assembly into the front suspension lower arm.

tomsn048@gmail.com



7. Raise the front suspension lower arm back up into position and make sure lower ball joint is seated in spindle bore.

8. Install the lower ball joint attaching nut and tighten to 108-153 Nm (80-113 lb-ft). Install a new cotter pin.

9. Remove the spring compression tool.

10. Verify the front coil spring is properly indexed relative to the front suspension lower arm.

11. Loosen the forcing nut to relieve spring tension and remove the tool from the front coil spring.

12. Raise vehicle. Position the front shock absorber and install the washer and upper nut. Tighten nut to 34-46 Nm (25-34 lb-ft).

tomsn048@gmail.com

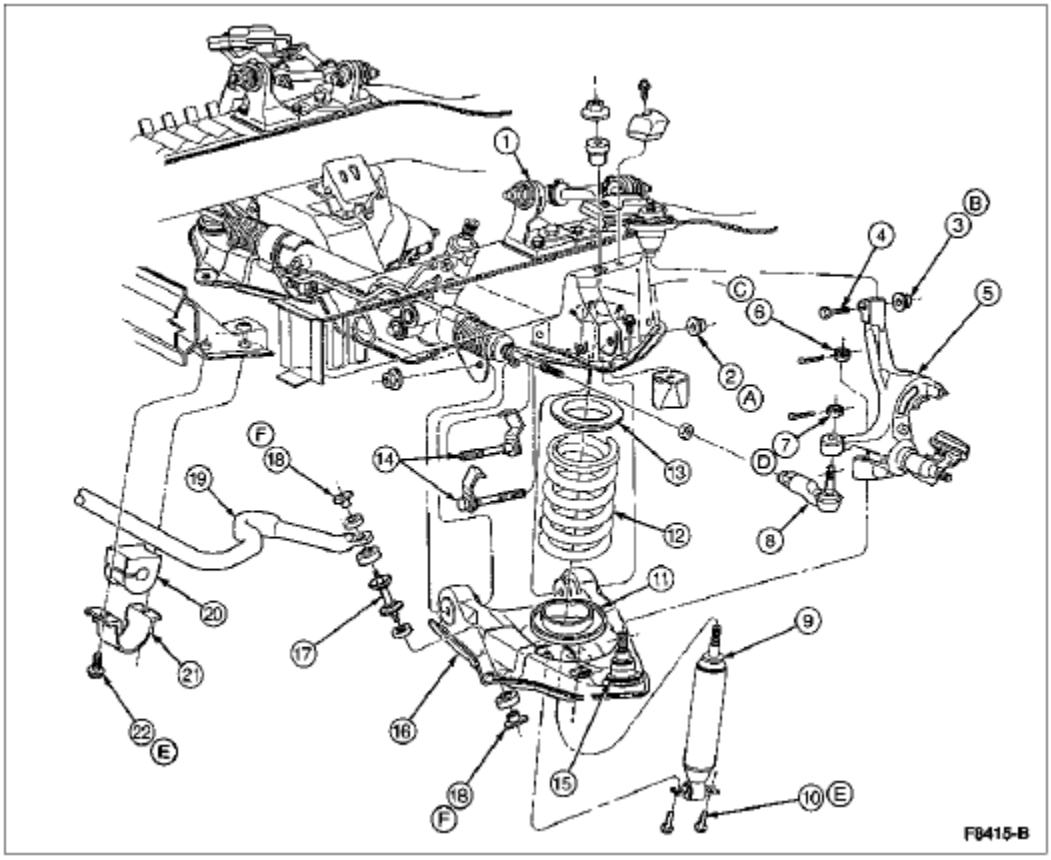
13. Install the two bolts attaching the front shock absorber to the lower control arm and tighten to 27-32 Nm (20-24 lb-ft).

14. Connect the stabilizer bar link bolt to the front suspension lower arm and tighten to 8-12 Nm (71-106 lb-in).

15. Lower the vehicle to normal ride height. Tighten nuts and lower control arm bolts to the No. 1 front crossmember to 136-190 Nm (100-140 lb-ft).

16. Lower the vehicle.

No. 1 Crossmember and Stabilizer Bar, Aerostar



Item	Part Number	Description
1	3083	Front Suspension Upper Arm
2	800237	Nut (2 Req'd)

19	5482	Front Stabilizer Bar
20	5484	Insulator
21	5486	Stabilizer Bar Bracket
22	806497	Bolt
A	—	Tighten to 136-190 Nm (100-140 Lb-Ft)
B	—	Tighten to 36-50 Nm (27-37 Lb-Ft)
C	—	Tighten to 108-153 Nm (80-113 Lb-Ft)
D	—	Tighten to 70-100 Nm (52-74 Lb-Ft)
E	—	Tighten to 27-32 Nm (20-24 Lb-Ft)
F	—	Tighten to 8-12 Nm (71-106 Lb-In)

tomsn048@gmail.com

tomsn048@gmail.com

Arm, Upper — Aerostar

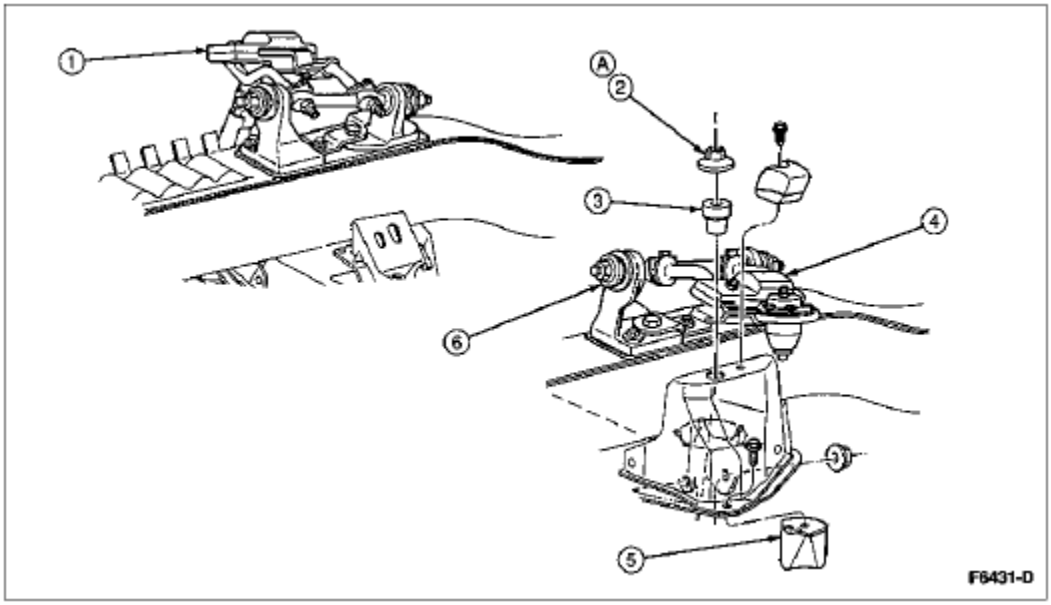
NOTE: The upper control arm assembly consists of the front suspension upper arm (3083), front suspension upper ball joint (3049), adjusting arm, brackets, bushings and nuts.

Removal

1. **NOTE: Any time the steering linkage is disconnected from the front wheel spindle (3105), the steering system must be placed in the on-center position.**

   Place the steering wheel and steering system in the on-center position.

Upper Control Arm Assembly, Aerostar



Item	Part Number	Description
1	3C156	Damper Assembly (RH)
2	805348	Nut and Washer
3	—	Shock Absorber Insulator (Part of 18198)
4	3C157	Damper Assembly (LH)
5	3020	Front Suspension Bumper
6	3083	Front Suspension Upper Arm Assembly

tomsn048@gmail.com

A	—	Tighten to 34-46 Nm (25-34 Lb-Ft)

2. **WARNING: WHEN SERVICING ANY COMPONENT IN THE UPPER CONTROL ARM AND BALL JOINT SYSTEM, ONLY ONE SIDE OF THE VEHICLE IS SERVICED AT A TIME. NEVER SERVICE BOTH SIDES AT THE SAME TIME.**

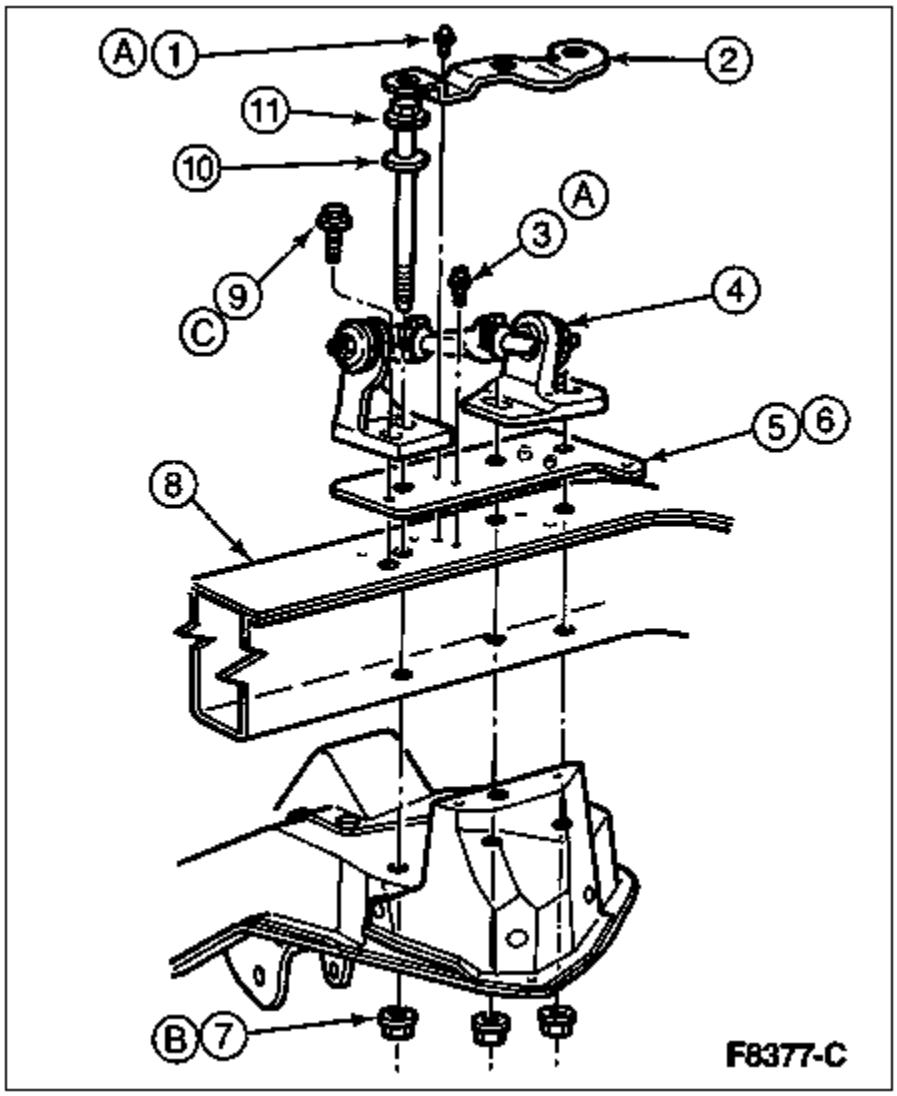
   Raise the vehicle on a frame hoist. Position a tall jack under the front suspension lower arm (3078) and raise the jack.

3. Remove the front wheel spindle as described in this section.

4. Remove retainer plate screw and the plate.

5. Mark the position of the control arm mounting brackets on the flat plate.

6. Remove the bolt and washer retaining the front mounting bracket to the flat plate.



tomsn048@gmail.com

Item	Part Number	Description
1	611194	Screw
2	3B204	Flat Plate (LH)
	3A375	Flat Plate (RH)
3	611175	Screw
4	3083	Front Suspension Upper Arm
5	3B380	Mounting Plate (LH)
6	3A009	Mounting Plate (RH)
7	804431	Nut and Washer Assembly
8	5005	Frame
9	804618	Bolt and Washer Assembly
10	804387	Washer
11	804386	Bolt
A	—	Tighten to 14-19 Nm (10-14 Lb-Ft)
B	—	Tighten to 196-264 Nm (145-195 Lb-Ft)
C	—	Tighten to 47-64 Nm (35-47 Lb-Ft)

7. From beneath the rail, remove the three nuts from bolts retaining two front suspension upper arm mounting brackets to the body rail.

8. Remove three long bolts retaining mounting brackets to body rail. Rotate front suspension upper arm out of position in order to remove the bolts.

9. Remove the front suspension upper arm, front suspension upper ball joint and mounting bracket assembly and flat plate from the vehicle.

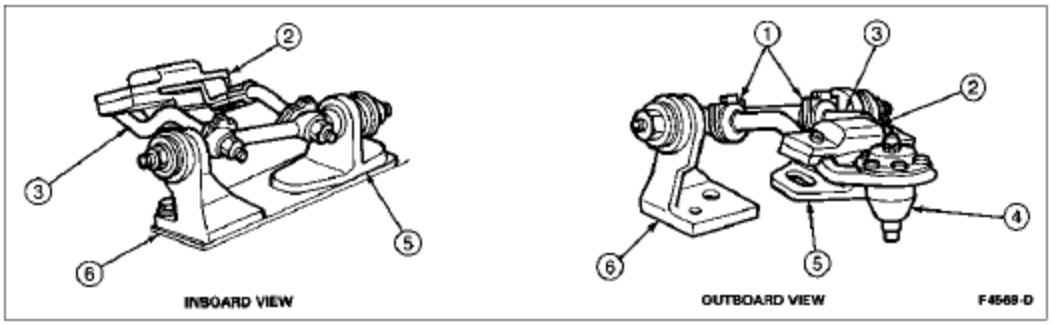
10. If required, remove and replace the upper and/or lower ball joint boot seal.

11. **NOTE: The front suspension upper arm and front suspension upper ball joint are serviced as an assembly.**

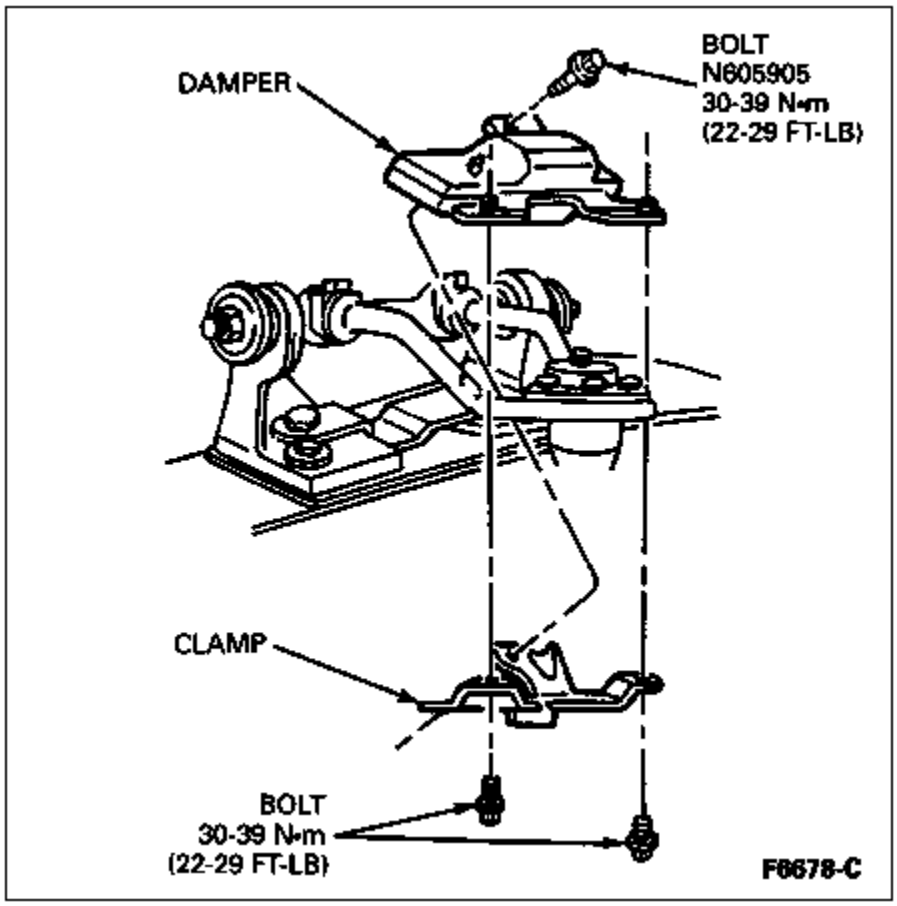
    If required, remove the damper assembly from the front suspension upper arm by removing the three retaining bolts.

Ball Joint and Upper Arm Assembly

tomsn048@gmail.com



Item	Part Number	Description
1	—	Alignment Shims (Part of 3083)
2	3C157	Damper Assembly
3	3083	Front Suspension Upper Arm
4	3049	Front Suspension Upper Ball Joint
5	—	Rear Mounting Bracket (Part of 3383)
6	—	Front Mounting Bracket (Part of 3383)



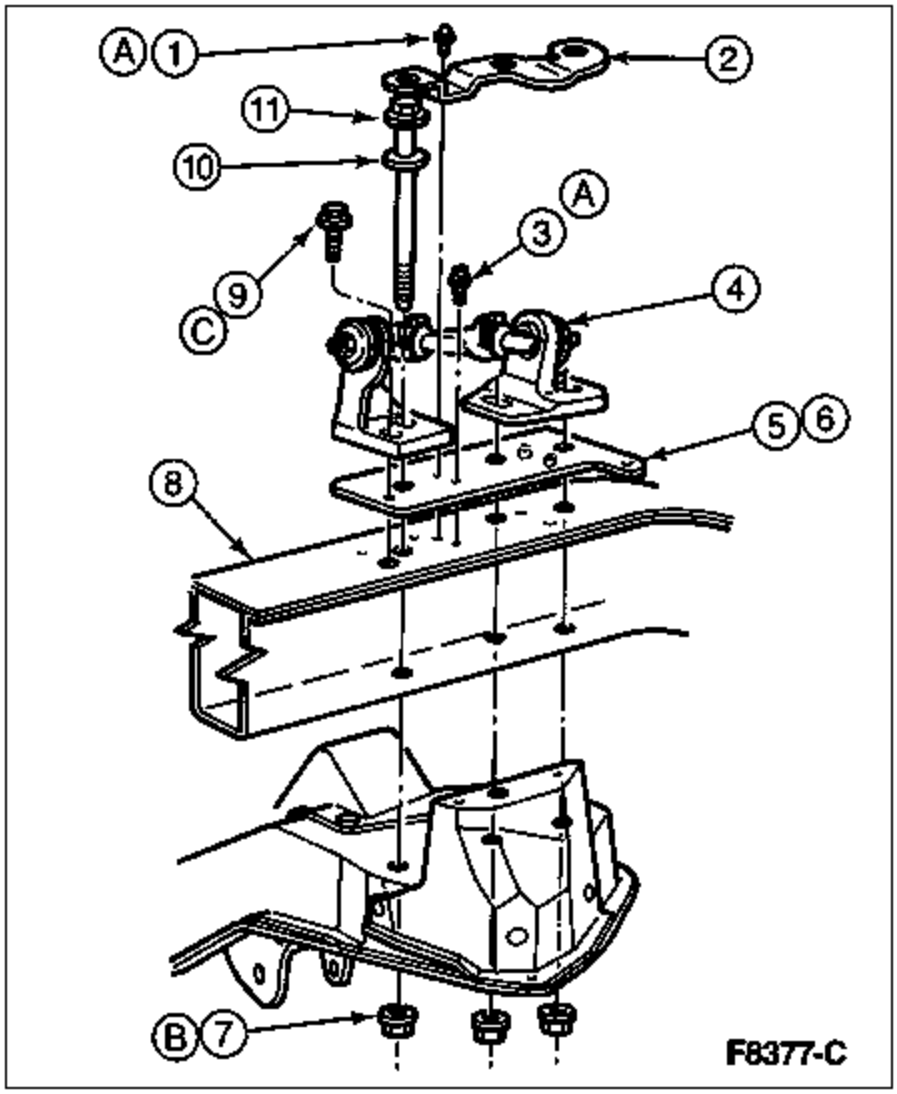
tomsn048@gmail.com

Installation

1. If removed, install the front suspension upper arm in the pivot arm.
2. Install the shims on the control arm studs using same number and location marked during removal.
3. Install and tighten the nuts retaining the shims to the front suspension upper arm to 95-135 Nm (70-100 lb-ft).
4. If removed, install the boot seal on the upper and/or lower ball joint.
5. If removed, install the damper assembly to the front suspension upper arm. Tighten the damper retaining bolts to 30-39 Nm (22-29 lb-ft).
6. Place flat plate on the frame (5005). Install bolt and tighten to 14-19 Nm (10-14 lb-ft).
7. Position mounting brackets and front suspension upper arm assembly on the flat plate.
8. Install three long bolts and washers retaining the mounting brackets to the frame.
9. Rotate or rock front suspension upper arm and mounting bracket assembly until the bolt heads rest against the mounting bracket and studs extend through the frame.
10. Align mounting brackets with marks made on flat plate during removal.
11. Position bolt retaining plate on mounting bracket and mounting plate assembly. Make sure the mounting brackets do not move from the marked position on the mounting plate. Install and tighten the screw to 14-19 Nm (10-14 lb-ft).
12. **CAUTION: The torque required for the mounting bracket to frame nuts and bolts is critical. Tighten to specified torque.**

    Install and tighten the nuts retaining the mounting bracket bolts to the frame to 196-264 Nm (145-195 lb-ft).

tomsn048@gmail.com



Item	Part Number	Description
1	611194	Screw

tomsn048@gmail.com

A	—	Tighten to 14-19 Nm (10-14 Lb-Ft)
B	—	Tighten to 196-264 Nm (145-195 Lb-Ft)
C	—	Tighten to 47-64 Nm (35-47 Lb-Ft)

13. Install and tighten the bolt retaining the front mounting bracket to the flat plate 47-64 Nm (35-47 lb-ft).
14. Install the front wheel spindle as described in this section.
15. If required, adjust caster, camber and toe-in as described in Section 04-00 .

tomsn048@gmail.com

Coil Spring — Ranger

SPECIAL SERVICE TOOL(S) REQUIRED

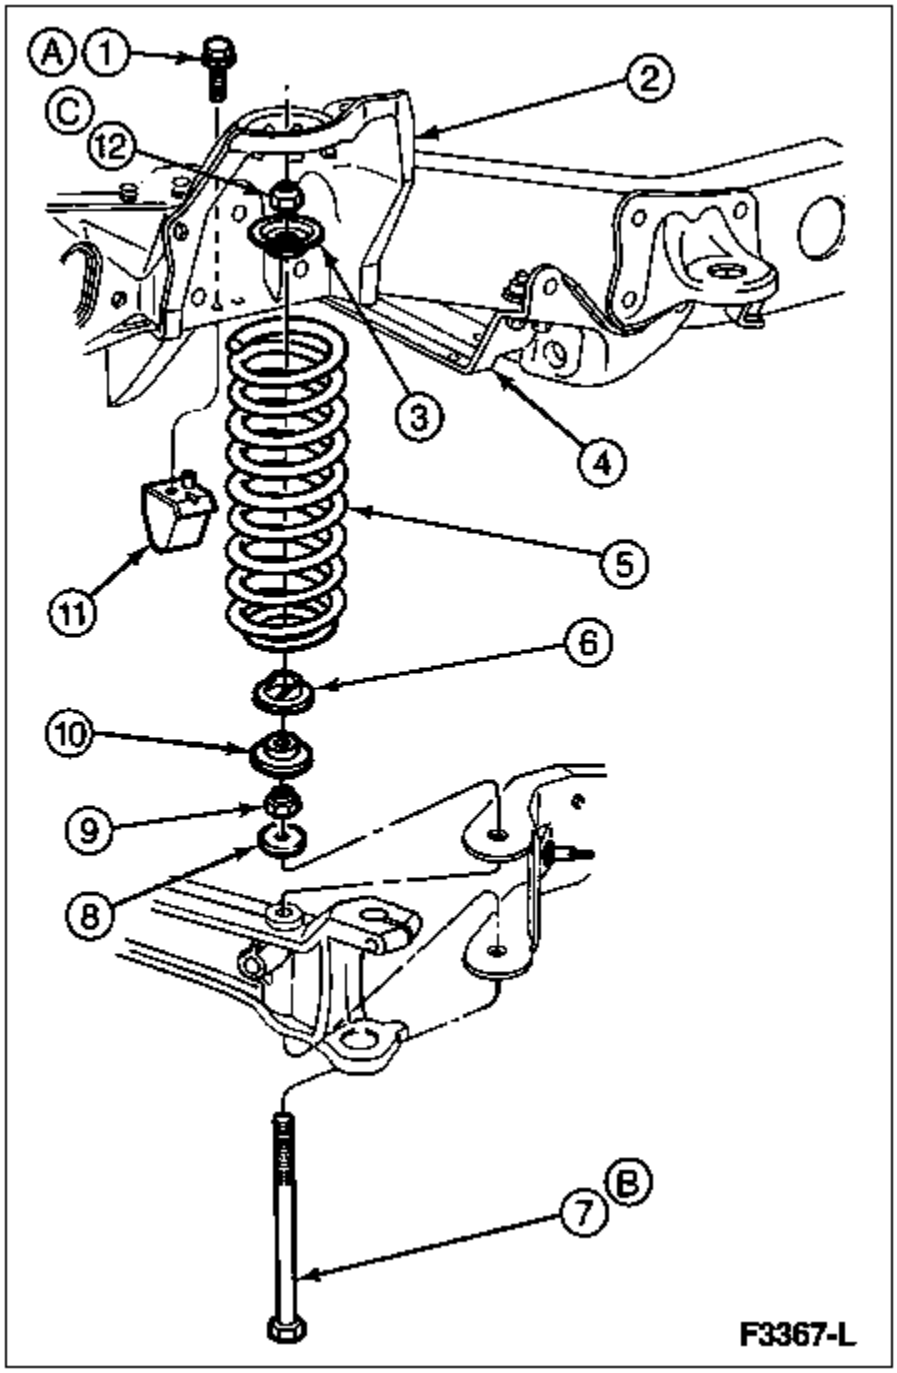
Description	Tool Number
Strut Spring Compressor	T81P-5310-A

Removal and Installation

1. **CAUTION: The axle must not be permitted to hang by the brake hose. If the length of the brake hose is not sufficient to provide adequate clearance for removal and installation of the front coil spring (5310), the front disc brake caliper (2B121) must be removed from the front wheel spindle (3105) according to the procedures specified in Section 06-03 . Strut Spring Compressor T81P-5310-A may be used to compress the front coil spring sufficiently, so the front disc brake caliper does not have to be removed. After removal, the front disc brake caliper must be placed on the frame or otherwise supported to prevent suspending the front disc brake caliper from the brake hose. These precautions are absolutely necessary to prevent serious damage to the tube portion of the caliper hose assembly.**

   Raise the front of vehicle and place safety stands under the frame and a jack under the axle.

tomsn048@gmail.com



Item	Part Number	Description
1	806358	Bolt
2	5B315	Front Spring Upper Seat (LH)
3	5A349	Lower Spring Retainer
4	3B183	Radius Arm Bracket (LH)
5	5310	Front Coil Spring
6	5414	Front Spring Insulator

tomsn048@gmail.com

7	390386	Bolt
8	379672	Washer
9	34992	Nut
10	58349	Lower Spring Seat
11	3B461	Front Suspension Bumper
12	34992	Nut
A	—	Tighten to 25-35 Nm (18-26 Lb-Ft)
B	—	Tighten to 255-345 Nm (190-255 Lb-Ft)
C	—	Tighten to 95-135 Nm (70-100 Lb-Ft)

2. Disconnect front shock absorber at lower shock stud.
3. Remove the nut securing the retainer to the lower spring seat. Remove the lower retainer.
4. Lower the axle and support without stretching the brake hose and tube assembly.
5. Either remove the front disc brake caliper or use Strut Spring Compressor T81P-5310-A. Remove front coil spring.
6. If sufficient slack exists in the brake hose assembly, a pry bar may be used to lift the front coil spring over the bolt that passes through the lower spring seat.
7. Rotate front coil spring so the built-in retainer on the upper spring seat is cleared.
8. Remove the spring lower seat and insulator.

For installation, follow removal procedures in reverse order. Tighten lower retainer and nut to 95-135 Nm (70-100 lb-ft). Tighten shock absorber-to-lower shock stud to 53-72 Nm (39-53 lb-ft).

tomsn048@gmail.com

tomsn048@gmail.com

Axle, I-Beam — Ranger

Removal and Installation

1. Remove the front wheel spindle (3105), the front coil spring (5310), and the front stabilizer bar (5482) (if so equipped) as outlined in this section.

2. Remove the spring lower seat from the radius arm, and then remove the bolt and nut that attaches the radius arm to the (I-beam) front axle.

3. Remove the axle-to-frame pivot bracket bolt and nut.

For installation, follow removal procedures in reverse order. Tighten axle-to-frame bracket bolt and nut to 150-200 Nm (111-148 lb-ft). Tighten axle to radius arm bolt to 255-345 Nm (190-255 lb-ft).

Front I-Beam Axle, Ranger 4x2

tomsn048@gmail.com

tomsn048@gmail.com

Axle Pivot Bracket — Ranger

Removal and Installation

1. **NOTE: Proper nuts (N802073-S2) for this application have an undercut to provide clearance to bolt knurl. Use proper nuts or install one 5mm (0.20-inch) thick hardened washer under each nut if a standard nut is used.**

   Remove front coil spring (5310), radius arm, and front wheel spindle (3105). Remove I-beam axle as described in this section.

2. Remove the four attaching nuts and two bolts and retainer assemblies. Remove the axle pivot bracket.

For installation, follow removal procedures in reverse order. Tighten nuts to 98-132 Nm (73-97 lb-ft).

tomsn048@gmail.com

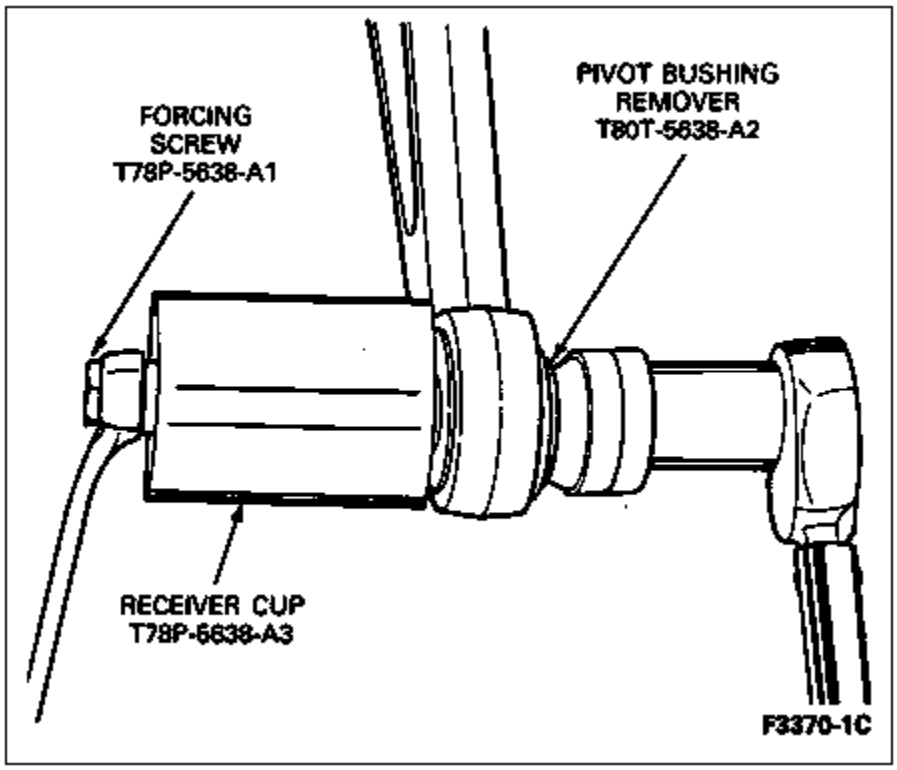
Axle Pivot Bushing — Ranger

SPECIAL SERVICE TOOL(S) REQUIRED

Description	Tool Number
Forcing Screw	T78P-5638-A1
Receiver Cup	T78P-5638-A3
Front Suspension Bushing Tool	T80T-5638-A2
Twin I-Beam Pivot Bushing Spacer	T82T-3006-AH

Removal and Installation

1. Remove front coil spring (5310) as described in this section.
2. To remove left I-beam axle pivot bushing, remove axle pivot nut and bolt.
3. Pull the pivot end of the left I-beam axle down until the bushing is exposed.
4. To remove right I-beam axle pivot bushing, remove entire right I-beam axle to gain access to pivot bushing. Refer to Front I-beam Axle removal and installation procedures in this section.



5. Install Forcing Screw T78P-5638-A1, Bushing Remover T80T-5638-A2 and Receiver Cup T78P-

tomsn048@gmail.com

5638-A3 onto pivot bushing. Place spacers T82T-3006-AH between the walls of the axle.

6. Turn the forcing screw and remove the pivot bushing.

For installation, follow removal procedures in reverse order. When installing pivot bushing in axle, use Bushing Spacer T82T-3006-AH, lower vehicle and tighten pivot bushing and nut to 150-200 Nm (111-148 lb-ft).

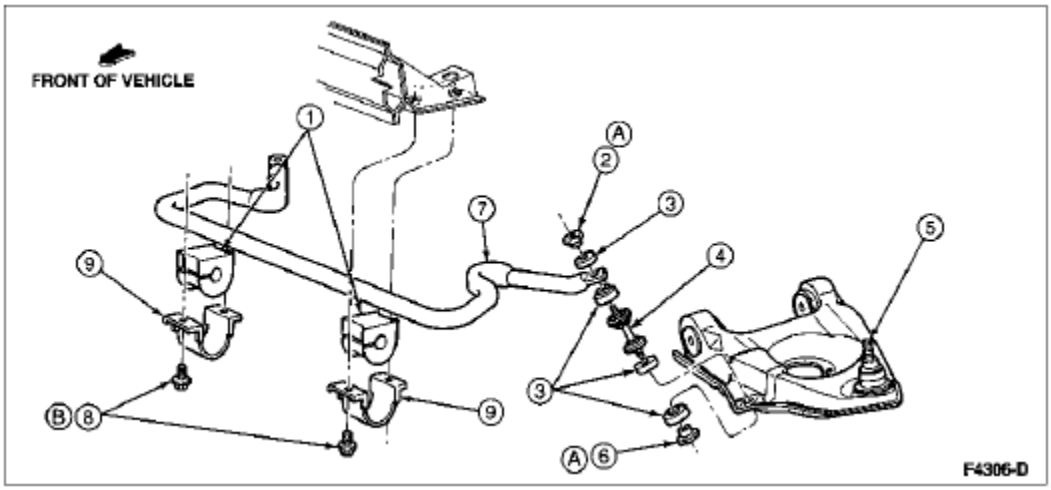
tomsn048@gmail.com

Stabilizer Bar — Aerostar

Removal and Installation

1. Raise vehicle on frame hoist and position suitable safety stands under vehicle.
2. Remove the nuts retaining the front stabilizer bar (5482) to the lower control arm link.
3. Remove the insulators and disconnect the front stabilizer bar from the links.
4. If required, remove the nuts retaining the links to the front suspension lower arm (3078).
5. Remove the insulators and remove the front stabilizer bar links (5K483).
6. Remove bar mounting bracket to frame bolts.
7. Remove the front stabilizer bar. If required, remove the insulators from the front stabilizer bar.

Front Stabilizer Bar, Aerostar



Item	Part Number	Description
1	5484	Stabilizer Bar to Frame Insulator
2	5C491	Nut
3	N803702	Insulator
4	3B439	Link Assembly
5	3050	Front Suspension Lower Arm Ball Joint

8	N806497	Bolt
9	5486	Stabilizer Bar Bracket
A	—	Tighten to 8-12 Nm (71-106 Lb-Ft)
B	—	Tighten to 22-33 Nm (16-24 Lb-Ft)

For installation, follow removal procedures in reverse order. Tighten all four stabilizer bar link nuts to 8-12 Nm (71-106 lb-in).

tomsn048@gmail.com

Stabilizer Bar — Ranger

Removal and Installation

1. Raise vehicle on hoist and position suitable safety stands under vehicle.
2. Remove stabilizer bar assembly nut and washer and disconnect the stabilizer link assembly from the front I-beam axle.
3. Remove the retainer-to-frame mounting bolts.
4. Remove the front stabilizer bar (5482) retainers from the stabilizer bar assembly.
5. Remove the front stabilizer bar from the vehicle.

For installation follow removal procedures in reverse order. Tighten stabilizer bar-to-I-beam mounting bracket bolt to 40-55 Nm (30-41 lb-ft). Tighten retainer bolts to 30-40 Nm (22-30 lb-ft).

tomsn048@gmail.com

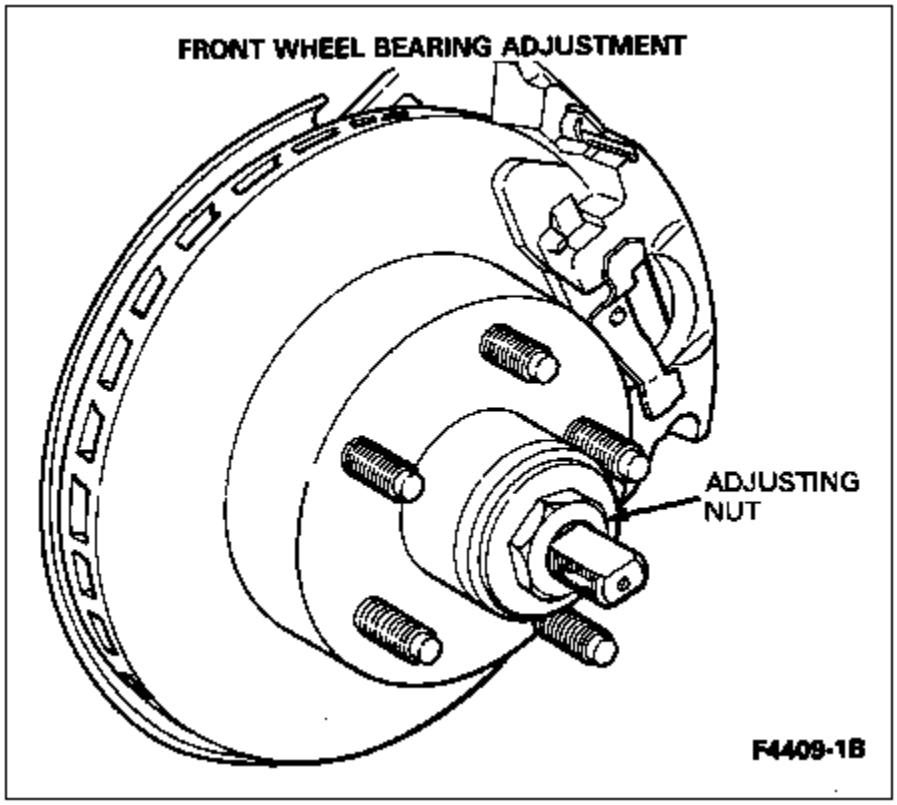
Wheel Bearings

If the wheel and tire assembly is loose on the front wheel spindle (3105) or does not rotate freely, adjust the front wheel bearings as follows:

1. Raise the vehicle until the tire clears the floor.
2. Remove the wheelcover if applicable. Remove the grease cap from the hub.
3. Wipe any excess grease from the end of the front wheel spindle. Remove the cotter pin and retainer. Discard the cotter pin.



4. Loosen the adjusting nut three turns. Obtain running clearance between the rotor brake surface and linings by rocking the entire wheel assembly in and out several times to push the front disc brake caliper (2B121) and brake pads away from the rotor. An alternate method for obtaining the proper running clearance is to lightly tap on the caliper housing. Be sure not to tap on any other area that may damage the front disc brake hub and rotor (1102) and the lining surfaces. **Do not pry on the phenolic caliper piston.**
5. **NOTE: The running clearance must be maintained throughout the bearing adjustment procedure as outlined in the following steps. If proper clearance cannot be maintained, the front disc brake caliper must be removed. Refer to Section 06-03 for removal and installation**

tomsn048@gmail.com

procedures.

Tighten the adjusting nut to 23-34 Nm (17-25 lb-ft) while turning the rotor in the opposite direction to seat the bearings.

6. Loosen the adjusting nut one-half turn.

7. Retighten the nut to 2.0-2.3 Nm (18-20 lb-in), using a torque wrench.

8. **NOTE: Do not turn adjuster nut to make castellations line up with hole in spindle.**

   Place the retainer on the adjusting nut. The castellations on the retainer must be aligned with the cotter pin hole in the front wheel spindle.

9. Remove the retainer from the nut and reindex retainer without moving nut. Repeat until castellations line up with hole in front wheel spindle.

10. Install a new cotter pin. Bend the cotter pin ends in opposite directions around the castellated flange of the retainer.

11. Check front wheel rotation. End play should be .006-.127mm (.0002-.005 inch) or a breakaway torque of 2.8 Nm (25 lb-in) maximum. If wheel rotates properly, reinstall the grease cap and wheelcover. If rotation is noisy or rough, remove, inspect and lubricate the bearing cones and cups as described in the Removal and Installation procedure in this section.

12. Before driving the vehicle, pump the brake pedal several times to restore normal brake travel.

tomsn048@gmail.com

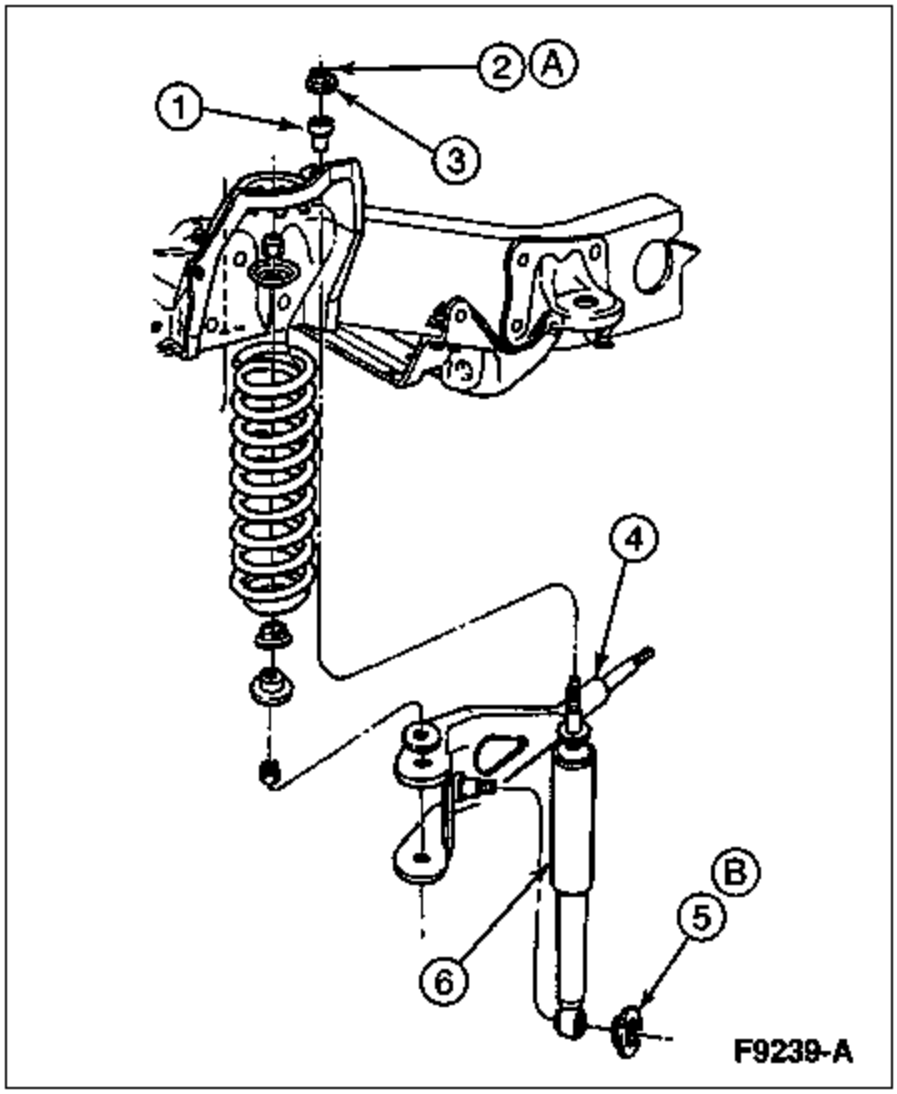
Shock Absorber

WARNING: THE LOW PRESSURE GAS SHOCK ABSORBERS ARE CHARGED WITH NITROGEN GAS TO 930 KPA (135 PSI). DO NOT ATTEMPT TO OPEN, PUNCTURE OR APPLY HEAT TO THE SHOCK ABSORBERS.

Removal and Installation

1. Raise vehicle on hoist with axle in the rebound position and place suitable safety stands under axle to prevent it from dropping down when shock is removed.
2. Remove the shock absorber upper nut and washer from the spring seat.
3. Remove stud nut and washer that holds the front shock absorber to the radius arm.
4. Slide the front shock absorber off the radius arm stud. Slightly compress the front shock absorber by hand and remove from the vehicle.

For installation, follow removal procedures in reverse order. Inspect the insulator in the spring seat. If the insulator requires replacement, install a new one. Tighten the lower nut to 53-72 Nm (39-53 lb-ft). Tighten the upper insulator, nut and washer to 34-46 Nm (25-33 lb-ft).



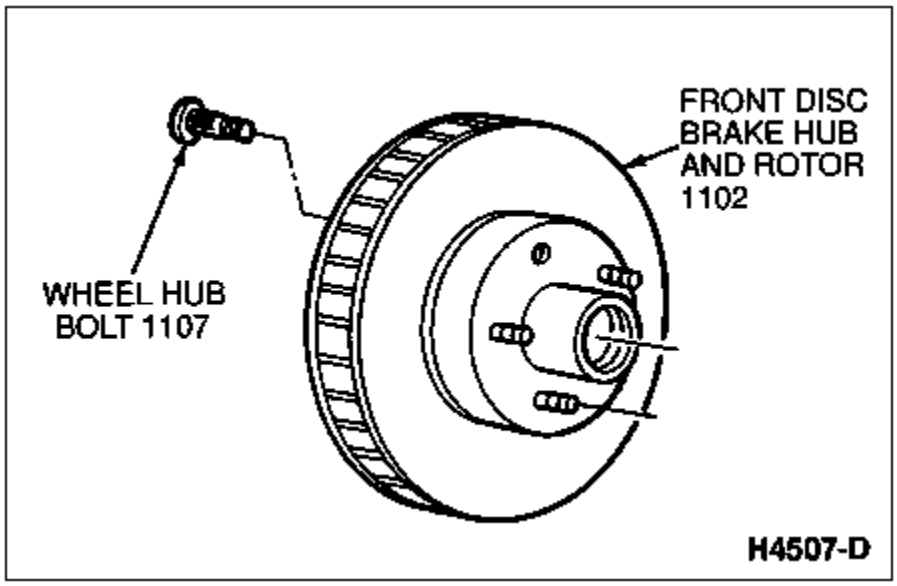
Item	Part Number	Description
1	18198	Insulator
2	N620468-S2	Nut
3	N802084-S2	Washer
4	3405	Radius Arm
5	N806372-S100	Nut and Washer
6	18045	Front Shock Absorber
A	—	Tighten to 34-46 Nm (25-33 Lb-Ft)
B	—	Tighten to 53-72 Nm (39-53 Lb-Ft)

Wheel Hub Bolt

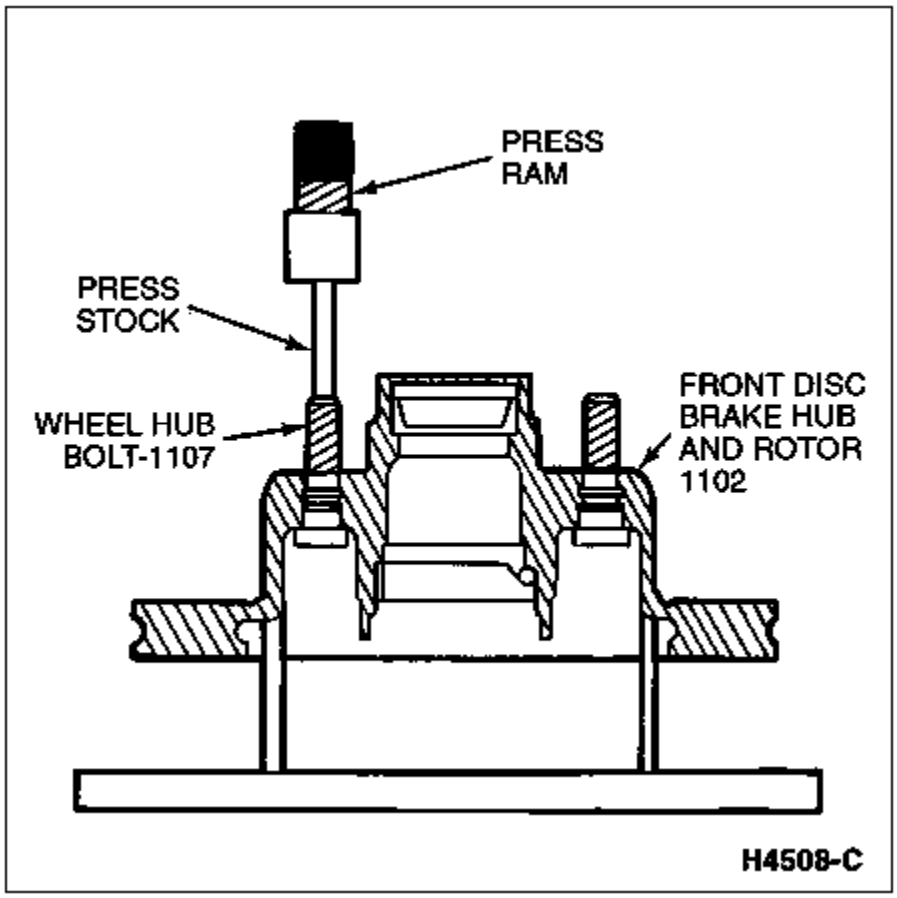
CAUTION: Service must be performed on any damaged components or the component that caused lug bolt (1107) to require replacement.

Removal

1. Raise the vehicle and install safety stands.
2. Remove the wheel and tire.
3. Remove the front front disc brake hub and rotor (1102) as described in Section 05-03A .



4. Position the front disc brake hub and rotor in a press so ram pressure is not directly exerted on the surface of front disc brake hub and rotor. With appropriate press stock, press the wheel hub bolt from the front disc brake hub and rotor. Discard the wheel hub bolt.



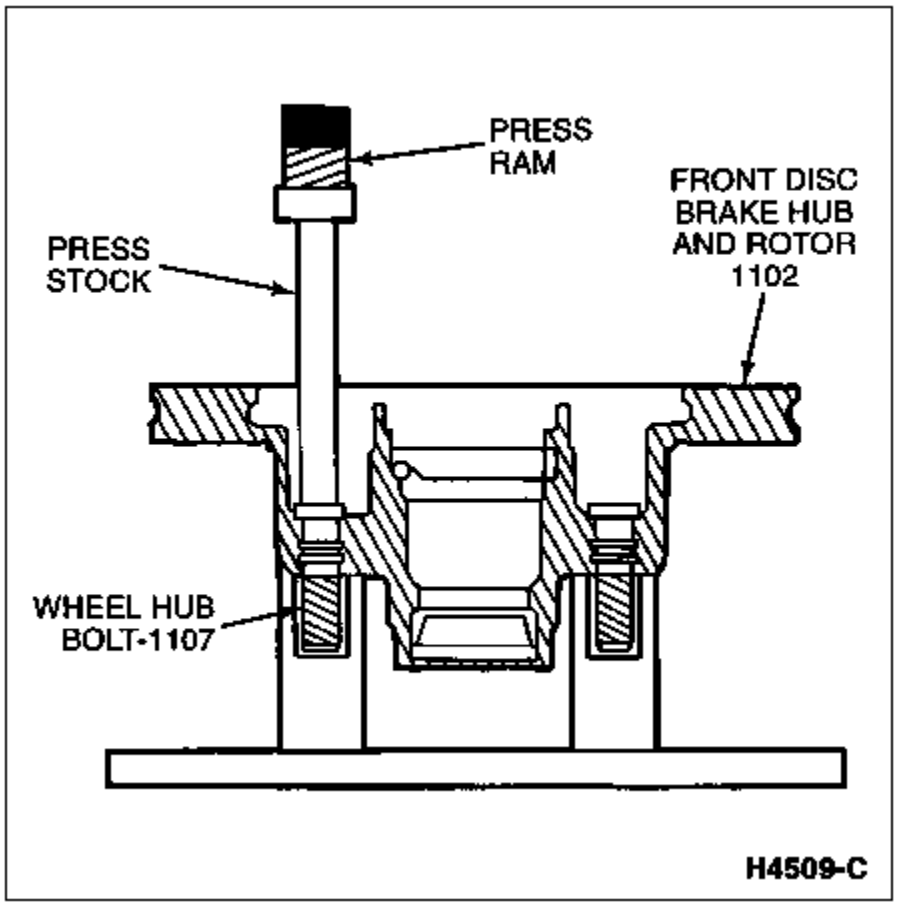
5. Inspect lug nuts (1012) for damaged threads. Discard if damaged.

Installation

1. Position a new lug bolt in the hole. Align the serrations of the new lug bolt with the serration marks from the old lug bolt. With a hammer, lightly tap the lug bolt until the serrations on the lug bolt are started in the hole. Make sure the lug bolt is not installed off-center in front disc brake hub and rotor.

2. Position the front disc brake hub and rotor in a press so the front disc brake hub and rotor is supported on the wheel mounting flange. Allow enough clearance for the lug bolt to pass through the hole. Do not apply ram pressure directly on the rotor surface of front disc brake hub and rotor.

3. With appropriate press stock, press the stud flush against the inner surface of the hub and rotor.



4. Install the front disc brake hub and rotor as described in Section 05-03A .
5. Replace any damaged lug nuts.
6. Install the wheel (1007) and tire.

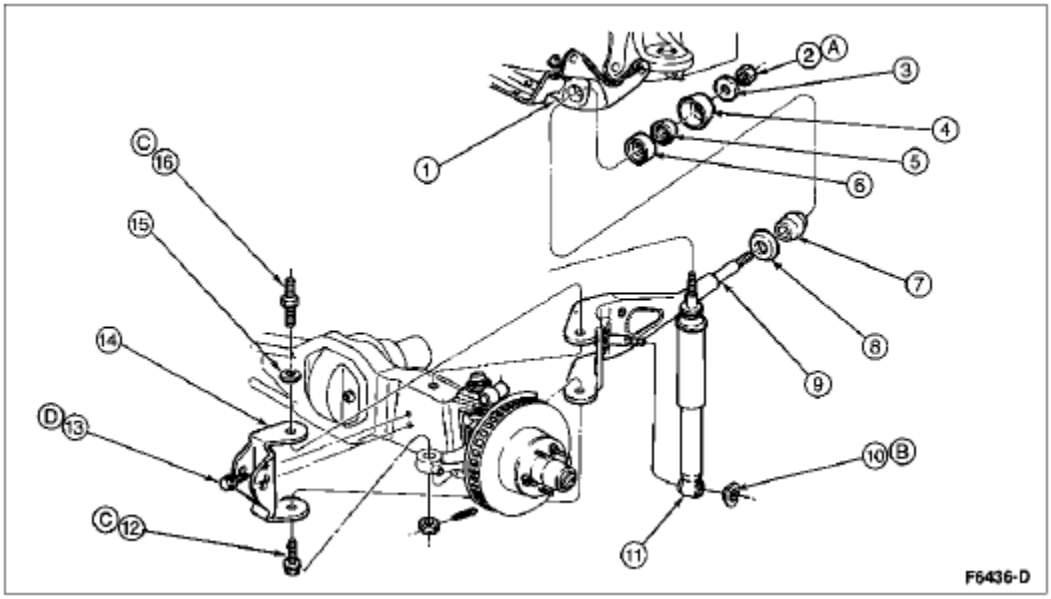
Radius Arm

CAUTION: The axle must be supported on the jack throughout spring removal and installation. Do not hang by the brake hose. If the length of the brake hose is not sufficient to provide adequate clearance for removal and installation of the spring, the front disc brake caliper (2B121) must be removed from the front wheel spindle (3105). Refer to Section 06-03 . After removal, the front disc brake caliper must be placed on the frame or otherwise supported to prevent suspending the front wheel spindle from the caliper hose. These precautions are absolutely necessary to prevent serious damage to the tube portion of the caliper hose.

Removal

1. Raise the front of the vehicle and place safety stands under the frame. Place a jack under the axle.

Radius Arm



Item	Part Number	Description
1	3B183	Bracket
2	34992	Nut
3	379572	Washer
4	3B463	Shield (RH Side Only)
5	3A184	Outer Insulator

6	3B244	Spacer
7	3B203	Inner Insulator
8	3B186	Retainer
9	3405	Radius Arm
10	N806372-S100	Nut and Washer Assembly
11	18045	Front Shock Absorber
12	391701	Bolt
13	40954	Bolt
14	5486	Stabilizer Bar Bracket
15	379572	Washer (LH Side Only)
16	390678	Stud
A	—	Tighten to 113-153 Nm (83-113 Lb-Ft)
B	—	Tighten to 53-72 Nm (39-53 Lb-Ft)
C	—	Tighten to 255-345 Nm (190-255 Lb-Ft)
D	—	Tighten to 21-29 Nm (15-21 Lb-Ft)

2. Disconnect the lower end of the front shock absorber from the shock lower stud.
3. Remove the front coil spring (5310) as described in this section. Loosen the axle pivot bolt.
4. Remove the spring lower seat and stud from the radius arm. Remove the radius arm lower attaching bolt to axle.
5. Remove nut, washer, shield (right-hand side only), outer insulator and spacer from stud at rear side of radius arm rear bracket.
6. Remove the radius arm from vehicle.
7. Remove the inner insulator and retainer from the radius arm stud.
8. Remove front bracket if necessary.

Installation

1. Install retainer and inner insulator on radius arm stud. Insert the stud through the radius arm rear bracket.
2. Position the front end of radius arm bracket to axle.
3. Install attaching bolts and stud in the bracket finger-tight.
4. Install spacer, outer insulator, shield (right-hand side only) washer and nut, in this order, on the arm stud at the rear side of the arm rear bracket. Tighten nut to 113-153 Nm (83-113 lb-ft).

5. Tighten stud to 255-345 Nm (190-255 lb-ft).

6. If removed, tighten the front bracket to axle bolts to 21-29 Nm (15-21 lb-ft) and lower bolt and washer to 255-345 Nm (190-255 lb-ft).

7. Install the spring lower seat and front spring insulator (5414) on the radius arm positioning hole in seat over the arm-to-axle bolt. Tighten the axle pivot bolt to 150-200 Nm (111-148 lb-ft).

8. Install the front coil spring as described in this section.

9. Connect the lower end of the front shock absorber to the lower stud on the radius arm with the attaching nut. Tighten the nut to 53-72 Nm (39-53 lb-ft).

Insulators, Radius Arm

Removal and Installation

1. Remove front stabilizer bar link attachment. Rotate stabilizer bar up and out of the way.

2. **CAUTION: The axle must be supported on the jack throughout spring removal and installation. Do not hang by the brake hose. If the length of the brake hose is not sufficient to provide adequate clearance for removal and installation of the spring, the front disc brake caliper (2B121) must be removed from the front wheel spindle (3105). Refer to Section 06-03 . After removal, the front disc brake caliper must be placed on the frame or otherwise supported to prevent suspending the front wheel spindle from the caliper hose. These precautions are absolutely necessary to prevent serious damage to the tube portion of the caliper hose.**

   Raise the front of the vehicle and place safety stands under the frame. Place a jack under the axle.

3. Disconnect the lower end of the front shock absorber from the shock lower stud.

4. Remove the front coil spring (5310) as described in this section. Loosen the axle pivot bolt.

5. Remove radius arm to radius arm bracket attaching nut and washer. Remove the outer insulator (and shield on right radius arm only) and spacer.

6. Move the radius arm and axle forward out of the radius arm bracket.

7. Remove the inner insulator and retainer.

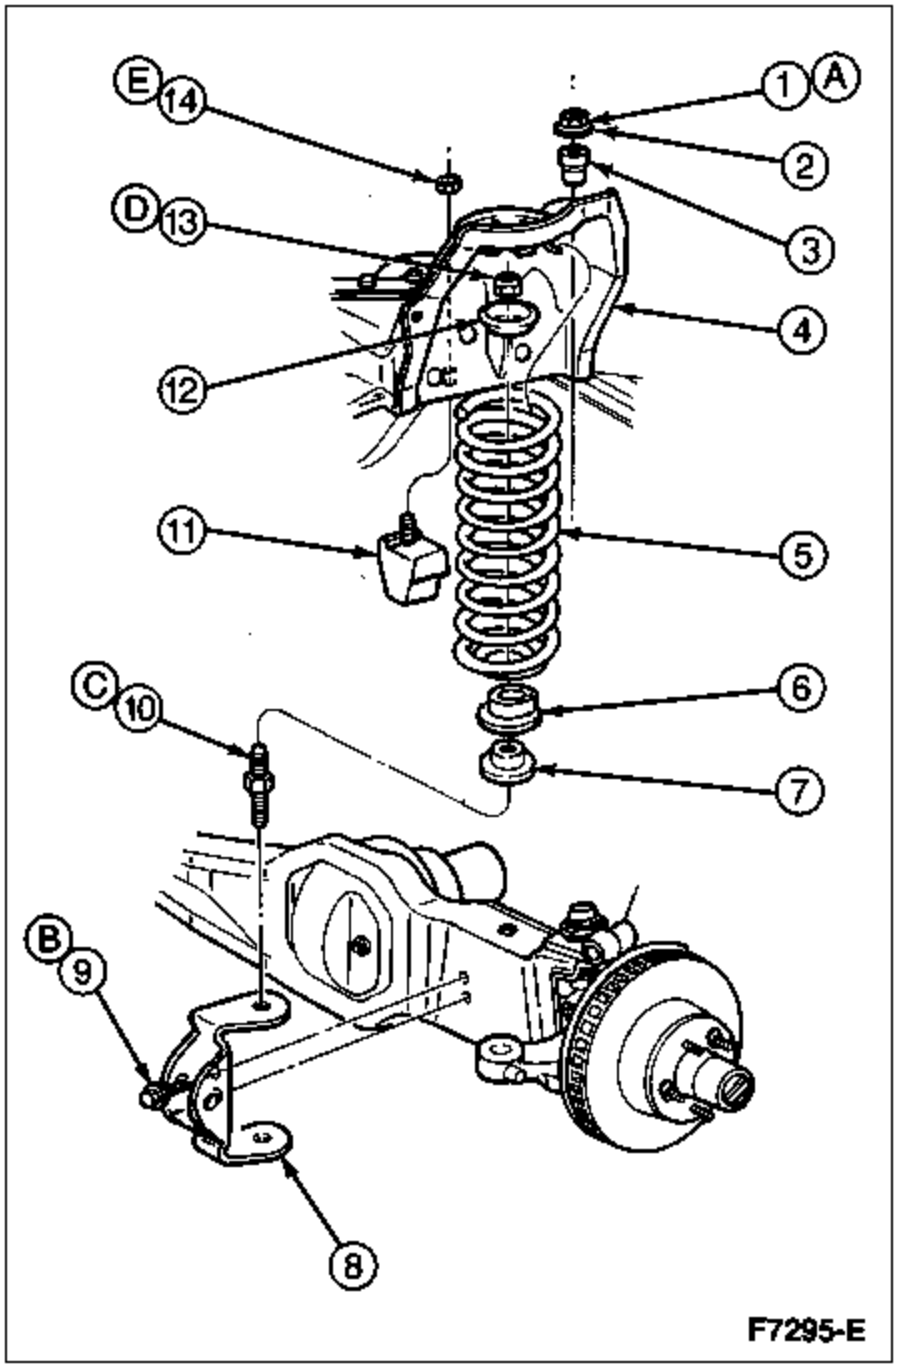
For installation, follow removal procedures in reverse order. Tighten radius arm-to-rear bracket nut 113-153 Nm (83-113 lb-ft). Tighten upper shock bolt to 34-46 Nm (25-33 lb-ft). Tighten axle pivot bolt 150-200 Nm (111-148 lb-ft).

Coil Spring

Removal and Installation

1. **CAUTION: The axle must be supported on the jack throughout spring removal and installation. Do not permit the axle to hang by the brake hose. If the length of the brake hose is not sufficient to provide adequate clearance for removal and installation of the front coil spring (5310), the front disc brake caliper (2B121) must be removed from the front wheel spindle (3105) according to the procedures specified in Section 06-03 . After removal, the front disc brake caliper must be placed on the frame or otherwise supported to prevent suspending the front disc brake caliper from the caliper hose. These precautions are absolutely necessary to prevent serious damage to the tube portion of the caliper hose.**

   Raise the vehicle and install safety stands. Position a jack beneath the front coil spring under the axle.



Item	Part Number	Description
1	N620468-S2	Nut
2	N802084	Washer
3	18198	Insulator
4	5B315	Upper Spring Seat (LH)
5	5310	Front Coil Spring
6	5414	Front Spring Insulator

7	5A307	Lower Seat
8	5486	Stabilizer Bar Bracket
9	40954	Bolt
10	390678	Stud
11	3020	Front Suspension Bumper
12	5A349	Retainer
13	388833	Nut
14	620481	Nut
A	—	Tighten to 34-46 Nm (25-33 Lb-Ft)
B	—	Tighten to 21-29 Nm (15-21 Lb-Ft)
C	—	Tighten to 255-345 Nm (190-255 Lb-Ft)
D	—	Tighten to 95-135 Nm (70-100 Lb-Ft)
E	—	Tighten to 25-35 Nm (18-26 Lb-Ft)

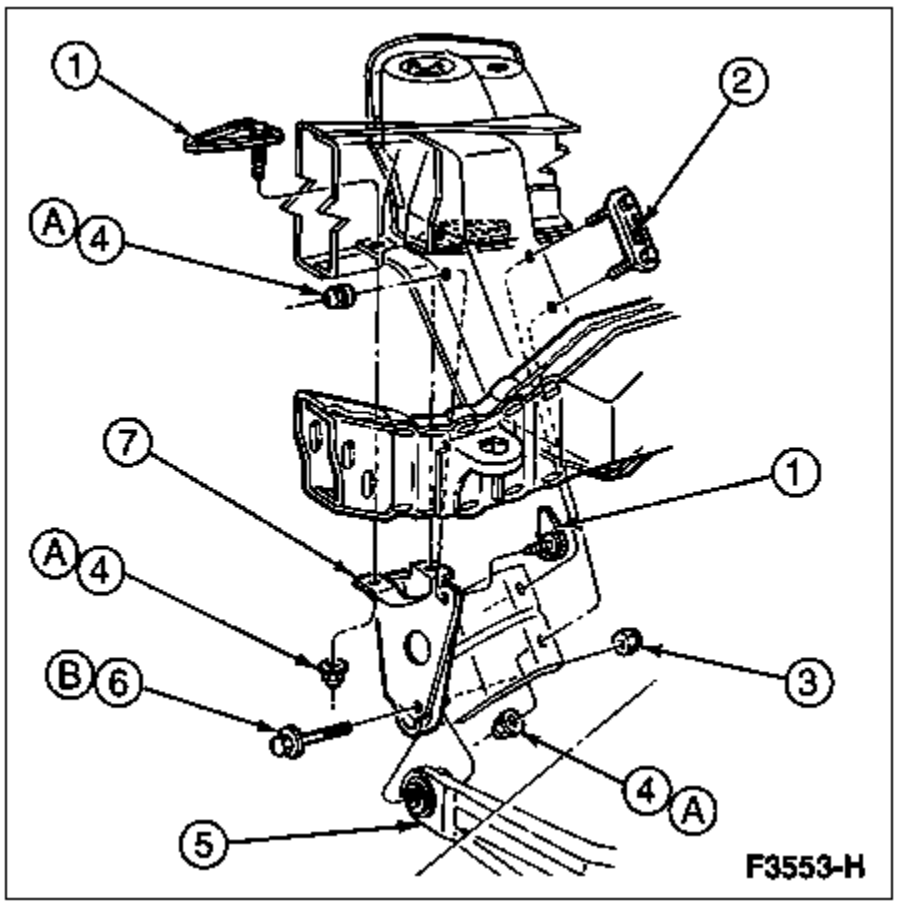
2. Raise the jack and compress the front coil spring.
3. Remove shock absorber nut to radius arm. Slide front shock absorber out from stud.
4. Remove spring-to-axle retaining nut and radius arm. Remove the retainer.
5. Slowly lower axle until all spring tension is released and adequate clearance exists to remove the front coil spring.
6. Remove the front coil spring by rotating upper front coil spring out of upper spring seat tabs. Remove the spacer and seat.

For installation, follow removal procedures in reverse order. Tighten spring retainer nut to 95-135 Nm (70-100 lb-ft). Tighten shock nut to radius arm 53-72 Nm (39-53 lb-ft).

Axle Pivot Bracket

Removal

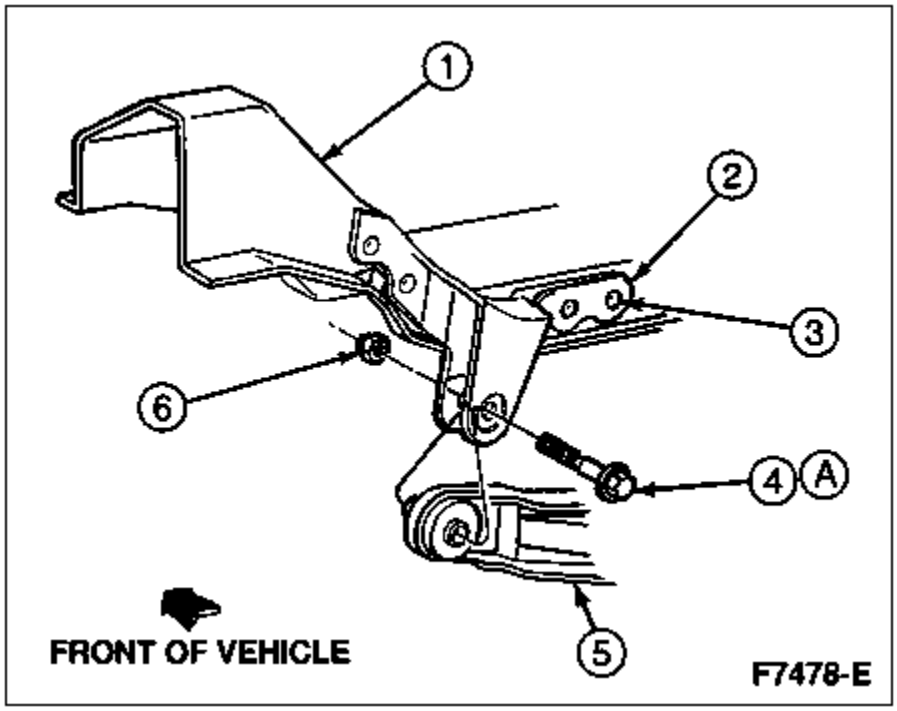
1. Raise vehicle on a frame hoist. Position a tall jackstand under the axle arm near the front axle pivot bracket. Lower the hoist until the axle is in contact with the jackstand.
2. Remove the bolt and nut attaching the axle to the front axle pivot bracket. Raise hoist and, if required, pry the axle free from the front axle pivot bracket.
3. On the right front axle pivot bracket, remove the attaching nuts.
4. Remove upper bolt and retainer and side bolt and retainer.
5. Remove and discard the lower bolt and retainer.
6. Remove the front axle pivot bracket from the front crossmember (5019).



Item	Part Number	Description
1	804933	Upper Bolt and Retainer (Install in Direction Shown)
2	807266	Side Bolt and Retainer (Install in Direction Shown)
3	620604	Nut
4	802073	Nut
5	3002	Left Axle Arm
6	801079	Bolt (Install in Direction Shown)
7	3K090	Front Axle Pivot Bracket
A	—	Tighten to 113-153 Nm (83-113 Lb-Ft)
B	—	Tighten to 150-200 Nm (111-148 Lb-Ft)

7. On the left front axle pivot bracket, drill out rivets so the mounting holes in the bracket and front crossmember are 9/16 inch in diameter.

8. Remove the left front axle pivot bracket.



Item	Part Number	Description
1	5019	Front Crossmember
2	3K090	Front Axle Pivot Bracket
3	65094	Rivet

4	801079	Bolt
5	3002	Right Front Axle
6	620604	Nut
A	—	Tighten to 150-200 Nm (111-148 Lb-Ft)

Installation

1. On the left front axle pivot bracket, position the pivot bracket on the front crossmember. Make sure the 9/16-inch drilled holes are in alignment.
2. Install the 9/16-12 x 1-1/2-inch Grade 8 replacement bolts, washers (2) and nuts. Tighten to 210 Nm (155 lb-ft).
3. On the right front axle pivot bracket, position the bracket on front crossmember.
4. Install upper bolt and retainer. Install the side bolt and retainer with the bolt heads facing toward the engine oil pan to maximize clearance. Install and tighten nuts to 113-153 Nm (83-113 lb-ft).
5. Drill out the mounting hole for the lower bolt and retainer in the bracket and front crossmember to a 9/16-inch diameter. Install 9/16-12 x 1-1/2-inch Grade 8 replacement washers (2) and nuts. Tighten to 210 Nm (155 lb-ft).
6. Lower the hoist until the axle engages bracket. Install the attaching bolt and nut. Tighten to 150-200 Nm (111-148 lb-ft).
7. Remove jackstand and lower vehicle.

Stabilizer Bar

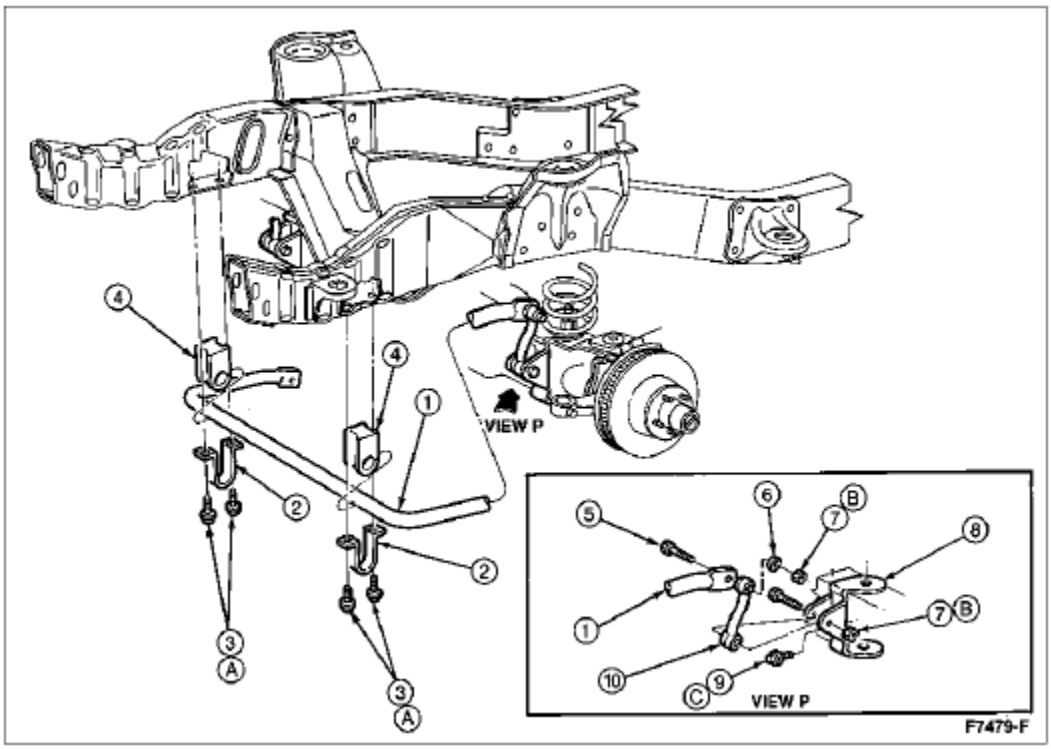
Removal

1. Remove bolts and retainers from center and right-hand end of front stabilizer bar (5482).
2. Remove nut, bolt and washer retaining front stabilizer bar to the front stabilizer bar link (5K483).
3. Remove the front stabilizer bar and insulators.

Installation

1. Place front stabilizer bar and insulators in position.
2. Install retainers, nuts and bolts. Tighten retainer bolts to 30-40 Nm (22-30 lb-ft). Tighten front stabilizer bar-to-link nut to 40-55 Nm (30-40 lb-ft).

Front Stabilizer Bar



Item	Part Number	Description
1	5482	Front Stabilizer Bar

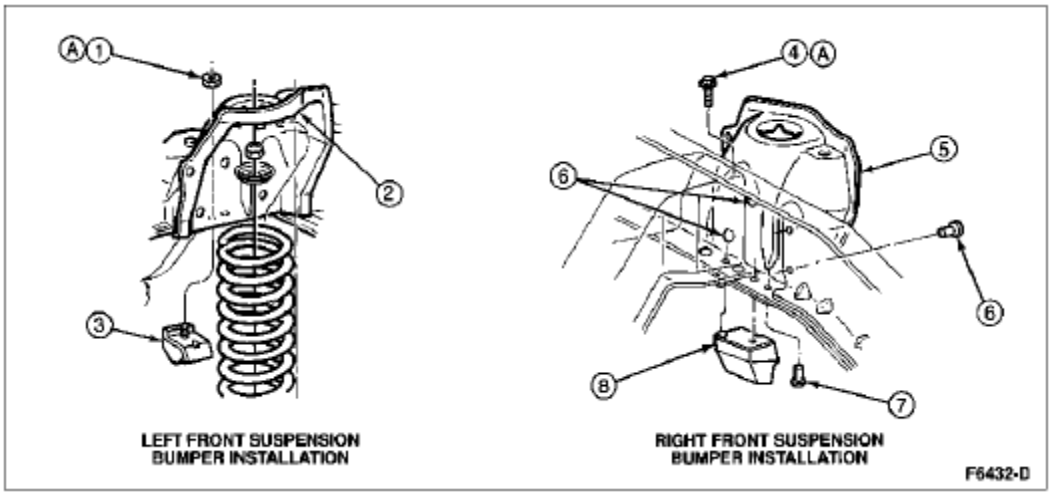
2	5486	Front Stabilizer Bracket
3	611646	Bolt
4	5484	Stabilizer Bar Insulator
5	605704	Bolt
6	800916	Washer
7	800937	Nut
8	5486	Stabilizer Bar Mounting Bracket
9	40954	Screw
10	5K483	Front Stabilizer Bar Link
A	—	Tighten to 30-40 Nm (22-30 Lb-Ft)
B	—	Tighten to 40-55 Nm (30-40 Lb-Ft)
C	—	Tighten to 21-29 Nm (15-21 Lb-Ft)

Bumper, Front

Removal and Installation

1. Remove hex bolt with a 10mm hex socket. Remove bumper.
2. Position front suspension bumper (3020) on frame. Install hex bolt and tighten bolt to 25-35 Nm (18-26 lb-ft).

Front Bumper



Item	Part Number	Description
1	620481	Nut
2	5B315	Upper Spring Seat (LH)
3	3B461	Front Suspension Bumper (LH)
